Table of Contents

Key to the species of Ericaceae of Bolivia, including two new species
James L. Luteyn—**1**

Two new species of **Festuca** from South America (Poaceae: Loliinae: sect. Subulatae)
Daniel Stančík and Paul M. Peterson—**21**

A new species of **Eriogonum** (Polygonaceae) from south Texas
Guy L. Nesom—**31**

A new variety of **Ipomoea costellata** (Convolvulaceae) from the Edwards Plateau region of Texas
Robert J. O'Kennon and Guy L. Nesom—**39**

Sphaeralcea caespitosa var. **williamsiae**, var. nov. (Malvaceae)
Noel H. Holmgren—**47**

The present status of Ledermann's April River localities in Papua New Guinea
W. Takeuchi and M. Golman—**55**

Biosystematic analysis of the **Thelesperma subnudum** complex (Asteraceae)
Curtis J. Hansen, Loreen Allphin, and Michael D. Windham—**71**

Liatris gholsonii (Asteraceae: Eupatorieae), a new blazing star from the Apalachicola River bluffs and ravines in Florida
Loran C. Anderson—**97**

A new species of **Gonolobus** (Apocynaceae: Asclepiadeae, Gonolobinae) from southern Costa Rica
Alexander Krings—**105**

A new species of **Medinilla** (Melastomataceae) from Anamalai Hills, South India
N. Sasidharan and P. Sujanapal—**109**

New taxa of **Crataegus** (Rosaceae) from the northern Okanagan–southwestern Shuswap diversity center
J.B. Phipps and R.J. O'Kennon—**115**

New combination in **Xylorhiza** (Asteraceae: Astereae)
Guy L. Nesom—**145**

Lectotypification of **Pseudognaphalium biolettii** (Gnaphalieae: Asteraceae)
Guy L. Nesom—**149**

Boerhavia coulteri var. **palmeri**, a new varietal combination for **Boerhavia** (Nyctaginaceae) of southwestern North America
Richard Spellenberg—**151**

Lectotypification of **Mentzelia texana** and **M. lindheimeri** (Loasaceae) with an assessment of their biological status
Billie L. Turner—**157**

Nomenclatural changes and innovations in **Panicum** and **Dichanthelium** (Poaceae: Paniceae)
Robert W. Freckmann and Michel G. Lelong—**161**

A new species of **Senecio** (Asteraceae) from Durango, Mexico
B.L. Turner—**175**

Two new species of **Weinmannia** (Cunoniaceae: Cunonieae) from southern Ecuador
Zachary S. Rogers—**179**

The taxonomy and morphology of **Macranthera flammea** (Orobanchaceae)
Jill D. Alford and Loran C. Anderson—**189**

The genus **Campomanesia** (Myrtaceae) in Atlantic rainforest fragments in Sergipe, northeast region of Brazil
Myrna F. Landim and Leslie R. Landrum—**205**

Biological status of **Hedyotis nigricans** var. **gypsophila** (Rubiaceae) in Texas
B.L. Turner—**215**

Documented chromosome numbers 2002: 1. Chromosome number of **Stenanthium** (Liliales: Melanthiaceae) and its significance in the taxonomy of tribe Melanthieae
Wendy B. Zomlefer and Gerald L. Smith—**221**

Documented chromosome numbers 2002: 2. Chromosome numbers in North American species of **Cerastium** (Caryophyllaceae)
J.K. Morton—**227**

Ethnobotany/Systematics

Usos de Melastomataceae en el Ecuador
Alina Freire Fierro, Diana Fernández, and Catalina Quintana—**233**

The identity of eaglewood (**Gyrinops**, Thymelaeaceae), a new economic resource for Papua New Guinea
W. Takeuchi and M. Golman—**261**

Floristics/Systematics

Vascular plants of Konza Prairie Biological Station: an annotated checklist of species in a Kansas tallgrass prairie
E. Gene Towne—**269**

The vascular flora of the Cerrado in Emas National Park (Goiás, central Brazil)
Marco Antônio Batalha and Fernando Roberto Martins—**295**

Rust fungi (Uredinales) of Northwest Argentina
José R. Hernández and Joe F. Hennen—**313**

Additions to the Cyperaceae and Juncaceae flora of the Río Mayo region, Sonora, Mexico
Eric H. Roalson, Thomas R. Van Devender, and Ana Lilia Reina G.—**339**

Listado preliminar de las Cactáceas y Agavaceas de la Sierra "El Viejo," Sonora, región prioritaria para la conservación en México
Carlos G. Velazco Macías and Glafiro J. Alanís Flores—**349**

Vascular flora of Big Lake Bottom Wildlife Management Area, Anderson County, Texas
Kay M. Fleming, Jason R. Singhurst, and Walter C. Holmes—**355**

Floristics of xeric sandylands in the post oak savanna region of East Texas
Barbara R. MacRoberts, Michael H. MacRoberts, and James C. Cathey—**373**

Effects of fire on two pitcher plant bogs with comments on several rare and interesting plants
Eric L. Keith and N. Ross Carrie—**387**

Native flowering plant species new or otherwise significant in Kentucky
Robert F.C. Naczi, Ronald L. Jones, F. Joseph Metzmeier, Mark A. Gorton, and Timothy J. Weckman—**397**

New records in Asteraceae for Alabama and Arkansas
Guy L. Nesom—**403**

KEY TO THE SPECIES OF ERICACEAE OF BOLIVIA, INCLUDING TWO NEW SPECIES

James L. Luteyn

Institute of Systematic Botany
The New York Botanical Garden
Bronx, New York 10458-5126, U.S.A.
jluteyn@nybg.org

ABSTRACT

A review of the Ericaceae of Bolivia is herein presented. Nineteen genera and 53 species are native; two genera and 19 species are endemic; 18 additional species are shared by Bolivia and adjacent Peru; one species is occasionally cultivated. Most taxa are found in the wet, cool habitat, montane "Yungas" of the eastern slopes of the Cordillera Real, ranging between 2000 m and 4000 m elevation. **Siphonandra boliviana** Luteyn and **Themistoclesia unduavensis** Luteyn are described and illustrated. A key in English and Spanish to the 19 genera and 53 native species is provided. The names of all taxa of Ericaceae attributed to Bolivia are accounted for.

RESUMEN

Se presenta una reseña de las especies de Ericaceae de Bolivia. Diez y nueve géneros y 53 especies son nativas; dos géneros y 19 especies son endémicas; 18 especies adicionales son compartidas por Bolivia y la parte adyacente de Perú; una especie es cultivada ocasionalmente. La mayoría se encuentra en hábitats montañosos, húmedos y fríos de las "Yungas" de la vertiente oriental de la Cordillera Real, entre 2000 y 4000 m de elevación. También se describen y se ilustran *Siphonandra boliviana* Luteyn y *Themistoclesia unduavensis* Luteyn. Se presenta una clave en inglés y en español para los 19 géneros y las 53 especies nativas. Los nombres de todos los taxones de Ericaceae atribuidos a Bolivia están justificados.

INTRODUCTION

The Ericaceae are a large, cosmopolitan family of over 125 genera and 4500 species, which inhabit the temperate regions of the world and montane areas in tropical latitudes (Luteyn 1998, in press). In the Neotropics, the Ericaceae are composed of 46 genera (70% endemic) and about 800 species (ca. 94% endemic), although generic limits in the Andean Vaccinieae are still poorly understood (Kron et al. 2002; Luteyn 1997, 2001). Neotropical Ericaceae are an Andean-centered family, adapted to moist, open, cool montane environments. Overall species richness in the Neotropics increases nearer the Equator, with the highest species numbers concentrated in Colombia and Ecuador between 1000 m and 3000 m. Nineteen genera and 53 species are native to Bolivia. Two of those genera and 18 of the species are endemic, while 18 additional species have ranges that overlap between Bolivia and adjacent Peru and one species range overlaps between Bolivia and extreme northwestern Argentina; one species is occasionally cultivated. In Bolivia, the Ericaceae occur almost exclusively in the wet,

cool, montane cloud forests, mostly in the "Yungas" regions of the eastern slopes of the Cordillera Real, ranging between 2000 m and 4000 m elevation. One of these species (*Satyria neglecta*) ranges primarily below 1000 m elevation, 12 species range primarily between 1000 m and 2000 m, 18 species range primarily between 2000 m and 3000 m, and 20 species range primarily between 3000 m and 4000 m. *Agarista boliviensis* and *Gaylussacia cardenasii*, in contrast, occur in relatively dry montane regions in south-central Bolivia at about 1200-2500 m elevation. Although Bolivia is a very large country within the Neotropics, it lies at the southern end of the distributional range of the family and many of its mountainous regions are dry. Therefore, relatively few Ericaceae occur in Bolivia compared to countries in the Northern Andes and adjacent southern Mesoamerica. There are no economic uses known for the Ericaceae of Bolivia.

There are very few general publications about the flora of Bolivia and only the out-dated checklist of Foster (1958) gives an idea of the numbers of species of Ericaceae that occur there. Killeen et al. (1993) is misleading for Ericaceae, since virtually all the taxa in Bolivia are shrubs not trees. There is, however, a project currently being organized by the Missouri Botanical Garden in collaboration with all the major herbaria in Bolivia and the New York Botanical Garden that has begun a modern checklist of the plants of Bolivia. With regards to the Ericaceae of Bolivia, only the larger overall treatment of the tribe Thibaudieae (=Vaccinieae) by A.C. Smith (1932) gives details of some of the Bolivian blueberries. The most up-to-date list of Ericaceae of Bolivia, along with some descriptions and photos, may be found on the website "Neotropical Blueberries" (Luteyn 1998). A list of all species of Ericaceae attributed to Bolivia, including the current status of names given by Foster (1958), is herein presented in an Appendix. The largest herbarium collection of Ericaceae in Bolivia is found in La Paz, at the National Herbarium (LPB); there is also a moderate sampling in Cochabamba (BOLV). The geographical regions of Bolivia in greatest need of more collecting and with greatest possibilities for more Ericaceae records would be the areas northeast of La Paz towards the frontier with Peru.

Neotropical Ericaceae, in general, have undergone dynamic speciation and extensive adaptive radiation due to their ecological and life-form plasticity, colonization abilities, adaptation to epiphytic habits, and co-evolution with hummingbirds (Luteyn 2002). Given the high diversity and endemicity within neotropical Ericaceae, along with high levels of habitat alteration, protection of Andean montane ecosystems should become a priority for their conservation.

FAMILY DESCRIPTION AND KEYS TO THE BOLIVIAN SPECIES OF ERICACEAE

ERICACEAE

Terrestrial or epiphytic *shrubs*, *subshrubs*, sometimes lianoid, rarely trees, often rhizomatous; indumentum when present of simple unicellular hairs, that are usually translucent or whitish, these sometimes glandular tipped, or often (es-

pecially on leaves beneath) of multicellular, multiseriate, swollen-headed, usually glandular, hair-like structures called fimbriae which are brownish to reddish-brown. *Leaves* alternate, simple, usually petiolate, exstipulate but rarely bud scales appearing pseudostipular; lamina coriaceous to membranous, evergreen, the margin usually entire but sometimes serrulate-crenate, the venation pinnate or plinerved; leaf scars usually with a single vascular bundle scar, nodes usually with one trace and one gap. *Inflorescences* axillary, racemose, paniculate, fasciculate, or flowers solitary; individual flowers pedicellate or rarely sessile in axils of small or large, deciduous or persistent floral bracts; pedicel bibracteolate; bracteoles persistent, small or large. *Flowers* bisexual, actinomorphic or slightly zygomorphic, 5(–7)-merous, obdiplostemonous, hypogynous or epigynous and with a biseriate perianth, typically without floral odors, rarely with extrafloral nectaries, the superior-ovaried genera pollinated by bees and the inferior-ovaried genera by hummingbirds; aestivation valvate, imbricate, or reduplicate; calyx continuous or articulate with the pedicel, synsepalous, the sepals rarely fleshy and accrescent to the fruit, the hypanthium when present terete, angled, or winged; corolla membranous to thick-carnose, polypetalous or more commonly sympetalous, cylindric, campanulate or urceolate, terete or angled to winged opposite the lobes; stamens 8–10(–14), in 2 whorls, usually twice as many as the petals or rarely just as many, equaling the corolla in overall length or 1/2–1/3 the corolla length, equal with each other or alternately unequal, borne on the edge of an obscure to prominent nectariferous disc; filaments equal or unequal, usually straight or rarely S-shaped (geniculate), ligulate but sometimes basally dilated, sometimes also basally papillose, distinct or connate, with or without spurs, shorter or longer than the anther; anthers inverting during development, 2-celled, equal or unequal, often distally with 2 distinct or connate tubules or terminal awns, sometimes provided with abaxial spurs; disintegration tissue present or lacking; thecae smooth to coarsely granular, the base rounded to apendiculate; tubules when present conical and rigid or cylindric and flexible, of equal or ca. 1/2 the diameter of the thecae, longer to shorter than the thecae; dehiscence introrse by longitudinal or more typically by apical to subapical clefts or pores, rarely perfectly terminal; pollen grains in tetrahedral tetrads; carpels 4–5(–10), fused; ovary superior or inferior, usually with as many locules as carpels or with twice as many locules as carpels or rarely loculate in lower portion and 1-locular above; placentation axile, rarely intruded parietal; ovules numerous per locule or rarely solitary, anatropous to campylotropous with a single integumentary layer; style single, fluted, hollow; stigma simple but occasionally weakly lobed. *Fruit* a loculicidal or septicidal capsule, berry, or drupe, with a usually persistent, rarely accrescent and fleshy calyx; seeds small, ca. 1–1.5 mm long, usually numerous (1 per locule in *Gaylussacia*), winged or tailed only in *Bejaria*, sometimes enclosed in a mucilaginous sheath, the testa thin with elongated or isodiametric cells, the en-

dosperm fleshy, the embryo straight, usually white or sometimes green. *Chromosome numbers*: **x**=6, 8, 11, 12(?), 13, 19, 23.

Ericaceae comprise ca. 125 genera and 4500 species worldwide, and are cosmopolitan with the exception of Antarctica. Nineteen genera and 53 species are native to Bolivia. *Rhododendron simsii*, native to China, is sometimes cultivated in the montane areas throughout the Neotropics (including Bolivia), but is not treated here.

ENGLISH KEYS

Notes on using the keys

The keys below are based primarily on herbarium specimens, although living (*in situ* and greenhouse-grown plants), alcohol-preserved material, and photographs taken from field or greenhouse-grown material have been used. Floral measurements are taken from herbarium material at anthesis unless otherwise stated; colors are from fresh material observed by the author unless otherwise stated; if a range of measurements is not available, the known measurement is preceded by the abbreviation "ca." (about); calyx limb length includes measurement of the lobes, and anther length includes thecae and tubules.

KEY TO THE SPECIES OF BOLIVIAN ERICACEAE WITH SUPERIOR OVARIES

1. Corolla with petals separate; fruit a septicidal capsule _____ **Bejaria aestuans**
1. Corolla with petals fused; fruit a loculicidal capsule or berry.
   2. Stamens with filaments geniculate; anthers without terminal awns, and without white disintegration tissue on abaxial side _____ **Agarista boliviensis**
   2. Stamens with filaments straight; anthers with terminal awns, and with white disintegration tissue on abaxial side.
      3. Fruit a berry, rarely calyx becoming fleshy at base but never surrounding the berry _____ **Pernettya prostrata**
      3. Fruit a capsule, surrounded by the fleshy, accrescent calyx (calyx rarely not fleshy).
         4. Flowers solitary in axils of normal (or only slightly reduced) leaves.
            5. Thick-stemmed shrub to 5 m tall; corolla campanulate, broadest at apex, yellowish-green _____ **Gaultheria buxifolia** var. **secunda**
            5. Thin-stemmed subshrub to 0.4 (rarely 1–2) m tall; corolla urceolate to nearly subglobose, inflated at the base and very constricted at the throat, pink to rose-red _____ **Gaultheria vacinioides**
         4. Flowers in axillary racemes.
            6. Abaxial surface of lamina and entire inflorescence tomentose-lanate _____ **Gaultheria eriophylla** var. **mucronata**
            6. Abaxial surface of lamina and inflorescences glabrous or sparsely to densely pubescent but never tomentose-lanate.
               7. Young twigs and inflorescences conspicuously strigose with straight, rigid, appressed hairs, usually so dense as to obscure surfaces; lamina usually densely and persistently reddish-strigose beneath.
                  8. Calyx glabrous; corolla glabrous to variably hairy, never densely strigose all over; ovary glabrous or very weakly short-pilose at apex;

inflorescence congested (glomerate) at anthesis with the flowers broadly overlapping _____ **Gaultheria glomerata**

8. Calyx and corolla densely strigose hirsute with ferruginous, subsetose, rarely glandular hairs; ovary densely short-white pilose or cinerous; inflorescence not congested at anthesis, the flowers widely spaced _____ **Gaultheria bracteata**

7. Young twigs and inflorescences glabrous or variously spreading pubescent, but not appressed-strigose with straight, rigid hairs; lamina glabrous or variously pubescent, but not strigose beneath.
   9. Repent, rhizomatous subshrub, 0.1–0.2 m tall; leaf lamina usually obovate with the apex rounded _____ **Gaultheria hapalotricha**
   9. Erect, subshrubs to shrubs, 0.1–8 m tall; leaf lamina various but only rarely obovate, the apex usually acute to acuminate.
      10. Leaf lamina usually distinctly and prominently reticulate-veined on **both** surfaces, the base usually acute to rounded; inflorescences clustered at branch tips and conspicuously exceeding the leaves in length; calyx and corolla eglandular; corolla white, pilose within _____ **Gaultheria reticulata**
      10. Leaf lamina not conspicuously reticulate-veined on both surfaces, the base usually rounded and deeply cordate; inflorescences scattered along branches, not exceeding leaves; calyx and corolla often glandular pubescent; corolla red, glabrous within _____ **Gaultheria erecta**

KEY TO THE SPECIES OF BOLIVIAN ERICACEAE WITH INFERIOR OVARIES

1. Stamens strongly unequal with filaments or anthers, **or** filaments and anthers alternately conspicuously unequal.
   2. Filaments equal and connate over entire length; anthers with tubules widening distally.
      3. Leaves elliptic-lanceolate, 6–10 cm long, 1.5–3 cm broad, basally obtuse to rounded, 3-plinerved; inflorescence densely pilose (except corolla); pedicels 16–21 mm long; corolla ca. 11 mm long _____ **Satyria boliviana**
      3. Leaves elliptic-oblong, 3–6 cm long, 1.2–1.8 cm broad, basally cuneate to subattenuate, pinnately veined; inflorescence glabrous; pedicels 6–12 mm long; corolla ca. 6 mm long _____ **Satyria neglecta**
   2. Filaments unequal, distinct or partially connate; anthers with sides parallel, not widening distally.
      4. Anthers equal; stamens 1/2–1/3 as long as corolla; floral bracts rarely large and showy but if so then early deciduous.
         5. Leaves pinnately veined _____ **Orthaea pinnatinervia**
         5. Leaves plinerved.
            6. Stems, petioles, leaves, rachis, pedicels, and corolla pilose _____ **Orthaea rusbyi**
            6. Plants essentially glabrous.
               7. Corolla 11–12 mm long _____ **Orthaea constans**
               7. Corolla 15–33 mm long.
                  8. Staminal filaments distinct.
                     9. Rachis 3–5 cm long; pedicels 8–13 mm long _____ **Orthaea weberbaueri**
                     9. Rachis ca. 1 cm long; pedicels ca. 7 mm long _____ **Orthaea ignea**
                  8. Staminal filaments connate.

10. Staminal dehiscence by terminal or subterminal pores _____ **Orthaea boliviensis**

10. Staminal dehiscence by lateral clefts _____ **Orthaea ferreyrae**

4. Anthers unequal; stamens as long as corolla or rarely 1/2–2/3 the corolla length; floral bracts usually large and showy, usually persistent through anthesis.
    11. Inflorescence a panicle _____ **Cavendishia martii**
    11. Inflorescence a raceme.
        12. Calyx densely woolly, the matted hairs persistent; leaves persistently soft-pilose beneath _____ **Cavendishia pubescens**
        12. Calyx glabrous to pilose, but never woolly and the hairs never matted; leaves glabrous to glabrate _____ **Cavendishia bracteata**

1. Stamens equal with filaments and anthers of equal lengths (rarely anthers inconspicuously alternately unequal).
    13. Bracteoles located at apex of pedicel, and surrounding calyx (and sometimes lower corolla).
        14. Leaves less than 5 mm broad.
            15. Corolla campanulate-cylindric, 10–14 mm long, white sometimes tinted with pink _____ **Disterigma pernettyoides**
            15. Corolla subcylindric to somewhat urceolate, 6 9 mm long, red _____ **Disterigma empetrifolium**

        14. Leaves more than 5 mm broad.
            16. Corolla 10–12 mm long, narrowly cylindric, red _____ **Disterigma pallidum**
            16. Corolla 4.5–7.5 mm long, subcylindric to ovate-urceolate, white to red.
                17. Flowers 4 merous; corolla subcylindric, rarely puberulous within; staminal filaments distinct _____ **Disterigma alaternoides**
                17. Flowers usually 5 merous (sometimes 4-merous); corolla ovate-urceolate, conspicuously pilose within; staminal filaments coherent at base _____ **Disterigma ovatum**

    13. Bracteoles located well below apex of pedicel, **or** if apical then not clasping calyx.
        18. Tubules elongate, thin, very graceful, about half as wide (or less) as thecae; dehiscence pores perfectly terminal.
            19. Filaments distinct; rachis to 0.5 cm long; calyx ca. 9 mm long; corolla 35–37 mm long _____ **Siphonandra magnifica**
            19. Filaments connate; rachis 2 -5 cm long; calyx 7–8 mm long; corolla 25–48 mm long.
                20. Corolla ca. 25 mm long _____ **Siphonandra elliptica**
                20. Corolla 43–48 mm long _____ **Siphonandra boliviana**
        18. Tubules about as wide as thecae, **or** if narrower then proportionally much shorter than thecae; dehiscence by lateral slits or elongate clefts.
            21. Thecae conspicuously papillate; tubules rigid, elongate- to short-conical; stamens often 1/3–1/2 as long as corolla.
                22. Leaves stiff coriaceous; pedicels 20 40(–55) mm long; calyx lobes prominent, 3–5 in number, often in a state of fusion, 1–3 mm long; corolla 18–35 mm long; stamens 9–15 mm long _____ **Psammisia guianensis**
                22. Leaves chartaceous to soft coriaeous; pedicels 10 14 mm long; calyx lobes lacking or 5, apiculate and less than 0.4 mm long; corolla 25 40 mm long; stamens 8–10 mm long _____ **Psammisia pauciflora**
            21. Thecae smooth to minutely papillate; tubules flexible, cylindric, elongate to short; stamens usually as long as corolla.

23. Calyx articulate with pedicel.
    24. Corolla elongate tubular,(7–)11–27 mm long, normally carnose or coriaceous, the lobes valvate; filamants short and inconspicuous with regard to anthers.
        25. Corolla 20 -27 mm long; staminal filaments distinct.
            26. Leaves truncate or subcuneate at base; calyx smooth, not papilose at base _____ **Thibaudia macrocalyx**
            26. Leaves attenuate at base; calyx strongly papillose at base _____ **Thibaudia axillaris**
        25. Corolla 7–13 mm long; staminal filaments connate.
            27. Leaves obtuse, rounded to subcordate at base; twigs, leaves, and inflorescences (including rachis, pedicels, calyx and sometimes corolla) densely white pilose _____ **Thibaudia densiflora**
            27. Leaves cuneate, attenuate or subattenuate at base; plant surfaces glabrous or essentially so.
                28. Leaf apex acute; calyx 5.5–6 mm long, the lobes deltate, ca. 1 mm long _____ **Thibaudia regularis**
                28. Leaf apex obtuse; calyx 2.5–3.5 mm long, the lobes apiculate, less than 1 mm long _____ **Thibaudia crenulata**
    24. Corolla urceolate to campanulate, 7–12 mm long, normally of thin texture and membranaceous, the lobes imbricate; filaments proportionally long with regards to anther length.
        29. Ovary with a single ovule in each of the 10 locules; fruit a drupe with 10 pyrenes _____ **Gaylussacia cardenasii**
        29. Ovary with few to numerous ovules in each of the 5(–10) locules; fruit a many-seeded berry.
            30. Leaves glabrous or lacking subfasciculate hairs beneath; corolla cylindric-urceolate, white to pinkish _____ **Vaccinium floribundum**
            30. Leaves with subfasciculate hairs beneath; corolla rotate-campanulate, green _____ **Vaccinium dependens**
23. Calyx continuous with pedicel, the pedicel not jointed at apex.
    31. Calyx conspicuously angled to 5-winged; corolla terete or angled.
        32. Calyx angled opposite the lobes _____ **Polyclita turbinata**
        32. Calyx angled to winged alternate with the lobes.
            33. Leaves linear, ca. 2 mm broad, 1-nerved _____ **Rusbya taxifolia**
            33. Leaves mostly ovate, greater than 1 cm broad, multi-nerved.
                34. Plants with pilose-hispid habit (including twigs, petioles, leaves beneath, racemes, pedicels, and calyx); corolla cylindric, terete throughout, 9–10 mm long, sparsely pilose distally _____ **Themistoclesia peruviana**
                34. Plants with glabrous habit (although leaves beneath with brownish fimbriae); corolla urceolate-turbinate, conspicuously swollen at base and narrowed at throat, bluntly 5-angled, 8–11 mm long, glabrous _____ **Themistoclesia unduavensis**
    31. Calyx terete; corolla terete.

35. Corollas usually large, carnose to coriaceous, (0.6–)1.5–5 cm or more long, if less than 1 cm then staminal tubules twice as long as thecae; staminal tubules 2–5 times longer than thecae; seeds with white embryos
    36. Corolla 0.6–0.8 cm long, white to pinkish _____ **Demosthenesia pearcei**
    36. Corolla 1.7–5 cm long, red.
        37. Corolla 2–3 cm long and 3–8 mm diam., slightly zygomorphic _____ **Demosthenesia mandonii**
        37. Corolla 3.5–5 cm long and 7–10 mm diam., actinomorphic _____ **Demosthenesia spectabilis**
35. Corollas small, thin membranaceous, up to 10 mm long, but if longer then filaments proportionally much longer than anthers; staminal tubules about equalling anthers; seeds with green embryos.
    38. Flowers usually in few- to many-flowered fascicles or racemes, rarely solitary; pedicels slender but not properly cernuous; filaments usually shorter than anthers.
        39. Inflorescence a fascicle of 3 6 flowers, the rachis none _____ **Diogenesia boliviana**
        39. Inflorescence a raceme of up to 18 flowers, the rachis 2.5–6 cm long _____ **Diogenesia racemosa**
    38. Flowers 1–2 per axil; pedicels usually relatively long and thin, filiform, cernuous, **or** rarely absent (i.e., flowers sessile); filaments usually longer than anthers.
        40. Flowers sessile _____ **Sphyrospermum sessiliflorum**
        40. Flowers conspicuously pedicellate.
            41. Leaves suborbicular to oblong-ovate, (0.7–) 0.9–1.5(–1.8) cm long, the apex rounded or obtuse; flowers usually extending well beyond the leaves; corolla 4 6 mm long; stamens 4 _____ **Sphyrospermum buxifolium**
            41. Leaves ovate to ovate-lanceolate, usually conspicuously longer than broad, (1–)2–3.5 (–5) cm long, the apex obtuse to acute, sometimes shortly and bluntly acuminate; flowers rarely extending beyond the leaves; corolla (4–)5–7(-9) mm long; stamens 4–5 or 8–10 _____ **Sphyrospermum cordifolium**

SPANISH KEYS

Notas sobre la utilización de las claves

Las siguientes claves se basan principalmente en ejemplares de herbario, aunque también en material vivo (*in situ* y de plantas de invernadero), material preservado en alcohol y fotografías tomadas en el campo y en invernaderos. Las medidas florales se tomaron del material de herbario en la antesis a menos que se diga lo contrario; los colores se tomaron del material vivo observados por el autor a menos que se diga lo contrario; si no se tiene un intervalo de

medidas, entonces las medidas conocidas se presentan precedidas por la abreviación "ca." (cerca); la longitud del limbo del cáliz incluye la medida de los lóbulos y la longitud de la antera incluye las tecas y los túbulos.

CLAVE PARA LAS ESPECIES BOLIVIANAS DE ERICACEAE CON OVARIO SÚPERO

1. Corola con pétalos separados; fruto una cápsula septicida _____ **Bejaria aestuans**
1. Corola con pétalos unidos; fruto una cápsula loculicida o una baya.
2. Estambres con filamentos geniculados; anteras sin aristas terminales y sin tejido blanco desintegrado en el lado abaxial _____ **Agarista boliviensis**
2. Estambres con filamentos rectos; anteras con aristas terminales y con tejido blanco desintegrado en el lado abaxial.
3. Fruto una baya, raras veces el cáliz se vuelve carnoso en la base pero nunca rodea la baya _____ **Pernettya prostrata**
3. Fruto una cápsula, rodeada por el cáliz carnoso y acrescente (cáliz raras veces no carnoso).
4. Flores solitarias en las axilas de las hojas normales (o ligeramente reducidas).
5. Arbusto de tallo grueso hasta 5 m de altura; corola campanulada, más ancha en el ápice, verde-amarillenta _____ **Gaultheria buxifolia** var. **secunda**
5. Subarbusto de tallo delgado hasta 0,4 (raras veces 1–2) m de altura; corola urceolada a estrechamente subglobosa, inflada en la base y muy contraida en la garganta, rosada a rosado-roja _____ **Gaultheria vaccinioides**
4. Flores en racimos axilares.
6. Superficie abaxial de la lámina y toda la inflorescencia lanado-tomentosas _____ **Gaultheria eriophylla** var. **mucronata**
6. Superficie abaxial de la lámina y la inflorescencia glabras o esparcida a densamente pubescentes pero nunca lanado-tomentosas.
7. Ramas jóvenes e inflorescencias conspicuamente estrigosas con pelos rectos, rígidos, adpresos, generalmente tan densos que ocultan las superficies; lámina en general densa y persistentemente rojizo-estrigosa en el envés.
8. Cáliz glabro; corola glabra a variablemente pubescente, nunca densamente estrigosa en todas partes; ovario glabro o muy débil y cortamente piloso en el ápice; inflorescencia congestionada (aglomerada) en la antesis con las flores ampliamente sobrepuestas _____ **Gaultheria glomerata**
8. Cáliz y corola densamente estrigoso-hirsuta con pelos ferrugíneos, subsetosos, raras veces glandulares; ovario densamente piloso con tricomas cortos, blancos o cinéreos; inflorescencia no congestionada en la antesis, las flores ampliamente espaciadas _____ **Gaultheria bracteata**
7. Ramas jóvenes e inflorescencias glabras o variadamente con pubescencia espaciada pero no apresado-estrigosa con pelos rectos, rígidos; lámina glabra o variadamente pubescente pero no estrigosa en el envés.
9. Subarbustos rizomatosos rastreros, 0,1–0,2 m de altura; lámina de la hoja generalmente obovada con el ápice redondeado _____ **Gaultheria hapalotricha**
9. Subarbustos a arbustos erectos, 0,1–8 m de altura; lámina de la hoja de forma variada pero raras veces obovada, el ápice generalmente agudo a acuminado.

10. Lámina de la hoja en general marcada y prominentemente reticulado-nervada en **ambas** caras, la base generalmente aguda a redondeada; inflorescencias agrupadas en la punta de las ramas y conspicuamente excediendo la longitud de las hojas; cáliz y corola eglandulares; corola blanca, pilosa por dentro _____ **Gaultheria reticulata**

10. Lámina de la hoja no conspicuamente reticulado-nervada en ambas superficies, la base generalmente redondeada y profundamente cordada; inflorescencias espaciadas a lo largo de las ramas, sin exceder la longitud de las hojas; cáliz y corola a menudo pubescente-glandulosos; corola roja, glabra por dentro _____ **Gaultheria erecta**

CLAVE PARA LAS ESPECIES BOLIVIANAS DE ERICACEAE CON OVARIO ÍNFERO

1. Estambres desiguales con filamentos o anteras, **o** filamentos y anteras alternamente desiguales en forma conspicua.
   2. Filamentos iguales y connados en toda su longitud; anteras con túbulos ensanchándose distalmente.
      3. Hojas elíptico-lanceoladas, 6–10 cm de largo, 1,5–3 cm de ancho, obtusas a redondeadas basalmente, 3-plinervias; inflorescencia densamente pilosa (excepto en la corola); pedicelos 16–21 mm de largo; corola ca. 11 mm de largo _____ **Satyria boliviana**
      3. Hojas elíptico-oblongas, 3–6 cm de largo, 1,2–1,8 cm de ancho, cuneadas a subatenuadas basalmente, pinnatinervias; inflorescencia glabra; pedicelos 6–12 mm de largo; corola ca. 6 mm de largo _____ **Satyria neglecta**
   2. Filamentos desiguales, libres o parcialmente connados; anteras con los lados paralelos, sin ensancharse distalmente.
      4. Anteras iguales; estambres 1/2–1/3 tan largos como la corola; brácteas florales raras veces grandes y vistosas pero si así, entonces deciduas tempranamente.
         5. Hojas pinnatinervias _____ **Orthaea pinnatinervia**
         5. Hojas plinervadas.
            6. Tallos, pecíolos, hojas, raquis, pedicelos y corola pilosos _____ **Orthaea rusbyi**
            6. Plantas esencialmente glabras.
               7. Corola 11–12 mm de largo _____ **Orthaea constans**
               7. Corola 15 33 mm de largo.
                  8. Filamentos estaminales libres.
                     9. Raquis 3–5 cm de largo; pedicelos 8–13 mm de largo _____ **Orthaea weberbaueri**
                     9. Raquis ca. 1 cm de largo; pedicelos ca. 7 mm de largo ___ **Orthaea ignea**
                  8. Filamentos estaminales connados.
                     10. Dehiscencia estaminal por poros terminales o subterminales ___ **Orthaea boliviensis**
                     10. Dehiscencia estaminal por suturas laterales _____ **Orthaea ferreyrae**
      4. Anteras desiguales; estambres tan largos como la corola o raras veces 1/2 2/3 de la longitud de ésta; brácteas florales generalmente grandes y vistosas, generalmente persistentes durante la antesis.
         11. Inflorescencia en panícula _____ **Cavendishia martii**
         11. Inflorescencia en racimo.
            12. Cáliz densamente lanoso, los pelos enredados persistentes; hojas con pelos suaves persistentes por el envés _____ **Cavendishia pubescens**

12. Cáliz glabro a piloso pero nunca lanoso y los pelos nunca enredados; hojas glabras a glabrescentes _____ **Cavendishia bracteata**

1. Estambres iguales con filamentos y anteras de igual longitud (raras veces las anteras alternamente desiguales en forma inconspicua).
13. Bractéolas localizadas en el ápice del pedicelo y rodeando el cáliz (y algunas veces la parte baja de la corola).
14. Hojas menos de 5 mm de ancho.
15. Corola campanulado-cilíndrica, 10–14 mm de largo, blanca, algunas veces teñida de rosado _____ **Disterigma pernettyoides**
15. Corola subcilíndrica a algo urceolada, 6–9 mm de largo, roja _____ **Disterigma empetrifolium**

14. Hojas más de 5 mm de ancho.
16. Corola 10–12 mm de largo, estrechamente cilíndrica, roja _____ **Disterigma pallidum**

16. Corola 4,5–7,5 mm de largo, subcilíndrica a ovado-urceolada, blanca a roja.
17. Flores 4-meras; corola subcilíndrica, raras veces pubérula por dentro; filamentos estaminales libres _____ **Disterigma alaternoides**
17. Flores generalmente 5-meras (algunas veces 4-meras); corola ovado-urceolada, conspicuamente pilosa por dentro; filamentos estaminales cohesionados en la base _____ **Disterigma ovatum**

13. Bractéolas localizadas muy por debajo del ápice del pedicelo **o** si apical entonces sin abrazar el cáliz.
18. Túbulos alargados, delgados, casi tan ancho como la mitad (o menos) de la teca; dehiscencia por poros perfectamente terminales.
19. Filamentos libres; raquis hasta 0,5 cm de largo; cáliz ca. 9 mm de largo; corola 35–37 mm de largo _____ **Siphonandra magnifica**
19. Filamentos connados; raquis 2–5 cm de largo; cáliz 7–8 mm de largo; corola 25–48 mm de largo.
20. Corola ca. 25 mm de largo _____ **Siphonandra elliptica**
20. Corola 43–48 mm de largo _____ **Siphonandra boliviana**

18. Túbulos casi tan anchos como la teca **o** si más delgados, entonces proporcionalmente mucho más cortos que la teca; dehiscencia por suturas laterales o hendiduras alargadas.
21. Teca conspicuamente papilosa; túbulos rígidos, alargados a cortamente cónicos; estambres a menudo 1/3–1/2 tan largos como la corola.
22. Hojas rígidamente coriáceas; pedicelos 20–40(–55) mm de largo; lóbulos del cáliz prominentes, 3–5, a menudo algo fusionados, 1–3 mm de largo; corola 18–35 mm de largo; estambres 9–15 mm de largo _____ **Psammisia guianensis**
22. Hojas cartáceas a suavemente coriáceas; pedicelo 10–14 mm de largo; lóbulos del cáliz ausentes ó 5, apiculados y menos de 0,4 mm de largo; corola 25–40 mm de largo; estambres 8–10 mm de largo _____ **Psammisia pauciflora**

21. Teca lisa a diminutamente papilosa; túbulos flexibles, cilíndricos, alargados a cortos; estambres generalmente tan largos como la corola.
23. Cáliz articulado con el pedicelo.
24. Corola alargada, tubular, (7–)11–27 mm de largo, normalmente carnosa o coriácea, los lóbulos valvados; filamentos cortos e inconspicuos con respecto a las anteras.

25. Corola 20 -27 mm de largo; filamentos estaminales libres.
    26. Hojas truncadas o subcuneadas en la base; cáliz liso, no papiloso en la base _____ **Thibaudia macrocalyx**
    26. Hojas atenuadas en la base; cáliz fuertemente papiloso en la base _____ **Thibaudia axillaris**
25. Corola 7–13 mm de largo; filamentos estaminales connados.
    27. Hojas obtusas, redondeadas a subcordadas en la base; ramas, hojas e inflorescencias (incluyendo raquis, pedicelos, cáliz y algunas veces la corola) densamente blanco-pilosas _____ **Thibaudia densiflora**
    27. Hojas cuneadas, atenuadas o subatenuadas en la base; superficies de la planta glabras o esencialmente glabras.
        28. Ápice de la hoja agudo; cáliz 5,5–6 mm de largo, los lóbulos deltados, ca. 1 mm de largo _____ **Thibaudia regularis**
        28. Ápice de la hoja obtuso; cáliz 2,5–3,5 mm de largo, los lóbulos apiculados, menos de 1 mm de largo _____ **Thibaudia crenulata**

24. Corola urceolada a campanulada, 7–12 mm de largo, normalmente de textura delgada y membranácea, los lóbulos imbricados; filamentos proporcionalmente largos con respecto a la longitud de las anteras.
    29. Ovario con 10 lóculos, un solo óvulo por lóculo; fruto una drupa con 10 pirenos _____ **Gaylussacia cardenasii**
    29. Ovario con 5(–10) lóculos, pocos a numerosos óvulos en cada lóculo; fruto una baya con muchas semillas.
        30. Hojas glabras o sin pelos subfasciculados en el envés; corola cilíndrico-urceolada, blanca a rosada _____ **Vaccinium floribundum**
        30. Hojas con pelos subfasciculados en el envés; corola rotado-campanulada, verde _____ **Vaccinium dependens**

23. Cáliz continuo con el pedicelo, no articulado.
    31. Cáliz conspicuamente angulado hasta 5-alado; corola terete o angulado.
        32. Cáliz angulado opuesto a los lóbulos _____ **Polyclita turbinata**
        32. Cáliz angulado a alado alterno con los lóbulos.
            33. Hojas lineares, ca. 2 mm de ancho, 1-nervias ___ **Rusbya taxifolia**
            33. Hojas principalmente ovadas, más de 1 cm de ancho, multinervias.
                34. Plantas con hábito híspido-piloso (incluyendo ramas, pecíolos, envés de las hojas, racimos, pedicelos y cáliz); corola cilíndrica, completamente terete, 9 10 mm de largo, espaciadamente pilosa en el parte distal _____ **Themistoclesia peruviana**
                34. Plantas con hábito glabro (aunque el envés de las hojas con fimbrias de color castaño); corola urceolado turbinada, conspicuamente hinchada en la base y estrecha en la garganta, ampliamente 5-angulada, 8–11 mm de largo, glabra _____ **Themistoclesia unduavensis**

31. Cáliz terete; corola terete.
    35. Corola generalmente grande, carnosa a coriácea, (0,6–)1,5–5 cm o más de largo, si menos de 1 cm entonces los túbulos estaminales dos veces tan largos como las tecas; túbulos estaminales 2–5 veces más grandes que las tecas; semillas con embriones blancos.
        36. Corola 0,6–0,8 cm de largo, blanca a rosada ___ **Demosthenesia pearcei**
        36. Corola 1,7–5 cm de largo, roja.
            37. Corola 2–3 cm de largo y 3–8 mm en diám., ligeramente zigomorfa _____ **Demosthenesia mandonii**
            37. Corola 3,5–5 cm de largo y 7–10 mm en diám., actinomorfa _____ **Demosthenesia spectabilis**
    35. Corola pequeña, delgada, membranácea, hasta 10 mm de largo, pero si es más larga entonces los filamentos proporcionalmente mucho más largos que las anteras; túbulos estaminales casi igualando las anteras; semillas con embriones verdes.
        38. Flores generalmente en fascículos o racimos de pocas a muchas flores, raras veces solitarias; pedicelos delgados pero no propiamente péndulos; filamentos generalmente más cortos que las anteras.
            39. Inflorescencia en fascículos de 3–6 flores, sin raquis _____ **Diogenesia boliviana**
            39. Inflorescencia en racimos de hasta 18 flores, el raquis 2,5–6 cm de largo _____ **Diogenesia racemosa**
        38. Flores 1–2 por axila; pedicelos en general relativamente largos y delgados, filiformes, péndulos **o** raras veces ausentes (flores sésiles); filamentos generalmente más largos que las anteras.
            40. Flores sésiles _____ **Sphyrospermum sessiliflorum**
            40. Flores conspicuamente pediceladas.
                41. Hojas suborbiculares a oblongo-ovadas, (0,7–)0,9–1,5(–1,8) cm de largo, el ápice redondeado u obtuso; flores generalmente extendiéndose mucho más allá de las hojas; corola 4–6 mm delargo; estambres 4 ____ **Sphyrospermum buxifolium**
                41. Hojas ovadas a ovado-lanceoladas, en general conspicuamente más largas que anchas, (1–)2–3,5(–5) cm de largo, el ápice obtuso a agudo, algunas veces corta y llanamente acuminado; flores raras veces extendiéndose más allá de las hojas; corola (4–)5–7(–9) mm de largo; estambres 4–5 u 8–10 ____ **Sphyrospermum cordifolium**

NEW SPECIES

Siphonandra boliviana Luteyn, sp. nov. (**Fig. 1**). TYPE: BOLIVIA. DEPTO. LA PAZ. Prov. Bautista Saavedra: Charazani, W of Chullina, 3400 m, 1 Aug 1994 (fl), *B. Herzog H200* (HOLOTYPE: NY; ISOTYPES: LZ, s.n.).

A *S. magnifica* staminum filamentis connatis nec distinctis, rhachidibus 2–5 nec 0.5 cm longis, et ab *S. elliptica* corollis 45–47 nec ca. 25 mm longis differt.

Shrub (size unknown); mature branches terete, glabrous, the bark exfoliating in thin strips; twigs subterete, sometimes shallowly angled or ribbed, short-pilose with white hairs; buds axillary, the scales 2, valvate, ca. 2 mm long, short-pilose. *Leaves* alternate, coriaceous, elliptic to oblanceolate, 2.5–5.5 cm long, 1–1.8 cm broad, basally cuneate, apically broadly acute to nearly obtuse, marginally entire, essentially glabrous above or sparsely short-pilose proximally along midrib, sparsely pilose beneath especially along midrib, also provided with reddish-brown, basally swollen, glandular fimbriae beneath; pinnately nerved with 4–6 secondary veins anastomosing near margin, the midrib and secondary veins impressed above and raised beneath, the reticulate veins plane to slightly impressed above but inconspicuously raised beneath; petiole rugose, subterete, broadly flattened above, 4–5 mm long. *Inflorescence* axillary, racemose, ca. 20-flowered, apparently nodding; rachis subterete, striate to angled, densely short-pilose with white hairs, at least 5 cm long (still in bud, apparantly still elongating); floral bracts ovate, acuminate, 3–4 mm long, densely short-pilose; pedicels subterete, striate to angled, densely short-pilose as rachis, 11–13 mm long; bracteoles located in proximal 1/3 pedicel, similar to floral bracts, 2–3 mm long. *Flowers*: calyx articulate with pedicel, 7–8 mm long, densely short-pilose as rachis; hypanthium cylindric, ribbed, 4–5 mm long, rounded at base; limb spreading-campanulate, 3.8–4.5 mm long; lobes 5, deltate, acute, 1.5–2 mm long; sinuses obtuse; corolla of 5 fused petals, long-cylindric, 43–48 mm long, 6–7 mm diam., short-pilose throughout, with white hairs, the lobes 5, deltate, acute, ca. 2 mm long; stamens 10, equal, ca. 32 mm long; filaments connate, glabrous, ca. 7 mm long; anthers ca. 28 mm long; thecae granular, ca. 6 mm long, incurved at base; tubules thin, delicate, about half as wide as thecae, ca. 22 mm long, dehiscing by perfectly terminal, flaring pores; ovary 5-locular; style about equaling corolla. *Berry* not seen.

Distribution.—Endemic to Bolivia and known only from the type collection, which was made in a *Weinmannia* forest.

Etymology.—The species is named for the country Bolivia to which it is endemic.

Siphonandra is a small, distinctive, high-elevation genus of three species: *S. elliptica* which is common and ranges from south-central Peru to northern Bolivia, *S. magnifica* which is endemic to Bolivia and is herewith maintained despite the fact that the type and only specimen was destroyed during World War II, and the new species herein described *S. boliviana*, for which only the type collection is known. With only one extant collection of the latter two species, it is difficult to assess the relationships between any of the three species in this genus. Nevertheless, *S. boliviana* is easily distinguished morphologically from the other two species by the characters mentioned in the key and diagnosis.

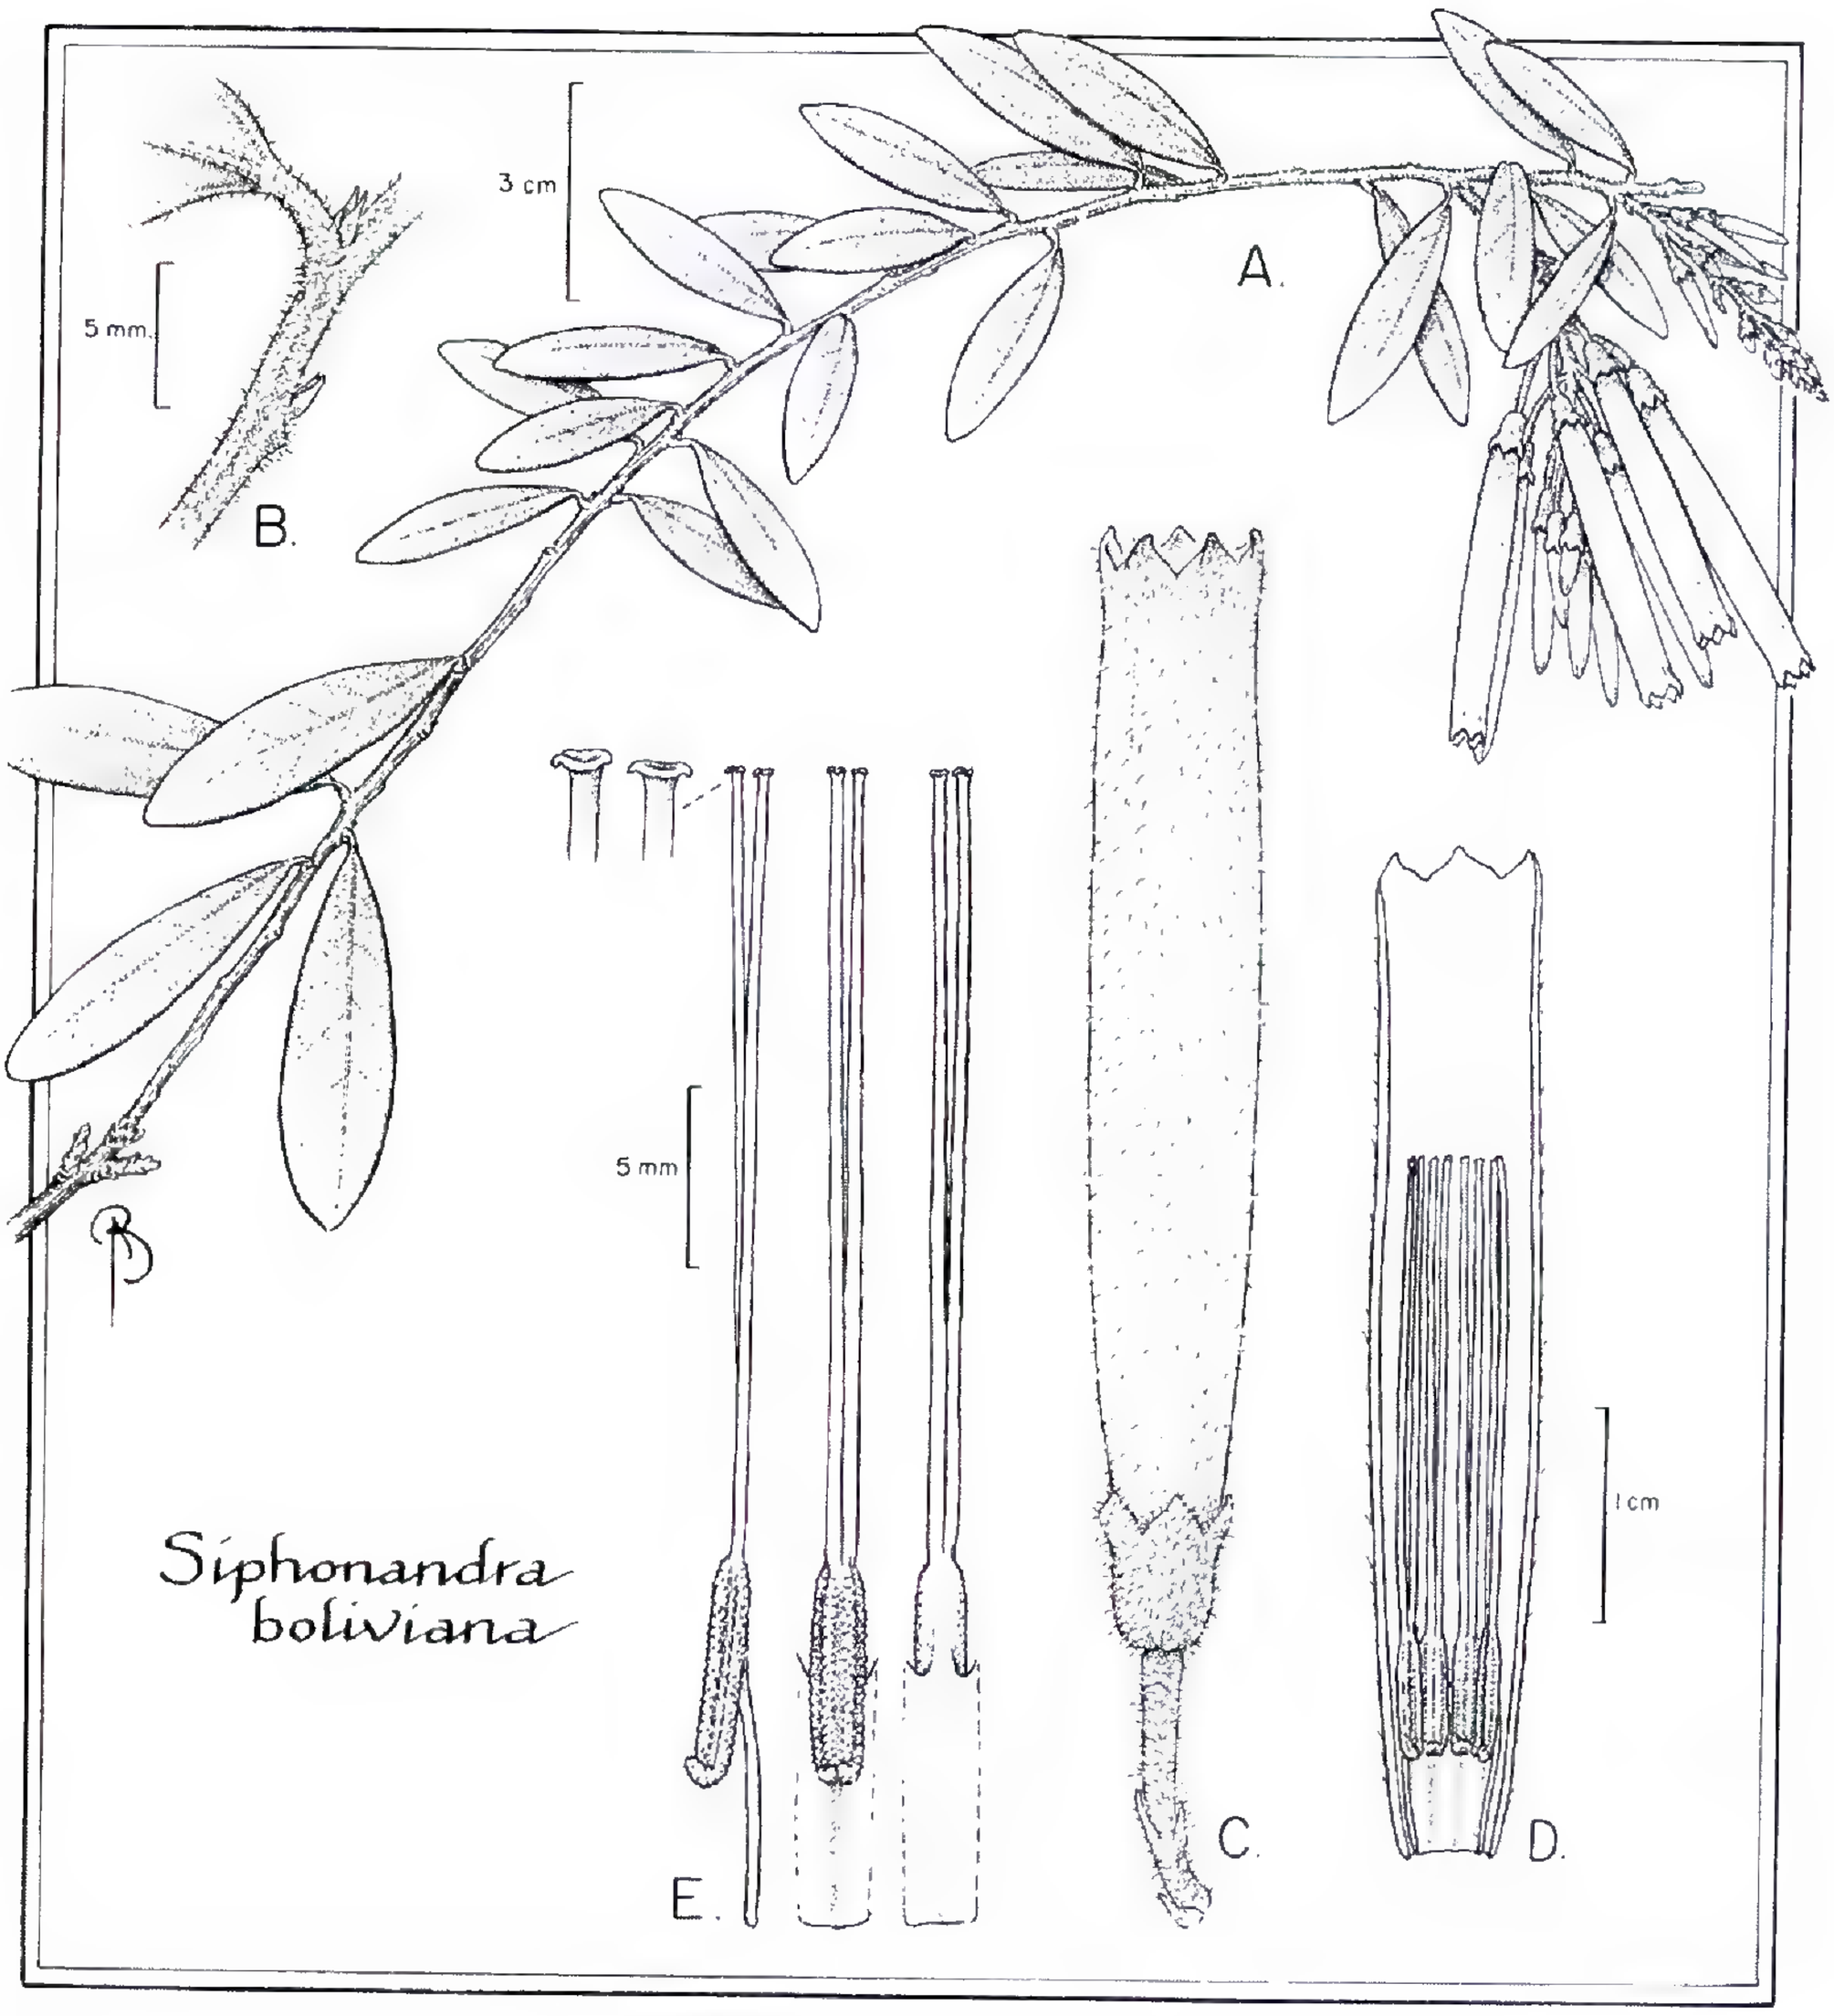

Fig. 1. *Siphonandra boliviana* Luteyn. A. Habit. B. Portion of stem showing pubescence. C. Flower showing floral bract, pedicel, bracteoles, calyx and corolla. D. Longitudinal section of corolla showing position of stamens. E. Stamens showing side, front, and back views with details of terminal dehiscence pores. (From type collection).

Themistoclesia unduavensis Luteyn, sp. nov. (**Fig. 2**). TYPE: BOLIVIA. DEPTO. LA PAZ. Prov. Nor Yungas: trail to Río Coscapa, ca. 2.5 km E of Unduavi, along new rd to Coroico, and ca. 6 km W of Cotapata, ca. 16° 17'S, 67° 53'W, 3200–3350 m, 19 Mar 2000 (fl), *J.L. Luteyn, E. Ann Powell & S. Beck 15471* (HOLOTYPE: NY; ISOTYPES: AAU, CAS, F, K, LPB, MO, TEX, plus 6 others to be distributed by LPB).

A *T. peruviana* habitu glabro nec piloso-hispido, corolla ventricosa et angulosa nec cylindrica et teretia, et glabra nec pilosa distaliter differt.

Rhizomatous, terrestrial or epiphytic *subshrubs*, to 30 cm tall; mature stems terete, striate, glabrous, the bark cracking longitudinally but not exfoliating;

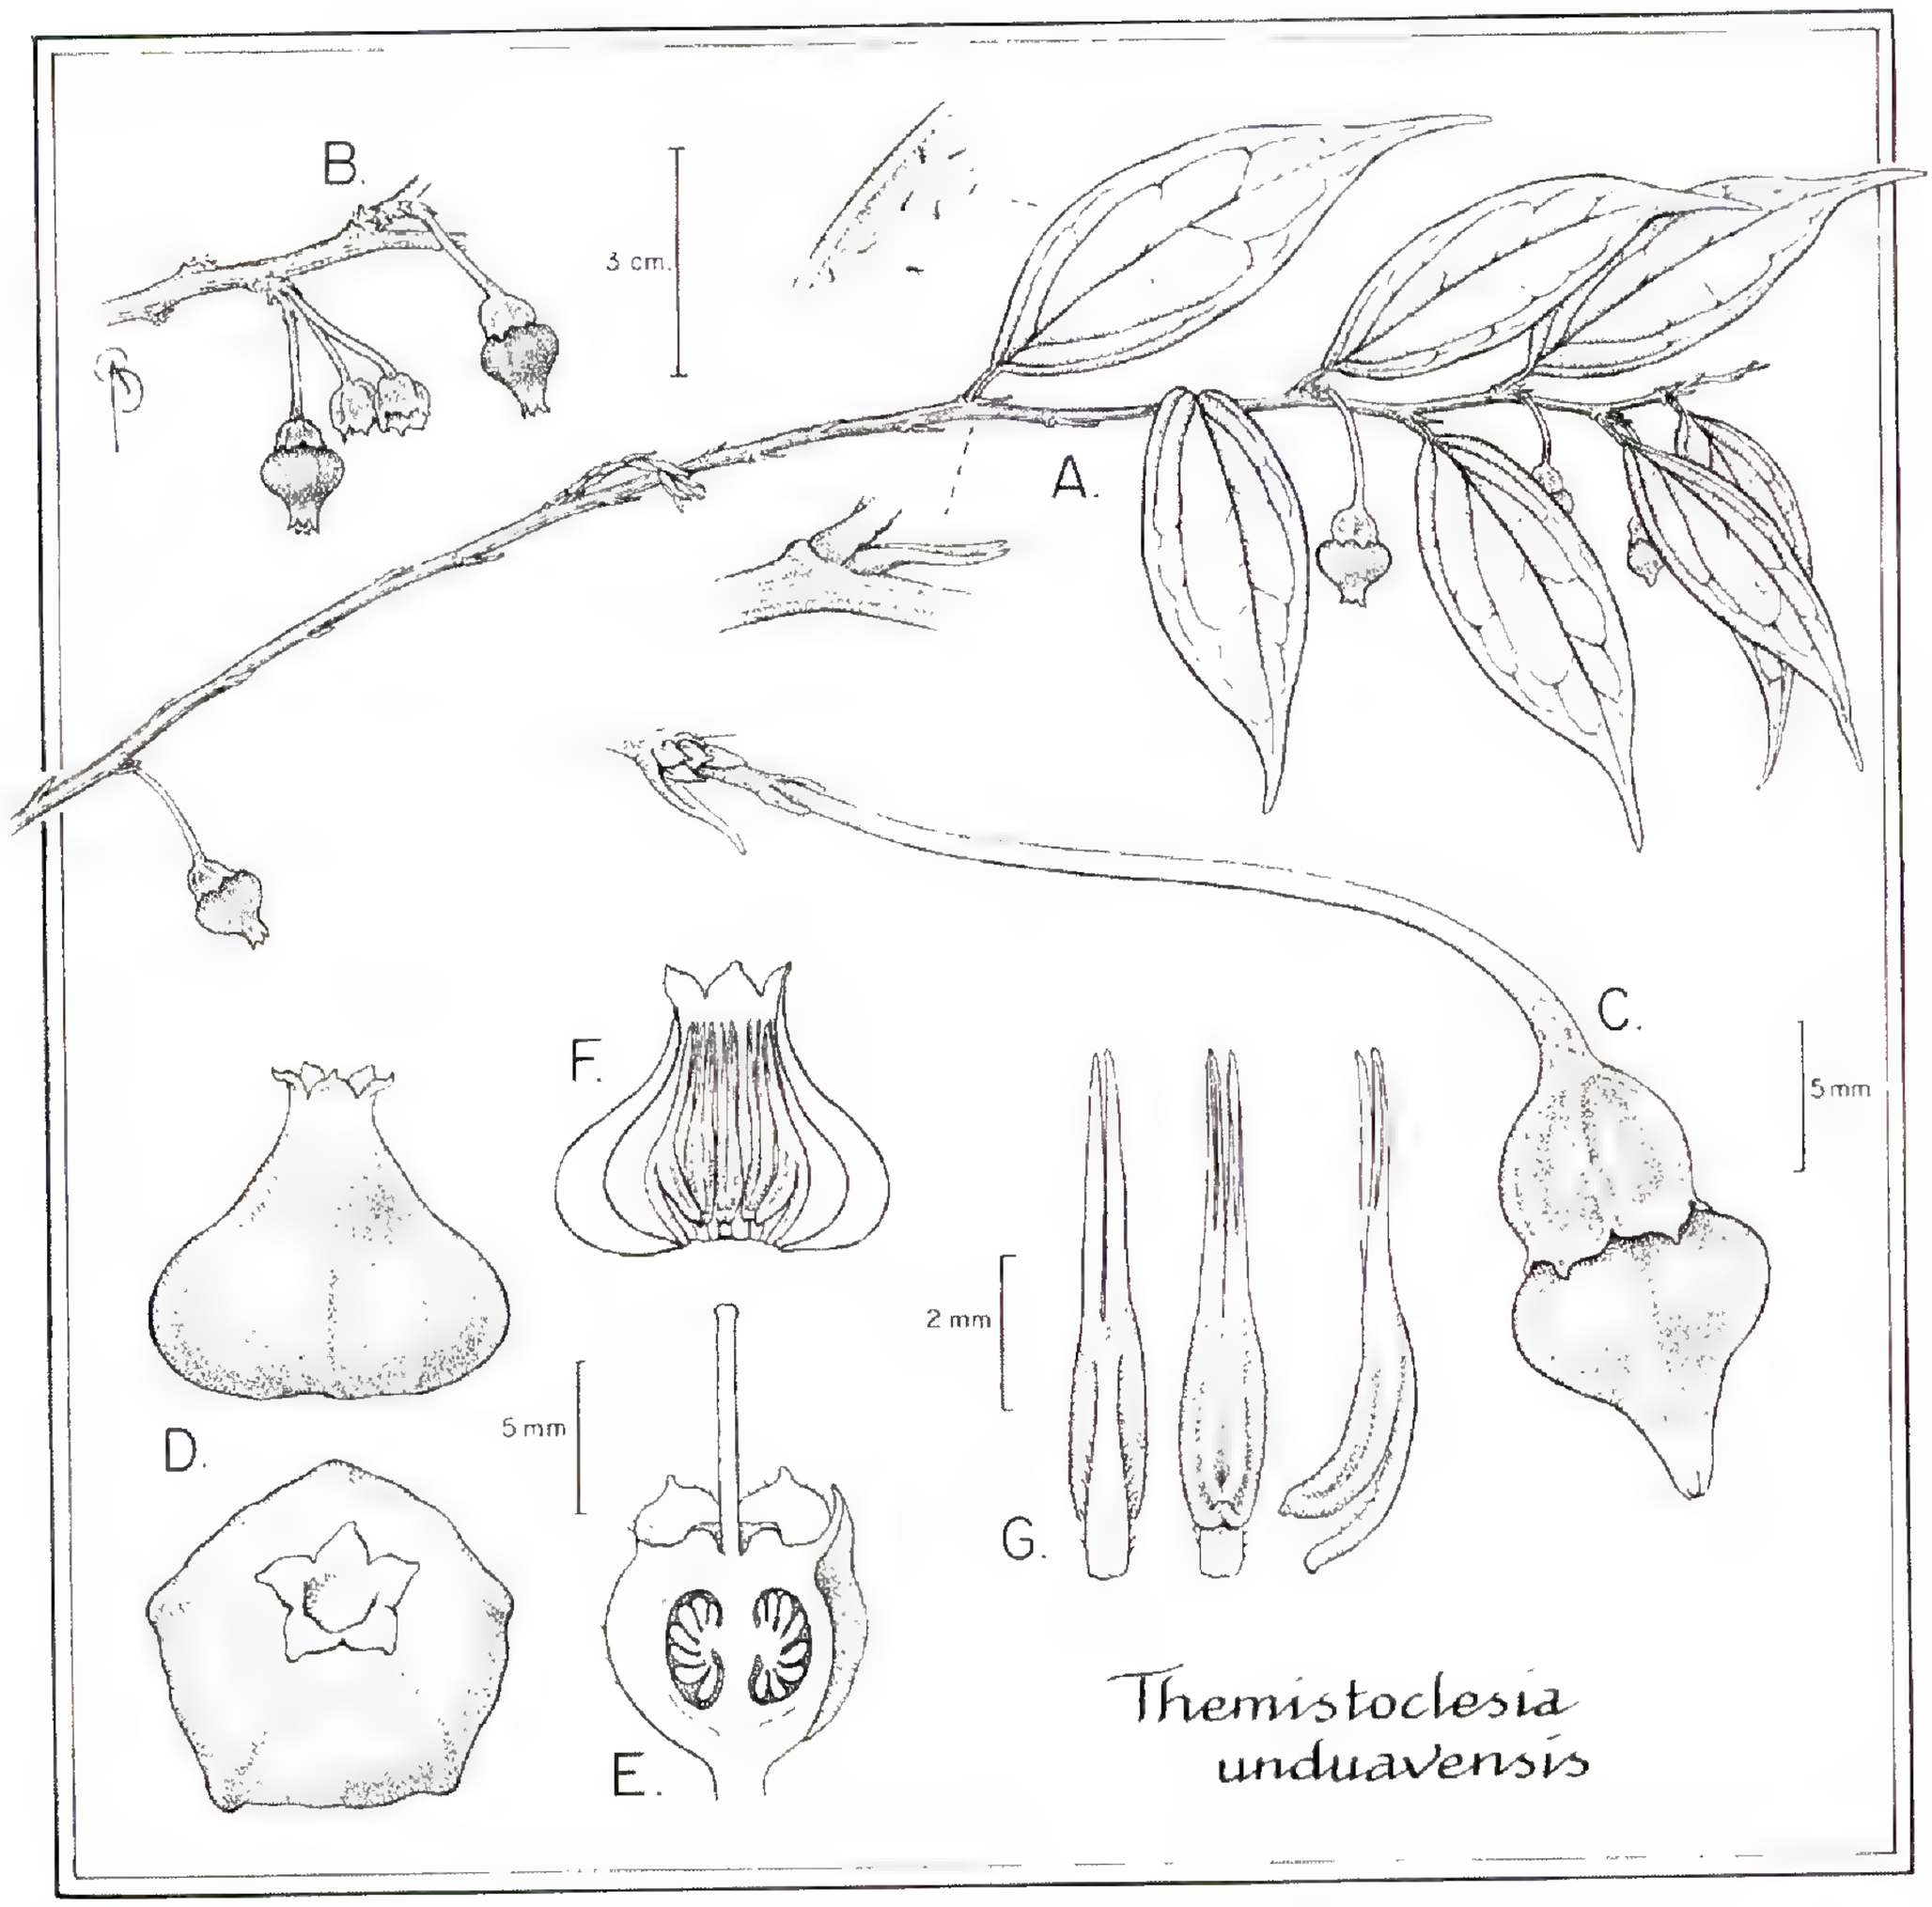

Fig. 2. *Themistoclesia unduavensis* Luteyn. A. Habit with details of leaf undersurface and axillary bud-scales. B. Portion of stem showing inflorescences. C. Inflorescence showing twig, floral bracts, pedicel, bracteoles, calyx, and corolla. D. Corolla showing side and top views. E. Longitudinal section of calyx. F. Longitudinal section of corolla showing position of stamens. G. Stamens showing back, front, and side views. (A from *Solomon 18195*; B-G from type collection).

twigs subterete, flattened to broadly and obtusely ribbed, weakly striate, glabrous; buds axillary, the scales 2, valvate, ovate, acuminate to acicular, 4–5 mm long. *Leaves* alternate, coriaceous, slightly bullate, clustered near apex, ovate to elliptic-ovate, 4.4–9 cm long, 1.4–4.5 cm broad, basally rounded to obtuse, apically long-acuminate, marginally entire, glabrous on both surfaces but provided with brownish, glandular fimbriae beneath; 3–5-plinerved with inner nerves arising 7–11 mm above base, midrib, lateral nerves, and reticulate veinlets impressed above and raised beneath; petioles rugose, subterete, broadly flattened above, 3.5–5 mm long, glabrate. *Inflorescences* axillary but usually from older, leafless nodes, flowers 1–2(–3) per node, when 2–3 then with very short

rachis; rachis (when present) subterete, 1–4 mm long, glabrous, obscure; floral bract ovate, acute, somewhat cucullate, ca. 2 mm long, marginally glandular-fimbriate, glabrous; pedicels slender, subterete, striate, sharply angled distally, 14–18 mm long, glabrous; bracteoles nearly basal, ovate, acuminate ca. 3 mm long, glabrous but marginally glandular-fimbriate. *Flowers*: calyx continuous with pedicel, 6–8.5 mm long, essentially glabrous; hypanthium obpyramidal, strongly 5-winged, 3.5–5 mm long, sparsely short-pilose along proximal portions of wings; limb spreading, ca. 3–3.5 mm long; lobes 5, broadly ovate, sharply and shortly acuminate, ca. 2–2.8 mm long, sparsely short-pilose along margins; sinuses acute; corolla of 5 fused petals, carnose, urceolate-turbinate, broadly swollen basally, broadly and bluntly 5-angled, 8–11 mm long, 7–12 mm diam. at base, glabrous, reddish-orange, the lobes 5, reflexed, deltate, acute, ca. 1.5 mm long, green in bud but becoming light green to white at anthesis; stamens 10, equal, nearly as long as corolla, ca. 8 mm long; filaments distinct, sparsely short-pilose, ca. 2.5–3 mm long; anthers ca. 7–7.5 mm long; thecae smooth, incurved at base, ca. 3.5 mm long; tubules distinct to base, ca. 3.5–4 mm long; ovary 5-locular; style about equaling corolla. Berry not seen.

Distribution.—Endemic to Bolivia and known only from the province of Nor Yungas, between Unduavi and Cotapata, at ca. 3000–3500 m. The plants are found in the wet, moss-covered, cloud forest associated with *Clusia*, *Weinmannia*, *Hedyosmum*, *Brunellia*, *Miconia*, and *Desfontainea*.

Etymology.—The species is named for the small village of Unduavi, close to the locality from which all collections have been made.

Themistoclesia is a neotropical genus of ca. 25 species, ranging from Costa Rica and Panama through the Andes of South America from Venezuela into northern Bolivia. *Themistoclesia unduavensis* may be distinguished by its rhizomatous, subshrub habit, somewhat bullate leaves, 1–3-flowered, axillary and often ramiflorous inflorescences, carnose corollas that are bluntly 5-angled and basally swollen, and reddish-orange corollas with green to white lobes. Individually each of these characters is either absent or uncommon amongst the other species in the genus, and the combination of characters effectively isolate this species from all others.

Additional collections examined: **BOLIVIA. La Paz. Nor Yungas:** between Unduavi and Cotapata, ascending Páramo Yunqueño, 3200 m, 8 Apr 1996 (fl), *Beck 22680* (NY, LBP); Unduavi, 3000 m, Jul 1965 (fl), *Braun 37* (US); 4 km E of Unduavi Nuevo, mule trail of Rusby, 3300 m, 20 Mar 1988 (fl), *Grifo & Solomon 1005* (BH, NY); trail to Río Coscapa, ca. 3 km E of Unduavi along new rd, 5.6 km W of Cotapata, 3300-3500 m, 5 May 1990 (fl), *Luteyn & Dorr 13476* (NY, LPB, plus 5 to be distributed); 1.4 km E of Cotapata, 3200 m, 20 Mar 1988 (fl), *Solomon 18195* (MO, NY).

APPENDIX

List of all species of Ericaceae attributed to Bolivia, including current status of names given by Foster (1958). [Key: names appearing in *italics* are currently

synonyms; names appearing in Roman are currently accepted; **!** = new species; **BO** = species endemic to Bolivia (or nearly so); * = species endemic to northern Bolivia and adjacent central to southern Peru; ** = species not found in Bolivia; **CULT** = introduced ornamental species.]

ACKNOWLEDGMENTS

Stephan Beck encouraged me to write this paper. I thank the Herbario LPB (La Paz, Bolivia), Jim Solomon, the Missouri Botanical Garden, and the late David N. Smith for facilities and logistical support. Thanks and acknowledgments are also given to the Jessie Smith Noyes Foundation and the National Science Foundation under whose grants field work was undertaken and this paper was written. I thank Stella Sylva for translating the key into Spanish and computer help, Bobbi Angell for the beautiful illustrations, and Carmen Ulloa U. and Walter Judd for critically reviewing the manuscript.

ABSTRACT

Two new species, *Festuca cuzcoensis* Stančík & P.M. Peterson and *F. tovarensis* Stančík & P.M. Peterson, from the Andes of Bolivia and Peru are described and illustrated. The two new species appear to be closely related to *Festuca flacca* Hack. ex E.B. Alexeev from Ecuador. A key to the South American species of *Festuca* sect. *Subulatae* is given.

RESUMEN

Se describen e ilustran dos especias nuevas de *Festuca* de los Andes de Bolivia y Perú: *F. cuzcoensis* Stančík & P.M. Peterson y *F. tovarensis* Stančík & P.M. Peterson. Las nuevas especies se consideran estrechamente relacionadas con la especies *F. flacca* Hack. ex E.B. Alexeev de Ecuador. Además se presenta una clave para la determinación de las especies de *Festuca* sect. *Subulatae* en Suramérica.

While making determinations of South American material in the United States National Herbarium the senior author recognized several specimens with unique features. The two new species discussed here appear to be members of *Festuca* subg. *Subulatae* (Tzvelev) E.B. Alexeev sect. *Subulatae*. The position of sect. *Subulatae* in subg. *Subulatae* is clear, however, the relationships with other sections in this subgenus are unresolved. Alexeev (1980, 1982, 1986) recognized three sections in subg. *Subulatae*: sect. *Subulatae*, sect. *Elmera* E.B. Alexeev, and sect. *Glabricarpae* E.B. Alexeev. Alexeev (1986) and Clayton and Renvoize (1986) also recognized two other subgenera in these flat-bladed South American species of *Festuca*: subg. *Subuliflorae* E.B. Alexeev and subg. *Obtusae* E.B. Alexeev. Aiken's et al. (1997) treatment included species of subg. *Subuliflorae* and subg. *Obtusae*, sensu Alexeev, in subg. *Subulatae* sect. *Obtusae*, and moved a single species from sect. *Elmera*, sensu Alexeev, to sect. *Subulatae*. In addition, Lu (1992) described sect. *Longiglumes* S.L. Lu to include some Chinese species within subg. *Subulatae*. Clearly, there are considerable differences of opinion among prominent agrostologists as to possible taxonomic relationships among these *Festuca* species.

Section *Subulatae* consists of about 25 species from North and South America, Asia, and Africa (Aiken et al. 1997; Alexeev 1977, 1980, 1988; Lu 1992; Stančík ined.). Individuals of *Festuca* sect. *Subulate* are typically loosely tufted

with extravaginal innovations lacking cataphylls, with flat blades without well-developed ribs, and have relatively large, open panicles with numerous branches. In this section the spikelets are typically lanceolate with two short, entire, and narrow glumes that are membranous to coriaceous/membranous. The coriaceous/membranous lemmas are lanceolate, entire, and usually long-awned or rarely awnless. Anthers are short (1–2 mm long) and the ovary hairy, rarely glabrous. The two new species discussed here clearly are members of subfamily Pooideae, tribe Poeae, and subtribe Loliinae (Soreng et al. 2001). With the addition of these two new species in South America, *Festuca* sect. *Subulatae* consists of the following eight species: *F. cochabambana* E.B. Alexeev, *F. coromotensis* Briceño, *F. cuzcoensis*, *F. flacca* Hack. ex E.B. Alexeev, *F. parodiana* (St.-Yves) Nicora, *F. sodiroana* Hack. ex E.B. Alexeev, *F. tovarensis*, and *F. ulochaeta* Nees ex Steud.

Festuca cuzcoensis Stančík & P.M. Peterson, sp. nov. (**Fig. 1**). TYPE: PERU. DEPARTAMENTO CUZCO. Provincia Urubamba: above Ollantaytambo, in shade, high up ravine, 3600 m, 5 Dec 1923, *A.S. Hitchcock 22532* (HOLOTYPE: US-1164548!).

Festuca ulochaeta auct. non Nees ex Steud: Hitchcock 1927, 321 p.p. Macbride 1936, 123 p.p. Tovar 1993, 90 p.p.

Haec species a *Festuca ulochaeta* Nees ex Steud. et *F. tovarensis* Stančík & P.M. Peterson culmis multinodis (6–12 non 2–4) et aristae brevi [3–4 (–5) non 5–12 mm] differt. A *Festuca ulochaeta* Nees ex Steud. et *F. cochabambana* E.B. Alexeev ligula folii 2–3 (non 0.2–2) mm longa distinguitur.

Perennial, loosely tufted. Culms 80–110 cm tall, erect, glabrous, with 6–12 nodes in basal half, the internodes short. Sheaths membranous, brown, more or less pubescent, margins free; innovations extravaginal; auricles absent. Ligules 2–3 mm long, membranous, acuminate, dentate. Blades 12–15 cm long, 3–9 mm wide, flat, green, scabrous on ribs of abaxial surface. Panicles 20–25 cm long, 5–10 cm wide, open; branches pendant, scabrous. Spikelets 8–10 mm long; florets 3–4 (perfect); rachilla 1.2–1.4 mm long, puberulent. Glumes narrowly lanceolate, coriaceous, purplish, scabrous, apex acute; lower glume (2–)2.5–4.5 mm long, 1-veined; upper glume 4–6 mm long, inconspicuously 3-veined. Lemma 7–8.5 mm long, lanceolate, chartaceous to membranous, 3- or 5-veined, purplish-green; apex scabrous, entire; awn 3–4(–5) mm long, scabrous, straight. Palea almost as long as lemma, 2-keeled, the keels finely scabrous, deeply 2-dentate. Lodicules oblong, 2-dentate. Stamens 3; anthers (1.2–)1.5–2 mm long. Ovary apex with a few hairs. Caryopses lanceolate.

Distribution and habitat.—This species was collected in Andean forest zone of Peru and northeastern Bolivia between 3200–3850 m.

Etymology.—The specific epithet refers to the type locality region, i.e., Department Cuzco in southern Peru.

Additional specimens examined: **BOLIVIA. Departamento La Paz:** Unduavi, in Walden, 3300 m, 12 Feb 1907, *Buchtien 6415* (US). PERU. **Departamento Ancash. Prov. Yungay:** Huascarán National Park,

Festuca tovarensis Stančík & P.M. Peterson, sp. nov. (**Fig. 2**). TYPE: PERU. Departamento Huancavelica, Provincia Tayacaja: Chuspi-Hda. Tocas, entre Colchabamba y Paucarbamba, monte bajo, 2800 m, 22 Apr 1954, *O. Tovar 2057* (HOLOTYPE: US-2181286!; ISOTYPE: USM!).

Festuca ulochaeta auct. non Nees ex Steud: Tovar 1993, 90 p.p. Brako L. et al. 1993, 950.

Haec species a *Festuca ulochaeta* Nees ex Steud. lemmate breviore (5.5–6.5 non 6–9 mm), arista 5 7 (non 7 15) mm longa et recta (non flexuosa) differt. A *Festuca flacca* Hack. ex E.B. Alexeev ligula folii 1–2 (non 2–4.5) mm longa, truncata et ciliata (non lacerata), glumis superioribus 3.5–5 (non 2.3–3.5) mm et antheris 1.5–1.6 (non 0.9–1.2) mm distinguitur.

Loosely tufted perennials. Culms 70–90 cm tall, erect, glabrous, with 2–4 nodes in basal half. Sheaths membranous, brown, margins free; innovations extravaginal; auricles absent. Ligules 1–2 mm long, membranous, truncate, margins ciliate. Blades 8–15 cm long, 1.5–4.5 mm wide, linear, flat, green, scabrous with ribs on abaxial surface. Panicles 15–20 cm long, 7–10 cm wide, open; branches pendant, scabrous. Spikelets 7.5–9.5 mm long; florets 3 (perfect); rachilla 1.1–1.4 mm long, puberulent. Glumes narrowly lanceolate, coriaceous, purplish, glabrous, apex acute (sometimes scabrous); lower glume 1.5–1.8 mm long, 1-veined; upper glume 3.5–4.5(–5) mm long, 1–3 veined. Lemma 5.5–6.5 mm long, lanceolate, chartaceous to membranous, 3-veined, purplish-green, scabrous; apex entire; awn 5–7 mm long, terminal, scabrous, straight. Palea as long as lemma, 2-keeled, the keels scabrous; apex hairy, deeply 2-dentate. Lodicules ca. 0.8 mm long, lanceolate, acuminate. Stamens 3; anthers 1.5–1.6 mm long. Ovary sparsely hairy near apex. Caryopses lanceolate; hilum linear, 2/5–1/2 of total length.

Distribution and habitat.—This species is known only from the Andean forest zone of Peru, at 2500–3250 m.

Etymology.—The specific epithet honors the eminent Peruvian botanist and agrostologist, Oscar Tovar Serpa.

Additional specimens examined: **PERU. Departamento Ayacucho. Prov. Huanta/La Mar. Tambo:** Wolken-Nebel Buschwald, 37 km to Ayna, 3250 m, 23 Mar 1977, *Ellenberg 7024* (USM). **Departamento Cajamarca. Prov. Cajamarca:** Road to Yumagual, 2500 m, 26 Jun 1966, *Vega 249* (USM).

DISCUSSION

In South America sect. *Subulatae* is represented by eight native species (Table 1). In this table we compare the salient morphological features that distinguish these taxa, including the North American species, *F. subulata* Trin. All the spe-

tip of ovary	glabrous	hairy	sparsely hairy	sparsely hairy	sparsely hairy	sparsely hairy	glabrous	hairy	hairy

cies are morphologically very similar to one another. However, *F. ulochaeta* can be easily separated from the remaining seven species by having long-awned lemmas with the awn flexuous whereas the other taxa have straight awns or awnless lemmas. *Festuca cuzcoensis* and *F. tovarensis* are possibly most closely related to *F. flacca* since all three share lanceolate spikelets of the same size, 2–4 florets per spikelet, straight awns 3–12 mm long, and small anthers 1.1–2 mm long. *Festuca cuzcoensis* differs from *F. tovarensis* by having 6–12 nodes per culm (2–4 nodes in *F. tovarensis*), acuminate ligules (verses truncate), lower glumes (2–)2.5–4.5 mm long (verses 1.5–1.8 mm), lemmas 7–8.5 mm long (verses 5.5–6.5 mm), and a glabrous ovary (verses sparsely hairy). *Festuca parodiana* shares the following characteristics with *F. sodiroana*: truncate ligules, 4–6 florets per spikelets, and awnless lemmas. However, *F. parodiana* can be separated from *F. sodiroana* by having a hairy (glabrous in *F. sodiroana*) ovary, lower glumes 2–2.5 mm long (verses 1.3–1.8 mm), upper glumes 3–4 mm long (verses 2.2–2.9 mm), lemmas 7–8 mm long (verses 5–6.5 mm), and 5–7 nodes per culm (verses 2–4). *Festuca coromotensis* is almost awnless (mucronate) but differs from *F. sodiroana* and *F. parodiana* by having large, scabrous lemmas 8–9 mm long. There appears to be a geographic component as well since the principal area of distribution for *F. ulochaeta* is southeastern Brazil and northeastern Argentina with new range extensions reported from the Cordillera Oriental of Colombia and Cordillera de Mérida in Venezuela (Stančík 2001). The remaining seven species occur exclusively in the montane forest zone of the Andes in small endemic populations ranging from Argentina in the south to Colombia and Venezuela in the north. *Festuca elviae* Briceño, a Venezuelan species, is also a possible member of *Festuca* sect. *Subulatae*. However, further study is needed to confirm its inclusion in this section.

KEY TO THE SPECIES OF *FESTUCA* SECT. *SUBULATAE* IN SOUTH AMERICA

1. Lemmas awnless or with a mucro to 0.5 mm long.
   2. Lemmas 8–9 mm long, densely scabrous _____ **F. coromotensis**
   2. Lemmas 6.5–8 mm long, glabrous or papillate.
      3. Culms with 2–4 nodes; lower glumes 1.2–1.8 mm long; upper glumes 2.0–2.9 mm long; lemmas 5–6.5 mm long; ovary glabrous _____ **F. sodiroana**
      3. Culms with 5–7 nodes; lower glumes 2 2.5 mm long; upper glumes 3–4 mm long; lemmas *7*–8 mm long; ovary hairy _____ **F. parodiana**
1. Lemmas with awn 3–15 mm long.
   4. Lemma awns markedly flexuous, 7–15 mm long _____ **F. ulochaeta**
   4. Lemma awns straight, 3–12 mm long.
      5. Sheaths pubescent _____ **F. cochabambana**
      5. Sheaths glabrous, rarely scabrous.
         6. Lower glumes (2–)2.5–4.5 mm long; lemma awns 3–4 mm long _____ **F. cuzcoensis**
         6. Lower glumes 1.2–2.4 mm long; lemma awns 5–12 mm long.

BOOK REVIEW

JAMES D. MAUSETH, ROBERTO KIESLING, and CARLOS OSTOLAZA. 2002. **A Cactus Odyssey.** (ISBN 0-88192-526-8, hbk.). Timber Press, Inc., 133 S.W. Second Avenue, Suite 450, Portland, OR 97204-3527, U.S.A. (Orders: www.timberpress.com, 800-327-5680, 503-227-2878, 503-227-3070 fax). $39.95, 306 pp, 191 color photos, 4 maps, 6" × 9".

This book describes the history/evolution of cacti in South America showing the dynamic variety of habitats from high desert to low rainforest. *A Cactus Odyssey* is a fine addition to botanical literature based on experiences taken from the extensive careers of the authors in the region, along with numerous field trips in Bolivia, Argentina and Peru between the years 1995 and 2000. The hard work and combined expertise of three botanists, James Mauseth from Texas, Roberto Kiesling from Argentina, and Carlos Ostolaza from Peru led to the publication of this tour through the parts of South America that supports diverse cactus populations. Along with the unusual plants that are studied, the authors' interactions with the local peoples that are encountered, provides interesting perspectives on the areas where they traveled. A point of particular interest is the wide range of morphological differences among these cacti found in very different places. Dr. Mauseth has done extensive work on the anatomy and physiology of the Cactaceae. In the book, many points are made illustrating why certain cacti grow as they do, and why they are so well adapted to their sometimes harsh surroundings. The geological history of the Americas is also shown as a key factor in the evolution of Cactaceae.

Written not only for botanists, the terminology and amount of technical detail are well presented, giving the reader good definitions and descriptions. Included in the explanation of why the Cactaceae are only native to the Americas, the authors tell the reader what the common traits are among all cacti; those being the presence of areoles, clusters of spines, betalain pigments, and the characteristic structures of flower, fruit and seed. Those traits combine to make the cacti very different from similar looking plants from other continents. A discussion of the water storage system in and the special modifications of different tissues related to the environment, give the reader insight to the incredible process of survival that the cacti have developed living in such extreme environments. The herbarium specimen, seed and other collections taken for lab examination have given the authors thousands of hours of future lab work, as well as potential reams publishable data.

The book includes excellent photography; some very impressive photographs taken at high elevation show hillsides otherwise barren except for compact groups of densely spined cacti. The differences in growth habits from the high elevation to middle and low elevation populations are significant. Major changes in soil type and weather, as well as the beneficial relationships with other plants, increase the ability for cacti to have more vigorous growth. "Nurse" plants range from trees and shrubs in woodland areas, to tall grasses in prairies, to rain forests trees where the cacti are epiphytes on branches along with bromeliads. An interesting note taken of the cacti that are shown is how many of them look very similar to the tall growing saguaro cacti in Arizona. Close to 18 different genera are shown as tall, branching plants; but when examined closely they are very different from their North American cousins. The efforts of these three authors have provided an exciting tour through parts of the world seldom seen by travelers. This is enlightening work describing habitat and aspects of a spectacular plant family and its evolution never before considered by most people.

—Justin Allison, Botanical Research Institute of Texas, Fort Worth, TX 76102-4060, U.S.A.

A NEW SPECIES OF *ERIOGONUM* (POLYGONACEAE) FROM SOUTH TEXAS

Guy L. Nesom

Botanical Research Institute of Texas
509 Pecan Street
Fort Worth, TX 76102-4060, U.S.A.

ABSTRACT

Eriogonum riograndis, sp. nov., is segregated from plants previously identified as *E. multiflorum* Benth. The new species is known from 17 counties of the Rio Grande plains in south-central Texas. *Eriogonum riograndis* differs from *E. multiflorum* in its broader leaves with auriculate-subclasping bases (vs. attenuate, non-clasping leaf bases) and its involucres with more numerous flowers (22–28(–36) vs. 6–12(–15) flowers). The two taxa are primarily allopatric and sharply discontinuous in morphology. Putative intermediates have been observed in three counties. Both species are distinct from the apparently closely related *E. annuum* Nutt. in their longer peduncles, sparsely tomentose and glabrescent involucres, and cordate perianth lobes.

RESUMEN

Eriogonum riograndis, sp. nov., se segrega de las plantas identificadas previamente como *E. multiflorum* Benth. La nueva especie se conoce de 17 condados de las llanuras de Río Grande en el sur-centro de Texas. *Eriogonum riograndis* difiere de *E. multiflorum* en sus hojas más anchas con bases auriculado-semiabrazadoras (en vez bases de las hojas atenuadas, no abrazantes) y sus involucros con flores más numerosas (22–28(–36) vs. 6–12(–15) flores). Los dos taxa son primariamente alopátricos y fuertemente discontinuos en su morfología. Se han observado intermedios putativos en tres condados. Ambas especies son distintas del aparentemente muy relacionado *E. annuum* Nutt. Por sus pedúnculos más largos, involucros esparsamente tomentosos y lóbulos del perianto glabrescentes, y cordados.

The Texas species of *Eriogonum* Michx. were treated in detail by Reveal (1968, 1970), who observed (1968, p. 203) that *E. multiflorum* Benth. and *E. annuum* Nutt. "are the most frequently collected species in the state and collectively the most widely distributed species." Together, they constitute subg. *Micrantha* (Benth.) Reveal (Reveal 1969). Reveal provided a set of detailed morphological contrasts to distinguish these two taxa, noting that their difference in perianth lobe shape allows easy identification. He did not call attention to significant infra-specific variation in either species.

The present study finds that plants previously identified as *Eriogonum multiflorum* can be separated into two, morphologically distinct sets of populations. Those occupying the largest part of the range in Texas, along with those from peripheral localities in northwestern Lousiana, southwestern Arkansas, and south-central Oklahoma (Fig. 2), are identified here as typical *E. multiflorum*. The type collection of *E. multiflorum* (Bentham, Trans. Linn. Soc. London 17:413. 1837) was made in 1833 by Thomas Drummond (Drummond

"between Brazoria and San Felipe de Austin," perhaps in what is now Austin County (from where a modern collection of *E. multiflorum* also has been made). An illustration based on the Drummond type material, presumably at K (Hook. Icon. Pl. 3, t. 250. 1840) shows leaves with non-clasping bases and the description notes "Involucres with about 6–9 flowers"—these features (see below) along with the general habit unambiguously establish the identity of the species. Observation of additional type material of *E. multiflorum* (GH photocopies!; isotype and syntypes fide annotations by J. Reveal in 1967) corroborate this. Plants identified as *E. multiflorum* in the Rio Grande plains of southern Texas represent a previously undescribed species.

Eriogonum riograndis Nesom, sp. nov. (**Figs. 1, 2**). TYPE: U.S.A. TEXAS. SAN PATRICIO CO.: 9 mi E of Sinton, Welder Foundation Research Area, near headquarters buildings, grassy field along swale and in swale, 28 Oct 1958, *F.W. Gould 8510* (HOLOTYPE: BRIT-SMU!; ISOTYPES: TAES!, UC).

Eriogono multifloro Benth. similis duratione annua, caulibus foliosis tomentosis, periantho stipitato, et lobis externis perianthii oblongi-cordatis; differt foliis majoribus ad basim auriculati-subamplectentibus et involucris floribus plus numerosis.

Annual or biennial herbs from a taproot, eglandular. **Stems** erect, 2.5–6(–11, –20 fide Reveal 1970, Richardson 1995) dm tall, usually unbranched until the inflorescence, closely but loosely gray-white and persistently woolly-tomentose. **Leaves** mostly on the lower 3/4–4/5 of the stem, basal not persistent, alternate, oblong-obovate to oblong-elliptic or oblong, epetiolate and shallowly auriculate-subclasping, apex rounded to obtuse, 15–40(–45) mm long, 10–22(–25) mm wide, margins flat or narrowly revolute, entire but often closely undulate, upper surface lightly but persistently woolly-tomentose, lower surface densely and persistently white- to tawny-tomentose. **Inflorescences** cymoid, usually relatively compact. **Involucres** on peduncles 2–5 mm long, turbinate to turbinate-campanulate, 2–2.8 mm high, 2–3 mm wide, 5(–6)-lobed, externally sparsely but persistently tomentose to glabrate, internally densely tomentose. **Flowers** 22–28(–36) per involucre, exserted from the involucre on filiform pedicels. **Perianth** bright white to pinkish, maturing or drying orangish, externally glabrous, internally sparsely tomentose; perianth lobes dissimilar, outer lobes basally cordate and broadly oblong to oblong-elliptic, 2–2.7 mm long, 1.5–2.2 mm wide, midrib thick from base to apex, inner lobes linear, 0.1–0.2 mm wide. **Fruits** dark brown to red-brown, 1.9–2.2 mm long, not winged, glabrous.

Habitat and phenology.—Fields, pastures, roadsides, mesquite prairies, oak woodlands, and other open habitats, sandy soil; (Aug–)Sep–Nov(–Dec).

Distribution.—The distribution of *Eriogonum riograndis* (Fig. 2) corresponds to phytogeographic pattern #17 of Sorrie and Weakley (2001): South Texas-Northeast Mexico Mesquital. They note that "The northern portion is commonly denoted as the South Texas Plains, but ecologically the whole area

FIG. 1. Habit and details of *Eriogonum riograndis* (from holotype, BRIT).

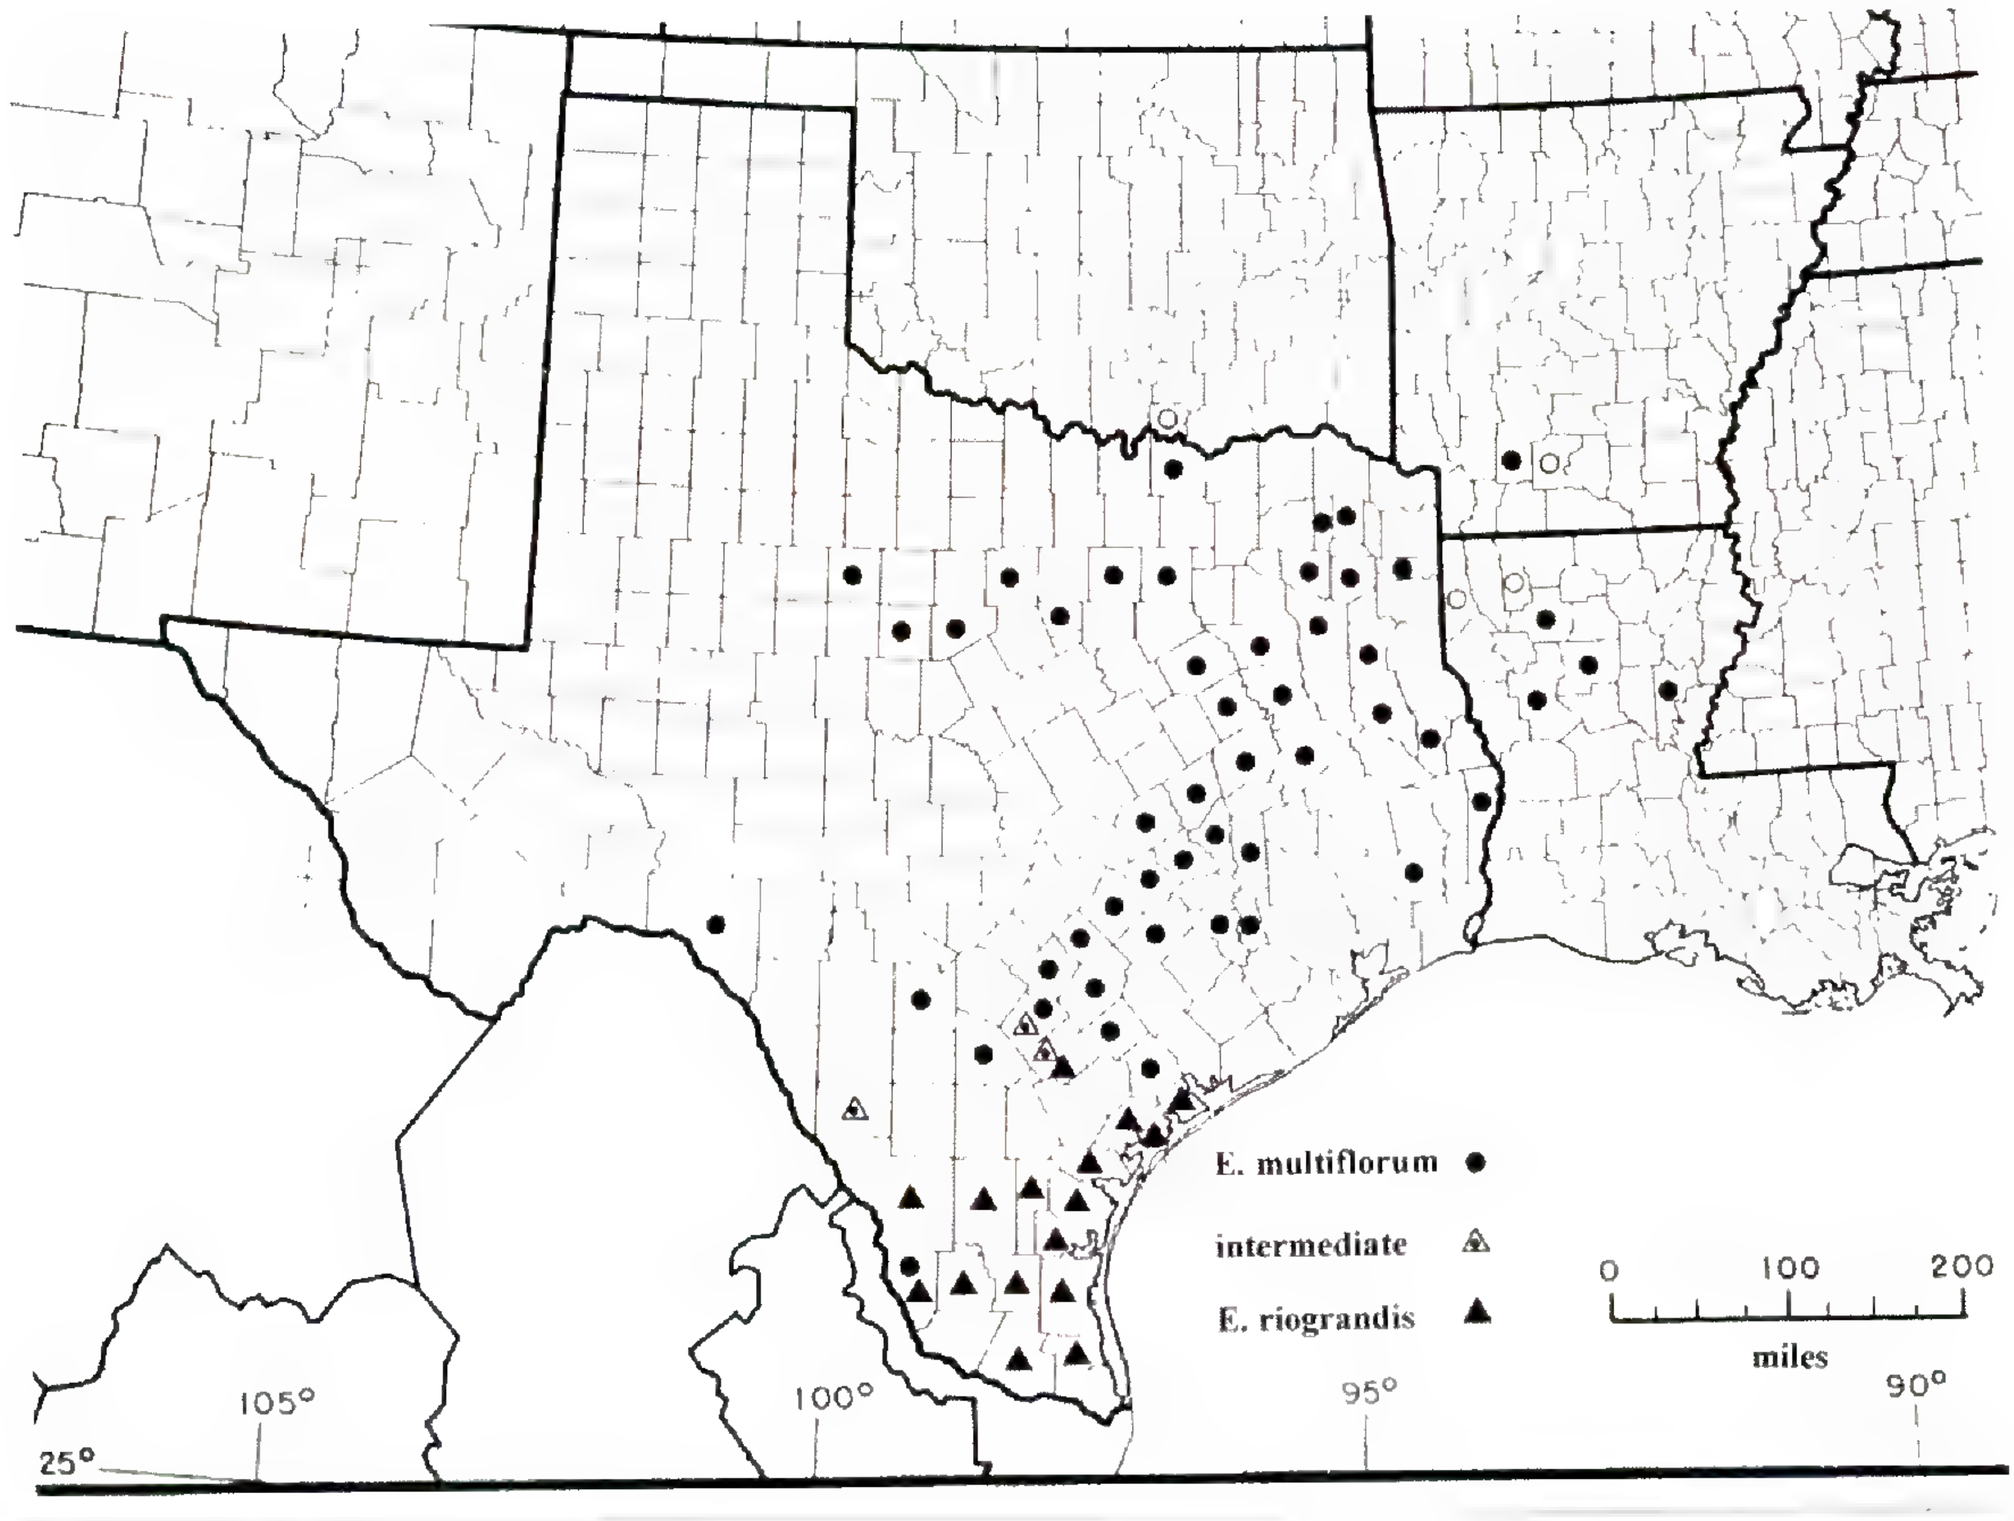

FIG. 2. Geographic distribution of *Eriogonum riograndis* and *E. multiflorum*. Records are from BRIT-SMU, CAMU, OKLA, TAES, TEX-LL, and VDB. Open symbols represent records from collections not seen in this study but added from Smith (1988) and MacRoberts (1989) and from photocopies of Oklahoma specimens from OKLA.

is more properly termed the Tamaulipan Scrub region, or Tamaulipan Mesquital, due to the dominant shrubby vegetation, especially *Prosopis glandulosa* Torr. ..." (Sorrie & Weakley 2001, p. 61). The distribution of the recently described *Pseudognaphalium austrotexanum* Nesom (Nesom 2001) also fits the same phytogeographic pattern. Reveal (1970) noted that *E. multiflorum* occurs in Mexico; presumably this would be *E. riograndis* in the interpretation here, but a specimen documenting the Mexican distribution has not been seen in the present study.

Etymology.—The appositive epithet refers to the central geographic feature in the range of the new species, the Rio Grande (river).

Additional collections examined. **U.S.A. Texas. Aransas Co.:** 4.7 mi E of Rockport, 19 Sep 1936, *Parks* and *Cory 20336* (TAES); Aransas Refuge, 30 Sep 1944, *Cory 45936* (TAES); St. Joseph Island, irregular dunes beyond back beach, 7 Nov 1964, *Andrews 72* (TEX); Aransas Wildlife Refuge, sandy soil at Equipment Shed, 18 Sep 1968, *Fleetwood 9317* (LL); sandy soil along Hwy 35 ca 5 mi N of Rockport, 26 Sep 1981, *Brown 5421* (TAES); 1/2 mi N of Goose Island State Park on Park Road 13, common in clearing in oak woodland, 29 Dec 1982, *Fryxell 3836* (BRIT, TEX). **Brooks Co.:** 3 mi E of Encino, 6 Jul 1935 [sterile], *Parks* and *Cory 141421* (TAES); 14 mi S of Falfurrias, sandy oak region, 15 Sep 1942, *Lundell 11941* (LL); a few mi E of Jim Hogg Co. line on Rd 755, loose sand prairie, 13 Sep 1954, *Johnston 541455*

Eriogonum multiflorum and *E. riograndis* can be distinguished by a simple visual inspection relying primarily on leaf morphology. A count of flowers per involucre, usually requiring low magnification, confirms their distinction. Morphological differences between the two are summarized in the following contrast.

1. Leaves oblong-obovate to oblong elliptic or oblong, 1.5–4(4.5) cm long, 10 22(25) mm wide, auriculate-subclasping at the base, upper surfaces persistently tomentose to weakly glabrescent, usually grayish; flowers 22–28(–36) per involucre _____ **Eriogonum riograndis**

1. Leaves mostly narrowly elliptic-lanceolate to narrowly lanceolate, 2–5(–8) cm long, 3–9(15) mm wide, attenuate at the base, rarely rounded, but not auriculate subclasping, upper surfaces glabrescent to glabrate, commonly reddish; flowers (6 -)9–12(16) per involucre _____ **Eriogonum multiflorum**

These two taxa are similar in habit and overall morphology, and they apparently have a sister relationship. *Eriogonum riograndis* is similar to *E. multiflorum* in its annual duration, leafy and tomentose stems, cymose inflorescence with pedunculate involucres, stipitate perianth internally pubescent but externally glabrous, and dissimilar perianth lobes (outer oblong-cordate, inner linear). They have similar phenologies and both occur in sandy habitats. As a pair, these taxa differ from *E. annuum* in their oblong-cordate outer perianth lobes (vs. obovate and basally attenuate) and sparsely tomentose, commonly glabrescent involucres (vs. densely and persistently tomentose). The involucres of *E. annuum* also are on shorter peduncles (subsessile to 1–3 mm long), often giving the inflorescence branches a somewhat secund appearance, and each involucre produces 25 or more flowers (similar to those of *E. riograndis*).

Eriogonum riograndis and *E. multiflorum* are primarily allopatric in geographic range (Fig. 2), but *E. multiflorum* has been documented within the range of *E. riograndis*.

Zapata Co. *E. riograndis* and *E. multiflorum* both have been collected here. Plants of the latter (*Hamby 1711*, TEX) are typical in leaf morphology and flower number, as are plants of *E. riograndis* (citation above).

A few plants with apparently intermediate features have been collected (Fig. 2).

Dimmit Co. (18 mi E of El Indio, *Miller et al. 5775*, TAES): leaves narrow, sessile but flowers 36 per involucre. This plant has leaves of *E. multiflorum* but a high number of flowers like *E. riograndis*. *Hoglund s.n.* (Carrizo Springs, TEX) has narrow, sessile leaves but 20–21 flowers per involucre.

Karnes Co. (2 mi S of Karnes City, *Johnson 1010*, LL, SMU, TAES): leaves relatively narrow and strongly glabrescent but those on the upper 2/3 of the stem basally truncate to subauriculate and subclasping; involucres 18–27-flowered (tending toward intermediate in flower number). These plants are identified here as *E. riograndis*. Another from Karnes Co. (*Johnson 1618*, SMU) is florally

immature but similar in leaf morphology to *Johnson 1010*, but the tendency for smaller number of flowers and the sessile lower leaves indicate that genes from *E. multiflorum* may be present.

Wilson Co. (Kicaster, *Parks Rx 3016*, TEX): upper leaves clasping to subclasping, flowers ca. 18–22. This plant is similar to those of *Johnson 1010* in Karnes Co., apparently intermediate. *Parks* and *Cory 11800* (E of Floresville, TAES) has narrow sessile leaves but 24 flowers. *Parks 5355* (Kicaster school, TAES) is typical *E. multiflorum*.

Choice of rank.—Conspicuous morphological and geographic discontinuity between *Eriogonum multiflorum* and *E. riograndis* is the predominant feature of their contrast. Putative morphological intermediates suggest that hybridization may occur where they come into geographically close contact, but no zone of intergradation exists to suggest that significant gene flow occurs between the two taxa. It might be argued that their apparent sister relationship should be recognized by treating them as varieties within a single species, but the degree of morphological differentiation between species in any given genus (including *Eriogonum*) is variable, and the discontinuity documented here (with inference of genetic isolation) provides justification for treating *E. multiflorum* and *E. riograndis* at specific rank, consistent with species concepts in many other genera.

ACKNOWLEDGMENTS

I am grateful to the staff of TEX-LL for their help during a recent visit there, TAES for a loan of specimens, Emily Wood (GH) for sending photocopies of type material of *E. multiflorum*, Amy Buthod at OKL for helpful information on Oklahoma distribution, staffs of CAMU and OKLA for sending photocopies of Oklahoma collections, and to Jim Reveal for comments on the manuscript. Linny Heagy provided the fine illustration; a discussion with Ted Barkley regarding the choice of epithet was helpful.

A NEW VARIETY OF *IPOMOEA COSTELLATA* (CONVOLVULACEAE) FROM THE EDWARDS PLATEAU REGION OF TEXAS

Robert J. O'Kennon and Guy L. Nesom

Botanical Research Institute of Texas
509 Pecan Street
Fort Worth, TX 76102-4060, U.S.A.

ABSTRACT

Ipomoea costellata var. ***edwardsensis***, var. nov., is described, illustrated, and mapped. It apparently is endemic to the Edwards Plateau region of Texas, where it is known from six counties. It is set apart from *I. costellata* elsewhere in its range by its combination of shorter peduncles and bright white, nearly rotate flowers with fewer and deeper lobes.

RESUMEN

Se describe, se ilustra y se cartografía ***Ipomoea costellata*** var. ***edwardsensis***, var. nov. Es aparentemente endémica de la región de la meseta Edwards de Texas, de donde se conoce de seis condados. Se separa de *I. costellata* por su combinación de pedúnculos más cortos y flores blanco brillante, casi rodadas con menos lóbulos y más profundos.

Plants of a small-flowered, pedatisect-leaved morning glory from the Edwards Plateau region of Texas are identified as *Ipomoea costellata* Torrey but are distinct from other plants of the species in morphology, phenology, and geography. The Edwards Plateau plants are here recognized as a distinct variety.

Ipomoea costellata Torrey var. **edwardsensis** O'Kennon & Nesom, var. nov. (**Figs. 1, 2, 3**). TYPE: U.S.A. TEXAS. TRAVIS CO.: Colorado River, Montopolis Bridge, 8 Nov 1934, *B.C. Tharp s.n.* (HOLOTYPE: TEX).

Differt a *I. costellatae* Torrey sensu lato pedunculis brevioribus longitudine petiolum aequantibus et corollis albis rotatis lobis paucioribus profundioribus.

Plants annual herbs from a filiform taproot, at first erect, becoming prostrate or clambering on low vegetation, slightly twining at the very tips. ***Stems*** simple or with 1–5 (or more) branches originating ca. 2–4 cm above the base, terete, 3–60 cm long, 0.5–1 mm in diameter, branching, green, glabrous. ***Leaves*** pedatisect, 2–3.5 cm wide, petioles 7–25 mm long, nearly even in length or decreasing slightly from base to apex of stem, glabrous, ultimate leaf segments 7–9(–11), linear to linear-lanceolate, unequal, the longest 15–24 cm long, 1.5–3 mm wide, outer shorter than the inner and usually lobed from near the base, green above and beneath, glabrous, margins entire, sparsely hispid-ciliate, apices acute, apiculate. ***Flowers*** solitary or less commonly paired; peduncle spreading to slightly decurved or ascending, terete, filiform, 3–22 mm long, green, glabrous to sparsely

FIG. 1. Habit and floral details of *Ipomoea costellata* var. *edwardsensis* (from *O'Kennon 8125*).

FIG. 2. Photographs of *Ipomoea costellata* var. *edwardsensis* flowers (from *Nesom FW99* and *O'Kennon*).

hispid-pilose; pedicel 6–8 mm long, slightly thicker than the peduncle, separated from the peduncle by a pair of awl-shaped bracts, glabrous to sparsely hirsute-pilose; sepals equal, subimbricate, elliptic to elliptic-lanceolate, 4–5.2 mm long, 1.5–2 mm wide, midrib green, low-carinate, smooth to muricate, margins entire, hyaline, the apex rounded to retuse, apiculate; corolla tubular to long-campanulate, all parts bright white, glabrous, 8–11 mm long, tube 4–5 mm long, 2 mm in diameter, limb with 5 oblong-ovate, apiculate, spreading lobes 2–2.5 mm long, flowers opening with lobes nearly erect, spreading at right angles at full anthesis, closing erect past maturity; stamens subequal, white, filaments pubescent along whole length with long, viscid trichomes; style white, 4.5 mm long (equaling the filament length), glabrous, stigma white, slightly bilobate, apparently in contact with the anthers. ***Fruits*** bilocular dehiscent capsules 5–6 mm in diameter, tan upon drying, chartaceous, glabrous; seeds 4, dark brown to blackish, obovoid, 3-angled, ca. 3 mm long, 2 mm wide, densely and minutely strigose.

Additional collections examined. **United States. Texas. Bexar Co.:** Government Canyon State Natural Area, E side of Wildcat Canyon, E edge of San Geronimo Quad or W edge of Helotes Quad, 'guesstimated' lat/long—29° 33'51" N, 98° 45'00" W, elev. 1200–1240 ft, rare, two plants seen among sparse herbaceous vegetation in very shallow dark brown clay in natural opening on Cretaceous limestone bedrock exposed on flattest part of ridgetop, associates include *Sporobolus vaginatus*, *Bothriochloa ischaemum* var. *songarica*, *Croton monanthogynus*, *Senna lindheimeriana*, 24 Oct 1995, *Carr 15050* (TEX). **Burnet Co.:** N of RM Road 1431, 1.8 road mi WNW of US Rte 281, Marble Falls Quad, local in thin, fairly dry, organic-sandy soil in unshaded weather pit on low granite outcrop, ca. 1500 ft elev., annual, stems twining only at tips of taller plants, 18 Aug 1988, *Carr 9136* with Kutac, Lynch, and Brown (TEX); RM Road 1431, 1.7 mi W of jct with US Rte 281 in Marble Falls, area of exposed granite, N side of road across from large quarry, 23 Oct 2001, *Nesom FW99* and O'Kennon (BRIT, TEX). **Gillespie Co.:** Onion Creek Bluff, 400 m E of FM 783 in NW Gillespie Co., scarce in limestone crevices 10 m above Onion Creek, 19 Oct 1990, *O'Kennon 8125* (BRIT). **Llano Co.:** near the summit of Dutch Mountain, ca. 1.5 mi N of Enchanted Rock, infrequent vine, 29 Sep 1976, *Butterwick and Lamb 3303* (TEX). **Travis Co.:** Austin, Colorado River below Dam, 29 Sep 1929, *Ecology Class s.n.* (TEX); Austin, Onion Creek, 15 Oct 1929, *Whitehouse W-29-3* (TEX); McKinney Falls State Park, S of Onion Creek at mouth of Williamson Creek, frequent, locally abundant in thin soil in weather pits on exposed calcareous bedrock, ca. 100–300 ft, 29 Oct 1985, *Carr 7050* (BRIT, TEX). **Uvalde Co.:** 2.1 mi W of jct of FM 127 and FM 1049 on FM 127, dry limestone ledge, 2 Nov 1985, *Keeney 5371* (BRIT).

Etymology.—The epithet alludes to the location of the plants on the Edwards Plateau.

Distribution, habitat, and phenology.—Collections at hand indicate that *Ipomoea costellata* var. *edwardsensis* is distributed over the Edwards Plateau, although the plants are apparently uncommon and inconspicuous. Shinners' treatment of Texas *Ipomoea* (1970) noted only that *I. costellata* occurs in the trans-Pecos region, although in 1960 he annotated the three early collections from Travis County (1929 and 1934, cited above) as *I. costellata*; McDonald (1995) did not map or cite any collections of *I. costellata* from the Edwards Plateau. We suspect that searches for var. *edwardsensis* will broaden its known distribution

but confirm that it is endemic to the Edwards Plateau. Limestone ledges and crevices, and thin soil of weather pits in bedrock of limestone and granite, 100–1500 ft elev. Flowering (August–)September–November. We observe that var. *edwardsensis* apparently is particularly sensitive to grazing.

Ipomoea costellata (excluding var. *edwardsensis*) occurs in Texas in the trans-Pecos region and in Webb Co. (Fig. 3), continuous with its distribution in the Mexican states of Chihuahua and Coahuila. It is recorded from all of the northernmost states of Mexico (Sonora, Chihuahua, Coahuila, Nuevo León, and Tamaulipas) except Baja California and continues southward to Guatemala (see McDonald 1995, Fig. 2). Austin and Huáman (1996) reported its occurrence also in Venezuela but not Guatemala.

A recent taxonomic revision (McDonald 1995) treats *Ipomoea costellata* and seven closely related species within *Ipomoea* sect. *Leptocallis* (G. Don) J.A. McDonald, and another species has been recently added (Austin & Tapia Muñoz 2001). *Ipomoea costellata* is distinct within sect. *Leptocallis* in its annual, taprooted habit and small flowers (ca. 1 cm long). *Ipomoea costellata* alone in the section is autogamous—self-pollination is facilitated by the stigma in contact with stamens. Variety *edwardsensis* also has this reproductive arrangement and is obviously closely related to the rest of the species, but its geographic separation and set of differences (couplet below) provide a reasonable basis for formal taxonomic recognition.

Peduncles 3–22(–30) mm long, peduncle plus pedicel mostly shorter than or equal to the subtending leaf, ca. equal the petiole length; corollas bright white, with five, oblong-ovate lobes; flowering (Aug-)Sep–Nov _____ **Ipomoea costellata** var. **edwardsensis**

Peduncles (15–)27–70 mm long, peduncle plus pedicel mostly 1.5–3 times longer than the subtending leaf; corollas pink, purple, bluish, white, or yellow, with ten, shallowly rounded lobes; flowering (Jun–)Jul–Oct _____ **Ipomoea costellata** var. **costellata**

Ipomoea flowers are fragile and commonly are not useful for taxonomic distinctions in pressed specimens. We emphasize the short peduncle length, especially of mature fruits, as the most obvious and easily observed feature to distinguish var. *edwardsensis*. Scattered plants of *I. costellata* sensu lato (var. *costellata*) may have peduncles approaching the short length of var. *edwardsensis*, but the latter (as a population system) is set apart from rest of the species by this feature.

The flower color of *Ipomoea costellata* was described by McDonald (1995) as "blue, or rarely yellow throughout." Other sources note the following: "pale lavender" (Texas—*Whitehouse 17154*, SMU), "pale pink" (Texas—*Turner et al. 53447*, SMU), "reddish" (Texas—*Keough 227*, TEX), "purple" (Texas—*Butterwick and Lamb 1759*, TEX), "rose-purple" (New Mexico—Martin & Hutchins 1981), lavender (photo of Texas plant—Rickett 1969), "limb pale pink, throat and tube near white" (New Mexico—*Spellenberg 3852*, LL), "lavender or purplish, tube paler" (Sonora—Wiggins 1964), "tube lavender, purple near tips, yellow-white

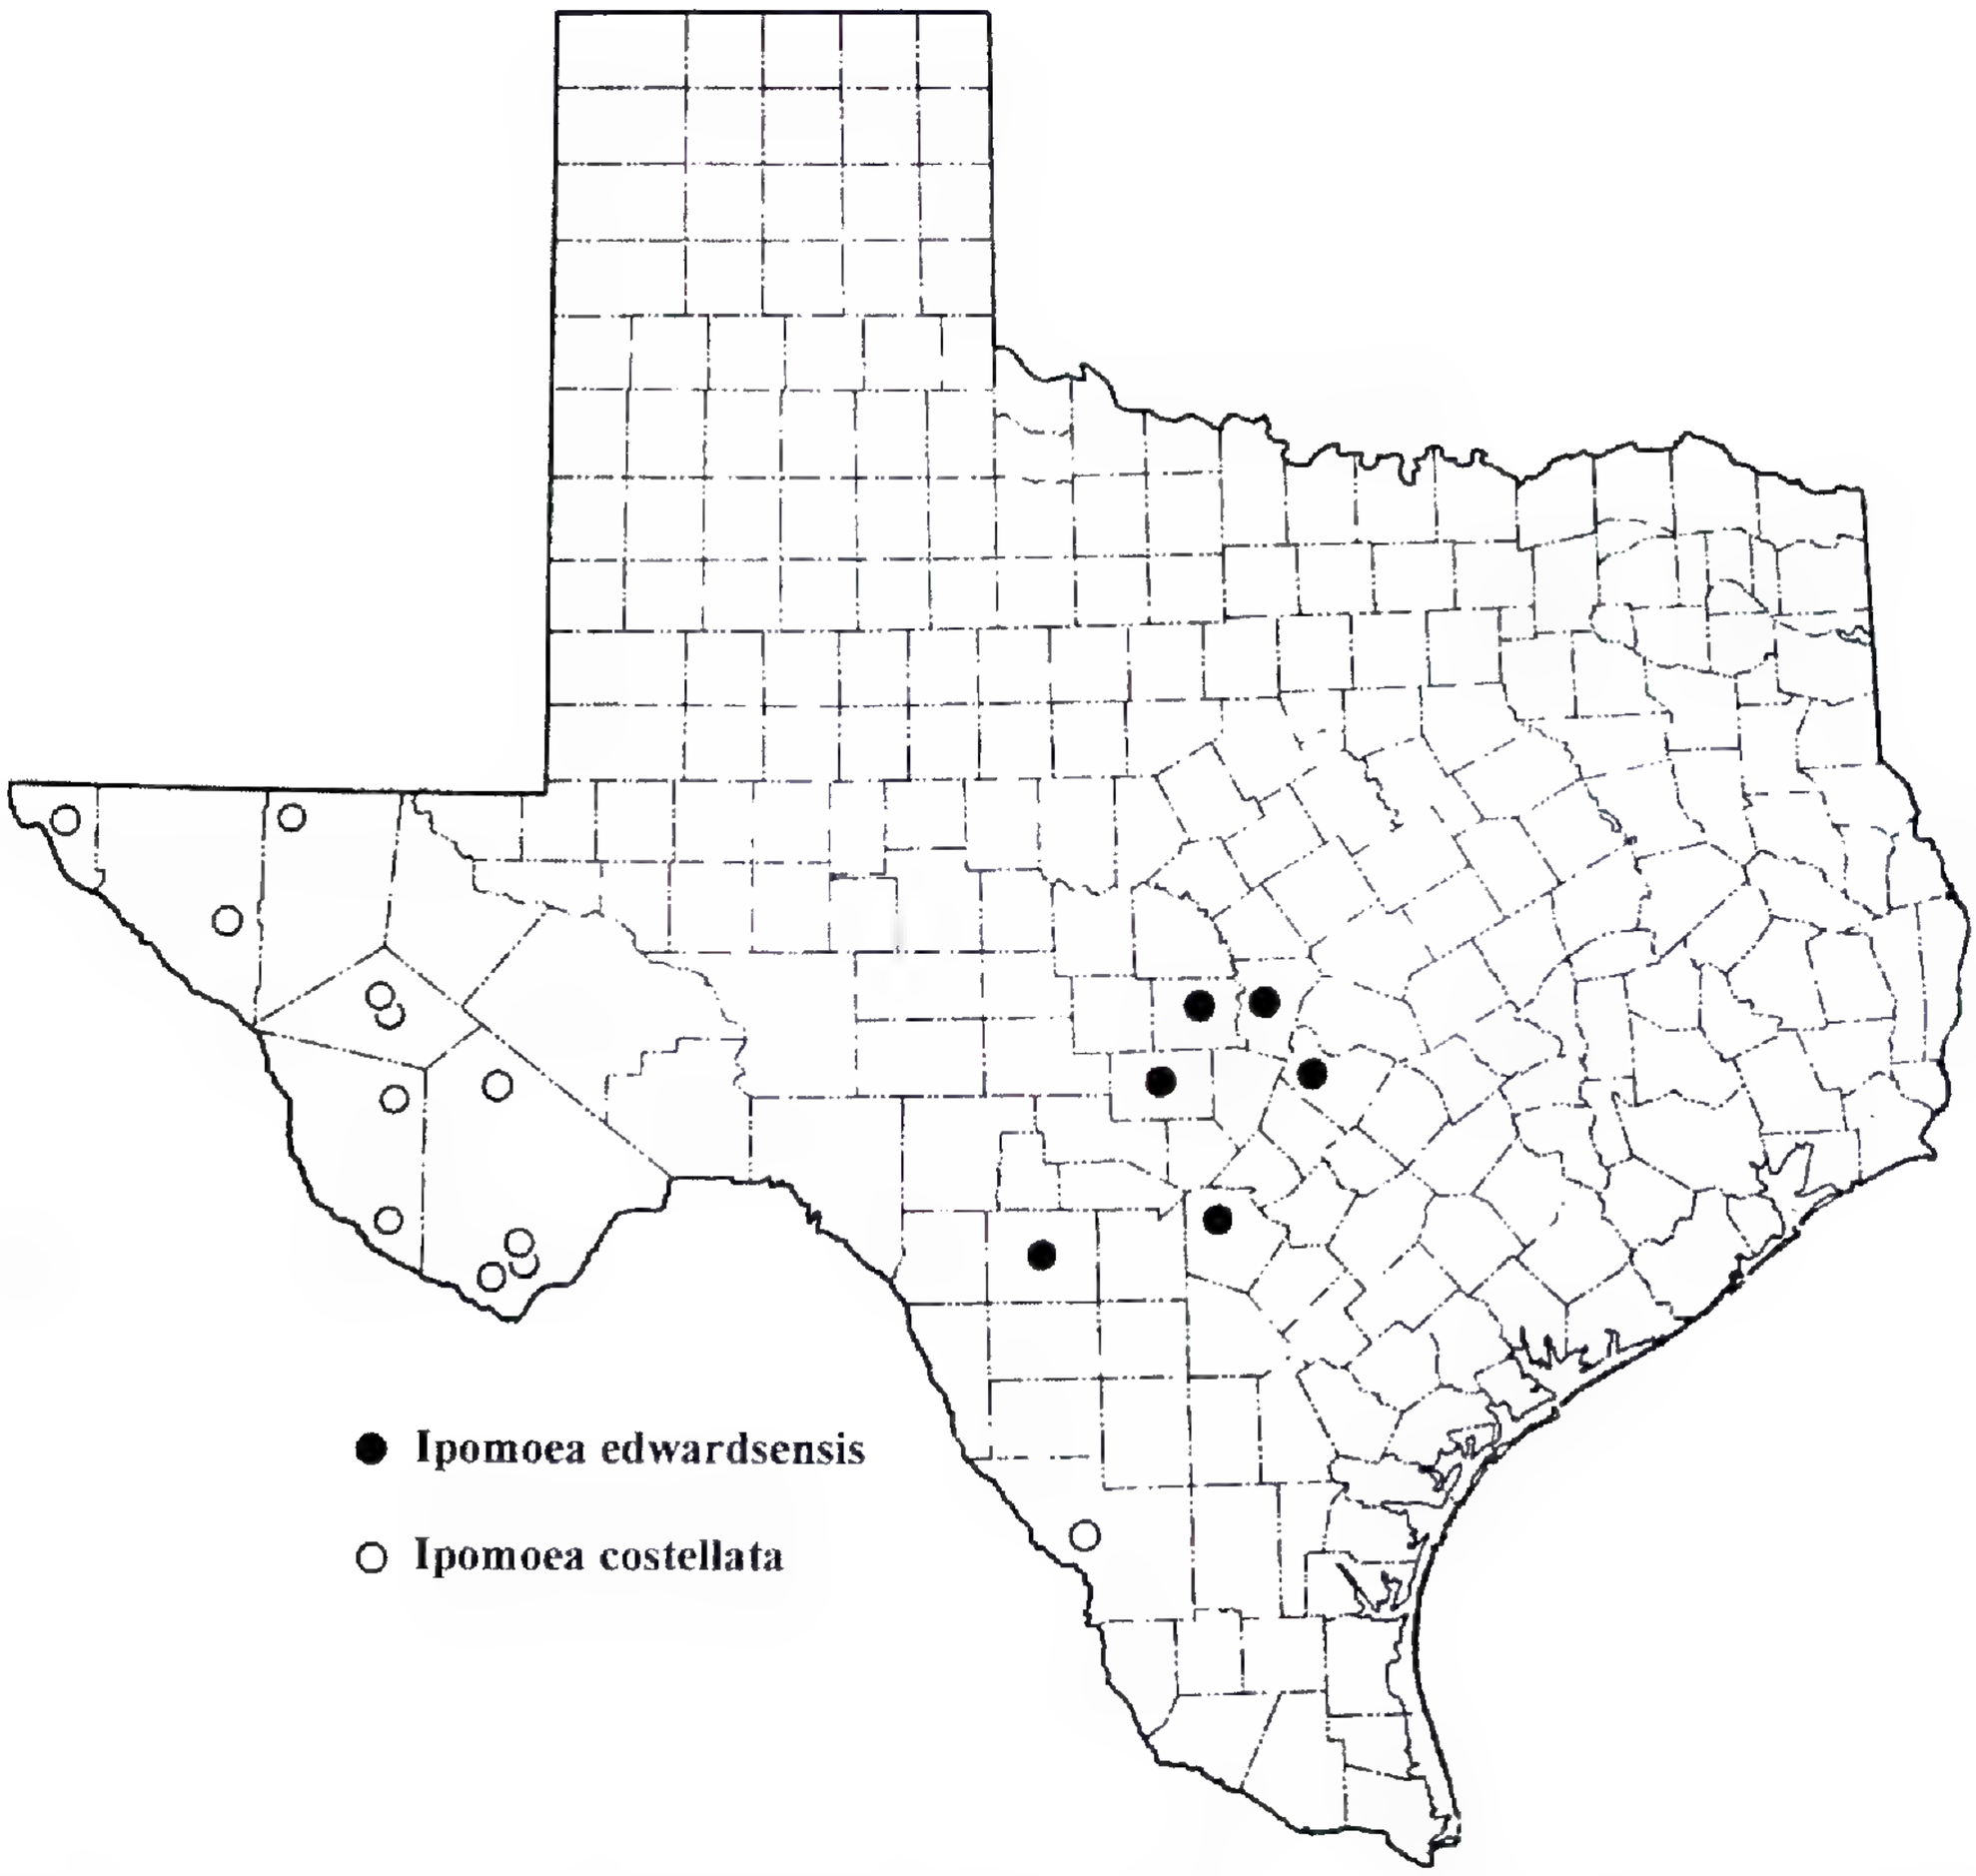

FIG. 3. Distribution of *Ipomoea costellata* var. *edwardsensis* and *I. costellata* var. *costellata* in Texas. The range of var. *costellata* continues westward to Arizona and southward to Guatemala (see text). Records are from BRIT-SMU and TEX-LL.

at base" (Chihuahua—*Henrickson 7557*, TEX), "yellow tube, purple-red limb" (Chihuahua—*Henrickson 7692*, TEX), "cream with green-yellow throat" (Coahuila—*Wendt 1783*, TEX), and "pale blue" (Chiapas—*Breedlove 52353*, TEX). Plants in the vicinity of Edo. Mexico produce yellow flowers (according to McDonald) and have been segregated as *I. painteri* House—this taxon was included in the synonymy of *I. costellata* by McDonald but treated as distinct by Rico R. (1985), who described the flower color of *I. painteri* as white or creamy. Plants in Nuevo León and Tamaulipas also apparently produce white flowers and are further distinguished within the species by thick taproots and apparently perennial duration; peduncles of these plants are long.

The corolla morphology of var. *edwardsensis* also is distinctive from any we are aware of within *Ipomoea costellata* and certainly from populations of the species on the periphery of var. *edwardsensis* in Texas and northern Mexico.

In var. *edwardsensis*, the limb is deeply and relatively narrowly lobed, and at full anthesis, the lobes spread at nearly right angles to the tube (Fig. 2). The line drawing (Fig. 1) shows a flower as it appears in early anthesis, just opening. Flowers of *I. costellata* elsewhere in its range apparently have ten, shallow lobes and the limb is funnelform, widening gradually toward the apex (Rickett 1969, pl. 99; Warnock 1977, Fig. 6, p. 178)—"corolla campanulate ... limb subentire, scantily 10-lobate," as described by McDonald (1995, p. 106).

Variety *edwardsensis* is clearly a 'satellite' of the larger and variable *I. costellata* sensu lato. Recognition of var. *edwardsensis* emphasizes its relative internal consistency and its morphological and geographical distinction from the rest of the species. Other recognizable geographic variants, particularly as distinguished by flower color, have been formed within *I. costellata*, this process perhaps quickened by the apparent tendency for autogamy. Formal recognition of the Edwards Plateau populations implies that other geographic segments of *I. costellata* might also be justifiably recognized (McDonald pers. comm.), and we agree with this.

McDonald (1995) did not provide a formal statement of his concept of varietal versus specific rank within sect. *Leptocallis*, but several species in his treatment include geographically distinct varietal taxa separated by one to several apparently non-intergrading morphological characters. In contrast, Yatskievych and Mason (1984) recognized two varieties within *I. tenuiloba* Torrey (of sect. *Leptocallis*) that are morphologically intergrading, this taxonomy accepted by McDonald. Yatskievych and Mason also observed that *I. tenuiloba*, *I. capillacea* (Kunth) G. Don, and *I. plummerae* A. Gray (including *I. patens* (A. Gray) House) constitute "a very close-knit species complex." With further consideration of the rationale for applying ranks within sect. *Leptocallis*, we believe that the Edwards Plateau variety of *I. costellata* eventually may be treated at higher rank.

ACKNOWLEDGMENTS

We are grateful to the staff of TEX-LL for their help during recent visits. Andrew McDonald and Dan Austin reviewed the manuscript and we are grateful to Andrew McDonald for a discussion of variation in *I. costellata*. Linny Heagy provided the fine illustration.

BOOK REVIEW

STEPHEN ANDERTON. 2001. **Urban Sanctuaries: Peaceful Havens for the City Gardener.** (ISBN 0-88192-502-0, hbk.). Timber Press, Inc., 133 S.W. Second Avenue, Suite 450, Portland, OR 97204-3527, U.S.A. (Orders: www.timberpress.com, 800-327-5680, 503-227-2878, 503-227-3070 fax). $29.95, 144 pp, 148 color photos, 4 color plans, 4 b/w plans, 8 1/2" × 11".

Creating a "sanctuary" is a popular topic, turning up frequently in the recent crop of gardening literature. British garden writer Stephen Anderton shows how you can create a peaceful oasis in a hectic environment. The emphasis in *Urban Sanctuaries* is on the traditional backyard, but Anderton's key concepts will apply to smaller and more exotic areas as well. Anderton's approach is a down-to-earth yet inspiring presentation of alternatives ranging from cutting-edge designs of cool contemporary plots to family-oriented backyards and container gardens that make maximum use of minimum space.

Anderton's concepts remain constant throughout his narrative. In *Part One: The Body of the Garden* he addresses the fundamental basics of garden design. What type, full or partial, and time of sun does the plot receive? What type of soil does your garden have? What plants or design elements are already there, and will you include them or not? What is your preferred planting style: traditional, tropical, minimalist? Do you want to incorporate a water feature? The scale of plantings as well as water and soil supplies must be considered carefully. To make it seem larger, the pace of movement through the area should be slowed and there must be a place to sit, which seems obivious, but during the design stage the fact that eventually one will want to spend leisure time in one's garden is often overlooked. The broad scope of his vision encompasses all categories of stylistic considerations, with the aim of directing the reader to a design path best suited to one's fundamental predilections. By looking at innovative designs for varied styles of urban gardens Stephen Anderton shows how they can be adapted to create outdoor spaces that are not only imaginative but are also imbued with a mood of peace and serenity.

Part Two: The Spirit of the Garden follows Anderton's musing on different garden themes and ideas of how to make those themes a reality. He uses case studies to provide design solutions complete with diagrams for gardens with magic with mystery, the natural approach, devoted to water, minimalist style, and more. A selected directory, complete with US hardiness zones, of 72 plants that meet his criteria of those that are "tough, easy to grow, and ... have a long season". Plants selected range from trees to perennials.

A prominent personality in the world of English gardening, Stephen Anderton writes a Saturday column for *The Times* (London) and regularly contributes to *Horticulture, The Garden, and Gardens Illustrated*. This unique resource for the city dweller should appeal to gardeners of all levels. *-Gary Jennings, Botanical Research Institute of Texas, Fort Worth, TX 76102-4060, U.S.A.*

SPHAERALCEA CAESPITOSA VAR. *WILLIAMSIAE*, VAR. NOV. (MALVACEAE)

Noel H. Holmgren

New York Botanical Garden
Bronx, NY 10458-5126, U.S.A.

ABSTRACT

In Railroad Valley of east-central Nevada is a less densely pubescent, thinner-leaved, and somewhat smaller-flowered version of *Sphaeralcea caespitosa* of west-central Utah. This variety is described as new, *S. caespitosa* var. *williamsiae* N.H. Holmgren.

KEY WORDS: Malvaceae, Great Basin flora, *Sphaeralcea caespitosa* var. *williamsiae*

RESUMEN

En el valle Railroad del centro-este de Nevada está una versión de *Sphaeralcea caespitosa* con pubescencia menos densa, hojas finas, y flores algo más pequeñas que la del centro-oeste de Utah. Se describe como una nueva variedad, *S. caespitosa* var. *williamsiae* N.H. Holmgren.

The genus *Sphaeralcea*, consisting of about 40 species, is found in temperate and warm temperate parts of North and South America. It is a difficult genus taxonomically with poorly delimited species. Frequent hybridization and back-crossing may be the culprits. In North America there are about 26 species with the greatest concentration in southwestern United States and northern Mexico. Arizona should be considered as the center of diversity for the North American members with about 16 species, and the concentration decreases nearly exponentially with distance in all directions. The Intermountain Region, an area more than two-and-a-half times larger than Arizona, is home to 12 species with only three extending north of the region: *S. grossulariifolia* (Hook. & Arn.) Rydb., *S. munroana* (Douglas ex Lindl.) Spach ex A. Gray, and *S. coccinea* (Nutt.) Rydb. The latter two species extend to Canada and *S. coccinea* reaches the furthest east for the genus, extending into southern Manitoba, western Minnesota, western Iowa, Kansas, Oklahoma, and western Texas.

Although Kearney's (1935) revision of the North American species is now 67 years old, it has held up relatively well, which is remarkable for such a complex genus. His concepts of the species are still accepted, but perhaps reluctantly by many flora writers, in the absence of a modern assessment of the all the North American species. The only modifications come from the seven new taxa that have since been added, five of which are in the Intermountain Region. Welsh, in his study of the genus for the *Utah Flora* (Welsh et al. 1993), added four of them, *S. psoraloides* S.L. Welsh (1980), *S. janeae* (S.L. Welsh) S.L. Welsh (1980, 1998), *S. moorei* (S.L. Welsh) S.L. Welsh (Welsh 1980; Atwood & Welsh, in

press), and *S. grossulariifolia* var. *fumariensis* S.L. Welsh (Welsh & Atwood 2001); and a fifth from just south of the Utah border in northwestern Arizona, within the Intermountain Region, *S. gierischii* N.D. Atwood & S.L. Welsh (In press). Two other new additions are species from south of the region, *S. polychroma* La Duke (1985) and *S. reflexa* Fryxell, Valdés-Reyna & Villarreal (1991).

In my study of the genus for *Intermountain Flora* I have found the need to expand *S. caespitosa* M. E. Jones to accommodate a disjunct population from Railroad Valley in Nye County, Nevada, which can be distinguished as a separate variety. The species is closely related to *S. ambigua* A. Gray, differing from it most significantly in its shorter stature. The geographical ranges of the two varieties of *S. caespitosa* lie to the north of the northern limits of *S. ambigua* in Utah and eastern Nevada and to the east of its most northern limits in western Nevada and eastern California. A historical scenario for how the two varieties evolved is not implicit from their geographical setting. The two exist in similar desert-valley habitats separated by about 160 km of four major north-south oriented mountain ranges alternating with three relatively broad valleys. Their close similarity may be indicative of recent evolution from an element that migrated northward during a warmer Holocene episode, and their subsequent isolation has been long enough (in this interpretation) for some genetic drift to occur.

The two varieties of *S. caespitosa* can be distinguished from each other and from *S. ambigua* by the characters in the following key.

1. Plants 2.5–8 dm tall; calyx 8–16 mm long; staminal column (3.5–)4–5 mm long; schizocarp of 8–12(14) mericarps; seeds 1.5–2 mm long; southern half of Nevada and southwestern and northwestern Utah (but absent from the distributions of the *S. caespitosa* varieties), southward through southeastern California and western Arizona to Baja California _____ **S. ambigua**
1. Plants small, 0.3–2.5 dm tall; calyx 10–18 mm long; staminal column 3.5–9 mm long; schizocarp of 11–14 mericarps; seeds 1.9–2.3 mm long; east-central Nevada and central-western Utah _____ **S. caespitosa**
   2 Calyx 13 18 mm long; petals 16 23 mm long; staminal column 3.5 6 mm long; leaves thickish, grayish-green, densely pubescent, usually with stellate hairs overlapping and concealing or nearly concealing the surface; plants 0.3–1.5(1.7) dm tall; endemic to the western Utah desert in southwestern Millard County and adjacent northwestern Beaver County, at 1600–2000 m elevation _____ var. **caespitosa**
   2. Calyx 10–14 mm long; petals 15–20 mm long; staminal column 6 -9 mm long; mature leaves relatively thin, greenish, moderately pubescent with a considerable amount of surface exposed; plants 0.7–2.5 dm tall; endemic to Railroad Valley in northeastern Nye County, Nevada, at 1400–1600 m elevation _____ var. **williamsiae**

Sphaeralcea caespitosa M.E. Jones

Perennial herb, 0.3–1.6(–2.5) dm tall, arising from a woody, branched caudex surmounting a taproot; *herbage* grayish-green with a dense pubescence or pale greenish with a moderately dense pubescence, the hairs stellate, the rays of the hairs spreading in several different directions; *stems* few to several, ascending

or erect, unbranched; *leaves* all cauline, petiolate, the petioles 1–3.5(–7) cm long, the blades of the leaves at midstem larger than the lower, 1.5–4.5(–5) cm long and about as wide, deltate, ovate, or suborbicular, the base cordate, truncate, or broadly cuneate, the margin coarsely crenate or dentate-crenate, and sometimes obscurely 3-lobed, palmately veined, the veins prominent beneath and slightly channeled above; *stipules* filiform or linear; *inflorescence* few-flowered, the lower flowers racemose or solitary in leaf axils, the upper ones often in thyrsoid clusters, the rachis, pedicels, and calyces pubescent as below; *pedicels* 3.5–13 mm long, divaricately ascending, with stipular bracts at the base; *involucral bracts* filiform, pale brownish; *calyx* 10–18 mm long, the lobes lanceolate to ovate, acute, 2/3–3/4 of the calyx length; *petals* 15–23 mm long, the short claw ciliate, the blade obovate, reddish-orange (grenadine); *staminal column* 3.5–9 mm long, stellate pubescent, bearing anthers at the apex; *styles* with capitate stigmas; *schizocarp* of 11–14 mericarps forming a ring 7.5–8.5 mm in diam., each mericarp 2-seeded, 3–5.5 mm high, 2.2–4.6 mm wide, rounded dorsally and rounded to obtuse apically, coarsely reticulate on the sides of the indehiscent lower 1/3 and smooth-sided on the upper 2/3, pubescent on back; *seeds* 1.9–2.3 mm long, reniform, dark brown to black, minutely puberulent in patches.

Sphaeralcea caespitosa M.E. Jones var. **caespitosa** (**Fig. 1A–D**). *Sphaeralcea caespitosa* M.E. Jones, Contr. W. Bot. 12:4. 1908. TYPE: UTAH. BEAVER CO.: "Wa Wa ..., west of Frisco, at Dry Station, ... on very poor volcanic soil covering lava with a shallow coat, and in crevices of the rocks where there is a little soil," 6000 ft, Beaver Co., Utah, 25 Jun 1906, *M.E. Jones s.n.* (HOLOTYPE: POM!; ISOTYPES: NY!, US!)

Perennial herb 0.3–1.7 dm tall; *herbage* grayish-green, densely pubescent, the stellate hairs on mature leaves usually overlapping and concealing the leaf surface; *leaves* with petioles 1–3.3 (–5) cm long, the blades thick, 1.5–4.5 cm long and about as wide, deltate, ovate, or suborbicular, the base truncate to broadly cuneate, the margin coarsely crenate and sometimes obscurely 3-lobed; *calyx* 13–18 mm long; *petals* 16–23 mm long; *staminal column* 3.5–6 mm long; *mericarps* each 4.5–5.5 mm high and 3.2–4.6 mm wide, rounded apically.

Habitat.—Shallow, gravelly alluvial soils, mainly from the Sevy Dolomite Formation (Welsh 1993), and also from calcareous formations, often growing in shadscale, rabbitbrush, or matchweed associations, ranging from (1400) 1600 to 2000 m elevation.

Distribution.—West-central Utah in the valleys and foothills of southwestern Millard County and adjacent Beaver County, in and around the Desert Range Experimental Station (Fig. 2).

Phenology.—Flowering from late May to June, fruiting from mid June to August.

Sphaeralcea caespitosa M.E. Jones var. **williamsiae** N.H. Holmgren, var. nov. (**Fig. 1E–H**). TYPE: U.S.A. NEVADA. NYE CO.: Railroad Valley, just W of Lockes (Black

Rock Station), 34.5 air km SW of Currant, 38° 33'13"N, 115° 46'34"W, T8N R55E S15, 4850 ft, 28 May 2001, *N.H. Holmgren & P.K. Holmgren 14322* (HOLOTYPE: NY!; ISOTYPES: BRY!, RENO!, UTC!).

A *Sphaeralcea caespitosa* var. *caespitosa* foliis tenuioribus, modice (non dense) pubescentibus atque calyce breviore, 10–14 mm (non 13–18 mm) longa differt.

Perennial herb 0.7–2.5 dm tall; *herbage* greenish, moderately pubescent; *leaves* with petioles 1.5–3.7(–7) cm long, the blades relatively thin, 1.5–3.5(–5) cm long, 1.5–3(–4) cm wide, deltate or ovate, the base cordate to truncate, the margin coarsely toothed or dentate-crenate and sometimes obscurely 3-lobed; *calyx* 10–14 mm long; *petals* 15–20 mm long; *staminal column* 6–9 mm long; *mericarps* 3–5.5 mm high, 2.2–3.5 mm wide, obtuse apically.

Habitat.—Shallow gravelly soils on alluvium and valley fill, in greasewood and shadscale communities, growing with *Artemisia spinescens*, *Atriplex*

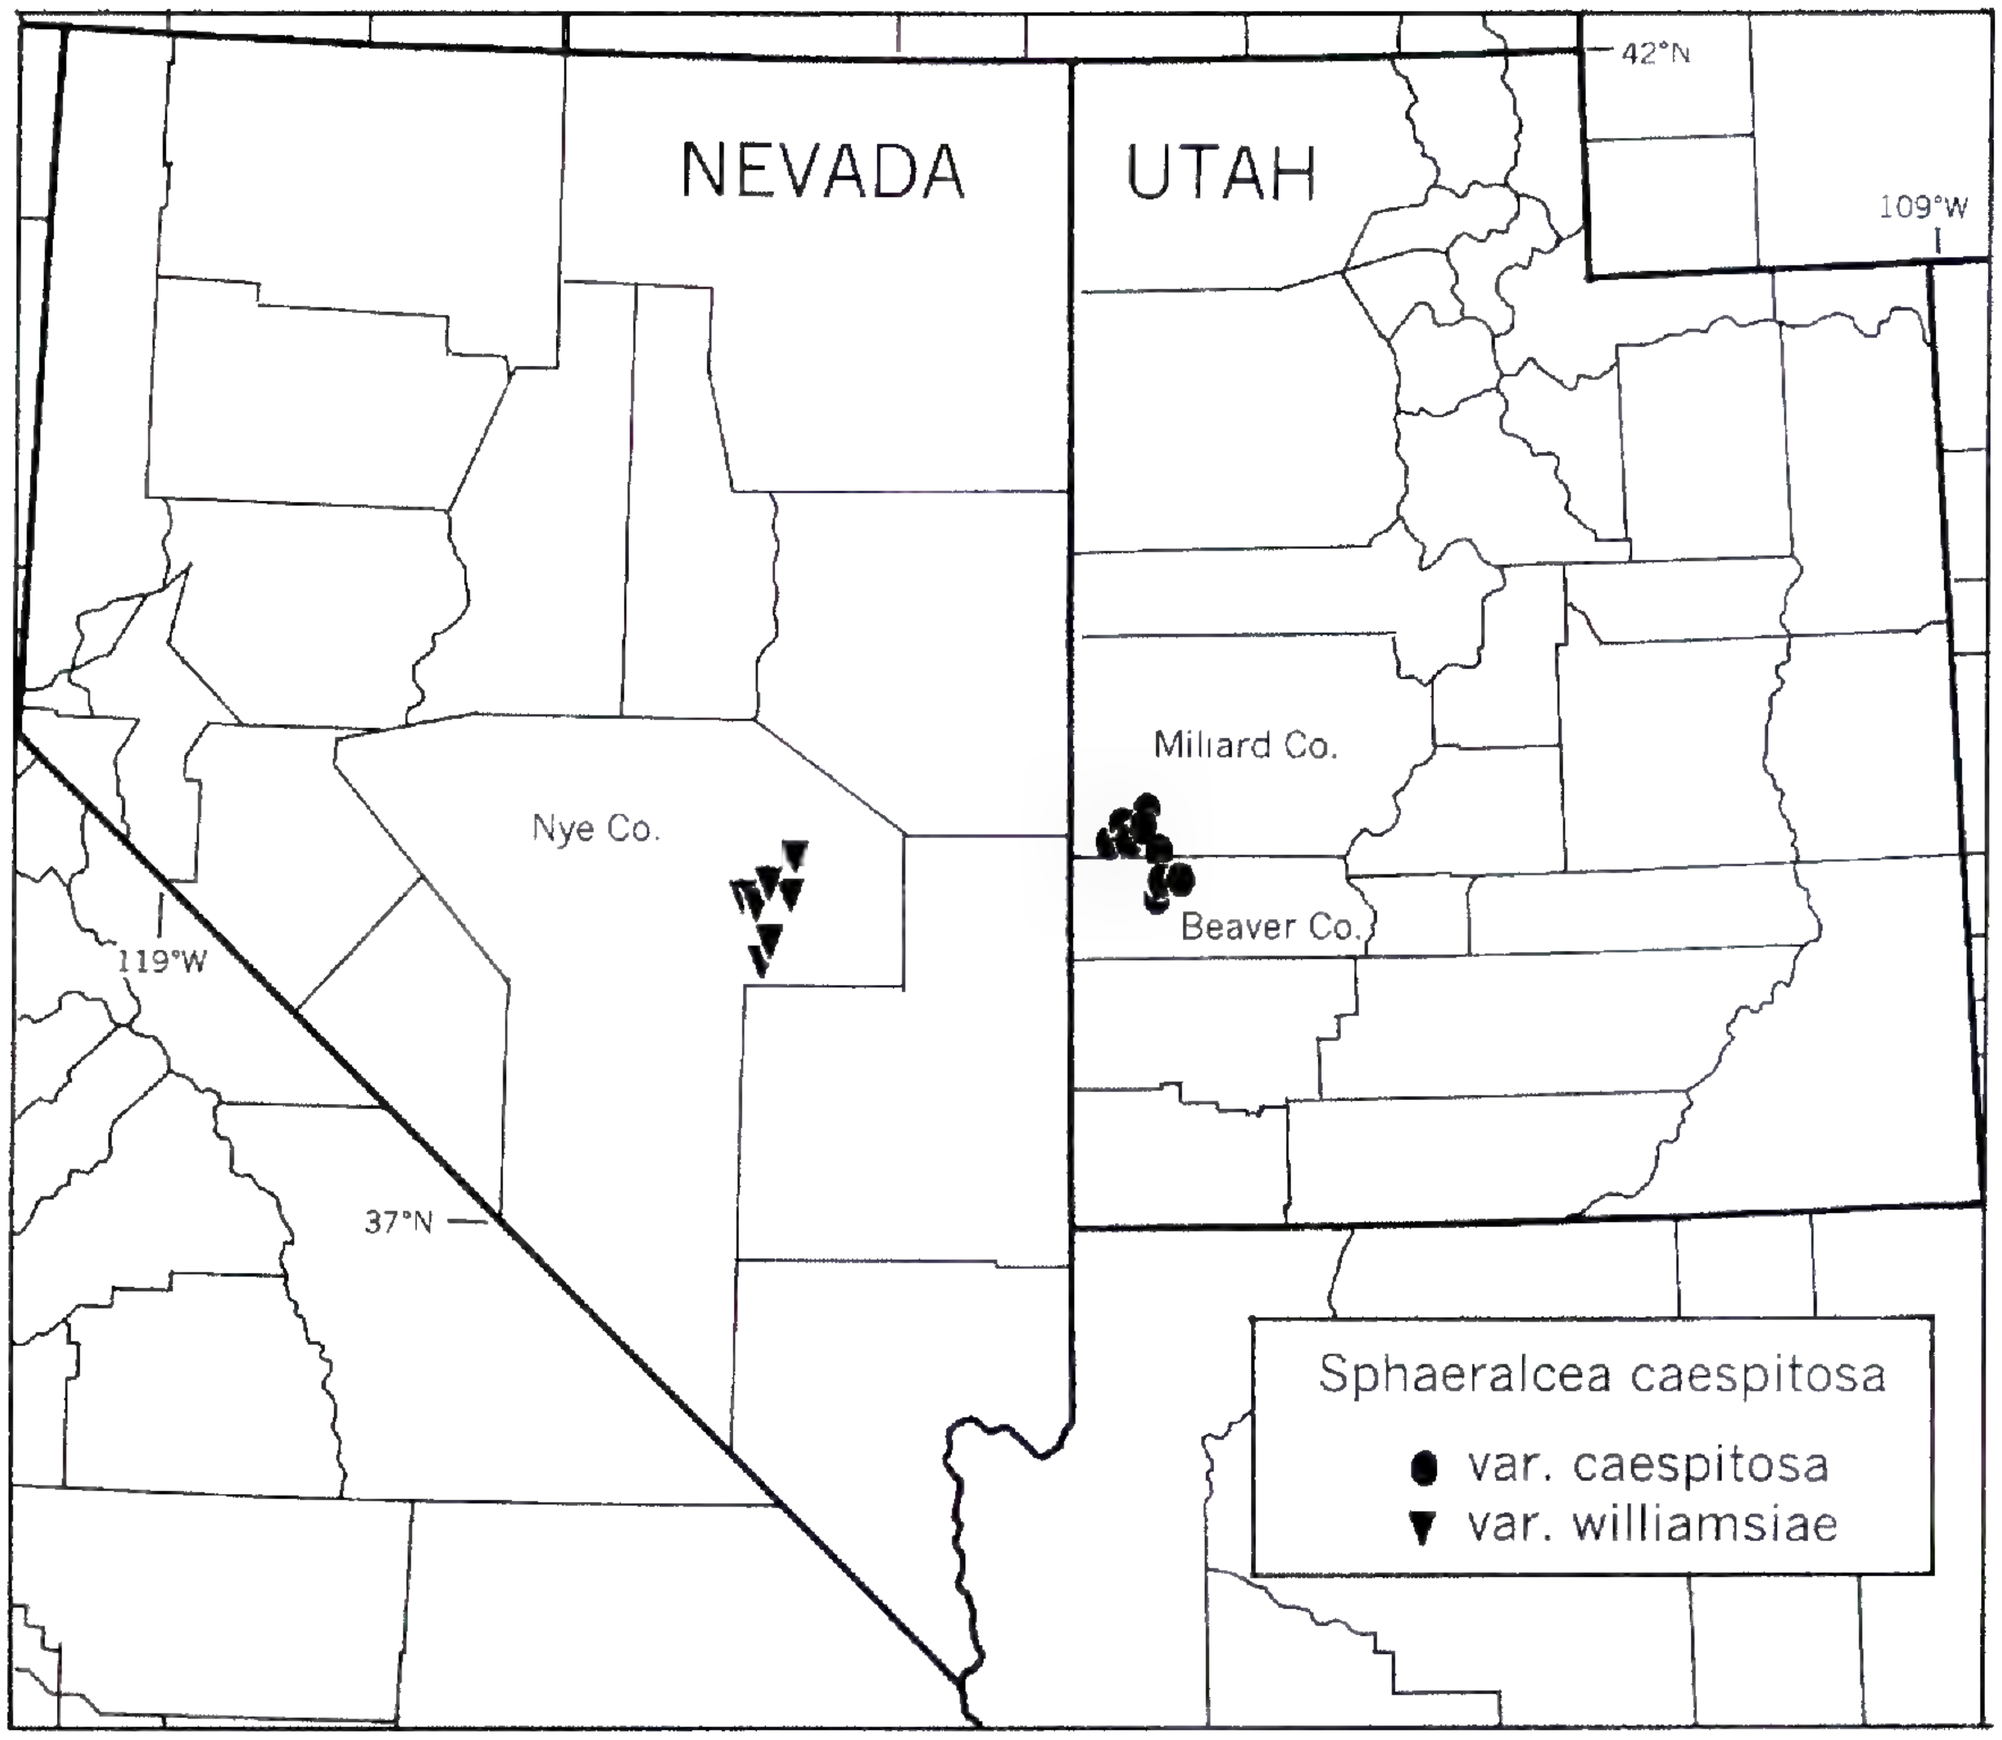

Fig. 2. Map of Nevada and Utah, showing the distributions of *Sphaeralcea caespitosa* var. *caespitosa* and *S. caespitosa* var. *williamsiae*.

confertifolia, *Ephedra viridis*, *Eriogonum shockleyi*, *Hilaria jamesii*, and *Kochia americana*, ranging in elevation from 1400 to 1600 m elevation.

Distribution.—Railroad Valley, northeastern Nye County, Nevada.

Phenology.—Flowering from May to June, fruiting from mid May to July.

Etymology.—It gives me special pleasure to name this lovely desert mallow in honor of Margaret Jensen Williams (1917–2000). *Sphaeralcea* ranked among the top of the many native Nevada genera for which Margaret had great fondness, and it is apparent from her many collections of this taxon that she regarded it as being particularly special. As seen by the tributes to her (Tiehm 2000), Margaret touched many lives.

Her sense of adventure lured her to many parts of the world, but she had a special bond with the Great Basin, especially Nevada. She always lived in Nevada, born in Gardnerville to ranchers, John and Wilhelmina Jensen. She earned her bachelor's degree at the University of Nevada, Reno, in chemistry and a master's degree in mathematics. She married her Chemistry Professor, Loring Williams, and together raised to two children. She was a math instructor at the

University until her appointment was terminated by bureaucratic nepotism rules. From 1959 until retirement in 1981, she taught 4th grade children in a Reno elementary school.

At home, in the early 1950s, she began to concentrate her enormous energy on gardening, at first growing the standard nursery-trade plants. As time passed, she became more and more sophisticated in her choice of garden subjects, especially alpine rock garden plants. It was not long before she was an active member of American, English, and Scottish rock garden societies. Her interests in the Nevada flora were spurred on by the writings in the society journals of Dwight Ripley and Rupert Barneby on their botanical excursions throughout the Great Basin. This deepening interest led her to take classes in plant taxonomy and field botany. At first she was just collecting seeds for exchange with rock garden friends in the U.S. and abroad. Then in the early 1970s, John Thomas Howell of the California Academy of Sciences inspired her to collect plant specimens.

In 1975 she founded the Northern Nevada Native Plant Society, which she presided over for several years, first as President, then as Executive Director. Her charisma, strong will, passion for plants, and contagious enthusiasm drew in a large and active membership, and the Society continues to thrive.

Her legacy lives on through the many research collections filed throughout many herbaria. Her collections filed at the New York Botanical Garden are especially valuable in our research on the *Intermountain Flora* (Cronquist et al. 1972–1997). She was involved in one way or another in collecting 12 specimens that are now types for species or varieties. Where she was not listed as the principal collector, it can be assumed that Margaret was the one who enabled the collection to be made. This attractive new variety joins *Polyctenium williamsiae* Rollins, *Eriogonum ovalifolium* var. *williamsiae* Reveal, and *Astragalus convallarius* var. *margaretae* Barneby as honorific eponyms.

On a personal note, my wife Pat and I will always treasure our many memories of Margaret. She supported our *Intermountain Flora* research in so many ways, from providing food and lodging in her home, transporting us to and from the airport and the RENO herbarium, to being a prompt and delightful correspondent.

ACKNOWLEDGMENTS

My deepest gratitude goes to Patricia K. Holmgren for her careful reading of the manuscript, assistance in field work, dealing with collecting permits, and in procuring loans. I am grateful to Arnold Tiehm for his prompt and informative responses to my queries, to Bobbi Angell for her expert illustrations in Fig. 1, and to Patricia Eckel for her rendering of the Latin diagnosis, and to Paul Fryxell and Steven Hill for their thoughtful and constructive reviews. I thank the curators of the herbaria at BRY, RENO, US, UT, and UTC for being gracious hosts in their herbaria and, in some instances, for lending me their specimens. The research for this paper was in conjunction with my ongoing research on the *Intermountain Flora*, which has, during my research on the Malvaceae, been supported by The New York Botanical Garden with additional funding from the Mary Flagler Cary Charitable Trust, the George S. and Dolores Doré Eccles Foundation, the Harriet Ford Dickenson Foundation, The Andrew W. Mellon Foundation, and Mrs. Nicholas J. Sakellariadis.

ABSTRACT

The April River of East Sepik Province has received little attention since the German explorations of the early 1900s. However the social, logistical, and vegetation status of April environments present considerable opportunities for floristic discovery and documentation.

KEY WORDS: botanical survey, Kaiserin-Augusta Expedition, type localities, Papua New Guinea.

ABSTRACT (JAPANESE)

その生物史上のユニークな価値にもかかわらず、東セピック州のエイプリルリバー地域は、ドイツ人による最初の探検以来わずかにしか注目されてこなかった。 セピック川流域の、史学的に価値がある地域を調査するにあたっては、まず現状を知ることが重要である。そこで、最近の調査によって得られた、社会的状況、各種調査を行うための諸々の環境や植生に関する概要を発表する。本調査結果から当地域は植物学上の発見や新たな考証が行われる可能性が非常に高いということがうかがえる。

INTRODUCTION

Of all the exploratory surveys conducted in New Guinea during the last 100 years, the German Kaiserin-Augusta Expedition of 1912–13 stands out as being particularly significant. During that expedition, botanist Carl Ledermann traveled extensively through the south Sepik basin with a multidisciplinary contingent, eventually collecting a total of 6,639 angiosperm numbers over a period of 18–19 months. Originating at an early point in the exploration of the Papuasian flora, a disproportionate number of Ledermann's collections were designated as type specimens. Many of his localities have never been revisited. The unfortunate circumstances of Ledermann's labors are an enormous obstacle to modern scientific inquiry, for the main German sets were destroyed in the

1943 fire at Berlin Herbarium, effectively erasing the primary basis for the identification of numerous plant species. Veldkamp et al. (1988) have provided an informative discussion of the relevant issues surrounding the loss of such a critical botanical corpus.

One of the most productive parts of the Kaiserin-Augusta itinerary was the series of collecting trips made by Ledermann to the April River (Aprilfluss). The Aprilfluss yielded a bountiful harvest of new species, many of which have unfortunately proven impossible to evaluate without the original collections. With modern assessment indicating the apparent existence of a zone of floristic endemism centered on the Hunstein-April region, it has become particularly desirable to revisit the classical localities and secure new material. Such efforts would enable neotypification of many species whose types were lost at Berlin (e.g., *Tapeinochilos hollrungii* K. Schum.; cf. Gideon 1998). Although a list of plants requiring new collections is reportedly being compiled (Veldkamp et al. 1988), no summaries are yet available.

The first serious reexamination of Ledermann's sites occurred in 1966, with the CSIRO-sponsored expedition to Mt Hunstein by R. Hoogland and L. Craven. In 1989 a multi-institutional survey returned to the Hunstein Range under the auspices of the National Geographic Society, obtaining 1,200 more botanical numbers (cf. Bakker 1994 for a general account). The first author, one of five botanists on that expedition, independently returned to the Hunstein summit in July–August 1990 and to the nearby Waskuk Hills in August 1994 and June 1995. Additional collections from the April-Sitipa drainages were made in September 1990, and from the April River serpentine zone on the south side of Mt Hunstein, in July 1995 (Fig. 1). The most recent trip to the subdistrict occurred in August 2001 (cf. Takeuchi & Golman 2002; Takeuchi & Renner 2002), from which much of the information in the following narrative has been taken.

THE SOCIAL ENVIRONMENT

The indigenous population of the Hunstein subdistrict is spread diffusely through the region in small clan-based villages. Ambunti is the largest settlement; with a district headquarters, tradestores, an aid post, two schools, several churches, and a grass airstrip. Further upriver and within the April catchment, the average settlements are much smaller, often consisting of a single extended family. At Garuka (Waskuk Hills) for example, the total adult population was exactly ten during the time of the 1995 survey. The larger villages like Baglam and Melawei have about a hundred inhabitants.

In the Sepik region, river-borne traffic is the major means of communication, trade, and transport. Most of the population are thus concentrated near the water. This also affords the people convenient access to fish and saksak (made from the starchy pith of the *Metroxylon* palm) which together comprise the bulk of the average villager's diet. A limited amount of subsistence slash and

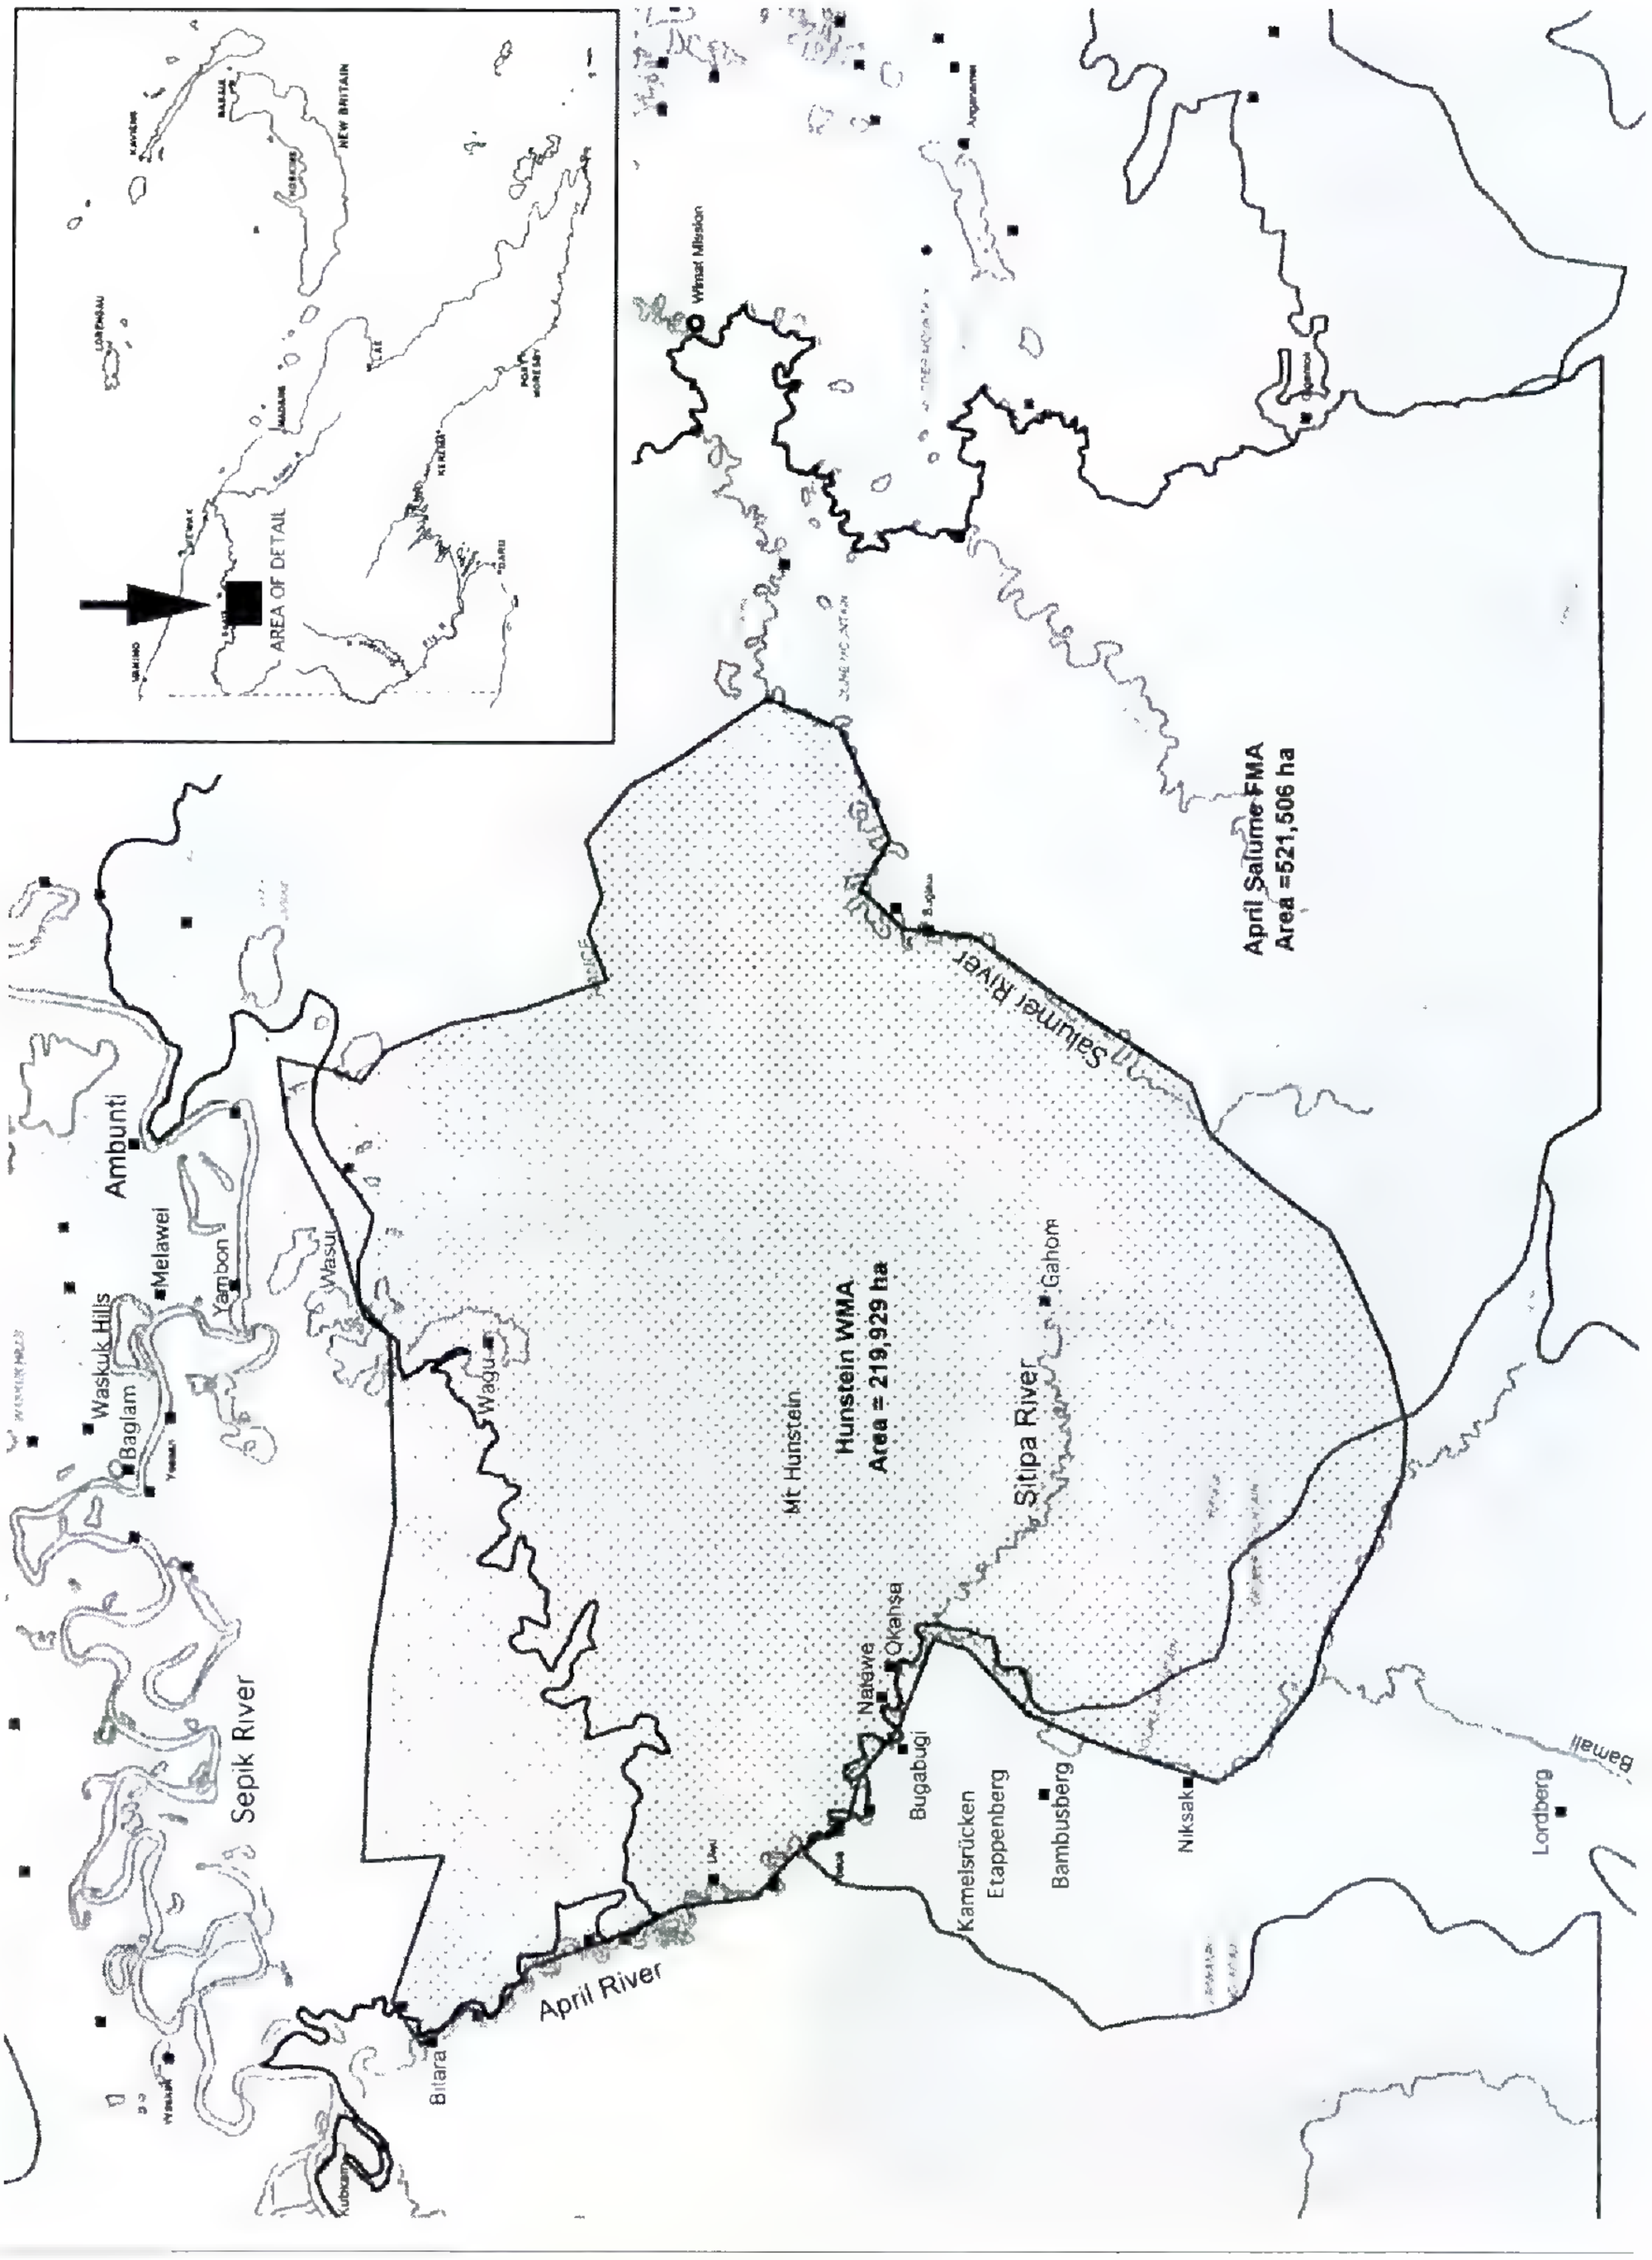

FIG. 1. Principal localities from the Hunstein subdistrict. Scale 1:500,000. The April Salumei FMA (Forest Management Agreement) Area is a proposed logging concession. Inset shows location of the Hunstein tract.

burn gardening provides dietary variety. Sweet potatoes, taro, bananas, and coconuts constitute the main crops, but plantings are generally not a principal source of village sustenance. For the most part, the April River populace are semi-nomadic hunter-gatherers.

Like the Sepik River, the April is a meandering silt-laden waterway which often changes course after severe floods. A recently introduced fish from South America (the pacu, erroneously identified as a piranha in the local media) has now entered the April drainage and is rapidly becoming the most commonly caught fish for consumption. Villagers report that the appearance and proliferation of the pacu have been accompanied by disappearance of many native fish species, particularly the endemic species of Sepik catfish (*Arius* spp., cf. Allen 1991). The pacu has reportedly been involved in several fatal attacks on bathers, but such anecdotal reports are often exaggerated and their veracity is uncertain.

Socioeconomic development in the April region is virtually nonexistent. The local economy is primarily subsistence in nature, and cash incomes are opportunistic. Money is occasionally earned from the sale of wood carvings, crocodile skins, birdwing butterflies, cacao, and from seasonal sources in the ecotourism niche market. Very recently, a lucrative trade has also emerged involving *Gyrinops ledermannii* Domke (Thymelaeaceae), with Indonesian buyers paying up to PNGK 800–1,000 (USD 265–335) for each kg of black wood. The arborescent species is endemic to the upper Sepik (Ding Hou 1960), and has become a significant income source for landowners due to consumer demand for the wood's pleasing fragrance, a development reminiscent of the sandalwood trade. Known as 'may-hasei' in the Parenemo language, *G. ledermannii* is common on the southwest side of Kamelsrücken and is also distributed on slopes facing the April River, particularly near Etappenberg (Takeuchi & Golman 2002). For many decades the species was known only by Ledermann's type gathering from the May River, but current indications suggest the tree probably ranges even into West Papua (ibid.).

In spite of income from such incidental sources, by Western standards the overall status of the people would be regarded as impoverished. Due to the inaccessibility of health services, mortality rates are high, especially from malaria and infections, and the local inhabitants frequently seek palliatives and remedies from whatever natural resources are at hand. Skin diseases like ringworm and scabies often affect entire villages.

April River culture is an improbable assortment of incongruities and apparent contradictions. Villagers have adopted western standards of dress, yet still retain their traditional lifestyle and customs. Many of the residents speak standard English, often freely intermixed with their tribal tokples (Baihenemo, Parenemo, Waskukil) in ad hoc combination. Although Christianity in its many variants is dominant throughout the region, belief in sorcery is closely interwoven through the Christian ethic. Sudden deaths are nearly always attributed

to black magic or to secret murders (sanguma) facilitated by plant poisons. 'Ukhop pok' (*Anodendron oblongifolium* Hemsl.; Apocynaceae) is the most commonly mentioned agent in sanguma killings. There is also a widespread conviction in the existence of spirits (masalai), believed to pervade all aspects of the natural world and which form an inseparable part of the villagers' metaphysical world-view.

The population growth rate for East Sepik Province is currently 2.9% per annum, a relatively high figure, but below the Mamose[1] regional average of 3.3% (National Statistical Office 2001). Most of the provincial population is concentrated in the built-up areas near the coast, and the interior sections such as April River consist primarily of wilderness habitat. Due to the low population densities in this part of PNG, there are no subsistence-based threats to the environment. However, because the entire region along the April-Salumei is one of PNG's most economically depressed areas, landowners are understandably attracted by the inducements offered by logging and mining interests. A major portion of the district has been proposed as a timber concessional area under the Forest Management Agreement protocols (cf. Papua New Guinea Forest Authority 1998). Reconciling the conflicting desire for socioeconomic development on one hand, with conservation concerns on the other, will be a major challenge for community planners. Many of the relevant issues are presently being addressed by the World Wildlife Fund (WWF), through the establishment of an ICAD (Integrated Conservation and Development) program in the Hunstein area and the related demarcation of a Wildlife Management Area (WMA; Fig. 1). The Village Development Trust is also contemplating start-up of a comparable program in the Bugabugi territory and the Waskuk Hills (Aung & Kisokau pers. comm.). In the past, investigators moved freely throughout the area, subject only to approval from the customary landowners. With the recent and impending developments, this is likely to change. Intervention by nongovernment organizations (NGOs) invariably results in new requirements which can complicate scientific access and research. The complications are offset however, by the real and perceived benefits which NGO association can deliver to affected communities.

Land ownership and the subsequent control of access to forest resources are traditional and patrilineal. Nearly all territories fall under clan jurisdiction, so discretion must be exercised during plant collecting in order not to trespass on land unapproved for gathering. A gratuity paid to the landowner(s) is often necessary to ensure approval for plant collecting.

THE LOGISTICAL ENVIRONMENT

In contrast to the many obstacles which confronted the first explorers, access to the upper Sepik has improved to such an extent that the region is now a major

[1]Mamose is the administrative unit composed of West Sepik, East Sepik, Madang, and Morobe Provinces.

ecotourist destination. Until recently, ocean-going tourist vessels made regularly-scheduled luxury cruises as far upstream as Ambunti. Although travelers can still expect numerous delays arising from conditions endemic to developing countries, entry to the April basin has been considerably eased by the new airfields at Bugabugi and Niksak.[2] Both airfields are small grass strips maintained by New Tribes Mission, and can accept only the single-engine Cessna 206, with maximum lift capacity of 5 passengers or 400 kg. Otherwise access can also be made via the airfield at Ambunti, which can accommodate larger twin-engined Islanders capable of carrying 19 passengers or 1,600 kgs of freight (Missionary Air Fellowship). From Ambunti a visitor would ordinarily proceed to the April River with dugout canoes powered by Yamaha outboard motors (15, 30, or 40 hp motors are the usual ratings). The fuel consumption of a 30 hp motor on a roundtrip between Ambunti and Bugabugi will be at least 140 liters. In the upper Sepik, fuel is problematic, being either unavailable or prohibitively expensive.

The buttress ridges in the vicinity of Bugabugi (Pinape, Natawe, and Okahsa), lead directly to Mt Hunstein and represent the easiest path to the top. In 1989, the National Geographic expedition approached the summit from the north, which is actually the longest and most logistically difficult land route. Ledermann's two trips to Hunsteinspitze had come the same way, from Ambunti and through Wasui-Wagu Lagoon (cf. Steenis-Kruseman 1950: 317–18). The entry via Wagu was similarly taken by Hoogland and Craven in 1966 (Craven pers. comm.). The quickest access however, is to follow the south-descending ridges from the April River, preferably starting at Natawe (Fig. 2). With the newly operational airfield at Bugabugi, the latter route can now be used to reach the Hunstein crestline within two days of departure from the provincial seat at Wewak. The south-side approach provides the added advantage of passage through unexplored ultrabasic habitats.

Field conditions in the April drainage are onerous. The heat and humidity are stultifying during dry periods and the wet season is accompanied by torrential downpours after which the river is hazardous at many places along its course. Prolonged visits are a health risk. The physical difficulties are aggravated by the absence of any service infrastructure throughout the region, except for basic facilities at missionary stations. Over much of the year the mosquito and leech populations are exceptionally troublesome even by the standards of an alluvial tropical environment. When it is not raining, horseflies are annoyingly plentiful, especially in areas where pigs are present in the forest. Poisonous snakes have been responsible for a substantial number of deaths in the village communities.

[2] Niksak is 18 km north of Lordberg, one of the enigmatic localities from Ledermann's Aprilfluss itinerary on the Bamali tributary, and would be the only cost-effective point of access in any future attempt at revisiting the latter site.

FIG. 2. Photographic montage from a vantage point at Natawe. A: Okahsa, at the base of foothills of the Hunstein Range. Foreground: main streamcourse of the April River. B: Etappenberg (on slopes behind the ridgeline). C: the distinctive double peaks of Kamelsrücken (the high peak is the Mt Samsai of modern maps). Ledermann's Bambusberg and Lordberg are behind the crestline on the horizon, in a direction ca. halfway between Okahsa and Etappenberg.

THE FLORISTIC ENVIRONMENT

The vegetation along the April River consists of three principal formations. The swamp forest (with several facies including levee forest, meander scrolls, swales, etc.) is the dominant community on the flood plain. Typically waterlogged or inundated during rainy periods, the swampy habitat is dominated by *Metroxylon sagu* Rottb., *Campnosperma brevipetiolata* Volk., or herbaceous vegetation (especially *Saccharum robustum* Brandes & Jeswiet ex Grassl; cf. Warner & Grassl 1958). On better drained alluvium the forest is more structurally developed, giving rise to a second association with many macrophyllous taxa (e.g., *Artocarpus communis* J.R. & G. Forst., *Caryota rumphiana* Mart., *Pangium edule* Reinw., *Sterculia macrophylla* Vent., and *Nauclea orientalis* L.). These communities have characteristically high proportions of robust climbers along the edges, particularly *Calamus*, *Korthalsia*, and to a lesser extent *Freycinetia*, and the interior sections often support a luxuriant shrub layer. On the Hammermaster and Saunders (1995a, b) forest classification system, the riverine vegetation is described as an open forest on low elevation plains and fans, or as swamp woodland (forest code 'Po' and 'Ws' on overlays SB 54-4 and SB 54-3 to the Ambunti and Mianmin 1:250,000 Australian Survey Corps topographic sheets). Paijmans (1976) provides a concise overview of the vegetation in such environments.

At several places along its course, the April River skirts the base of serpentine/ultramafic foothills and there is a sharp floristic break as the swamp and alluvial associations are replaced by foothill forest. The contrasting features of the forest facies on ultramafics are: 1) a pronounced reduction in climbers (e.g., *Calamus* is virtually absent), 2) a more varied canopy structure, including a noticeable reduction in large-leaved taxa, 3) increased floristic richness, most apparent in an understory which is not subject to the periodic flooding characteristic of the alluvial flats, 4) a 'clean' visual aspect to the community, with good visibility through the forest because of the absence of climbers and comparative lack of epiphytic growth on tree boles, 5) a very obvious change in taxonomic composition, many taxa being common on the ultramafic slopes but absent from immediately adjacent alluvial forest. When observed from the outside, the ultramafic community is similar in physiognomy and structure to a montane forest, except for the paucity of epiphytes. Based on air photo interpretation, the April foothill zone is a medium-crowned low altitude upland forest (code 'Hm' in Hammermaster & Saunders 1995a), a vegetation type which is probably Papuasia's richest forest structural category (Louman & Nicholls 1995). Although an unpublished report (Sohmer et al. 1991) provides a brief botanical description of the Hunstein Range, there is still nothing in the way of a comprehensive account for the April basin.

The forest on ultramafic foothills is easily accessed near Bugabugi[3] (Pinape, Natawe and Okahsa: in sequential order upriver), though the best section is situ-

ated at the base of the Hunstein Range between Gahom and Okahsa, close to the junction of the April and Sitipa rivers (Figs. 3, 4). A conspicuous feature of the hill community is the presence of *Agathis labillardieri* Warb. emergents on the ridge buttresses and crestlines. *Agathis* attains heights exceeding 50 m, and the April provenances can be seen from the river towering over the surrounding canopy. The populations are of commercial significance, so not unexpectedly, has attracted the attention of logging and ecoforestry operators. Due to the steep and rocky slopes, Bugabugi villagers do not establish subsistence gardens in the foothill habitat, and the slopes are thus remarkably free of human disturbance. However, many understories near the river are being disrupted by domestic and wild pigs. Large seral gaps are also scattered through the forest as a result of natural disturbances from landslides, lightning strikes, and windthrows. For a lowland environment, the frequency of lightning-induced gaps is surprisingly high, an indication of the intense electrical and thunderstorm activity in the Hunstein Range.

During the 1998 el Niño disturbance, the Hunstein subdistrict and the entire basin to the south was severely affected by drought. The Sepik became dry in many sections even though it represents the largest catchment system among PNG's rivers. At Yambon gate, the Sepik current normally accelerates through a narrow channel renowned for treacherous whirlpools (cf. Townsend 1968), yet villagers were able to walk across to the opposite bank during the 1998 drought. In spite of such conditions, and unlike many other forested sites in PNG, April River environments did not experience any fires during the last disturbance. However a large tract downstream of Bitara has been recently flattened by cyclonic-force winds, and the forest canopy in a swath ca. 1 km wide completely removed. From current events, it is apparent that vegetational histories in this basin are at least partly determined by catastrophic events (cf. Johns 1986).

Since the time of its initial exploration, the Hunstein subdistrict has been judged a particularly significant hotspot for diversification and endemism. The biodiversity status of the area has assumed legendary proportions, even though the perception of unusual richness can be regarded as a natural outcome of physical and historical considerations.

The geological complexity of the April-Hunstein territory is a major contributing factor in the diversification of its flora. Alluvium, colluvium, sandstone, shale, mafic/ultramafic metamorphics, igneous, clay, and coralline lime

---

[3]Bugabugi is 11–12 km NE of the classical locality of Etappenberg, the latter representing one of Ledermann's collection sites on Kamelsrucken (Came Back; on some maps now as Samsai Mt) of the Aprilfluss itinerary. Kamelsrücken is known to the Bugabugi people as Oopay. There is some inconsistency in the use of the location name 'Samsai' or 'Samsait', because the name is applied by Wagu and some Bugabugi villagers to Mt. Hunstein (Hunsteinspitze), and is used with that reference, for example, in the Hoogland and Craven collections from 1966.

FIG. 3. Exterior view of the forest at Okahsa. Foreground: April River. The serpentine zone encompassing Okahsa and the south-descending foothills have never been properly explored. Although many plot studies and botanical surveys have been concluded in PNG during the last ten years, there is still not even one floristic account for communities on ultrabasics.

stone substrates occur throughout the area in patches of varying size (Davies & Hutchison 1980a, b). There is thus a highly fragmented pattern of contrasting substrates over the terrain, reflecting the manifold geological origins of the present territory and capable of supporting specialist taxa in a complex mosaic. Superimposed on the foundation of edaphic environments is an exceptional annual rainfall estimated at 7,000–9,000 mm (ibid.). High rainfalls are directly related to floristic diversification (Gentry 1988) so perhumid conditions in the April basin have probably played a major role in the development of a speciose flora. When the dynamic fragmentation of the ecosystem is then considered, over presently observable scales ranging from lightning strikes to catastrophic storms, it is not difficult to imagine how a great number of plant species can be accommodated in side by side fashion over relatively small distances. The heterogeneity of April habitats also needs to be viewed in terms of the evidence regarding correlations between plant distributions and phases of tectonic accretion (cf. Welzen 1997). Part of the district's reputation as a zone of floristic peculiarity (Veldkamp et al. 1988) is due to its easternmost position in the terrane complex which constructed most of northern West Papua (cf. Pigram & Davies 1987). The Hunstein flora is probably best understood as an extension of the West Papuan flora. During the time of Davies and Hutchison (1980b) the Hunstein-April-Salumei petrology was already known to extend

FIG. 4. Interior perspective of the ultramafic forest at Okahsa. Small trees with depauperate crowns are typical of such substrates. Stem densities are high.

westwards rather than eastwards. If the division between PNG and West Papua were to be based on geophysical rather than political criteria, the border would be at April-Salumei rather than Sandaun.

Based on the relationship to tectonics, future distributional records of Hunstein/April endemics will occur to the west, as the Papuan affinity clarifies through further exploration of West New Guinea (Indonesian West Papua). At present, the Indonesian side is even more inadequately surveyed than PNG, and the historical disparity in documentation between the two halves is partly responsible for the perception of unusually high endemism in the Hunstein/April region. The newly discerned disjunction of *Myrmephytum* in the Vogelkop and Hunstein areas (Jebb pers. comm.), of *Faika* in West Papua and the April River (Takeuchi & Renner 2002), and the probable occurrence of *Gyrinops ledermannii* in Jayapura (Takeuchi & Golman 2002) are suggestive of the phytogeographic connections, and of the effect which historical patterns in floristic documentation have on assumed distributions (Figs. 5, 6).

DISCUSSION

Nearly 90 years after the Kaiserin Augusta Expedition, many of the environments along the April River are still unexplored. The localities at the Expedition's farthest penetration into the south basin, near the headwaters of the Bamali tributary, have never been revisited. Of these, Lordberg is probably the most intriguing, but any effort focused on the Divide south of Niksak will undoubtedly reap huge rewards. The recent discoveries from Bugabugi exemplify the possibilities. Although the 6,639 collections taken by Ledermann represent an unprecedented achievement for his time, even a personal effort of that intensity cannot provide the desired level of sampling saturation for such a floristically rich region. A collections program delivering at least 10,000 new numbers is much needed.

The factors militating in favor of future survey success in the April drainage can be recanted: 1) forest communities in the region are in an exceptional state of preservation, 2) traditional lifestyles and ethnobotanical competences are still retained by local villagers, who are thus a valuable source of the folklore knowledge being rapidly lost in other districts, 3) improved site access to the interior basin will enable adoption of cost-effective logistical schedules, 4) research conducted by various investigators since 1989, has created local awareness of the work done by scientists, which will facilitate future inventories.

No collections effort conducted under normal constraints, can achieve 100% coverage of a targeted flora. There is always something which will be overlooked on account of rarity, phenology, localized distribution, logistical limitations, etc. Even the collections obtained by Ledermann during his Sepik travels are not such a superlative effort as may appear at first glance. The 6,600+ numbers from the Kaiserin Augusta survey amount to approximately 400 numbers per

FIG. 5. *Faika villosa* (Kaneh. & Hatus.) Philipson, in the forest understory at Okahsa (det. by S.S. Renner).

FIG. 6. As for figure 5, showing leaves, branchlet, and fruits (leaf blades ca. 10 cm wide). The April River *Faika* occurrences are a PNG generic record in Monimiaceae (cf. Takeuchi & Renner 2002).

month on a time-averaged basis (excluding Ledermann's 2 months of inactivity due to sickness). By the productivity standards of contemporary collectors working under rapid assessment protocols, this is a below-average result. The significance of the Ledermann collections are another matter altogether however. And in fairness, the logistical environment of his time was undoubtedly much more limiting than now. The difficulties of prolonged expeditionary schedules also should not be underestimated. Anyone with knowledge of Papuasian forest environments can appreciate the hardships in being exposed to tropical conditions for the duration which Ledermann was subjected to.

Some indication of the spottiness of Ledermann's sampling coverage can be gauged by results from the 1966 and 1989 expeditions to Mt. Hunstein. Several scores of new taxa have been described from the later visits, so clearly the original effort was not very comprehensive. To what extent does that situation apply to even more remote sites, such as Niksak-Lordberg? On the basis of accumulating evidence showing that the richest floristic interval in Papuasia is the premontane zone (Takeuchi & Golman 2001), the best environments within the April region are probably the ones at the Central Divide, and these have never been seen since Ledermann's time. The diversity potential of this flora has yet to be plumbed.

ACKNOWLEDGMENTS

We thank parataxonomist A. Towati of Ambunti, the Glei villagers of Waskuk, and the Galiase and Kokomo clans, for their assistance during our visits to the upper Sepik. Hitofumi Abe (Ecosystem Research Group, University of Western Australia) wrote the Japanese translation. Figure 1 was adapted from Geographic Information System downloads from the PNG Forest Authority. Reviewers David Middleton (Harvard University Herbaria) and an anonymous referee, made helpful comments on the draft.

ABSTRACT

Chromosome studies and phylogenetic analyses of morphology, allozymes, and nrDNA-*ITS* sequence data were used to resolve taxonomic relationships in the *Thelesperma subnudum* complex. Of special interest is the placement of three globally rare members of the complex: *Thelesperma caespitosum*, *T. pubescens*, and *T. subnudum* var. *alpinum*. The first two rare taxa yield only diploid (*n*=12) chromosome counts; *T. subnudum* var. *alpinum* is consistently tetraploid (*n*=24). *Thelesperma subnudum* var. *subnudum* exhibits both diploid (*n*=12) and tetraploid (*n*=24) populations. Phylogenetic analyses of individual data sets strongly support (bootstrap 88%–99%) *T. subnudum* var. *alpinum* as being more closely related to *T. pubescens* and *T. caespitosum* than to *T. subnudum* var. *subnudum*. Combined analyses give the strongest support (bootstrap 100%) for the clade of *T. pubescens*, *T. caespitosum*, and *T. subnudum* var. *alpinum*. Preliminary evidence suggests that *T. subnudum* var. *alpinum* may be an allotetraploid resulting from hybridization between *T. pubescens* and *T. subnudum*. Based on the available evidence, we propose the following nomenclatural changes: ***Thelesperma pubescens*** Dorn var. ***caespitosum*** (Dorn) C.J. Hansen, stat. nov., and ***Thelesperma windhamii*** C.J. Hansen, nom. et stat. nov.

KEY WORDS: *Thelesperma*, Asteraceae, nrDNA-*ITS* sequences, phylogenetics, and systematics.

RESUMEN

Se han usado estudios cromosómicos y análisis filogenéticos de datos morfológicos, alozimas y de secuencias de nrDNA-ITS para tratar de resolver las relaciones taxonómicas dentro del complejo *Thelesperma subnudum*. De especial interés es la posición taxonómica de los tres miembros del complejo: *Thelesperma caespitosum*, *T. pubescens* y *T. subnudum* var. *alpinum*, considerados globalmente raros. Los dos primeros taxa mostraron solamente poblaciones diploides (*n* = 12), mientras que *T. subnudum* var. *alpinum* se mostró constantemente como tetraploide (*n* = 24). *Thelesperma subnudum* var *subnudum* mostró tanto poblaciones diploides (*n* – 12) como tetraploides (*n* = 24). Los resultados del análisis filogenético de diferentes tipos de datos soportan más fuertemente (bootstrap 88%–99%) el agrupamiento de *T. subnudum* var. *alpinum* con *T. caespitosum* y *T. pubescens*, que su agrupamiento con *T. subnudum* var. *subnudum*. Los análisis combinados mostraron el máximo soporte (bootstrap 100%) para el clado compuesto por *T. subnudum* var. *alpinum*, *T. caespitosum* y *T. pubescens*. Evidencias preliminares sugieren que *T. subnudum* var. *alpinum* podría ser un alotetraploide resultante de la hibridación entre *T. subnudum* y *T. pubescens*. De acuerdo con la evidencia disponible proponemos los siguientes cambios nomenclaturales: ***Thelesperma pubescens*** Dorn var. ***caespitosum*** (Dorn) C.J. Hansen, stat. nov. y ***Thelesperma windhamii*** C.J. Hansen, nom. et stat. nov.

PALABRAS CLAVE: *Thelesperma*, Asteraceae, nrDNA-*ITS* secuenciación, filogenética y sistemática.

Thelesperma Lessing (Asteraceae: Heliantheae, Coreopsidinae) comprises about 15 species, mostly herbaceous perennials (annuals and subshrubs rare), native to south-central and western North America and warm-temperate South America (Melchert 1963; Bremer 1994a). The genus is thought to be monophyletic based on shared characters such as strongly dimorphic involucral bracts, scarious-margined inner involucral bracts that are connate from 1/5 to 1/2 their lengths, opposite leaves, and pappi that are absent or composed of hispid or serrulate awns (Bremer 1994a). Previous taxonomic studies of *Thelesperma* have focused on morphology (Shinners 1950a, b; Alexander 1955) and cytology (Melchert 1963; Greer 1997; Greer & Powell 1999) and were not explicitly phylogenetic. Nevertheless, past work on the genus has identified some species groups that may be monophyletic. One of these is the *Thelesperma subnudum* complex, which is restricted to the Colorado Plateau and areas adjacent to the Rocky Mountains in western North America (Fig. 1). This group includes five commonly accepted taxa: *T. subnudum* A. Gray var. *subnudum*, *T. subnudum* A. Gray var. *alpinum* S.L. Welsh, *T. pubescens* Dorn, *T. caespitosum* Dorn and *T. marginatum* Rydb. Features used to distinguish members of the *T. subnudum* complex are given in Table 1.

Delimitation of taxa within the *Thelesperma subnudum* complex has varied, and at least three classifications have appeared (Table 2). Dorn (1990), who discovered and named *T. pubescens* and *T. caespitosum*, recognized each as distinct species. He treated *T. marginatum* as a separate species and accepted *alpinum* as a variety of *T. subnudum*. In the 2nd edition of *A Utah Flora*, Welsh et al. (1993) classified both *T. caespitosum* and *T. subnudum* var. *alpinum* as varieties of *T. subnudum*; *T. marginatum* and *T. pubescens* were not treated because the former is not known from Utah and discovery of the latter in Utah postdates publication of the flora. Cronquist et al. (1994) recognized only *T. subnudum* and *T. pubescens* at the species level; *T. caespitosum* and *T. subnudum* var. *alpinum* were included within *T. pubescens*, and *T. marginatum* was treated as a variety of *T. subnudum*.

These divergent classifications result from differing interpretations of the available morphological and cytological information. Additional genetic data (e.g., allozyme and DNA) are needed to allow an informed choice between competing taxonomies. The need to pursue these studies has been heightened recently by conservation concerns. *Thelesperma pubescens*, *T. caespitosum*, and *T. subnudum* var. *alpinum* are rare taxa restricted to a few localized populations (Fig. 1). All three have been listed as potentially endangered (category 2) by the U.S. Fish and Wildlife Service (U.S. Dept. of Interior 1985, 1993). The accumulation of genetic data is an important step in determining their eligibility for federal protection under the Endangered Species Act.

Our objectives in this study are threefold: 1) to develop baseline genetic data for members of the *Thelesperma subnudum* complex, 2) to analyze the data in

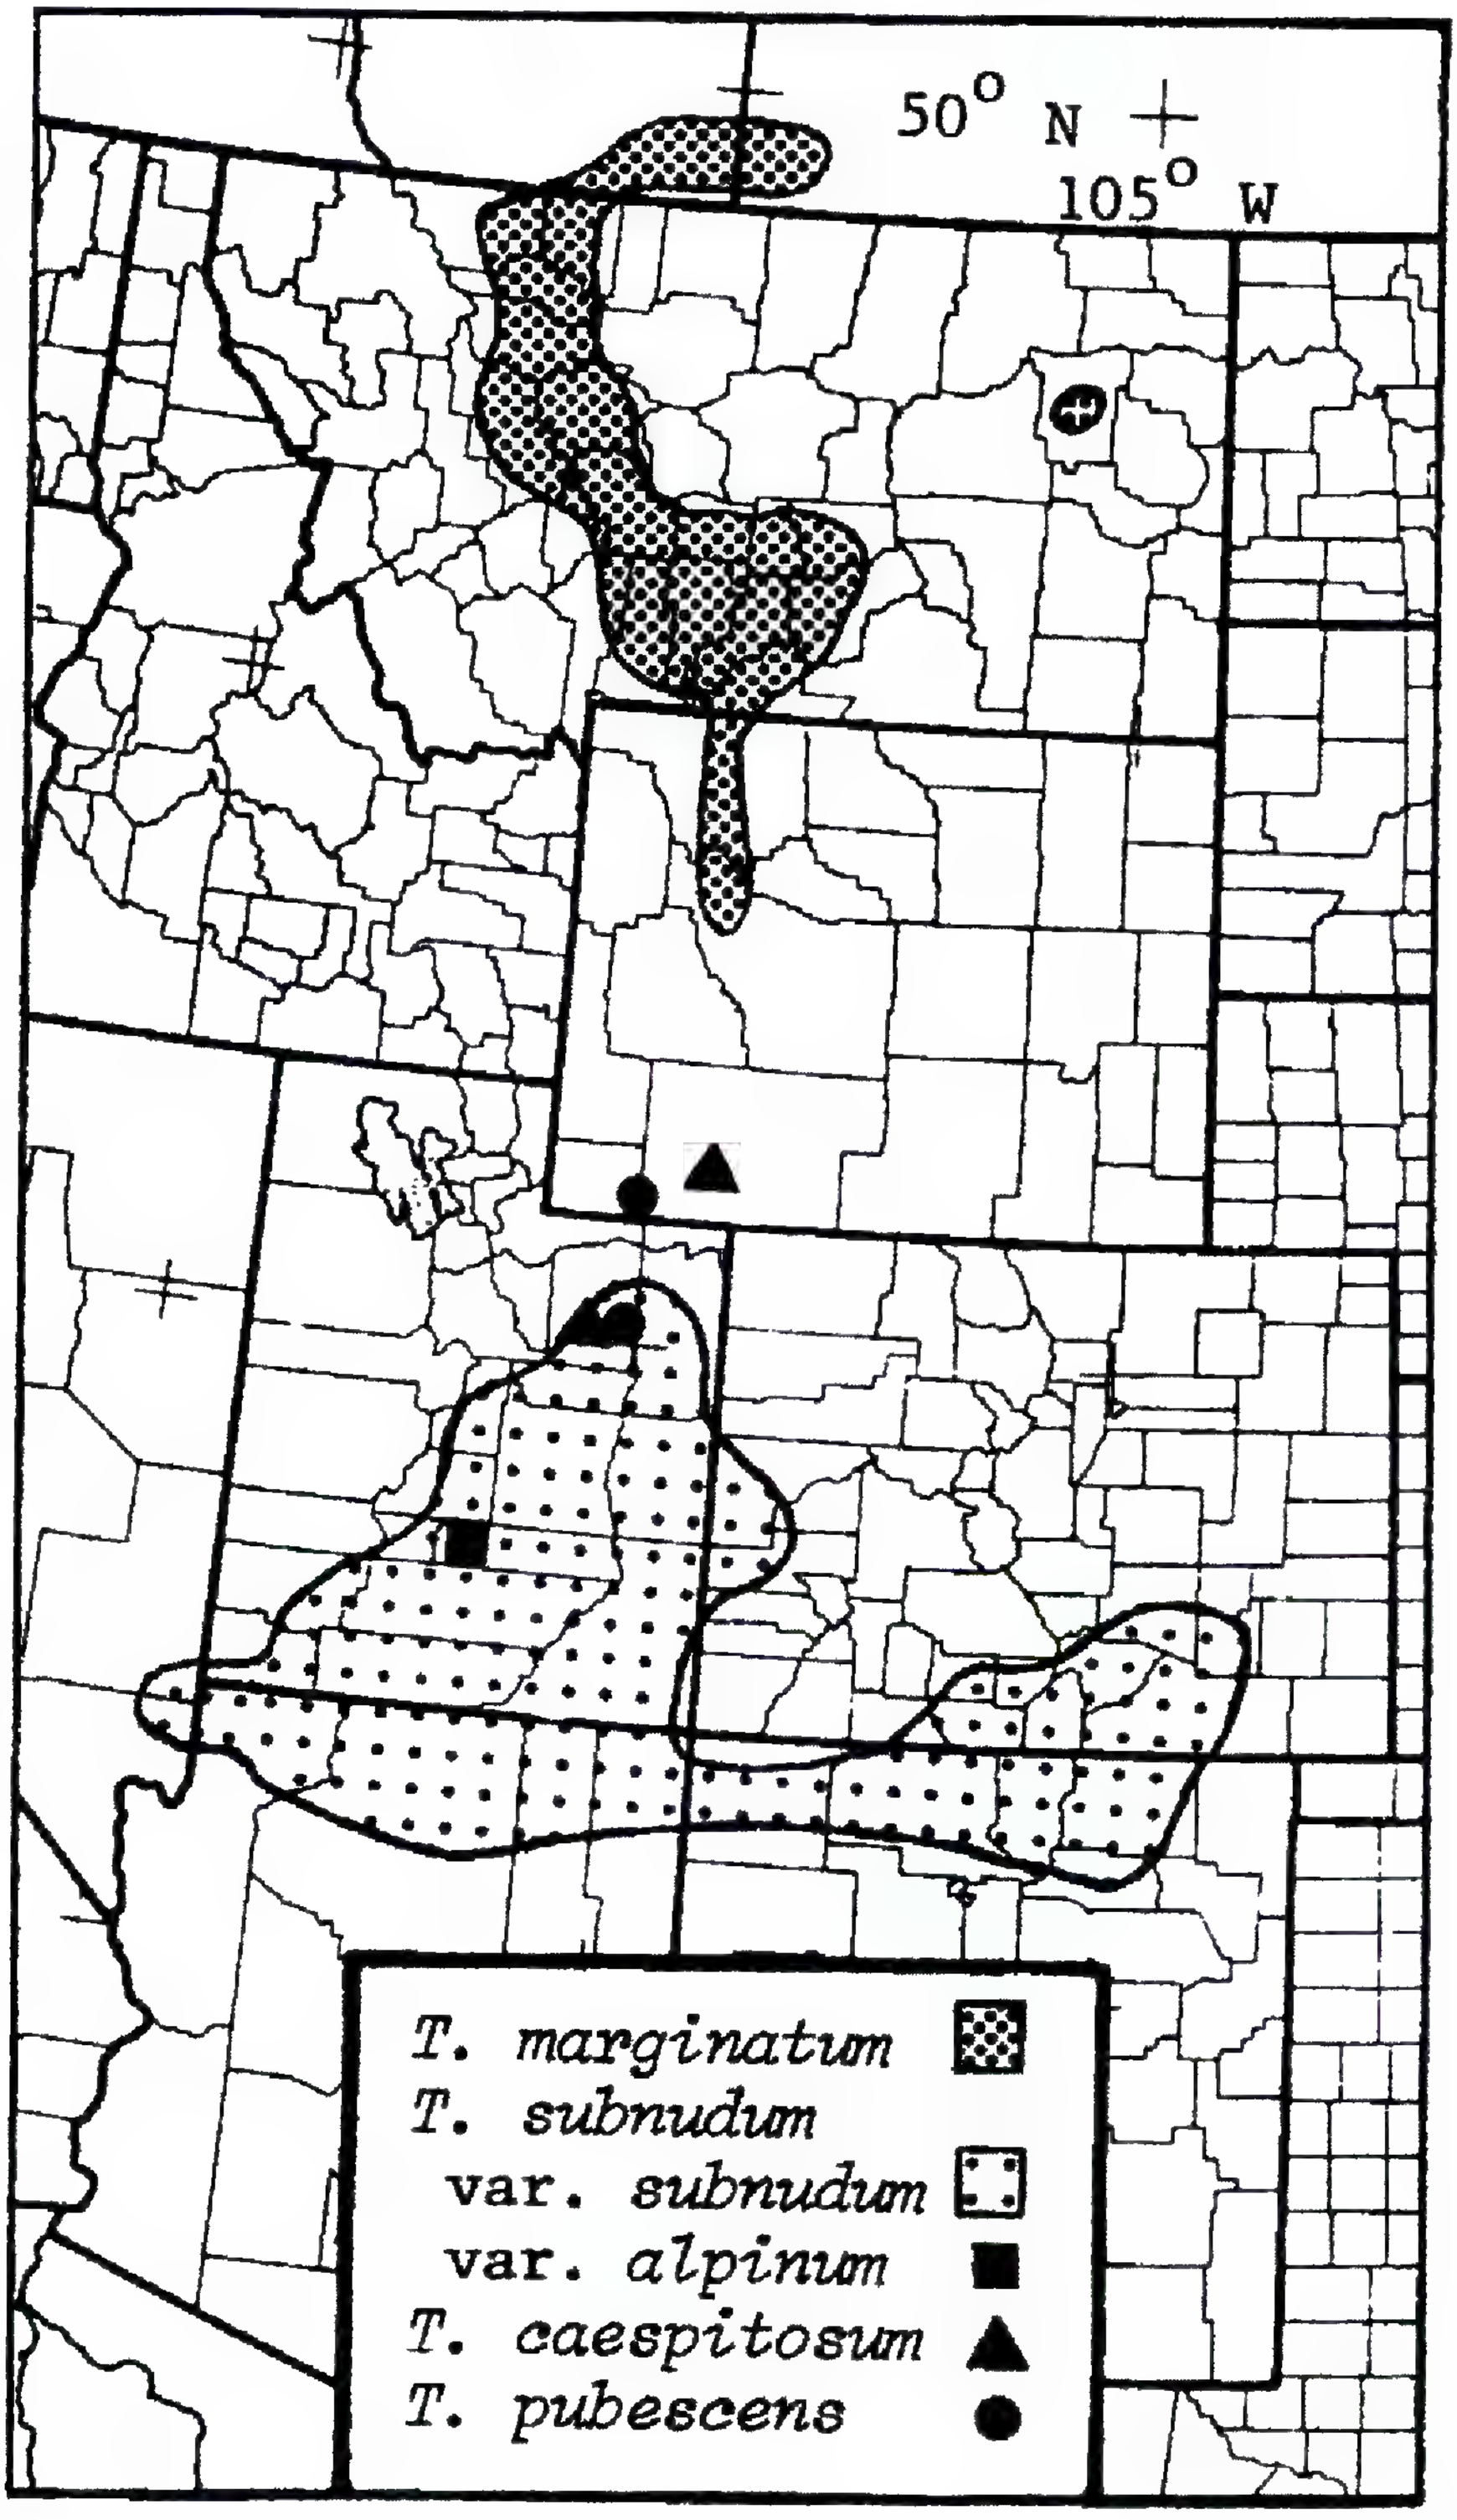

FIG. 1. Distribution of taxa in the *Thelesperma subnudum* complex. (Modified from Dorn 1990).

TABLE 1. Selected morphological, ecological, and distributional features distinguishing taxa of the *Thelesperma subnudum* complex. Modified from Dorn 1990.

Taxa	Leaf segments	Pubescence	Heads	Rootstock	Habitat	Elevation (m)
T. subnudum	long, broad	none	1-several, radiate (rarely) discoid	somewhat creeping	common, sandy soils	1050–2310
T. subnudum var. *alpinum*	short, narrow	lower stems & leaves	1(2), discoid	somewhat creeping, branched caudex	specialized, Carmel Form. Navajo Sandstone	1830–2680
T. marginatum	long, broad	none	1-several, discoid	somewhat creeping	common, sandy out wash	2130–2835
T. pubescens	short, narrow	leaves	1(2), discoid	branched caudex	specialized, weathered Bisnop conglomerate	2430–2715
T. caespitosum	short, narrow	petioles (lower blade)	1(2), discoid	branched caudex	specialized, whitish shale	1220–2680

concert with morphology to produce an explicit phylogenetic hypothesis for these taxa, and 3) to compare that hypothesis to existing classifications and propose any desirable taxonomic changes. Through this process, we hope to shed light on the relationships and possible origin of *T. subnudum* var. *alpinum*, the rarest and most enigmatic member of the group.

MATERIAL AND METHODS

Determination of Chromosome Numbers/Ploidy Level

Ploidy levels were determined for all taxa in the *T. subnudum* complex using a combination of chromosome counts and analyses of allozyme banding patterns. For chromosomal observations, capitula (in bud) were obtained from field populations and fixed in Farmer's solution (3 parts ethanol:1 part glacial acetic acid). Chromosome counts were made from meiotic figures obtained using standard squash techniques and acetocarmine staining (Turner & Johnston 1961; Strother 1972). Preparations were examined under phase contrast on a Zeiss Axioplan2 Microscope. Images of chromosome squashes were saved electronically using Zeiss Image® software from Carl Zeiss, Inc.

In populations for which flower buds were unavailable, ploidy level was determined by careful examination of allozyme banding intensities across a variety of enzymes (Danzmann & Bogart 1982a; Dessauer & Cole 1984; Pryer & Haufler 1993). Because allozyme markers are additive, codominant, and

TABLE 2. Previous taxonomic treatments of *Thelesperma subnudum* and allied taxa.

Dorn (1990)	Welsh et al. (1993)	Cronquist et al. (1994)

inherited in a Mendelian fashion, the expressions of alleles at various ploidy levels are expected to be proportional to their gene dosages. In our study, chromosomally documented diploids in *Thelesperma* always showed balanced band patterns at heterozygous loci. If a heterozygote showed unequal band intensities of 3:1 (in a monomeric enzyme) or 9:4:1 (in a dimeric enzyme), the particular individual always proved to be tetraploid (the only type of polyploid encountered during our study). Thus, chromosomally unknown populations could be assigned to a specific ploidy level based on the presence or absence of unbalanced heterozygous allozyme patterns.

Morphological Data

Our coding of morphological character states is based on observation of approximately 300 herbarium sheets from ASC, BRY, GH, MONTU, NMU, NY, RM, UT, and UTC (herbarium designators follow Holmgren et al. 1990). These data were supplemented by information obtained from Melchert (1963), Welsh (1983), Dorn (1983, 1990), Jansen et al. (1991), Ryding & Bremer (1992), Welsh et al. (1993), Cronquist et al. (1994), and Karis & Ryding (1994). Ingroup taxa included *T. subnudum* var. *subnudum*, *T. subnudum* var. *alpinum*, *T. pubescens*, *T. caespitosum*, and *T. marginatum*, plus the related species *T. filifolium* (Hook.) A. Gray, *T. longipes* A. Gray, and *T. megapotamicum* (Spreng.) Kuntze. *Bidens* has been identified as a possible sister genus to *Thelesperma* (Ryding & Bremer 1992) and two species of that diverse genus, *B. cernua* L. and *B. frondosa* L., were chosen as outgroup taxa. A total of 16 characters (14 binary and 2 multi-state) was included in the morphological analysis (Tables 3, 4).

nr DNA-ITS Sequence Data

Samples used in the DNA study are identified by their GenBank accession numbers in Table 5. *ITS* sequences for the outgroups *Bidens cernua* and *B. frondosa* were obtained from GenBank; voucher data for these collections can be found in Ganders et al. (2000). The *ITS* sequences for all *Thelesperma* taxa were obtained directly by extracting total DNA from the leaf tissue of dried specimens using a basic CTAB extraction protocol (Hillis et al. 1996). Two different individuals from each taxon were sampled in order to check for intraspecific differences. The *ITS*-1 & 2 and 5.8S regions were amplified using the polymerase chain

reaction (PCR) and two primers in a 1:1 ratio. Primers used in PCR amplification and DNA sequencing were *ITS*-4 (White et al. 1990) and a modified sequence of *ITS*-5 (White et al. 1990). The latter, designated *ITS*-1, has the sequence: GTC CAC TGA ACC TTA TCA TTT AG (L. Urbatsch, pers. comm.). The following PCR cycling protocol was used in amplification: a 95°C hot start for 12 min.; 40 cycles of: 95°C for 20 sec., 54°C for 30 sec., and 73°C for 1 min.; a 4 min. final extension at

73°C; and ending with a hold at 4°C. To confirm base positions, the *ITS*-1 & 2 and intervening 5.8S regions of *Thelesperma* were sequenced in both directions. The contigs, or unidirectional sequences, were assembled using Sequencher (Gene-Codes, Ann Arbor, MI) and visually checked. Base positions that gave equally strong, contrasting signals on both strands were coded as ambiguous according to the IUPAC-IUB ambiguity code set included in the program Sequencher. All characters were coded as unordered, and gap characters ("-") were treated as missing data rather than a fifth character state (Baldwin 1993).

Allozyme Data

An electrophoretic survey was performed to analyze allozyme variation at a variety of enzyme loci. A total of 765 plants were sampled from 25 natural populations (about 30 plants/population) representing all taxa in the *Thelesperma subnudum* complex, *T. longipes* A. Gray, and one outgroup population of *Bidens cernua* L. (Table 5). Fresh leaf material was collected in the field and kept on ice until returning to the laboratory (2-3 days maximum). Tissue was then ground using a mortar and pestle in the phosphate-PVP extraction buffer of Soltis et al. (1983). Extracts were absorbed onto wicks cut from Whatman 3MM filter paper and stored at -80°C until electrophoresis.

A total of 19 enzymes was surveyed electrophoretically for variability. Six enzymes, representing 11 putative loci, provided consistent, interpretable results. Two buffer systems were used to resolve these enzymes in 11.5% (w/v) starch gels. A tris-citrate/borate buffer system (System 6 of Soltis et al. 1983) provided good resolution for leucine aminopeptidase (LAP), phosphoglucoisomerase (PGI), phosphoglucomutase (PGM), and triosephosphate isomerase (TPI). A pH 7.5 modification of the morpholine-citrate buffer system of Odrzykoski and Gottlieb (1984) was used to resolve malate dehydrogenase (MDH) and shikimate dehydrogenase (SkDH). Staining schedules and protocols followed Soltis et al. (1983) and Murphy et al. (1996).

Genotypes were inferred directly from electromorphs observed on the stained gels, based on the assumption that enzyme substructure and compartmentalization parallel those observed in other flowering plants (Gottlieb 1981). When enzymes showed more than one allozyme locus, the most anodal (fastest migrating) locus was designated number 1, the next fastest number 2, etc. If more than one allele was present at a locus, the most anodal allele was designated *a*, the next fastest *b*, etc.

In a departure from common practice, the allozyme alleles detected at each locus were coded as present or absent for each taxon and included in a phylogenetic analysis. Although advocated by some (Mickevich & Johnson 1976; Mickevich & Mitter 1983; Buth 1984), this approach has been criticized by Swofford et al. (1996) because it violates the assumption of character independence. Similar treatment of allozyme data from *Mimulus* sect. *Erythranthe*

(Windham unpubl.) produced a phylogenetic tree highly concordant with information from other sources, suggesting that these data may contain a strong phylogenetic signal in spite of their perceived limitations. The allozyme analysis undertaken here is presented as an experiment to further assess the value of enzyme data in phylogenetic reconstruction.

Phylogenetic Analyses

All phylogenetic analyses were performed using the computer program PAUP (*Phylogenetic Analysis Using Parsimony, version 3.1*; Swofford 1991) utilizing random stepwise addition. Only the shortest trees were retained in each search. All characters were considered unordered and given equal weights, with multistate characters treated as 'uncertain.' Characters and character states were tracked, organized, and manipulated using the computer program *MacClade 3.0* (Maddison & Maddison 1992). Nodal support in each topology was determined by100 bootstrap replicates (BS; Felsenstein 1985), as well as by calculating Bremer support values (BV; Bremer 1988, 1994b).

Separate and combined phylogenetic analyses were conducted on three data sets: morphology, *nrDNA-ITS* sequences, and allozymes. Examining all relevant data in a combined fashion can produce a more robust estimate of phylogeny than separate analyses by maximizing congruence among different sources of data in phylogenetic inference (Hillis 1987; Kluge 1989; de Queiroz et al. 1995; Nixon & Carpenter 1996). To estimate levels of congruence among data sets, incongruence length differences (ILDs) were calculated (Mason-Gamer &

Kellogg 1996; Johnson & Soltis 1998). This index measures the amount of extra homoplasy that results from the combination of two or more data sets, as described by Mickevich & Farris (1981) and Farris et al. (1994, 1995). The ARNIE program in the Random Cladistics software package (Siddall 1995) was used to determine the significance of ILDs. α-values less than 0.05 were considered sufficient evidence to reject the null hypothesis of data set homogeneity. Combined analyses included only those taxa common to all phylogenetic data sets.

RESULTS

Chromosome Data

All individuals sampled from populations of *T. pubescens* and *T. caespitosum* proved to be diploid with chromosome counts of $n = 12$ (Table 6; Figs. 2A–B). Individuals sampled from populations of *T. subnudum* var. *alpinum* consistently were tetraploid with $n = 24$ (Fig. 2C). Our analyses revealed that some Colorado Plateau populations of *T. subnudum* var. *subnudum* are diploid (n=12; Fig. 2D) whereas others are exclusively tetraploid (n=24; Fig. 2E). Although the geographic ranges of these cytotypes overlap and both appear to be common (Windham, Hansen, & Allphin unpubl. data), we have yet to identify a locality where they occur together. Both ploidy levels of *T. subnudum* var. *subnudum* are represented in the morphological, DNA, and allozyme analyses that follow.

A chromosome number was not obtained directly for *T. marginatum*, and no previously published counts were found in the *Index to Plant Chromosome Numbers*. However, an analysis of allozyme banding intensities in our collection from Fremont Co., Wyoming, provided strong evidence that the plants at this locality are diploid. This sample of *T. marginatum* showed only balanced heterozygote banding patterns, as is expected in diploid organisms (Danzmann & Bogart 1982b; Wendel & Weeden 1989) and observed in all chromosomally verified diploid populations of *Thelesperma*.

Morphological Data

Parsimony analysis of 16 morphological characters yielded two most-parsimonious trees, the strict consensus of which is shown in Figure 3. Relative to the outgroup species chosen, *Thelesperma* was strongly supported as a monophyletic group (BV=6, BS=100%). The first branch within the *Thelesperma* clade produces a trichotomy that separates *T. megapotamicum* and *T. filifolium* (both with unequally lobed disc florets and a well developed pappus) from the other species. The clade encompassing the remaining taxa is weakly supported (BV=1, BS=70%), branching to form a polytomy in which each taxon (with the exception noted below) occupies its own unresolved branch. The only deviation from this pattern is the grouping of *T. caespitosum*, *T. pubescens*, and *T. subnudum* var. *alpinum* in a single clade with strong support (BV=2, BS=88%). Within this clade, the last taxon is moderately supported as sister to *T. caespitosum* and *T. pubescens*.

ITS Sequence Data

Of 663 characters (aligned length), 61 were variable, and 6 were phylogenetically informative. The sequence of *T. caespitosum* was incomplete with approximately 87 bp missing compared to the other sequences. Possible non-specific amplification of the *ITS* region in *T. caespitosum* resulted in a double signal on the chromatogram. Multiple attempts to re-extract DNA and obtain a clearer signal failed. To determine if there was a loss of phylogenetically informative characters in the missing region of *T. caespitosum*, two different sequence length scenarios were analyzed. The first scenario involved aligning all sequence lengths equal to that of *T. caespitosum* (i.e., no gaps in *T. caespitosum* but with an 87 bp truncation in all other taxa). The second scenario was to align full sequence lengths in all taxa except *T. caespitosum* (i.e., 87 bp gap in *T. caespitosum* only). In both analyses, the same single most-parsimonious tree was obtained

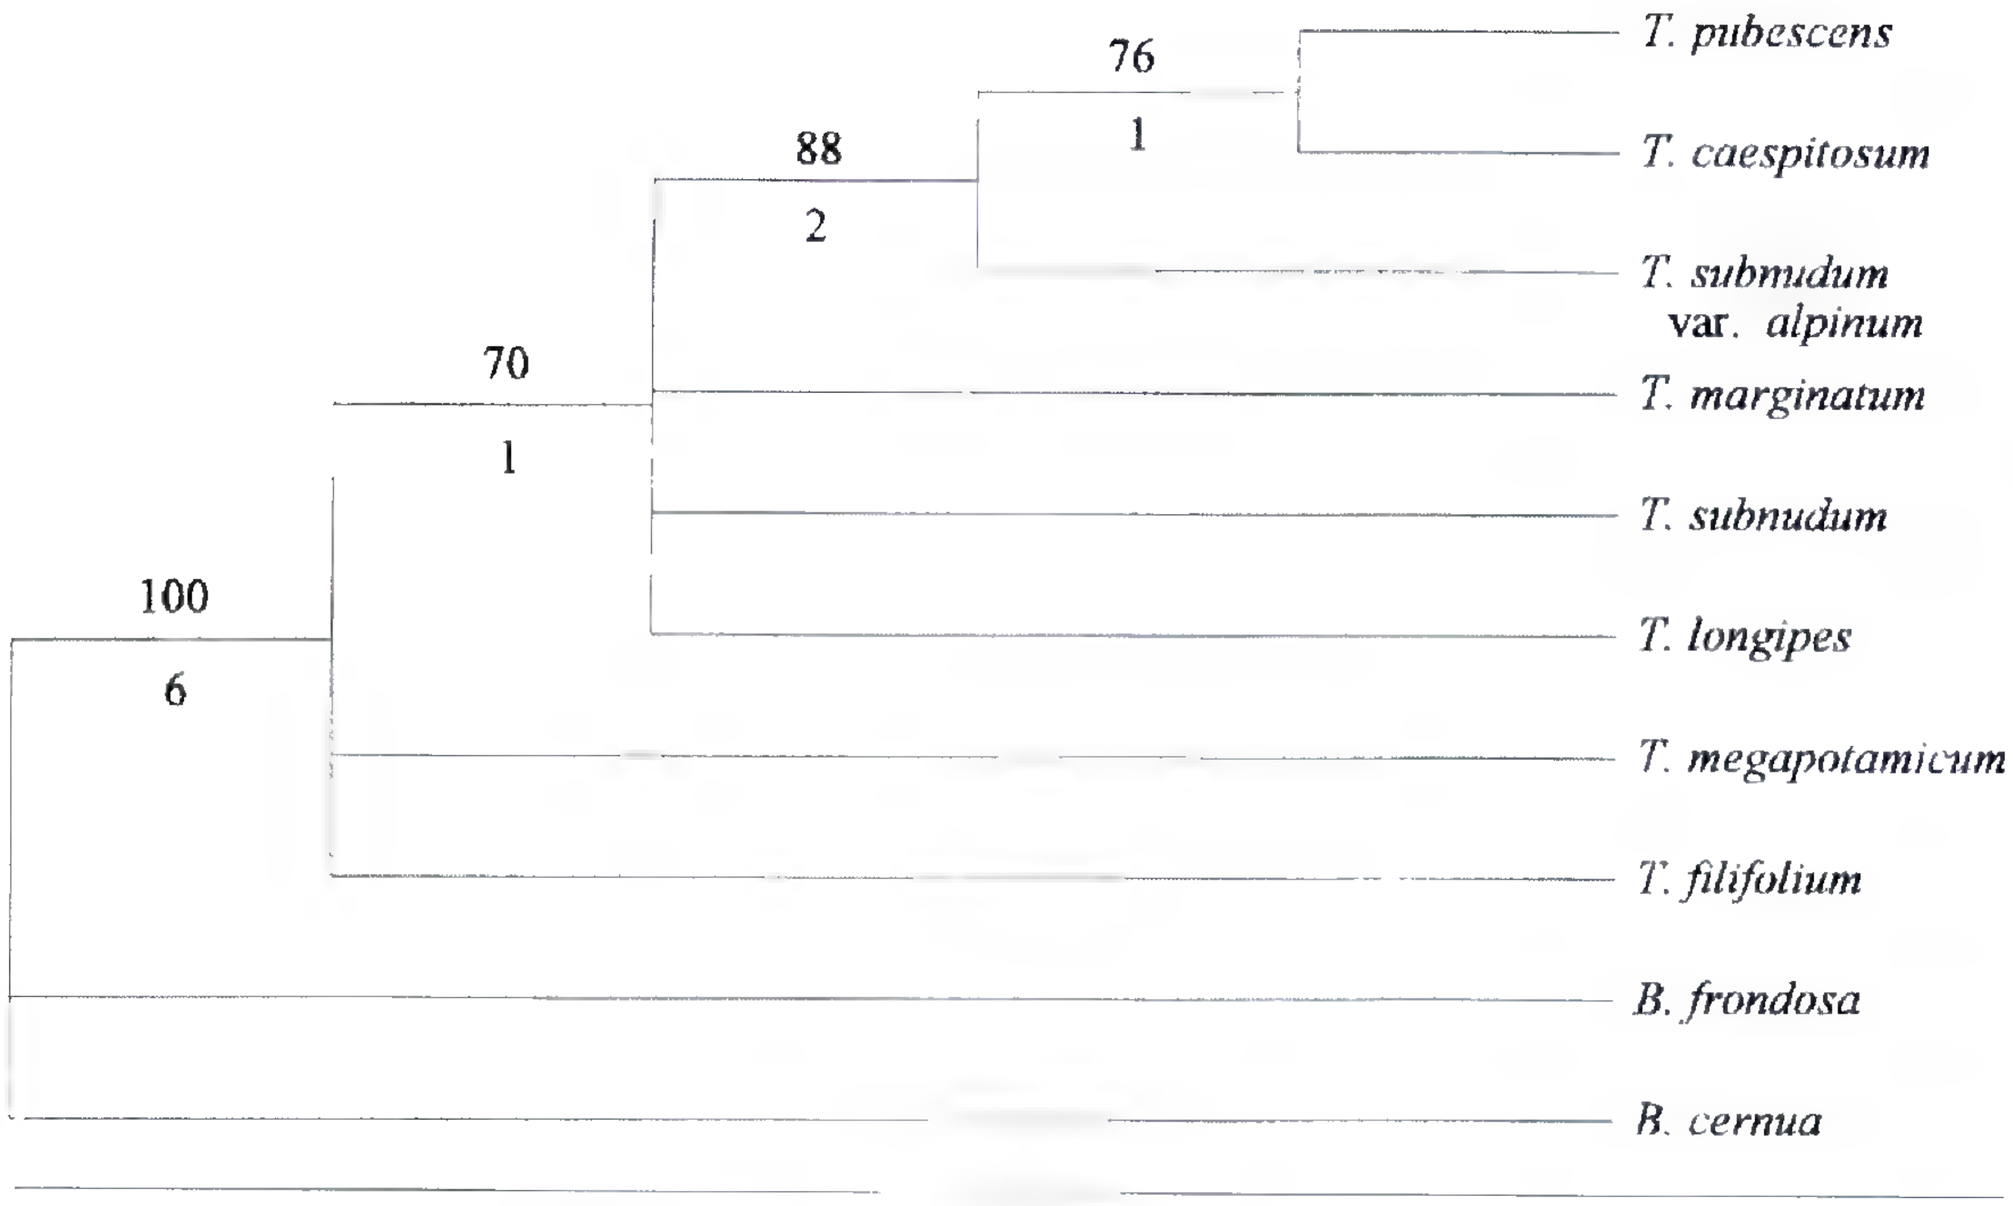

FIG.3. Strict consensus of 2 most-parsimonious trees based on morophological data. Bootstrap values are above the line, Bremer support values below. Length= 19, CI= 0.947, RI= 0.941.

(Fig. 4). Furthermore, bootstrap support only differed by 1–2 percent, being slightly higher in the second scenario. These results suggest that very few phylogenetically important characters are located in the 87 bp gap of *T. caespitosum* and subsequent combined analyses utilized the second scenario alignment.

The topology of the single most-parsimonious tree from the *ITS* sequence analysis was similar to that derived from morphology (Figs. 3, 4). The monophyly of *Thelesperma* is again supported by a 100% bootstrap value; Bremer support in the ITS data is significantly higher (BV=16). The only topological difference between the morphological and ITS trees involves the placement of *T. filifolium*. In the *ITS* analysis, this species forms a clade with all *Thelesperma* other than *T. megapotamicum* on a relatively well supported branch (BV=2; BS=86%). As in the morphological tree, all taxa on this branch form an unresolved polytomy with the exception of *T. pubescens*, *T. caespitosum*, and *T. subnudum* var. *alpinum*. Support for this clade is significantly higher in the *ITS* tree (BV=5; BS=99) and, once again, *T. subnudum* var. *alpinum* receives moderate support as the sister taxon of *T. caespitosum* and *T. pubescens*. A comparison of pair-wise distances based on the aligned *ITS* sequences shows very little divergence among these rare taxa (Table 7).

Allozyme Data

Missing allozyme data made up 5.3% of the total data matrix due to poor staining resolution of SKDH and PGI in populations of *T. marginatum* and *T. longipes*. The results of a phylogenetic analysis based on presence/absence data yielded

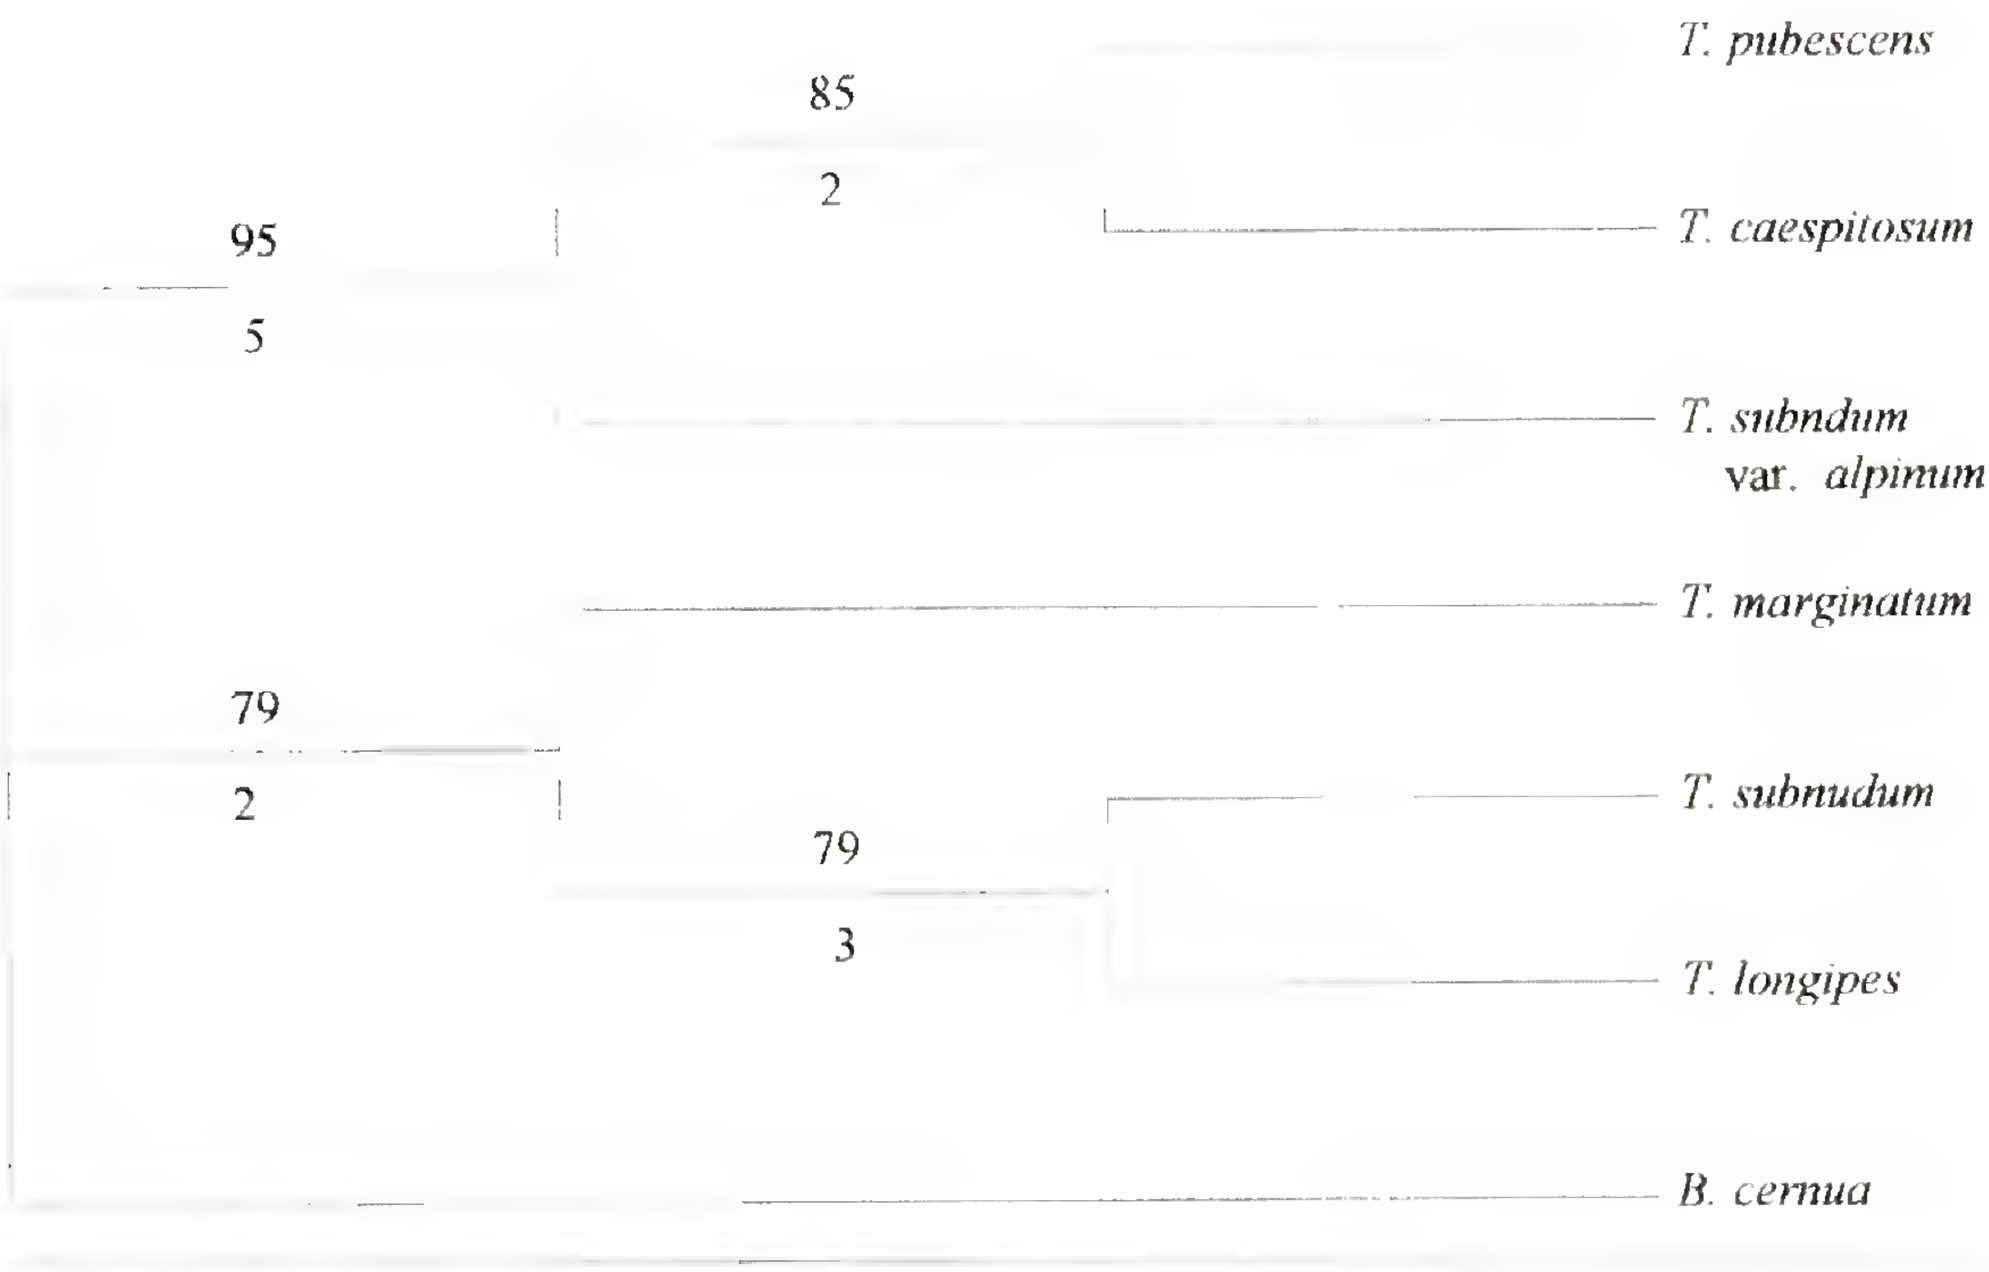

FIG.4. Single most-parsimonious tree from an exhaustive search based on ITS sequence data only. Bootstrap values are above the line, Bremer support values are below. Length= 70, CI= 0.986, RI= 0.968.

a single most-parsimonious tree (Fig. 5). Relative to the outgroup species *Bidens cernua*, the subset of *Thelesperma* taxa included in the allozyme analysis form two distinct clades. One consists of the three rare endemics, which show a strong association (BV= 5, BS=95%) comparable to that observed in the morphological and *ITS* trees (Figs. 3, 4). Once again, *T. subnudum* var. *alpinum* is sister to *T. caespitosum* and *T. pubescens*, and there is increased support for this topology (BV=2; BS=85%). The other *Thelesperma* clade recovered in the allozyme analysis (Fig. 5) consists of *T. marginatum*, *T. subnudum*, and *T. longipes*, which group together with moderate support (BV=2; BS= 79%). Nearly identical support (BV=3; BS=79%) exists for the placement of *T. marginatum* as the sister taxon to *T. subnudum* and *T. longipes*.

Combined Data Set Analysis

Statistical comparisons of trees resulting from the individual data sets revealed that they were highly congruent and amenable to being combined in a single analysis. This combined analysis of morphology, allozymes, and nrDNA-*ITS* sequences resulted in a single most-parsimonious tree, the topology of which was identical to that of the analysis based on allozymes alone (Fig. 6). Bootstrap and Bremer support values for the (*marginatum* (*subnudum/longipes*)) clade are not significantly different from those derived from the allozyme analysis. Support for the (*alpinum* (*pubescens/caespitosum*)) clade is increased by combining data sets. The association of these three taxa is supported by a 100% bootstrap estimate, and the Bremer support value increases to 12. Statistical

support for the placement of *T. subnudum* var. *alpinum* as sister to the other two taxa increases as well (BV=4; BS=94%).

DISCUSSION

We gathered molecular and morphological data, which were analyzed separately and in combination to obtain the best estimate of the phylogeny of the *T. subnudum* complex. Tree topologies were highly concordant, and the single most-parsimonious tree from the combined analysis was more resolved and exhibited improved nodal support over any of the individual analyses.

The level of congruence among data sets in this study indicates that allozymes contain valuable phylogenetic information that can be recovered through parsimony analysis. This suggests that concerns regarding the independence of characters (Swofford et al. 1996) should not disqualify allozymes from playing at least a limited role in phylogenetic studies. Because this approach is relatively untested, however, we will refrain from placing undue emphasis on the allozyme tree in the following taxonomic discussion. This applies to the combined analysis as well, because the topology of that tree may be unduly influenced by the relative abundance of informative allozyme characters. The taxonomy outlined below addresses only those patterns independently observed in all data sets.

The relationships portrayed in our phylogenetic trees can be summarized as follows. *Thelesperma pubescens* and *T. caespitosum* are closest relatives, forming a clade in all analyses and showing very little divergence from one another

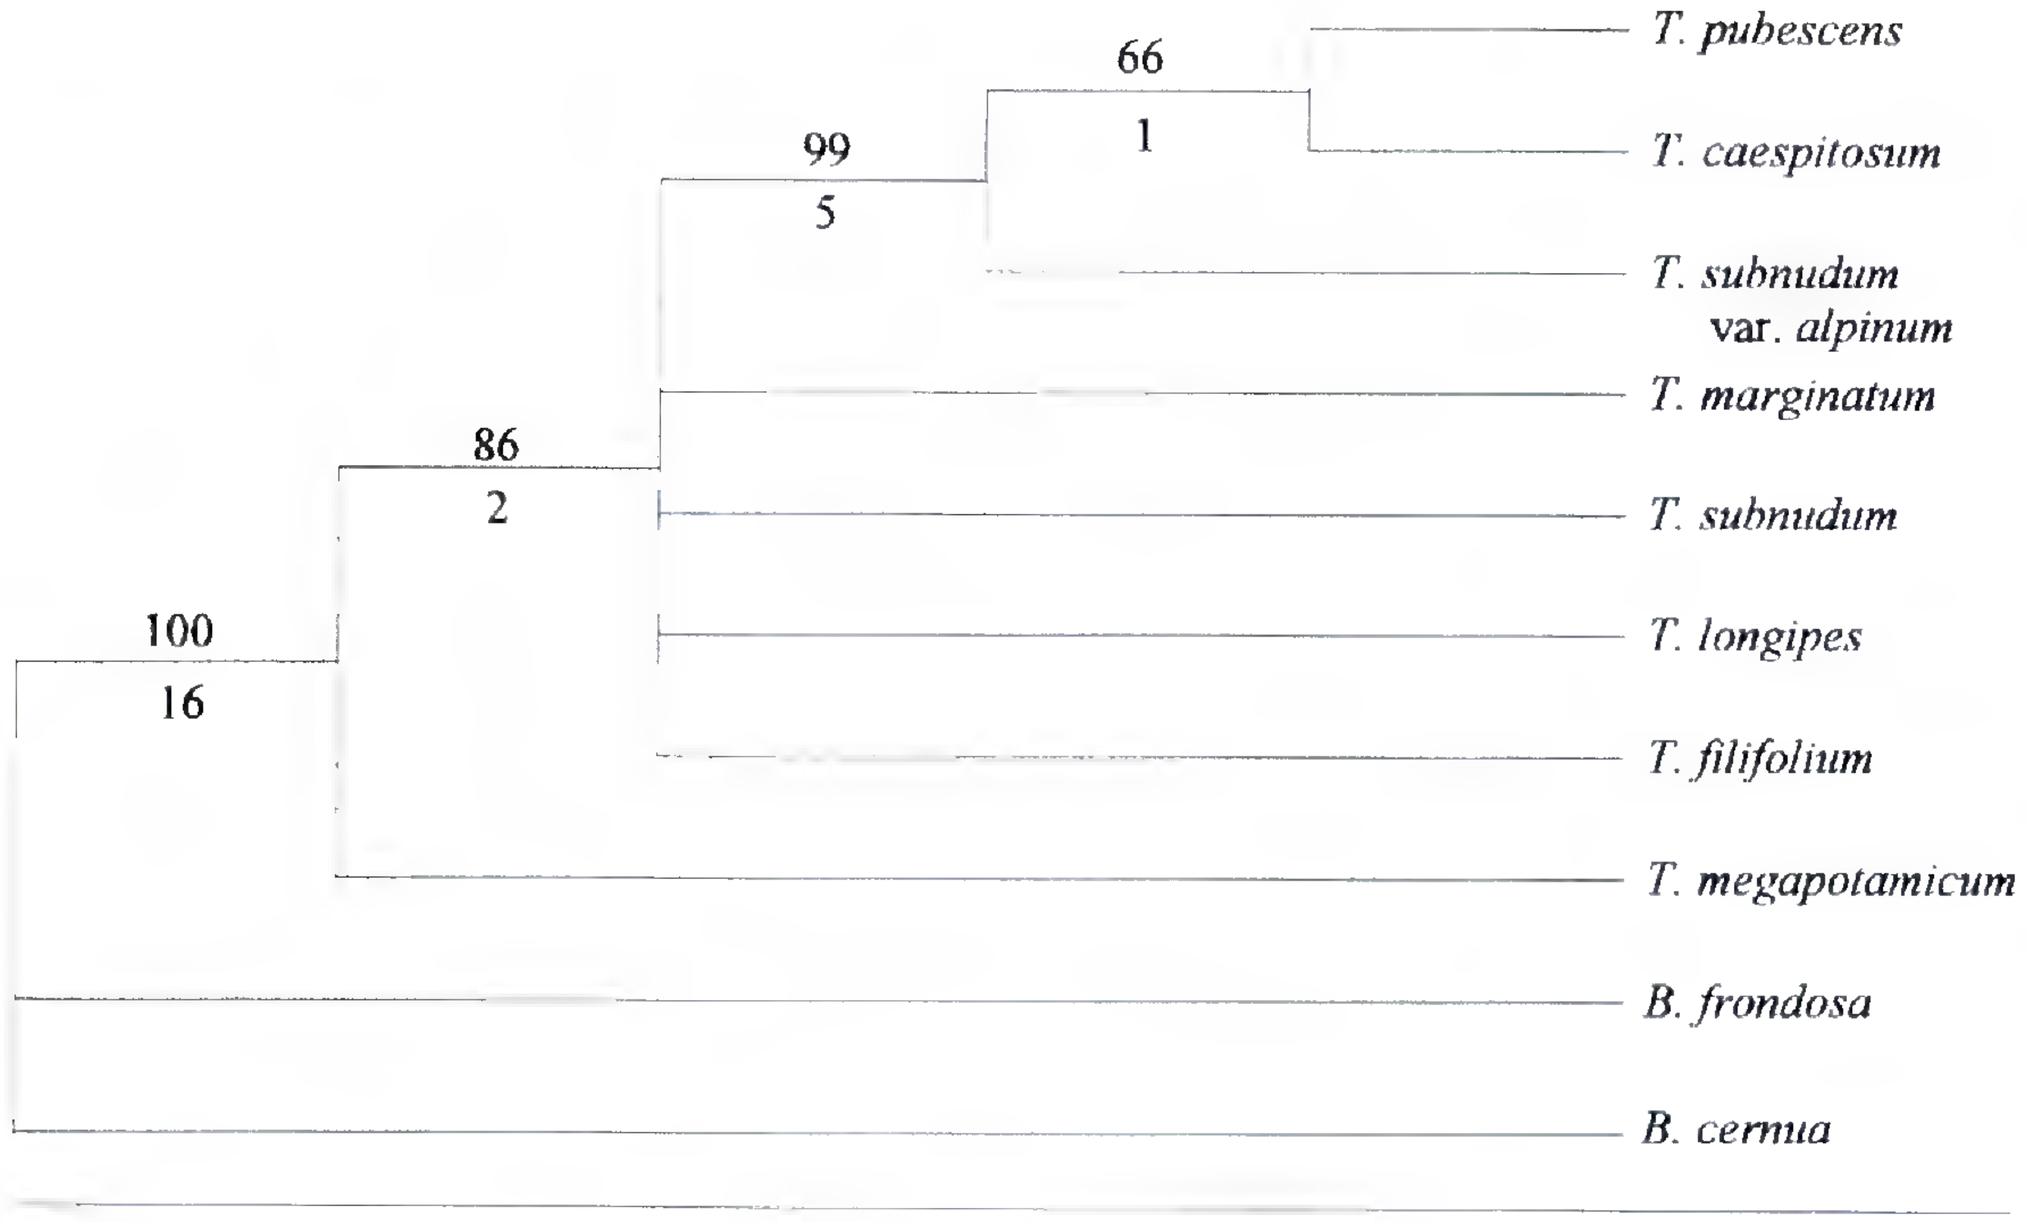

FIG. 6. Single most-parsimonious tree derived from combined analysis of allozyme, morphology, and *ITS*-DNA data sets. Bootstrap values are above the line, Bremer support values are below. Length= 137, CI= 0.905, RI= 0.772.

(Tables 4 & 7). Another relationship consistent across all analyses is the placement of *T. subnudum* var. *alpinum* as the sister taxon to the *T. pubescens/caespitosum* clade. Bootstrap support for this topology ranges from 88% in the morphological analysis to 100% in the combined analysis. Relationships among other taxa of the *Thelesperma subnudum* complex are poorly resolved, with the aforementioned clade forming a polytomy with *T. subnudum*, *T. marginatum*, and *T. longipes* in the morphology and *ITS* analyses (Fig. 3). In the allozyme and combined analyses (Fig. 4), those three taxa form a separate, moderately supported clade with *T. marginatum* basal to *T. subnudum* and *T. longipes*. These results are not wholly concordant with any of the proposed classifications of the *T. subnudum* complex summarized in Table 2, suggesting that nomenclatural changes are warranted.

The *Thelesperma pubescens/T. caespitosum* clade

Dorn (1990) recognized both taxa in this clade at the species level; Cronquist et al. (1994) combined them (and *T. subnudum* var. *alpinum*) under the name *T. pubescens*. Welsh et al. (1993) were mute on the matter of *T. pubescens* (which was not known to occur in Utah at the time the flora was published), but probably would consider it a variety of *T. subnudum*, the treatment accorded to *T. caespitosum*. The last classification is the least practicable in light of the data presented in this study. To treat *T. caespitosum* as a variety of *T. subnudum* and maintain monophyly, our data (Figs. 3, 4) indicate that other species would have to be subsumed within *T. subnudum* as well. These include *T. marginatum*, *T.*

longipes, and possibly even *T. filifolium*. We consider such a species concept, encompassing taxa not previously included in the *T. subnudum* complex, to be unacceptably broad.

Our data indicate that *Thelesperma pubescens* and *T. caespitosum* are sister taxa showing minimal genetic divergence. They differ by a single morphological character involving the distribution of pubescence on the leaves (Tables 3 & 4; Dorn 1990). Recent collections from near Anthro Mountain on the West Tavaputs Plateau in Duchesne Co., Utah (BRY- *Goodrich et al. 25159*) provide additional insight on their relationship. In that population, individual plants range from having strictly petiolar pubescence (*T. caespitosum* type) to complete leaf blade pubescence (*T. pubescens* type). Whether a result of incomplete primary divergence or secondary convergence resulting from hybridization or selection, there is complete intergradation. It appears that distribution of pubescence, in the absence of correlated characteristics, is probably a tenuous foundation for recognizing species in the *T. subnudum* complex.

Under the Biological Species Concept (Mayr 1942), *T. caespitosum* and *T. pubescens* are "groups of actually or potentially interbreeding populations" that probably should be recognized as conspecific. Invoking the Cohesion Species Concept (Templeton 1989), *T. pubescens* and *T. caespitosum* also qualify as conspecific based on phenotypic similarities (cohesion) due to gene flow by means of presumed interbreeding. Because these two taxa lack unique, diagnosable sets of morphological and molecular characteristics and don't appear to have separate evolutionary trajectories, they also would be considered a single species under the Phylogenetic Species Concept (Cracraft 1983; Davis & Nixon 1992).

With regard to the *caespitosum/pubescens* clade, our data are most congruent with the classification presented by Cronquist et al. (1994). In that treatment, *T. pubescens* is considered specifically distinct from *T. subnudum*, with *T. caespitosum* included within *T. pubescens*. We propose two modifications to this classification. First, we exclude *T. subnudum* var. *alpinum* from synonymy with *T. pubescens* for reasons that will be discussed below. Second, we propose to recognize *T. caespitosum* as a variety of *T. pubescens*. Excluding the intergradient population on Anthro Mountain, Utah, there is a definite correlation among pubescence, substrate, and geography (Table 1; Fig. 1). We feel that the incipient divergence in this clade is best recognized at the varietal level.

Origin and relationships of *Thelesperma subnudum* var. *alpinum*

This taxon appears to be exclusively tetraploid (Table 6), a point that is central to hypotheses regarding its evolutionary origin and to its classification. Tetraploids typically are derived from diploids through the incorporation of additional sets of chromosomes (see Harlan & DeWet 1975), and they are informally grouped according to the similarity of their constituent genomes (Crawford 1989). Polyploids containing genomes that are very similar chromosomally and genetically

(usually derived from within a single species) are considered autopolyploids. Because of genetic similarity to their progenitor diploids, autopolyploids are rarely given species status (e.g., Mosquin 1966). Polyploids that contain well-differentiated genomes (often obtained through hybridization between different species) are considered allopolyploids and usually treated as distinct species. The proper classification of *T. subnudum* var. *alpinum* thus hinges on whether it proves to be an autopolyploid or an allopolyploid.

Classifications of this taxon by Dorn (1990) and Welsh et al. (1993) imply that its closest relative is *Thelesperma subnudum*, and suggest that it may be an autopolyploid derived from within that species. Two lines of evidence refute that putative relationship. Although the taxon shows some morphological similarities to *T. subnudum* (Dorn 1990), the *ITS* sequence data clearly indicate a closer relationship to *T. pubescens* and *T. caespitosum*. In fact, all data sets developed during this study support the placement of *T. subnudum* var. *alpinum* as sister to these taxa, not *T. subnudum* var. *subnudum* (Figs. 3 & 4). Further evidence that var. *alpinum* is not an autopolyploid derivative of *T. subnudum* comes from the fact that known autopolyploids abound in this species and do not resemble var. *alpinum*. These undisputed autopolyploids in *T. subnudum* appeared identical to diploid *T. subnudum* in morphology and *ITS* sequences (Table 7). In our analyses, they were recognizable only through chromosome studies or the detection of unbalanced heterozygosity in allozyme markers shared exclusively with diploid *T. subnudum*.

Despite significant genetic similarity, it also seems unlikely that *Thelesperma subnudum* var. *alpinum* is an autopolyploid derivative of either *T. pubescens* or *T. caespitosum*. It varies toward *T. subnudum* in some morphological characters, most notably the somewhat creeping rootstock. The two taxa are similar enough to convince Dorn (1990) to maintain them as varieties of a single species. The presence, in most individuals, of a PGI-1 allele otherwise found only in *T. subnudum* and *T. marginatum* provides further evidence of genetic links to taxa outside the *T. pubescens/caespitosum* clade. Variety *alpinum* also shows several autapomorphic traits that distinguish it from *T. pubescens* and *T. caespitosum*, including pubescent flowering stems and unique allozyme variants.

We suspect that *T. subnudum* var. *alpinum* may be an allotetraploid resulting from hybridization between diploid *T. subnudum* and either *T. caespitosum* or *T. pubescens*. This would explain the pattern of shared characters and apparent morphological intermediacy that has led to such divergent classifications (Dorn 1990 vs. Cronquist et al. 1994). It also would explain allozyme banding patterns at the PGI-1 locus, where most individuals of var. *alpinum* are heterozygous for alleles derived from the *pubescens/caespitosum* and *subnudum/marginatum* clades respectively. At this one locus, var. *alpinum* approaches fixed heterozygosity, one of the genetic hallmarks of allopolyploidy. The absence of fixed heterozygosity at other allozyme loci may be due to homoeologous chro-

mosome pairing or extensive gene silencing (Windham 1988). Over time, allopolyploids lose expression of duplicated parental genes through various genetic processes, especially null mutations (Roose & Gottlieb 1976; Werth & Windham 1991). Given enough time, the polyploid taxon becomes genetically "diploidized" (Grant 1981).

A parallel process may explain the lack of diagnostic *T. subnudum ITS* sequences in var. *alpinum*. Recently formed allopolyploids would be expected to show the *ITS* sequences of both diploid parents (Soltis et al. 1995; Cook & Soltis 1999; 2000; Gernandt & Liston 1999). With time, however, *ITS* loci often experience concerted evolution, which randomly eliminates one of the parental sequences (Sang et al. 1995; Wendel et al. 1995; Polanco et al. 1999). Under this scenario, var. *alpinum* still could be an allopolyploid hybrid in which the original *T. subnudum* sequence has been lost to concerted evolution.

Each of the possible evolutionary origins (two autopolyploid and one allopolyploid) of *Thelesperma subnudum* var. *alpinum* discussed above would support a different classification for this taxon. The hypothesis that var. *alpinum* is an autopolyploid derived from *T. subnudum*, the only scenario congruent with the classifications of Dorn (1990) and Welsh et al. (1993), can be rejected. To uphold *alpinum* as a variety under *T. subnudum* and still maintain monophyly, we would have to expand the species definition of *T. subnudum* to include the entire complex plus *T. longipes* and, possibly, *T. filifolium* (Figs. 3 & 4). In our opinion, lumping half of the species in the genus *Thelesperma* into one species is not a desirable solution.

Our data are not sufficiently robust to distinguish between an autopolyploid origin of var. *alpinum* from within the *T. pubescens/caespitosum* clade or an allopolyploid origin through hybridization between members of that clade and *T. subnudum*. Nevertheless, we can propose a classification that would be phylogenetically congruent regardless of which scenario proves more plausible. To include var. *alpinum* within *T. pubescens* (as done by Cronquist et al. 1994) would be cladistically indefensible if *alpinum* subsequently is shown to be an allopolyploid. However, if we anticipate that the latter hypothesis is more plausible and recognize var. *alpinum* as a distinct species, such a treatment remains valid in the event that *alpinum* maintains its current position as the basal branch of the *T. pubescens/caespitosum* clade. Variety *alpinum* is morphologically distinct from the other members of this clade and, because of its polyploid chromosome number, is probably genetically isolated from the strictly diploid taxa. Thus, it can be recognized as a species under the Biological Species Concept (Mayr 1942) as well as the Phylogenetic Species Concept (Cracraft 1983; Davis & Nixon 1992; Davis 1996).

Other taxa in the *Thelesperma subnudum* complex

The two remaining taxa typically assigned to this complex are *T. subnudum*

and *T. marginatum*. Dorn (1990) treated them as distinct species; Cronquist et al. (1994) considered the latter a variety of *T. subnudum*. These taxa are part of an unresolved polytomy in the morphological and *ITS* data sets (Fig. 3), but form a moderately supported clade with *T. longipes* in the allozyme and combined trees (Fig. 4). The placement of *T. subnudum* as sister to *T. longipes* instead of *T. marginatum* in the latter trees suggests a relationship at odds with previous classifications, which exclude *T. longipes* from the *T. subnudum* complex. This result should be confirmed by additional studies before taxonomic revisions are proposed. Even if the allozyme data are discounted, there still is no support for expanding *T. subnudum* to include *T. marginatum* as proposed by Cronquist et al. (1994). Recognition of *T. marginatum* as a variety of *T. subnudum* would require its placement as sister to *T. subnudum* in a phylogenetic analysis. That these two taxa do not form a clade in any of our analyses suggests that they should continue to be treated as separate species. Each has a unique, diagnosable set of morphological and molecular characteristics indicative of a distinct evolutionary trajectory, thus satisfying the definition of a phylogenetic species (Davis & Nixon 1992).

In order to implement the classification outlined above, two nomenclatural innovations are necessary:

Thelesperma pubescens Dorn var. **caespitosum** (Dorn) C.J. Hansen, stat. nov. BASIONYM: *Thelesperma caespitosum* Dorn, Madroño 37: 293. 1990. TYPE: U.S.A. WYOMING. Sweetwater Co.: T18N, R106W, SE1/4 of SE1/4 of Sect. 31 and SW1/4 of SW1/4 of Sect. 32, 5 km SE of Green River, barren white shale ridge, 1890 m, 22 Jun 1988, *Dorn 4948* (HOLOTYPE: RM!).

Thelesperma windhamii C.J. Hansen, nom. et stat. nov. BASIONYM: *Thelesperma subnudum* A. Gray var. *alpinum* Welsh, Great Basin Naturalist 43: 369. 1983. TYPE: U.S.A. UTAH. Wayne Co.: T28S, R4E, S13 (NE1/4), 3 mi due N of Bicknell, bristlecone pine forest on multicolored clay hills, 2745 m, 20 Jul 1980, *Atwood and Thompson 7646a* (HOLOTYPE: BRY!).

This new name for *T. subnudum* var. *alpinum* honors the junior author, M.D. Windham, who proposed and co-directed the study. We chose not to raise the epithet *alpinum* to species rank because the taxon never occupies truly alpine habitats and most populations occur at moderate elevations (ca. 2200 m) in semi-desert regions.

KEY TO THE TAXA IN THE *THELESPERMA SUBNUDUM* COMPLEX (ASTERACEAE)

1. Leaves and stems glabrous or essentially so; leaves mostly 3–9 cm long; stems mainly 9–35(–50) cm tall, scattered along a somewhat creeping rhizomatous rootstock; rays present or absent; plants widely distributed.
   2. Ray florets present (rarely absent), scarious margins of inner involucral bracts mostly 1–1.5 mm or more wide; Nevada, Utah, Arizona, New Mexico, and Colorado _____ **T. subnudum**
   2. Ray florets absent, scarious margins of inner involucral bracts mostly 0.5–1 mm wide; Wyoming, Montana, Alberta, Saskatchewan _____ **T. marginatum**

1. Leaves or lower stems pubescent; leaves 1.5–4 cm long; stems mainly 3–19 cm tall, clustered on a thick, branching caudex with old, persistent leaf bases; ray florets absent; plant distribution restricted.
   3. Pappus a toothed crown; lower portion of flowering stems pubescent; plants from Wayne Co., Utah _____ **T. windhamii**
   3. Pappus absent; lower portion of flowering stems glabrous; plants from NE Utah and SW Wyoming.
      4. Leaves pubescent throughout; plants appearing gray-green _____ **T. pubescens** var. **pubescens**
      4. Leaves pubescent only on petioles or (rarely) on the proximal portion of the blade; plants appearing green _____ **T. pubescens** var. **caespitosum**

It is hoped that this revision of the *Thelesperma subnudum* complex will resolve some of the taxonomic confusion in the group. Although the treatment of *T. pubescens* and *T. caespitosum* as conspecific makes the aggregate taxon less rare, long-term monitoring and land management still will be necessary. All three rare taxa are restricted to specific substrates, and populations of *T. pubescens* near Green River and Hickey Mountain in Wyoming are endangered due to off-road vehicle use and oil and gas development. Populations of *T. windhamii* located west of Teasdale, Utah, are similarly threatened by off-road vehicle use.

To improve phylogenetic resolution, future studies should sequence more rapidly evolving regions of the *Thelesperma* genome, such as the external transcribed spacer regions of ribosomal DNA (Baldwin & Markos 1998). Artificial hybridization studies also might prove useful for revealing reproductive barriers and species boundaries. Ultimately, research should be expanded to include all taxa of *Thelesperma*. Deciphering relationships within *Thelesperma* will aid in identifying possible sister genera and thereby contribute to our knowledge of higher level relationships in the Coreopsidinae and Heliantheae.

ACKNOWLEDGMENTS

We thank Chris J. Stubben for help in locating and collecting populations of rare *Thelesperma* and for collecting samples of *T. longipes* from New Mexico. We also thank Lowell Urbatsch for providing *ITS* primer sequences. We are grateful to John Strother and Leigh Johnson for their reviews and helpful comments on earlier versions of the manuscript. We also give special thanks to Marcos Losada for his Spanish translation of the abstract. This study is based on a M.S. thesis by the senior author done at Brigham Young University.

LIATRIS GHOLSONII (ASTERACEAE: EUPATORIEAE), A NEW BLAZING STAR FROM THE APALACHICOLA RIVER BLUFFS AND RAVINES IN FLORIDA

Loran C. Anderson

Department of Biological Science
Florida State University
Tallahassee, FL 32306-4370, U.S.A.

ABSTRACT

A new species of *Liatris* (Asteraceae: Eupatorieae,) is described from Liberty County, Florida. Presumably its closest relative is *L. gracilis*, from which it differs in morphology, chemistry, and ecology. The species is diploid ($n = 10$).

KEY WORDS: Asteraceae, *Liatris*, blazing star, endemics

RESUMEN

Se describe una nueva especie de *Liatris* (Asteraceae: Eupatorieae,) del condado de Liberty, Florida. Probablemente su pariente más cercano es *L. gracilis*, de quien difiere en morfología, química, y ecología. La especie es diploide ($n = 10$).

The upper Apalachicola River region in the Florida panhandle has long been known for its diverse and unique flora. Asa Gray (1875) visited the area to observe *Torreya taxifolia* Arn. E.E. Callaway (1966), theologian, amateur archeologist, and one-time gubenatorial candidate in Florida, cited the unusual flora in support of his claim that the original Garden of Eden was located there. Further, he suggested the Torreya tree provided the Biblical "gopherwood" used in constructing Noah's ark. Although his ideas did not gain wide acceptance, many endemic taxa are nonetheless known from the area (Clewell 1977; Myers & Ewel 1990). It is the center of one of five "hot spots" for biotic rarity and richness in the continental United States (Stein et al. 2000). Now, a new species of *Liatris* can be added to the list of rare endemics found there.

For many years, local botanists, such as R.K. Godfrey and A.K. Gholson (pers. com.), have been aware of some unusual populations of blazing star in ravines and along the bluffs of the Apalachicola River in the Florida panhandle. The plants would most probably "key out" to *Liatris gracilis* Pursh, but they do not fit well.

Herz et al. (1984a) studied the chemistry of *Liatris gracilis*. Later, his team (Herz et al. 1984b) studied the "bluffs blazing star" and found that, in contrast to authentic *L. gracilis*, which contained an unusual group of germacrenolides, it possessed a distinctive group of heliangolides.

The Apalachicola bluffs plants are distinctive morphologically and chemi-

cally but have not been given nomenclatural recognition. The most recent summary of the genus (King & Robinson 1987) makes no mention of this taxon; neither does Wunderlin (1998) in his guide to the flora of Florida. It is here named *Liatris gholsonii* to honor Angus K. Gholson of Chattahoochee, Florida, an indefatigable field botanist and astute student of the local flora. Together, he and Godfrey collected an extensive population series of this new species.

METHODS AND MATERIALS

Vegetative and floral features of the new species and of *Liatris gracilis* were measured from the extensive population samples vouchered at FSU. Flowering heads were softened in a weak solution of NaOH in 50% ethanol to return tissues to their hydrated size and to facilitate dissection. Meiotic chromosome counts were determined from fresh flower buds preserved in Carnoy's solution (6:3:1 parts alcohol: chloroform: acetic acid). Gholson's personal herbarium is here termed "AKG"; it will eventually become part of FLAS.

SPECIES DESCRIPTION

Liatris gholsonii L.C. Anderson, sp. nov. (**Fig. 1**). TYPE: UNITED STATES. FLORIDA. Liberty Co.: shaded upper slopes of No Name Ravine on the Nature Conservancy's Apalachicola Bluffs and Ravines Preserve, T1N, R7W, SW1/4 Sec 7, 13 Sep 2001, *L.C. Anderson 19932* (HOLOTYPE: BRIT; ISOTYPES: FSU, MO, NY).

Herbae perennes plus minusve pubescentes et glanduloso-punctatae, caulibus 4.5–18.5 dm longis, eramosis infra inflorescentiam. Folia caulina inferiora petiolata 8–25 cm longa, laminis oblongo-lanceolatis 8–27 mm latis; folia superiora sessilia elliptica sursum sensim deminuentia. Inflorescentiae elongatae determinatae racemosae, pedicellis patentibus vel reflexis 2–26 mm longis. Bracteae florales infimae sessiles, anguste ellipticae, 2–5.9 mm longae, 1.8–9 mm latae. Capitula turbinata 6–10 mm longa, phyllariis 8–15 plerumque acutis ad acuminatis. Flosculi disci 3–6, corollis infundibuliformibus 6.7–10 mm longis roseis ad purpureis. Achaenia 4.5–4.8 mm longa 10-costata pubescentia, pappo barbellato 5–6 mm longo.

Perennial herbs, with spherical corm-like rootstocks 2–2.5 cm wide; radical leaves (usually absent at anthesis) long-petiolate, 22–25 cm long, blades entire, narrowly elliptic-oblong, 20–26 mm wide, glabrate, finely glandular-punctate on both surfaces. Stems (4.5–)5.5–12(–18.5) dm long, terete, striate, unbranched below the inflorescence, pubescent with hairs appressed or spreading. Cauline leaves alternate, entire, numerous, much longer than internodes, punctate; lower leaves (8–)13–22(–25) cm long, the petioles (2.5–)4–7(–10) mm long, ciliate, blades elliptic to oblong-lanceolate, tapering at base and tip, (8–)11–22(–27) mm wide, midveins raised and sparsely villosulous; leaves gradually reduced in size and becoming sessile toward the inflorescence, grading to the leafy floral bracts with little change in size or shape. Inflorescence elongate, determinate, racemose (rarely paniculate in damaged plants or frequently so in garden plants), pedicels spreading or reflexed at anthesis, pubescent, (2–)5–12(–26) mm long on heads toward base of inflorescence. Lowest floral bracts sessile, narrowly

FIG. 1. Plant of *Liatris gholsonii* (*Godfrey 76707.1*, a relatively small plant with few leaves to facilitate scanning) and enlargement of one head from *Anderson 19932*.

elliptic to lanceolate, (2–)2.5–4.5(–5.9) cm long, (1.8–)2–6(–10) mm wide. Heads turbinate-cylindric, (6–)6.5–8.5(–10) mm long, phyllaries (8–)9–12(–15), green to dark purple, ovate to oblong, acute to acuminate (rarely obtuse), glandular-punctate, ± ciliate, margins hyaline, white or roseate. Disk flowers 3–5(–6); corollas (6.7–)7–8.5(–10) mm long, narrowly funnelform, sparsely glandular punctate, throat pubescent internally, the tube ochroleucous or pinkish, the lobes pink to purple, slightly spreading to reflexed, (2.1–)2.5–3.6(–4.6) mm long; bifid styles pink, (11–)12–13(–14) mm long, anthers (2.5–)3.5–4(–4.4) mm long, with retuse appendages 0.2 mm long; mature achenes 3.5–5 mm long, 10-ribbed, gray except for raised, dull green ribs, narrowly turbinate, densely hispidulous, the

hairs 0.4–0.5 mm long, pappus strongly barbellate, 5–6 mm long, white, tinged with purple to give a dull rosy appearance. $n = 10$.

Phenology.—Primarily flowering from September to mid-October; a very few precocious plants blooming in early July and a few blooming in early November.

Habitat.—The species occurs in loamy sand or gravelly sand mostly in deep shade of deciduous woodlands on upper slopes of bayhead ravines or along the less shady ecotone between the woodland at tops of ravines adjoining more open scrub oak woodland. It also occurs in xeric to sub-mesic woodland and more or less open sites on bluffs facing the Apalachicola River or on sandy ridge tops between ravines.

Associated woody species include: *Asimina parviflora* (Michx.) Dunal, *Callicarpa americana* L., *Carya pallida* (Ashe) Engelm. & Graebn., *C. tomentosa* (Poir. in Lam.) Nutt., *Cornus florida* L. , *Diospyros virginiana* L., *Forestiera godfreyi* L.C. Anderson, *Fraxinus americana* L., *Ilex opaca* Ait., *Juniperus virginiana* L. , *Magnolia grandiflora* L., *Osmanthus americanus* (L.) Benth. & Hook. ex A. Gray, *Ostrya virginiana* (Mill.) K. Koch, *Persea borbonia* (L.) Spreng., Pinus *glabra* Walt., *Prunus alabamensis* Mohr, *Quercus alba* L., *Q. geminata* Small, *Q. hemisphaerica* Bartr., *Q. nigra* L., *Rhus copallina* L., *Sebastiania fruticosa* (Bartr.) Fern., *Sideroxylon lanuginosum* Michx., *Vaccinium arboreum* Marsh., and *Viburnum dentatum* L. A few herbaceous species are associates in the shaded sites, such as *Chasmanthium sessiliflorum* (Poir.) Yates, *Michella repens* L., *Smilax pumila* Walt., *Solidago arguta* Aiton, and *Spigelia marilandica* L.

DISCUSSION

Gaiser (1946) recognized 10 series of species in her monograph of *Liatris*. Series Graminifoliae (with obtuse, ciliolate phyllaries as in *L. gracilis*) and series Pauciflorae (which has generally larger heads with acuminate phyllaries that lack cilia) are relevant to this discussion. The phyllaries of *L. gholsonii* are ciliate (as in Graminifoliae) but usually acuminate (as in Pauciflorae). The distinctiveness of the two series was already diminished when Godfrey (1961) described *L. provincialis*; that Florida panhandle endemic has strongly acuminate but ciliolate phyllaries.

Gaiser (1950) studied the cytology in these series and found the species were all diploids (n = 10). The chromosomes were small with uniform karyotypes. For *Liatris gholsonii*, meiotic chromosome counts from buds of *Anderson 19932* were *n* = 10; the chromosomes were also very small, so chromosome numbers and karyotypes are not distinctive features taxonomically.

The new species appears most closely related to *Liatris gracilis*; both have small heads on relatively long, usually spreading pedicels. The two differ in their ecology, chemistry (Herz et al. 1984a, b), and morphology. Typical habitat for *L. gholsonii* is on more or less mesic, shaded ravine slopes and bluffs; only a few plants occur in full sun (in openings in the canopy from tree-fall or along the ecotone between the ravine and the adjacent sandhills), whereas *L. gracilis* typically occurs in sunnier, more xeric, open flatwoods and savannas. The two species are not sympatric, but *L. gracilis* does occur nearby in the same county.

Foliage is perhaps the most distinguishing feature separating the two species. Basal leaves on young plants are broadly elliptic in *Liatris gholsonii* (as in *Godfrey 84073*), whereas they are narrowly lanceolate in *L. gracilis* (see photograph in Gaiser 1950). Flowering plants of *L. gholsonii* tend to retain more of the basal and lower cauline leaves, which are also wider (mostly 11–22 mm wide) than those of *L. gracilis* (4–13 mm wide). The transition between cauline leaves and floral bracts is gradual in the new species, and the floral bracts are mostly 2–6 mm wide, whereas they are narrower (1.0–1.8 mm wide) in *L. gracilis*.

One might think the differences in foliage could be products of the species' differing habitats. In general, plants of the same or related species grown in full sun have smaller, narrower leaves than those found on plants grown in the shade. However, the larger leaves of *L. gholsonii* are not due to habitat. The few collections of *L. gholsonii* taken in full sun were more robust plants that had shorter internodes, average-sized cauline leaves for the species, but wider floral bracts than plants from shadier sites. Plants grown in full sun tended to have more phyllaries in their involucres (and thus be more like those of *L. gracilis*) than those grown in shade.

Personnel of the Apalachicola Bluffs and Ravines Preserve established a wildflower garden in full sun near their headquarters building. The garden soil was enriched with mushroom compost and was given supplemental water. Seeds of *Liatris gholsonii* from No Name Ravine were sown in the garden in 1997, and many plants became established. These plants are somewhat atypical in having mostly two or three stems per rootstock and large, paniculate inflorescences. These "full sun" plants still had the characteristic leaves and floral bracts of *L. gholsonii*.

Several features of floral morphology tend to separate to two species, but variation is sufficient within each species that no single feature provides absolute identification. For example, phyllaries in the new species tend to be acuminate, but some plants have phyllaries that are only acute (or rarely obtuse), and phyllaries in *Liatris gracilis* are usually very obtuse (rounded apically), but a few specimens have phyllaries that are acute or rounded but mucronate. Summation of some floral measurements from over 30 samples per species is in Table 1. Plants of *L. gholsonii* tend to have shorter involucres (shortest in the genus) with fewer phyllaries, but their corollas and achenes tend to be larger than those of *L. gracilis*.

Differences between the two species in floral morphology (Table 1) are present (though minimal is some cases). The salient distinguishing features between the two taxa are mostly vegetative; the following key couplet provides a useful summary:

Lower floral bracts over 2 mm wide; lower cauline leaves elliptic, mostly over 12 mm wide; phyllaries usually acuminate, rarely obtuse _____ **Liatris gholsonii**

Lower floral bracts under 2 mm wide; lower cauline leaves lanceolate, mostly under 12 mm wide; phyllaries usually obtuse, rarely acute _____ **Liatris gracilis**

Now the Florida panhandle has two endemic species of *Liatris*; *L. provincialis* is found in Franklin and Wakulla counties and is considered endangered in Florida (Coile 2000). The range of *L. gholsonii* is even more restricted; it ranges about 14 km from Torreya State Park to just south of Alum Bluffs and occurs on bluffs or in ravines only a short distance eastward from the Apalachicola River. The most distant population from the river is found in the headwaters of Sweetwater Creek about 9 km from the river. This species is clearly a candidate for listing as endangered.

ACKNOWLEDGMENTS

Staff of The Nature Conservancy's Apalachicola Bluffs and Ravines Preserve provided some logistical support. Mark Garland supplied the Latin diagnosis. Ken Womble scanned the specimens into Adobe Photoshop for the illustration. Guy Nesom, Bob Kral, and A.B. Thistle and anonymous reviewers provided helpful suggestions on the manuscript.

TABLE 1. Averages (and ranges) of selected floral features in *Liatris gholsonii* and *L. gracilis*.

	Liatris gholsonii	Liatris gracilis
Involucral length, mm	6.96(6.0–10.0)	7.62(5.5 10.0)
Phyllary number	10.69(8–15)	12.33(9–16)
Flower number	4.06(3–5)	4.30(3 7)
Corolla length, mm	7.84(6.8–9.8)	7.69(6.0–9.7)
Corolla lobe length, mm	3.09(2.1–4.6)	2.82(2.0–3.9)
Anther length, mm	3.80(2.6–4.5)	2.98(2.0–3.9)
Achene length, mm	4.07(3.5–5.0)	3.40(2.8 4.4)

BOOK REVIEW

GEORGE E. BURROWS and RONALD J. TYRL. 2001. **Toxic Plants of North America.** (ISBN 0-8138-2266-1, hbk.). Iowa State Press, 2121 State Avenue, Ames, IA 50014, U.S.A. (Orders: 1-800-862-6657, 1-515-292-3348 fax; www.iowastatepress.com). $174.95, 1350 pp, 8 color plates, numerous line drawings, 8 1/2" × 11".

What a magnificent book this is! It is a hefty (nearly 1400 pp. and 8 lbs.) treatment of the plants in North America that are known to be toxic to humans and domestic animals. The combined insights of the two authors, a veterinary toxicologist and plant systematist respectively, provide a breadth and depth of coverage that make this work a worthy successor to the earlier books of L.H. Pammell (1911) and J.M. Kingsbury (1962).

The work organized for easy use. There is a brief introductory chapter, which includes a delightful dedication to the late Dr. J.W. Dollahite of Texas A&M University, who made important contributions to veterinary toxicology in through the middle 20th century. Then comes the alphabetically arranged treatments for 75 families of plants that are known to be poisonous. The treatments are divided into genera, and the treatment for each genus includes a consideration of the species. Nomenclature conforms to current floristic usage in North America. There is a general description of the plant and a statement of range and habitat that are designed to permit ready identification. Each toxic plant or group of closely related plants is given a discussion of the disease problems, disease genesis, clinical signs, pathology, and treatment & control. The page margins are wide, and printed there are line drawings and generalized distribution maps for each plant. Short phrases in boldface noting the topics in the text are also given in the margins. Structural formulas are provided for the various toxins that are discussed in the text. A nice touch is the colored photographs of 64 toxic plants, presented on 8 colored plates in the center of the volume

After the families of known toxic concern, there is a less detailed chapter on 36 other families that are of doubtful or merely suspected toxicity. Then comes a short discussion on plant identification, a list of plants by their adverse effects, a list of plants of concern for dogs, cats, and other pets, an extensive glossary, and an index.

Each family treatment has its own list of references, and the lists are extensive and current. For example, the family Euphorbiaceae, which includes numerous toxic plants, has 194 entries in the list of references. These come from the veterinary, general toxicological, and botanical literature, and most of the references are from the past 25 years. Lengthy reference lists are given for other families as well, which make the book a rich bibliographic tool for researchers. A cursory pass-through showed all references to be from the English language literature.

A particularly attractive feature is the simple accessibility of the contents. A person needing information about a toxic plant (such information is often needed in a hurry) can locate the information easily and rapidly, and that is remarkable for such a large, encompassing book.

The book is an expensive reference work and doubtless some users will know of things that the authors might have included, but had the authors opted for perfection, the book would never have been completed. Instead of a piddly quibble here and there, we can all be grateful that the work was completed and made available to the great community of consumers of botanical and toxicological information.—*Theodore M. Barkley, Botanical Research Institute of Texas, barkley@brit.org*

A NEW SPECIES OF *GONOLOBUS* (APOCYNACEAE: ASCLEPIADEAE, GONOLOBINAE) FROM SOUTHERN COSTA RICA

Alexander Krings

Herbarium, Department of Botany
North Carolina State University
Raleigh, NC 27695-7612, U.S.A.
Alexander_Krings@ncsu.edu

ABSTRACT

A new species of *Gonolobus* is described, resulting from collections from southern Costa Rica.

RESUMEN

Se describe una especie nueva de *Gonolobus* como resultado de recientes colecciones del sur de Costa Rica.

Recent study of lianas and vines in southern Costa Rica resulted in a preliminary checklist of seventy species in thirty-two families from the Las Cruces Biological Station (Krings 1999). Ongoing work with collections resulting from this study revealed a new species of *Gonolobus* Michx. (Apocynaceae: Asclepiadeae, Gonolobinae).

Gonolobus tenuisepalus Krings, sp. nov. (**Fig. 1**). TYPE: COSTA RICA. PUNTARENAS: Coto Brus, San Vito de Java, Estación Biológica Las Cruces, 30 m downhill from Trail Marker Ft 59, 1200 m elev., 11 Mar 1997, *Krings 274* (HOLOTYPE: F; ISOTYPES: CR, NCSC, US).

Species nova *Gonolobus* distinguibili a *Gonolobus jaliscensis* B.L. Rob. & Greenm. petioli c. 4–4.3 cm longi; sepala lineare vel anguste lanceolata, supra glabrata, subtus dense pilosa, 5–7.2 mm; corollae purpureis, lobi deltatis, supra puberulis, subtus pilosis.

Twining vine; indument of short and long hairs, the short hairs straight, pointed or sometimes capitate, to 0.4 mm long, borne primarily along the stem, midvein, and secondary veins, long hairs straight to flexuously curved, (2–)2.8–3.5(–4.3) mm long, borne along stem, veins, and over leaf surfaces; stems densely yellowish-clear pilose or hirsute; latex white, abundant; petioles 4–4.3 cm long, densely yellowish pilose to hirsute; leaves opposite, 12–14 cm long, 6.8–8 cm wide, ovate, densely yellowish pilose to hirsute on both surfaces, the bases cordate to somewhat auriculate, frequently oblique, the apices acuminate; inflorescences axillary, umbelliform, densely 9–15-flowered, the peduncles 0.5–1 cm long; pedicels 7–9 mm long, densely yellowish pilose to hirsute, the hairs to 3 mm long; flowers mildly fetid; sepals 5, linear to narrowly lanceolate, 5–7.2 mm long, pilose or hirsute on the outer surface, glabrate on the inner surface; corolla campanulate

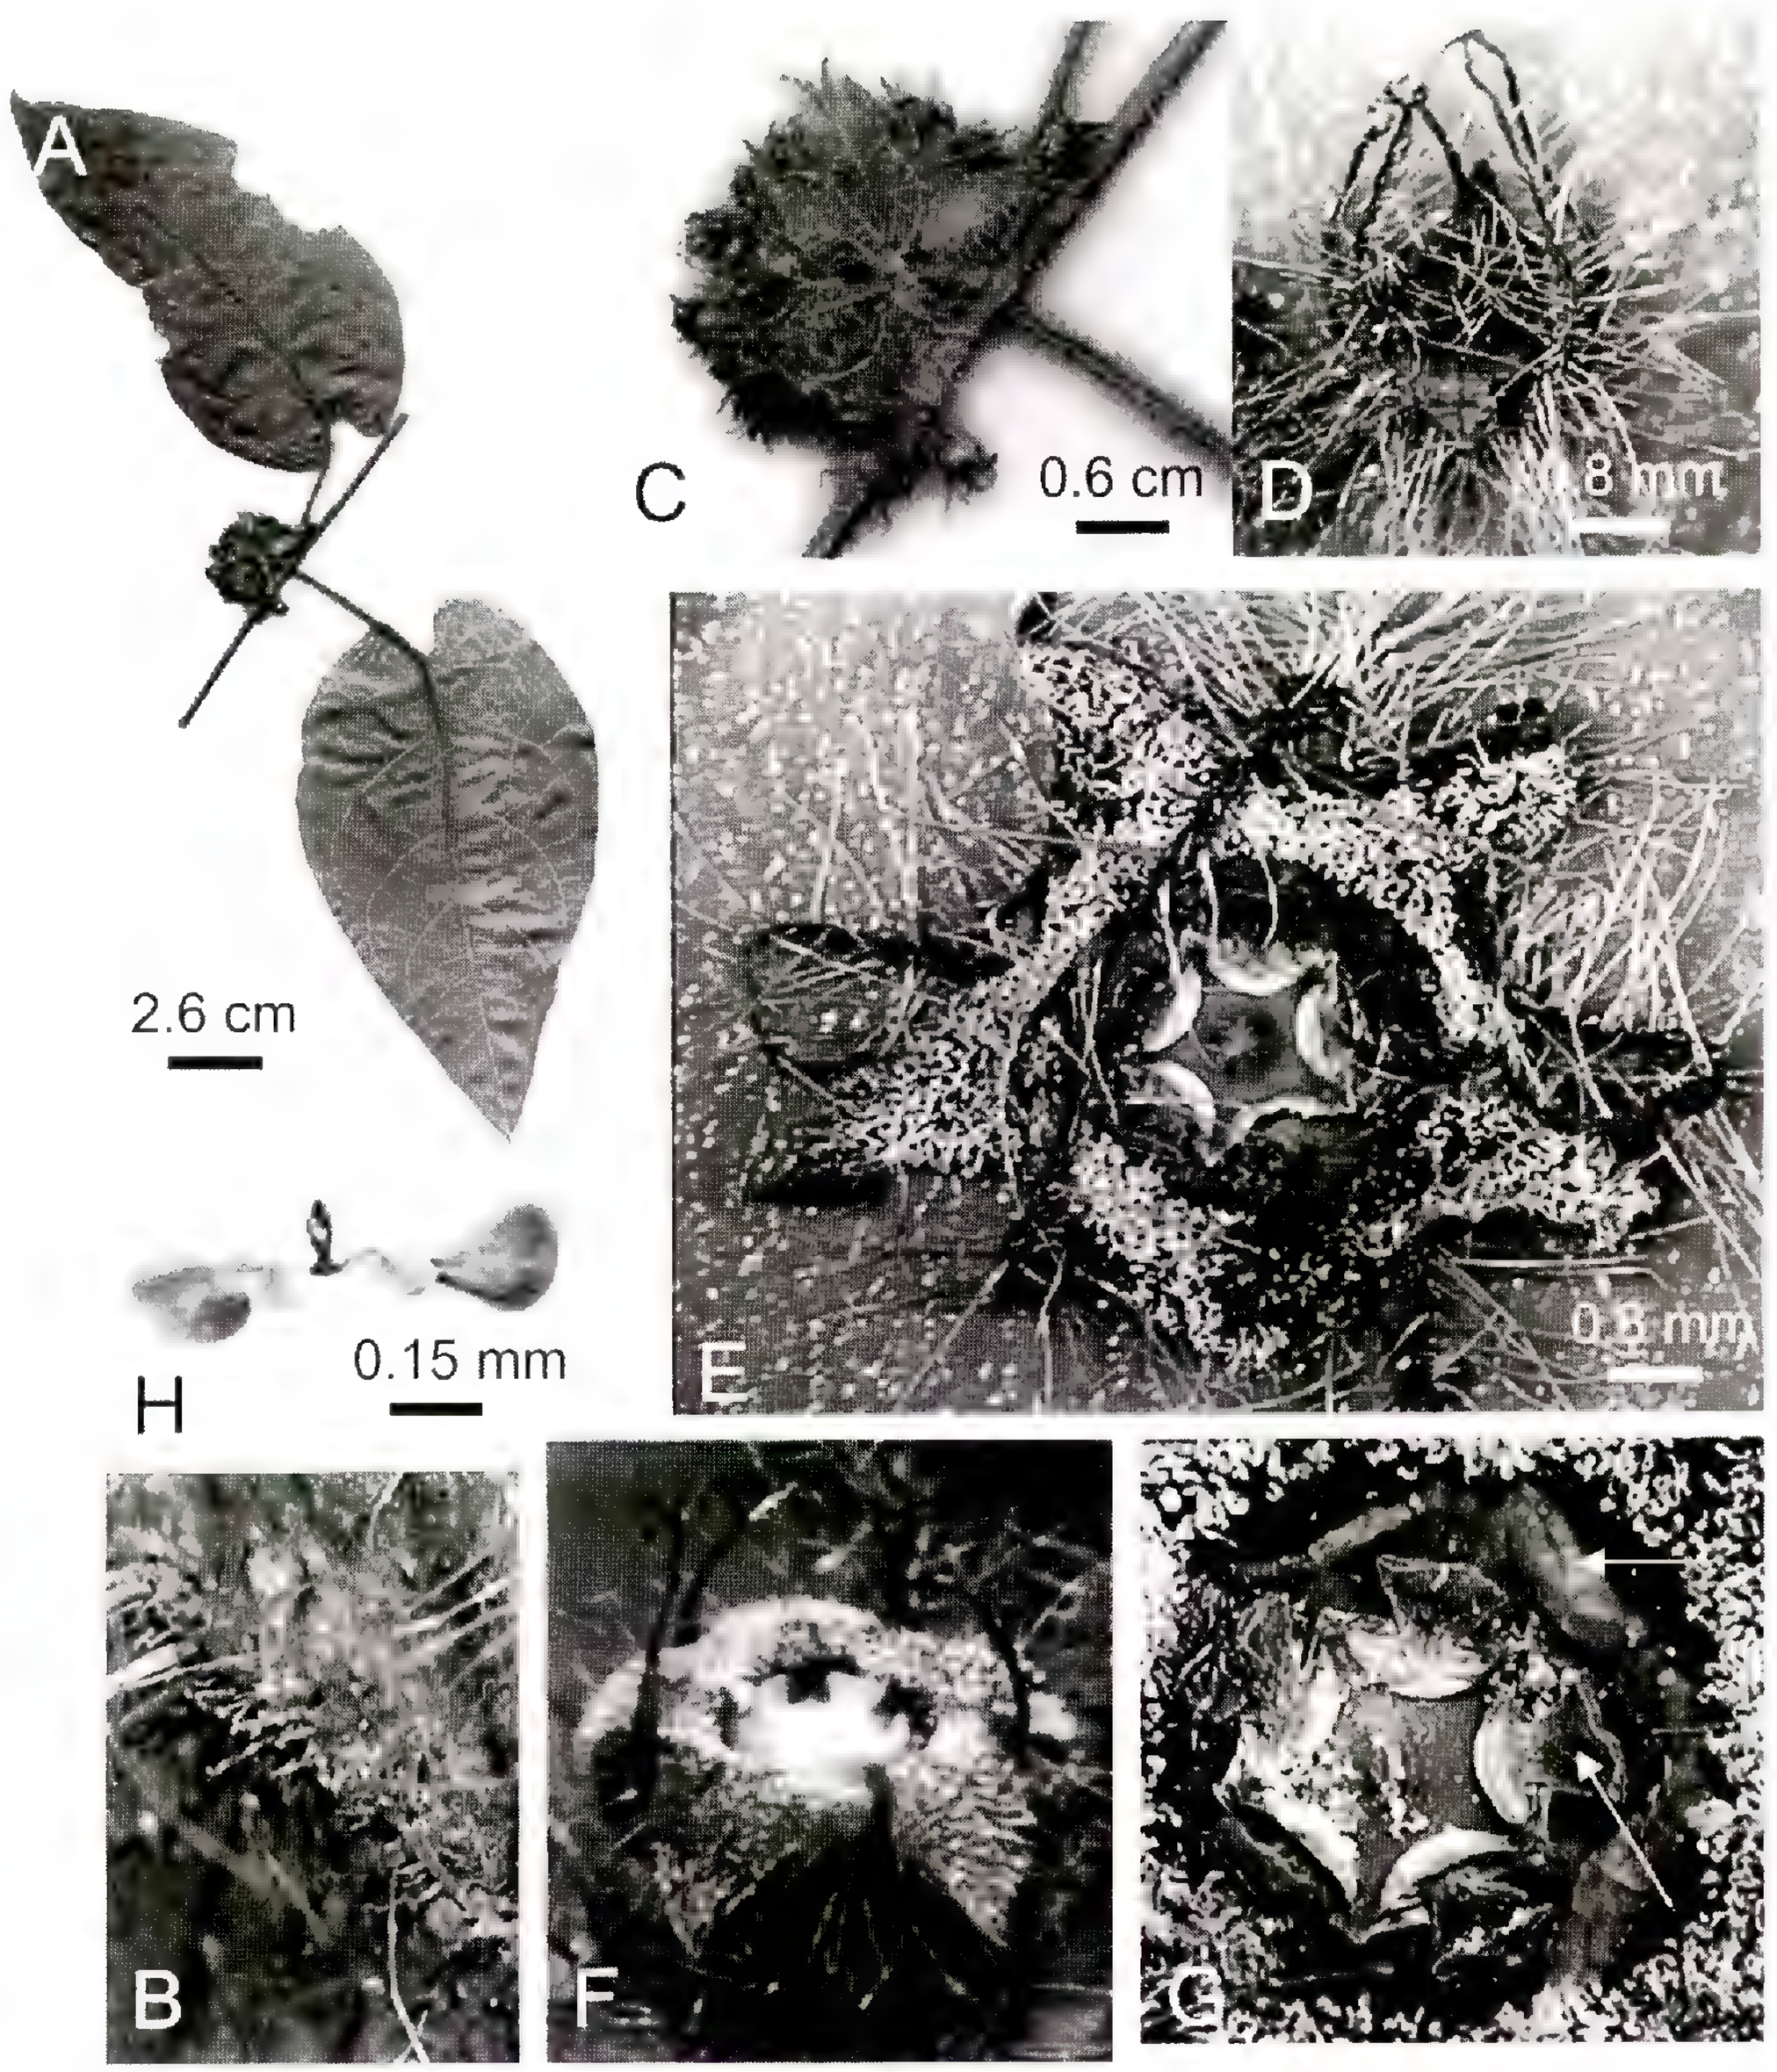

FIG. 1. *Gonolobus tenuisepalus* Krings: A. Leaves and inflorescence; B. Long and short stem trichomes; C. Inflorescence; D. flower in bud; E. Dried, flattened flower; F. Living flower, showing erect sepals and anther appendages; G. Detail of flattened flower (horizontal arrow indicates glabrous faucal annulus; diagonal arrow indicates anther appendages); H. Pollinarium. All based on *Krings 274* (HT: F; IT: CR, NCSC, US).

to suburceolate, 5-lobed, the tube 1–2.5 mm long, the lobes deltate, uniformly flat, dark purple to dark brownish-red, 3–4 mm long, conspicuously shorter than the sepals, long yellowish pilose to hirsute below, the hairs to 2.8 mm long, coarsely villosulous-strigillose above; faucal annulus 5-lobed, ca. 0.05-0.1 mm thick, glabrous; corona 1, 5 -lobed, fused at the base, adnate to and surrounding

the gynostegium, the lobes deltoid to rhomboid, essentially as high as the stylehead, 0.4–0.5 mm high; anthers with fleshy, obdeltate, dorsal appendages; pollinaria horizontal, ca. 0.5 mm long; follicles unknown.

Gonolobus comprises about 150 species limited to the New World tropics and subtropics (Stevens 2001). *Gonolobus tenuisepalus* appears to be closely related to *Gonolobus jaliscensis* B.L. Rob. & Greenm., sharing indument of short and long hairs, densely multi-flowered, umbelliform inflorescences, small corollas (ca. 8 mm in diam.), and similar coronas and anther appendages. *Gonolobus jaliscensis*, however, exhibits petioles shorter (to 2.2 cm long), sepals shorter (only to 2 mm long), corollas greenish to yellowish (purple in *G. tenuisepalus*), and anther appendages mushroom-shaped. With the addition of *G. tenuisepalus*, nine species of *Gonolobus* are known from Costa Rica (two yet undescribed, see Stevens 2001). An updated key follows:

1. Corollas barbellate within or with barbed lobes.
   2. Abaxial and adaxial leaf surfaces glabrous, except scattered appressed-pilose along the principal veins and in the axils; faucal annulus glabrous; anther appendages ⩾ 1.4 mm long _____ **Gonolobus barbatus** Kunth
   2. Abaxial and adaxial leaf surfaces puberulent; faucal annulus ciliate (although this sometimes hidden by the barbellate hairs of the corolla limb); anther appendages ca. 0.9 mm long _____ **Gonolobus edulis** Hemsl.
1. Corollas variously glabrous or pubescent, but not barbellate or barbed.
   3. Corolla purple, the lobes 4 mm long or less; faucal annulus 0.05-0.1 mm high, essentially a 5-lobed ridge; anther appendages obdeltate, ca. 0.5 mm long _____ **Gonolobus tenuisepalus** Krings
   3. Corolla greenish or yellowish (sometimes purple in *G.* sp. B and *G.* sp. D), the lobes ⩾ 6 mm long; faucal annulus various; anther appendages lacking (*G.* sp. B) OR ⩾ 0.3 mm long and variously shaped, the apices entire, bifid, or with a central mamillate tip.
      4. Outer petal surface with trichomes 0.8–1.5 mm long; anther appendages bifid _____ **Gonolobus heterophyllus** (Hemsl.) W.D. Stevens.
      4. Outer petal surface glabrous or the trichomes ⩽ 0.4 mm in length; anther appendages entire, mamillate tipped, or lacking, but not bifid.
         5. Corolla lobes ⩾ 15 mm long; anther appendages subquadrate, 1–2 mm long _____ **Gonolobus albomarginatus** (Pittier) Woodson
         5. Corolla lobes ⩽ 12 mm long; anther appendages various or lacking.
            6. Corolla purple, the lobes 7.2–9.5 mm long, the apices concave; faucal annulus an erect, 5-lobed tube, 0.7–1.2 mm long; anther appendages lacking _____ **Gonolobus** sp. B
            6. Corolla greenish or yellowish (sometimes purple in *G.* sp. D), the lobes of various lengths, planar; faucal annuli various, sometimes an indistinct ridge (e.g., *G. chiriquiensis*); anther appendages present.
               7. Leaf bases truncate to rounded; antner appendages rounded, with a short, central, mammillate tip _____ **Gonolobus chiriquensis** (Woodson) Woodson
               7. Leaf bases cordate; anther appendages various.
                  8. Corolla purple, brownish, or green, the tube 1.7–2.7 mm long, the

lobes 6.6–11.7 mm long, 3.2–4.7 mm wide; gynostegium stipitate, the stipe 0.3–0.6 mm long; corona cup-shaped _____ **Gonolobus** sp. D

8. Corolla green, the tube 3.7–5.7 mm long, the lobes 12.2–18.2 mm long, 7.8–12.5 mm wide; gynostegium essentially sessile; corona not cup-shaped _____ **Gonolobus denticulatus** (Vahl) W.D. Stevens

ACKNOWLEDGMENTS

Collections at Las Cruces Biological Station were made possible thanks to a travel grant and assistantship provided by the College of Forest Resources at North Carolina State University and fellowships in Tropical Biology from the Organization for Tropical Studies (OTS). I thank: OTS for permission to conduct research at Las Cruces and for help with collecting permits, Luis Diego Gómez for support and insight during my stay, Paul Fantz for help with the Latin diagnosis, Mary E. Endress and J. Francisco Morales for thoughtful reviews of the manuscript, and the following herbaria and their curators (particularly Robert Wilbur, William Burger, and Pedro Acevedo) for access to their collections: DUKE, F, US.

A NEW SPECIES OF *MEDINILLA* (MELASTOMATACEAE) FROM ANAMALAI HILLS, SOUTH INDIA

N. Sasidharan and P. Sujanapal

Kerala Forest Research Institute
Peechi 680 653
Kerala, INDIA

ABSTRACT

An undescribed species of the genus *Medinilla* Gaud., from the Anamalai Hills, South India, is described and illustrated.

RESUMEN

Una especie no descrita del género *Medinilla* Gaud., de Anamalai Hills, sur de India, se describe y se ilustra.

INTRODUCTION

Medinilla Gaud., an Afro-asiatic genus is estimated to have 430 species (Veldkamp pers. comm.). The genus has a bicentric distribution pattern due to the movement of landmasses during the late Cretaceous period from a Gondwanian origin (Nayar 1972). In Asia, the distribution ranges from Indian-Himalaya southwards to Sri Lanka, Myanmar, Thailand, Cambodia, Vietnam, Malay Peninsula eastward through the islands of the Malay Archipelago, New Guinea down to Northern Australia, and is adapted to warm humid paleotropical climate. More than 300 species are reported from the Indo-Malaysian region (Nayar 1966). Malayan regions and Madagascar are the principal centers of diversity and endemism- Philippines: 80 species, Madagascar: 70 species, Borneo: 48 species (Perrier 1951; Regalado 1990, 1995). Nayar (1972) has analyzed the distribution pattern of Asiatic Melastomataceae and recognized four centers. The Western Ghats is included in the Deccan-Ceylon center (Peninsular India and Sri Lanka) of species formation. Among the 9 Indo-Sri Lankan species, 5 are reported from Peninsular India and Sri Lanka and others are confined to the subtropical Himalayas and Assam hills. *Medinilla beddomei* Clarke and *M. malabarica* Bedd. are exclusive to Southern Western Ghats and the third species, *M. fuchsioides* Gard., formerly considered endemic to Sri Lanka, was recently reported from Southern Western Ghats (Shetty & Karthikeyan 1976).

During explorations in the windward region of Southern Western Ghats, interesting specimens of *Medinilla* were collected from three localities of Anamalai Hills. The specimens did not agree with the species known from India and Sri Lanka. Further study with literature on *Medinilla* (Bremer 1987; Perrier 1951; Regalado 1990, 1995) shows that the specimens have more affinity to Indo-Sri Lankan

SIDA 20(1): 109 – 113. 2002

species and is allied to *Medinilla malabarica* Bedd. The specimens were further compared with the collections from Indo-Malaysia in the Kew Herbarium and no matches were found. It is described and illustrated here as a new species.

Medinilla anamalaiana Sasidharan & Sujanapal, sp. nov. (**Fig. 1**). TYPE: INDIA. KERALA: Palakkad District, Parambikulam Wildlife Sanctuary, Shekkal mudi 1200 m, 1 May 1999, *P Sujanapal* 19431 (HOLOTYPE: MH; ISOTYPES: CALI, KFRI, L).

Medinilla anamalaiana M. malabaricae affinis in habitu omnium foliorum innovatiorumque rufobrunneorum, sed surculis succulentis (sub)quadrangularibus, foliis membranaceis 3-costatis, apice obtuse acuminato, inflorescentiis axillaribus vel e axillis defoliatis in seriebus horizontalibus, floribus breve pedicellatis gerentibus distinguendum. In *M. malabarica* rami annotini teretes indurati folia crasse coriacea 5-costata, apice acuto vel obtuso, flores in cymis pedunculatis gerentes.

Epiphytic subshrubs; branches fleshy, acutely quadrangular or subquadrangular, sparingly branched, sometimes rooting from lower nodes, smooth, on drying forms a winged appearance; stem 20–35 cm long, young shoots reddish-brown. Leaves membranous, opposite pairs unequal, sometimes equal, larger one 7–11.5 × 3–5 cm, smaller 4–6 × 2.5–3.5 cm, elliptic-oblong, base subcordate or obtuse, apex obtusely acuminate, acumen sometimes twisted, margin entire, 3-nerved, lateral ribs near the margins, faint towards apex; petiole 2–4 mm, flattened, glabrous. Flowers 4-merous, 2–5 in axils or from leafless nodes in horizontal row, sometimes 2 or 3 on a short stalk (1–2 mm); pedicel with 2 minute bracteoles at base, jointed, 2 mm at anthesis, elongating to 4 mm in fruit; hypanthium obovate, subquadrangular, 3 mm across, thinly puberulous, shortly narrowed at mouth with 8 minute teeth; petals 5–7 × 4 mm, rose-pink, obliquely obovate, minutely apiculate; stamens 8, filaments 3 mm long; anthers 2 mm long; ovary 1.5 mm across, obovoid, 4-celled, connected to hypanthium with 8 membranous appendages; style to 7 mm long; stigma minutely capitate, papillate. Berries 4 mm across, globose, glabrous; crowned by a small hypanthial limb; seeds many, yellowish-brown, 1.5 × 1 mm, smooth, ovoid, concave on the side of raphe.

Medinilla anamalaiana is allied to *M. malabarica* Bedd. in the general appearance of the leaves and reddish-brown tender shoots. However, it can be distinguished from the latter by the succulent quadrangular or subquadrangular branches, 3-nerved membranous leaves with obtusely acuminate apex and short pedicelled flowers in axils or from leafless nodes in horizontal rows. *Medinilla malabarica* Bedd. has terete woody branches, 5-nerved thickly coriaceous leaves with acute or obtuse apex and flowers in pedunculate cymes.

Note.—The floral structure of *Medinilla* appears to be uniformly similar in most of the species and is not much diagnostic value. Because of the high rate of endemism in *Medinilla* most of the workers followed geographic distribution in addition to morphological or vegetative characters in their regional revisions or floristic works. Our taxonomic concept for describing *M. anamalaiana* also follows the same approach in addition to morphological characters.

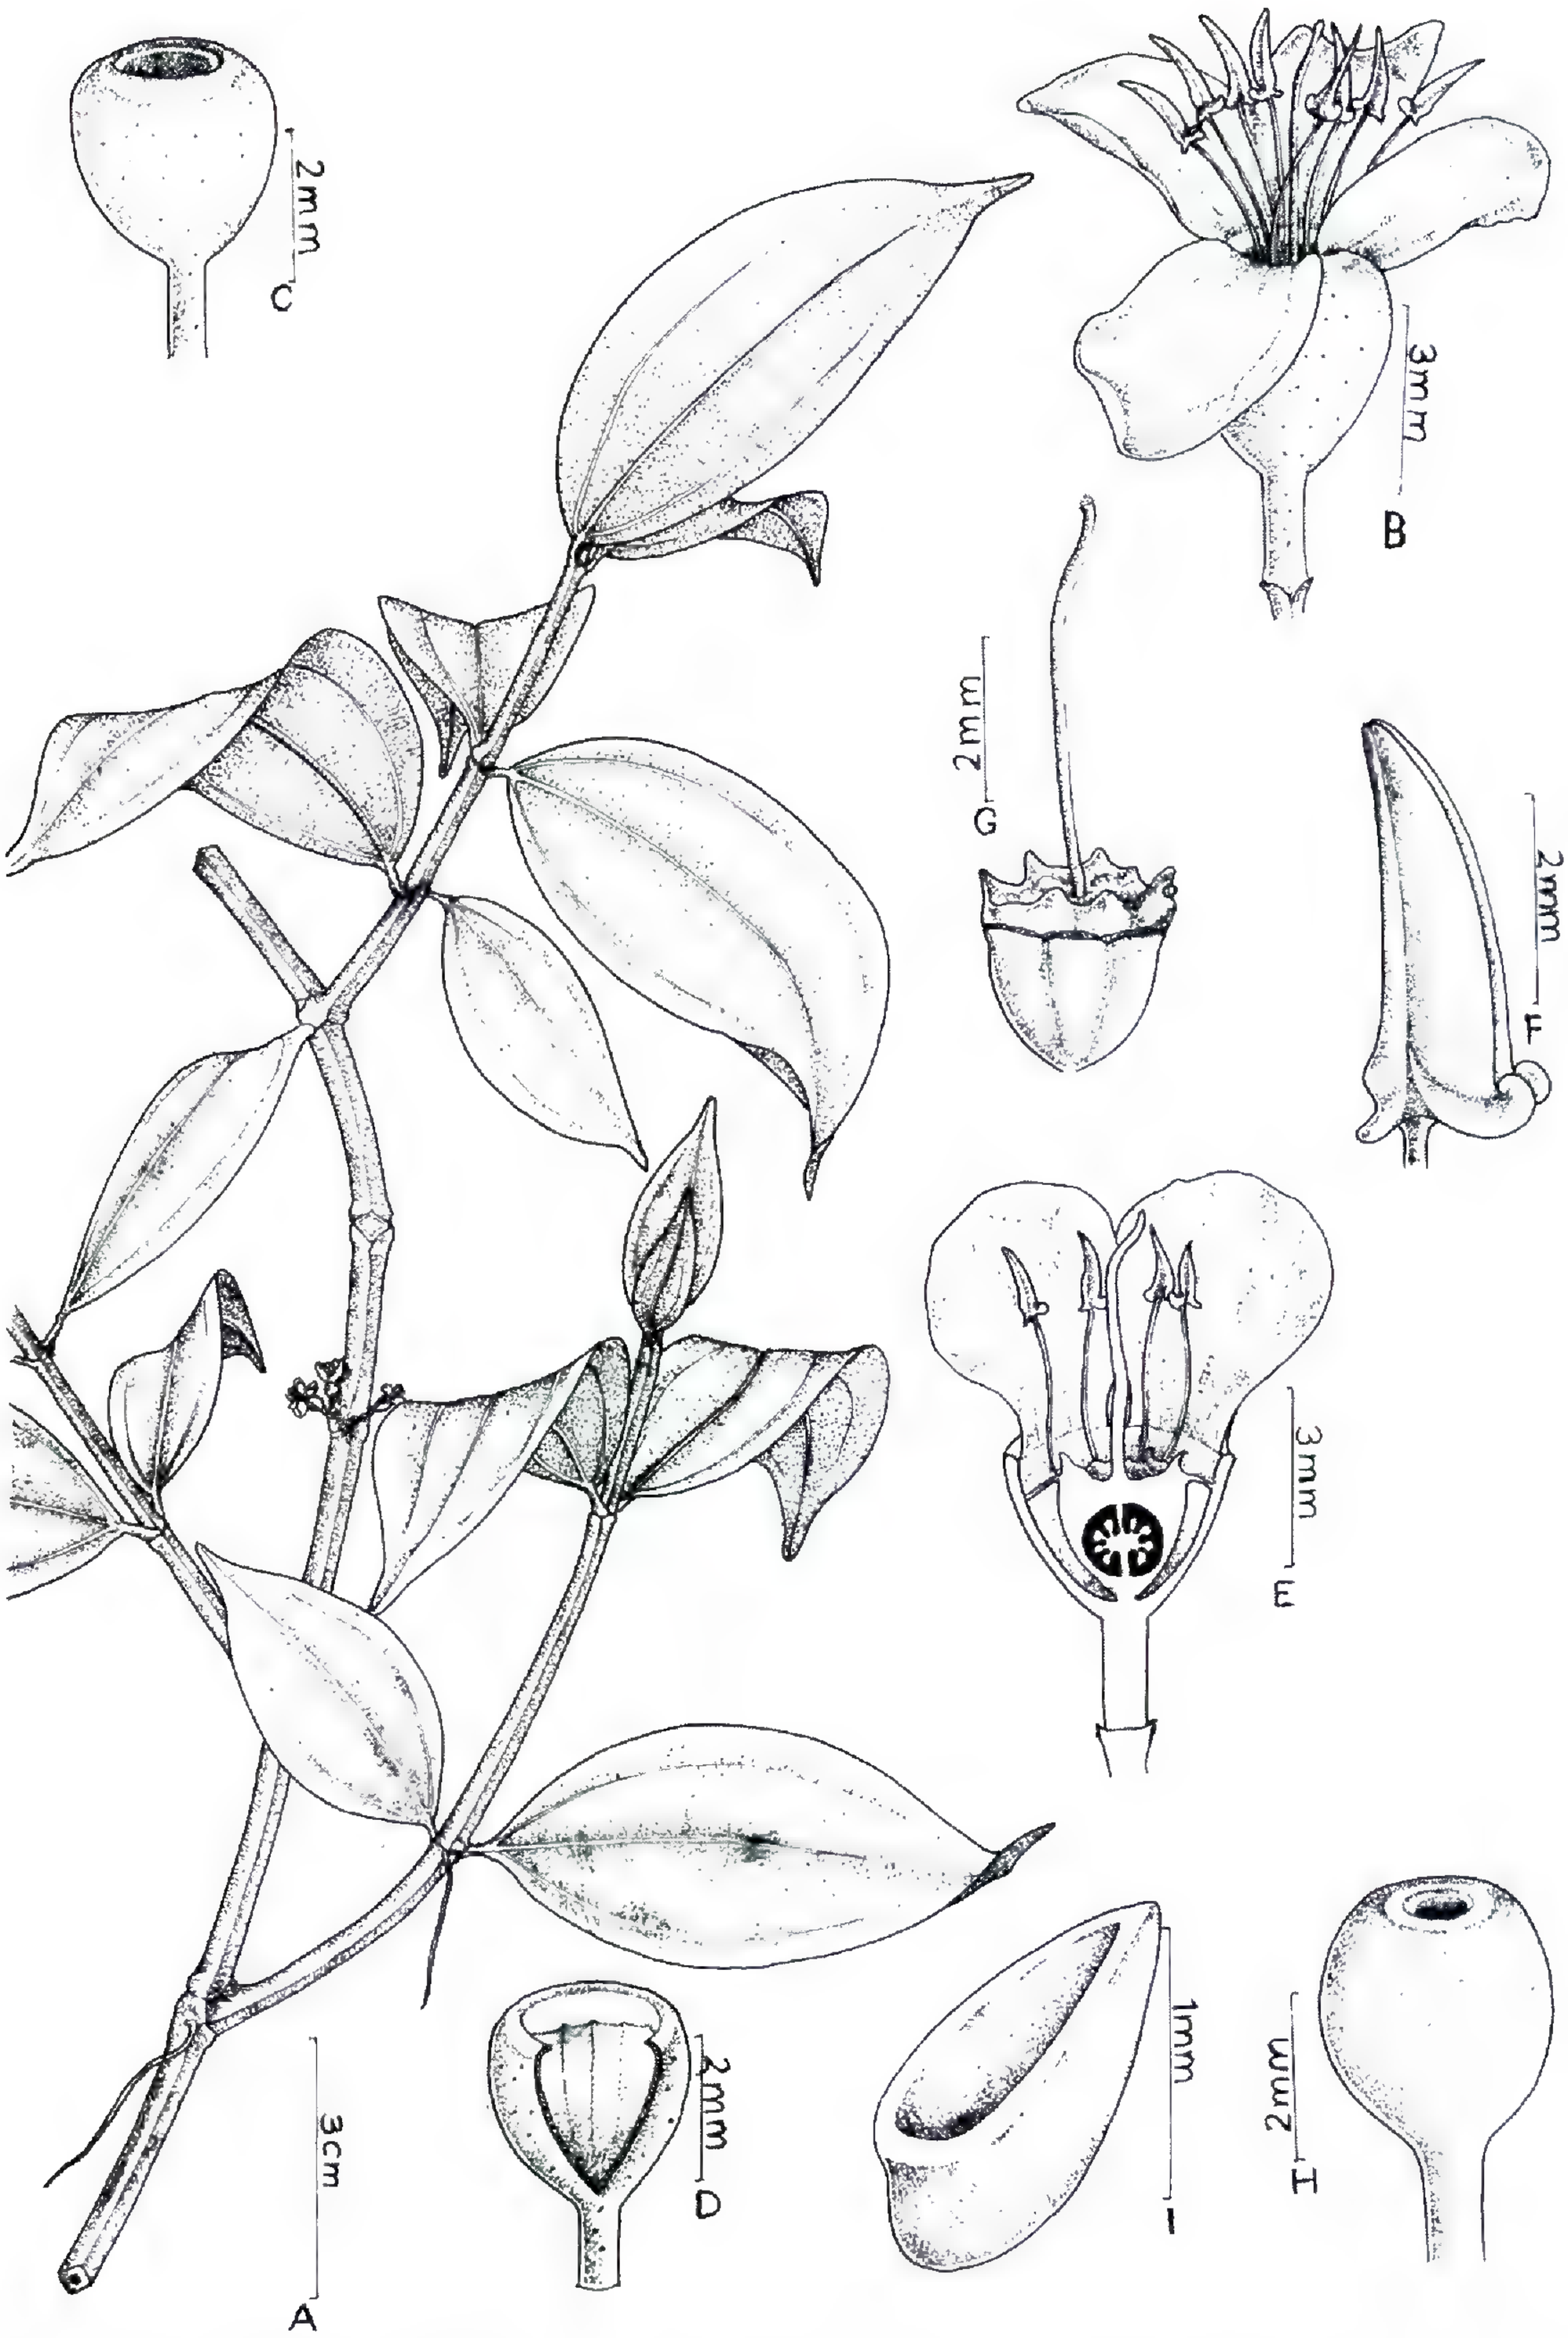

FIG. 1. *Medinilla anamalaiana* Sasidharan & Sujanapal. A. flowering twig; B. flower; C. hypanthium; D. hypanthium cut open; E. flower L.S; F. anther; G. pistil; H. fruit; I. Seed.

Flowering and Fruiting.—January–June.

Etymology.—The specific epithet of the new species is derived after its type locality, the Anamalai hills.

Distribution and Status.—The species is so far restricted to the evergreen forests, with an altitude ranges from 400–1300 m in the windward side of Anamalai hills.

Habitat and Ecology.—An epiphyte in the crevices of trees in the middle stratum of evergreen forests. This species is often found associated with epiphytes like *Aeschynanthus perrottetii* A. DC. Common tree associates are *Gymnanthemum arborea* (Buch.-Ham.) H. Rob, *Elaeocarpus glandulosus* Wall. ex Merr., *Turpinia malabarica* Gamble, *Drypetes wightii* (Hook. f.) Pax & Hoffm., *Palaquium ellipticum* (Dalz.) Baill., *Calophyllum polyanthum* Wall. ex Choisy, *Mesua thwaitesii* Planch. & Triana, etc.

PARATYPES: **INDIA. Kerala. Palakkad District:** Parambikulam Wildlife Sanctuary, Puliyala 1000 m, 3 Apr 2000, *P Sujanapal 30043* (KFRI). **Pathanamthitta District**: Goodrical Range, *Moozhiyar* 500 m, 23 May 1984, *N Sasidharan 3142* (KFRI). **Idukki District:** Periyar Tiger Reserve, Vallakkadavu 900 m, 3 Jun 1995, *Jomy Augustine & KP Rajesh 15429* (KFRI).

KEY TO SOUTH INDIAN SPECIES OF *MEDINILLA*

1. Flowers in horizontal rows or on 1–2 mm long peduncle; petals 5–7 × 4 mm _____ **M. anamalaiana**
1. Flowers in pedunculate cymes; peduncle 5–12 mm long; petals 10–14 × 8–10 mm.
   2. Leaves orbicular, fleshy; branchlets 2–3 mm thick, climbing _____ **M. beddomei**
   2. Leaves elliptic or elliptic-oblong, subcoriaceous; branchlets more than 5 mm thick, not climbing, clump forming.
      3. Petiole 4–7 mm long; lateral nerves arises from the base of the lamina _____ **M. malabarica**
      3. Leaves sessile or subsessile; lateral nerves arises ca. 2 mm above the base of the lamina _____ **M. fuchsioides**

ACKNOWLEDGMENTS

We are grateful to Wildlife Wing of Kerala Forest Department for the financial assistance; Director, Kerala Forest Research Institute, for providing facilities and Wildlife Wardens and Staff of the Parambikulam Wildlife Sanctuary and Periyar Tiger Reserve. Sincere thanks are also due to J.F. Veldkamp, Rijksherbarium, Leiden for critical comments and Latin diagnosis; V.B. Sajeev for illustrations. The first author is thankful to E. Nic Laughadha, Kew Herbarium for the help rendered in referring the relevant *Medinilla* specimens.

BOOK REVIEWS

DENNIS W. WOODLAND. 2000. **Contemporary Plant Systematics. Third Edition.** (ISBN 1-883925-25-8, hbk.). Andrews University Press, 213 Information Services Building, Berrien Springs, MI 49104-1700, 616-471-6134. (Orders: aupress@andrews,edu. http://www.andrews.edu/press). Price not given, 569 pp., numerous line drawings, 7" × 10 1/2".

Contemporary Plant Systematics is written with the undergraduate or serious amateur botanist in mind. Often texts on this subject are directed at a graduate audience and are more rigorous and contain less "practical" information. Too often this subject is misunderstood and just a black box of "use less" information to the layperson. Dennis opens this box to view by including such practical topics as: basic rules for constructing and using dichotomous keys, a how-to on collecting, handling, and preserving specimens, and the role of botanical gardens in society. I really liked the chapter on pre serving plant diversity that included such topics as: value of plant species to humans, how species become endangered, genetic engineering and biodiversity, and how you can help endangered wild plants. And finally, an epilogue on the relevance of systematics to society ending with the most practical of all: job opportunities and qualifications. The book stays true to its title and includes the im portant contemporary topics of phylogenetics and molecular systematics. Of course, the bulk of the book deals with the classification of vascular plants beginning with the Pteridophytes. Dennis has been careful to include groups from around the world to give a less North American-centric view of the vascular plant kingdom with each group illustrated with botanical line drawings. My complaint with the text is this: though it contains few photographs they are all in black and white. This gives the text a rather outdated appearance. Though the text comes with a CD photo atlas of 4,700 color images I feel a more contemporary text layout would benefit this text.—*Robert J. George, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A., rgeorge@brit.org*

KATHRYN BERNICK. 1998. **Basketry & Cordage from Hesquiat Harbour.** (ISBN 0-7718-0525-9, pbk.). Royal British Columbia Museum, P.O. Box 9815 Stn Prov. Govt, 675 Belleville Street, Victoria, British Columbia, VSW 9W2, Canada. $14.95, 152 pp., 114 figures, 6" × 9".

The Hesquait are a subdivision of the people of the Northwest Coast Culture Area and are related to the aboriginal inhabitants. The study of the plant-fiber artifacts from eight separate sites on the shores of Hersquait Harbor was undertaken as part of a larger project to reconstruct burial practices and site use over time.

The author has meticulously described and illustrated by drawings all the techniques of manufacture of the recovered artifacts, and the material composition and plant names are given. In addi tion there are photographs of the actual objects, which are classified by use. Finally, there is a comprehensive discussion of the findings and implications for further study.

This is not a book for the general reader or primarily for botanists, but the depth and clarity of the work make it a valuable addition to the library of archaeologists, anthropologists, and basketry enthusiasts.—*Ruth Ginsburg, Fort Worth, Texas.*

NEW TAXA OF *CRATAEGUS* (ROSACEAE) FROM THE NORTHERN OKANAGAN–SOUTHWESTERN SHUSWAP DIVERSITY CENTER

ABSTRACT

Five new species and one new variety of *Crataegus* (Rosaceae) are described for the northern Okanagan area of British Columbia. They are *C. castlegarensis* (ser. *Douglasianae*), *C. shuswapensis* (? ser. *Douglasianae*), and *C. okanaganensis* var. *wellsii*, *C. enderbyensis*, *C. orbicularis* and *C. atrovirens* (all ser. *Purpureofructi*). This generates a rich western North American center of diversity for *Crataegus*, with 13 species so far known from this newly recognized center. Four of the species described here are endemic to the northern Okanagan but *C. castlegarensis* ranges widely to northern Oregon, northeastern Utah and western Montana while *C. okanaganensis* var. *wellsii* extends into the Okanogan of Washington. All the new taxa are illustrated and mapped. Revised keys for the relevant series are provided.

KEYWORDS: *Crataegus*, Rosaceae, new taxa, systematics, Okanagan, diversity center.

RESUMEN

Se describen cinco especies nuevas y una variedad de *Crataegus* (Rosaceae) en el norte de la región de Okanagan en la Columbia Británica. Son *C. castlegarensis* (ser. *Douglasianae*), *C. shuswapensis* (? ser. *Douglasianae*), y *C. okanaganensis* var. *wellsii*, *C. enderbyensis*, *C. orbicularis* y *C. atrovirens* (all ser. *Purpureofructi*). Esto genera un centro de diversidad rico en el oeste de Norte América para *Crataegus*, con 13 especies conocidas hasta el momento en este nuevo centro. Cuatro de las especies descritas aquí son endémicas del norte de Okanaga pero *C. castlegarensis* llega hasta el norte de Oregón, noreste de Utah y oeste de Montana, mientras que *C. okanaganensis* var. *wellsii* se extiende por el Okanoga de Washington. Todos los nuevos taxa se ilustran y cartografían. Se aportan claves revisadas para las series relevantes.

The northern Okanagan of British Columbia and the southwestern part of the adjacent Shuswap drainage is the richest area for *Crataegus* in North America west of the Rocky Mountains. In addition to the five new species described here, there are another three (Phipps & O'Kennon 1998) recently described species (*C. okennonii* J.B.Phipps, *C. okanaganensis* J.B.Phipps & O'Kennon and *C. phippsii* O'Kennon), as well as four long-ago described species, *C. chrysocarpa* Ashe (incl. *C. piperi* Britton = *C. columbiana* Howell, sens. auctt.), *C. macracantha* Lodd. ex Loud., *C. douglasii* Lindl., *C. suksdorfii* (Sarg.) Kruschke, plus the introduced *C. monogyna* Jacq., for a total of 13 species. This is enough to recognize a local diversity

center for *Crataegus* (Fig. 1), by far the richest in western North America for an area of this size. This diversity center is mapped in more detail in Fig. 2 where many of the collection localities cited in this paper can be located. The contrast with earlier understanding of *Crataegus* in British Columbia is striking. T.M.C. Taylor (1973) listed only three species for the province, the native *C. douglasii* and *C. columbiana* and the introduced *C. monogyna*, although the illustration labelled *C. columbiana* is clearly *C. macracantha* as we have noted previously (Phipps 1998).

The native hawthorns of the Okanagan-Shuswap belong to a diverse range of series, not necessarily particularly closely related to one another, viz.: *Douglasianae*, *Purpureofructi*, all the species of which occur in the region, and *Macracanthae* and *Rotundifoliae* (sens. auctt.). The reasons for this rich variety of hawthorn in the northern Okanagan and southwestern Shuswap drainage cannot be spelled out precisely but presumably relate to the location of former glacial refugia, as well as the benign climate. It is, of course, clear that wherever the relevant refugia were at a given time they must have been constantly relocated by changes of Pleistocene climate. In this mountainous region, hawthorns are virtually restricted to the valley bottoms, become rarer southwards (the southern Okanagan is much drier) and are nearly absent from the forest environment of the middle slopes. In the somewhat mesic area of the northern Okanagan, which is the area of greatest natural diversity, natural hedgerows dominated by hawthorns are a feature of the agricultural landscape and hawthorns also occur along smaller watercourses and ditches as well as forming downslope hillside thickets in some moister sites. The annual rainfall here is around 500–600 mm but falls off to about 200 mm in the southern Okanogan.

In this paper we describe the new taxa *C. castlegarensis* (ser. *Douglasianae*), *C. shuswapensis* (? ser. *Douglasianae*), *C. okanaganensis* var. *wellsii*, *C. orbicularis*, *C. enderbyensis* and *C. atrovirens* (all ser. *Purpureofructi*). Updated keys are produced for the series in question. All species are illustrated with line illustrations. Distribution maps of the new taxa were created by Range-Mapper (Tundra Vole Software, Fairbanks, AL) from files of latitude-longitude coordinates and then artistically improved by Susan Laurie-Bourque using Corel Draw. The discoveries are the result of several years of fieldwork by the authors in the mid-1990s and 2001–2 plus further discoveries in 2000 by the first author with his wife Sheila and son William. The collections of May, 2002 substantially increase the number of flowering specimens previously available for study and from which the cited material derives.

TAXONOMY

In this part we set out the new taxa in the context of others in the same series by providing a key to series and references to descriptions of the already known

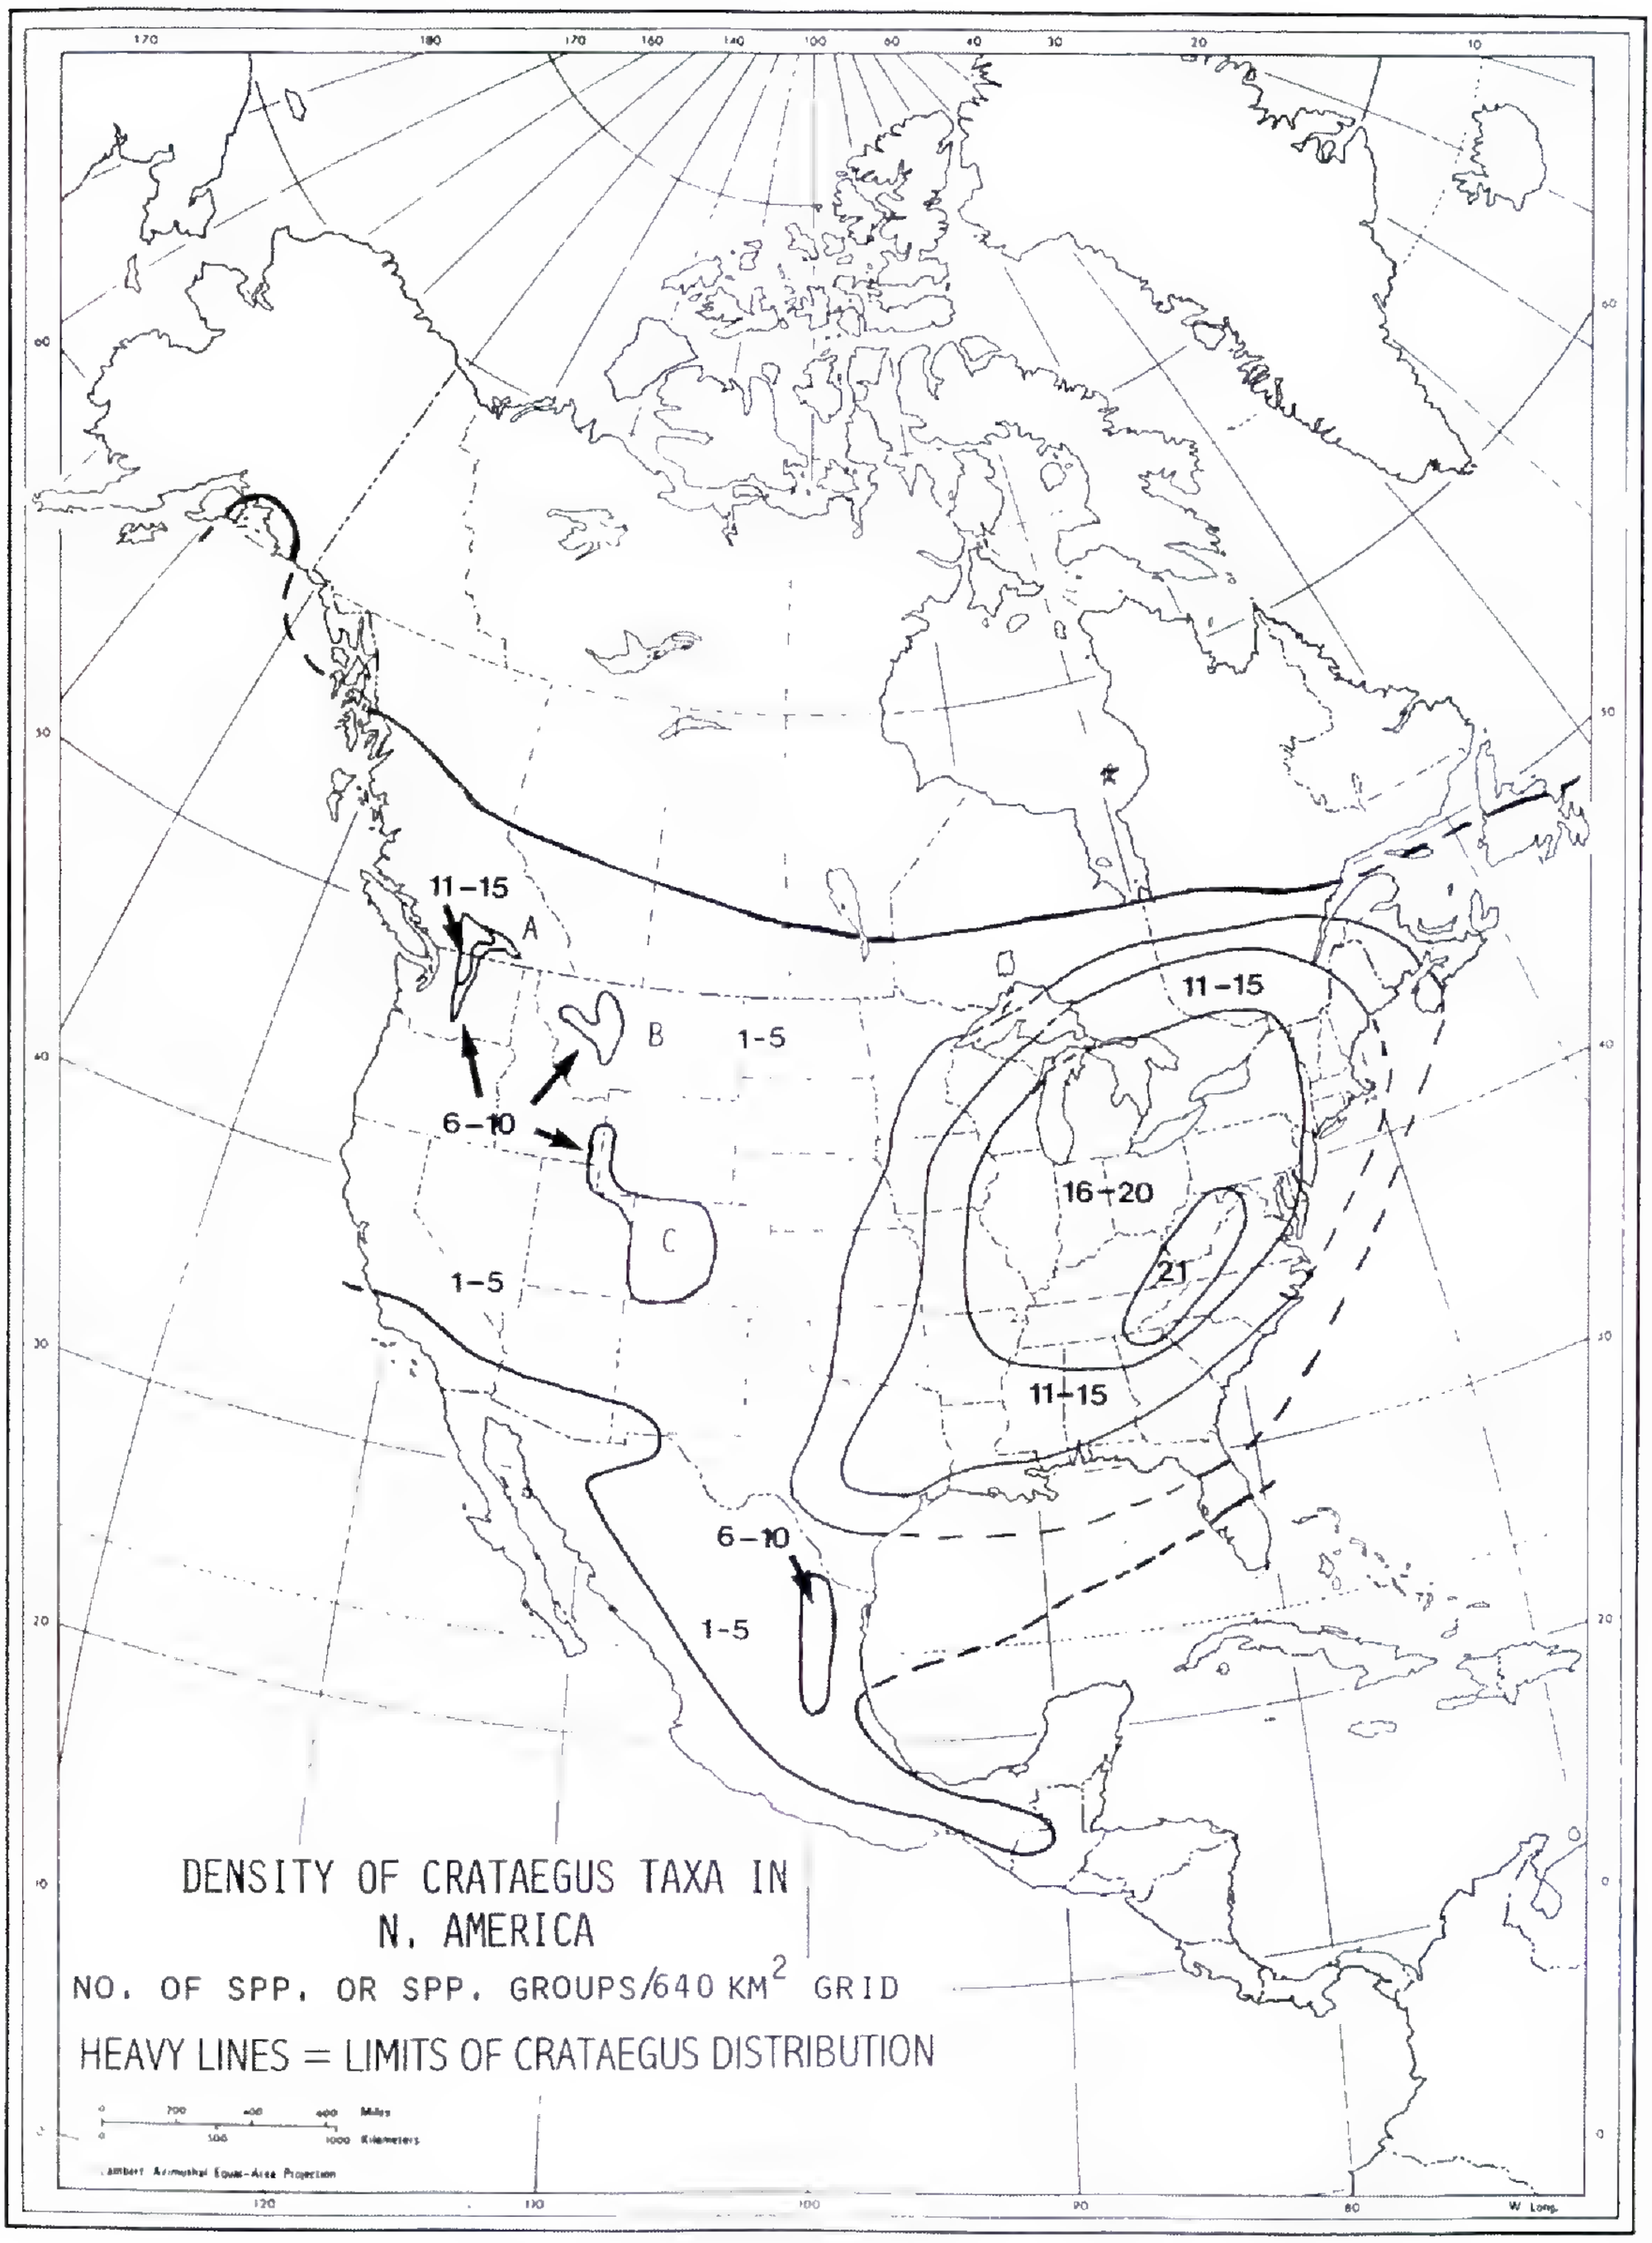

FIG. 1. Locator map for the Okanagan diversity center. Diversity centers indicated are: A = northern Okanagan–southwestern Shuswap; B = northwestern Montana; C = intermountain Colorado.

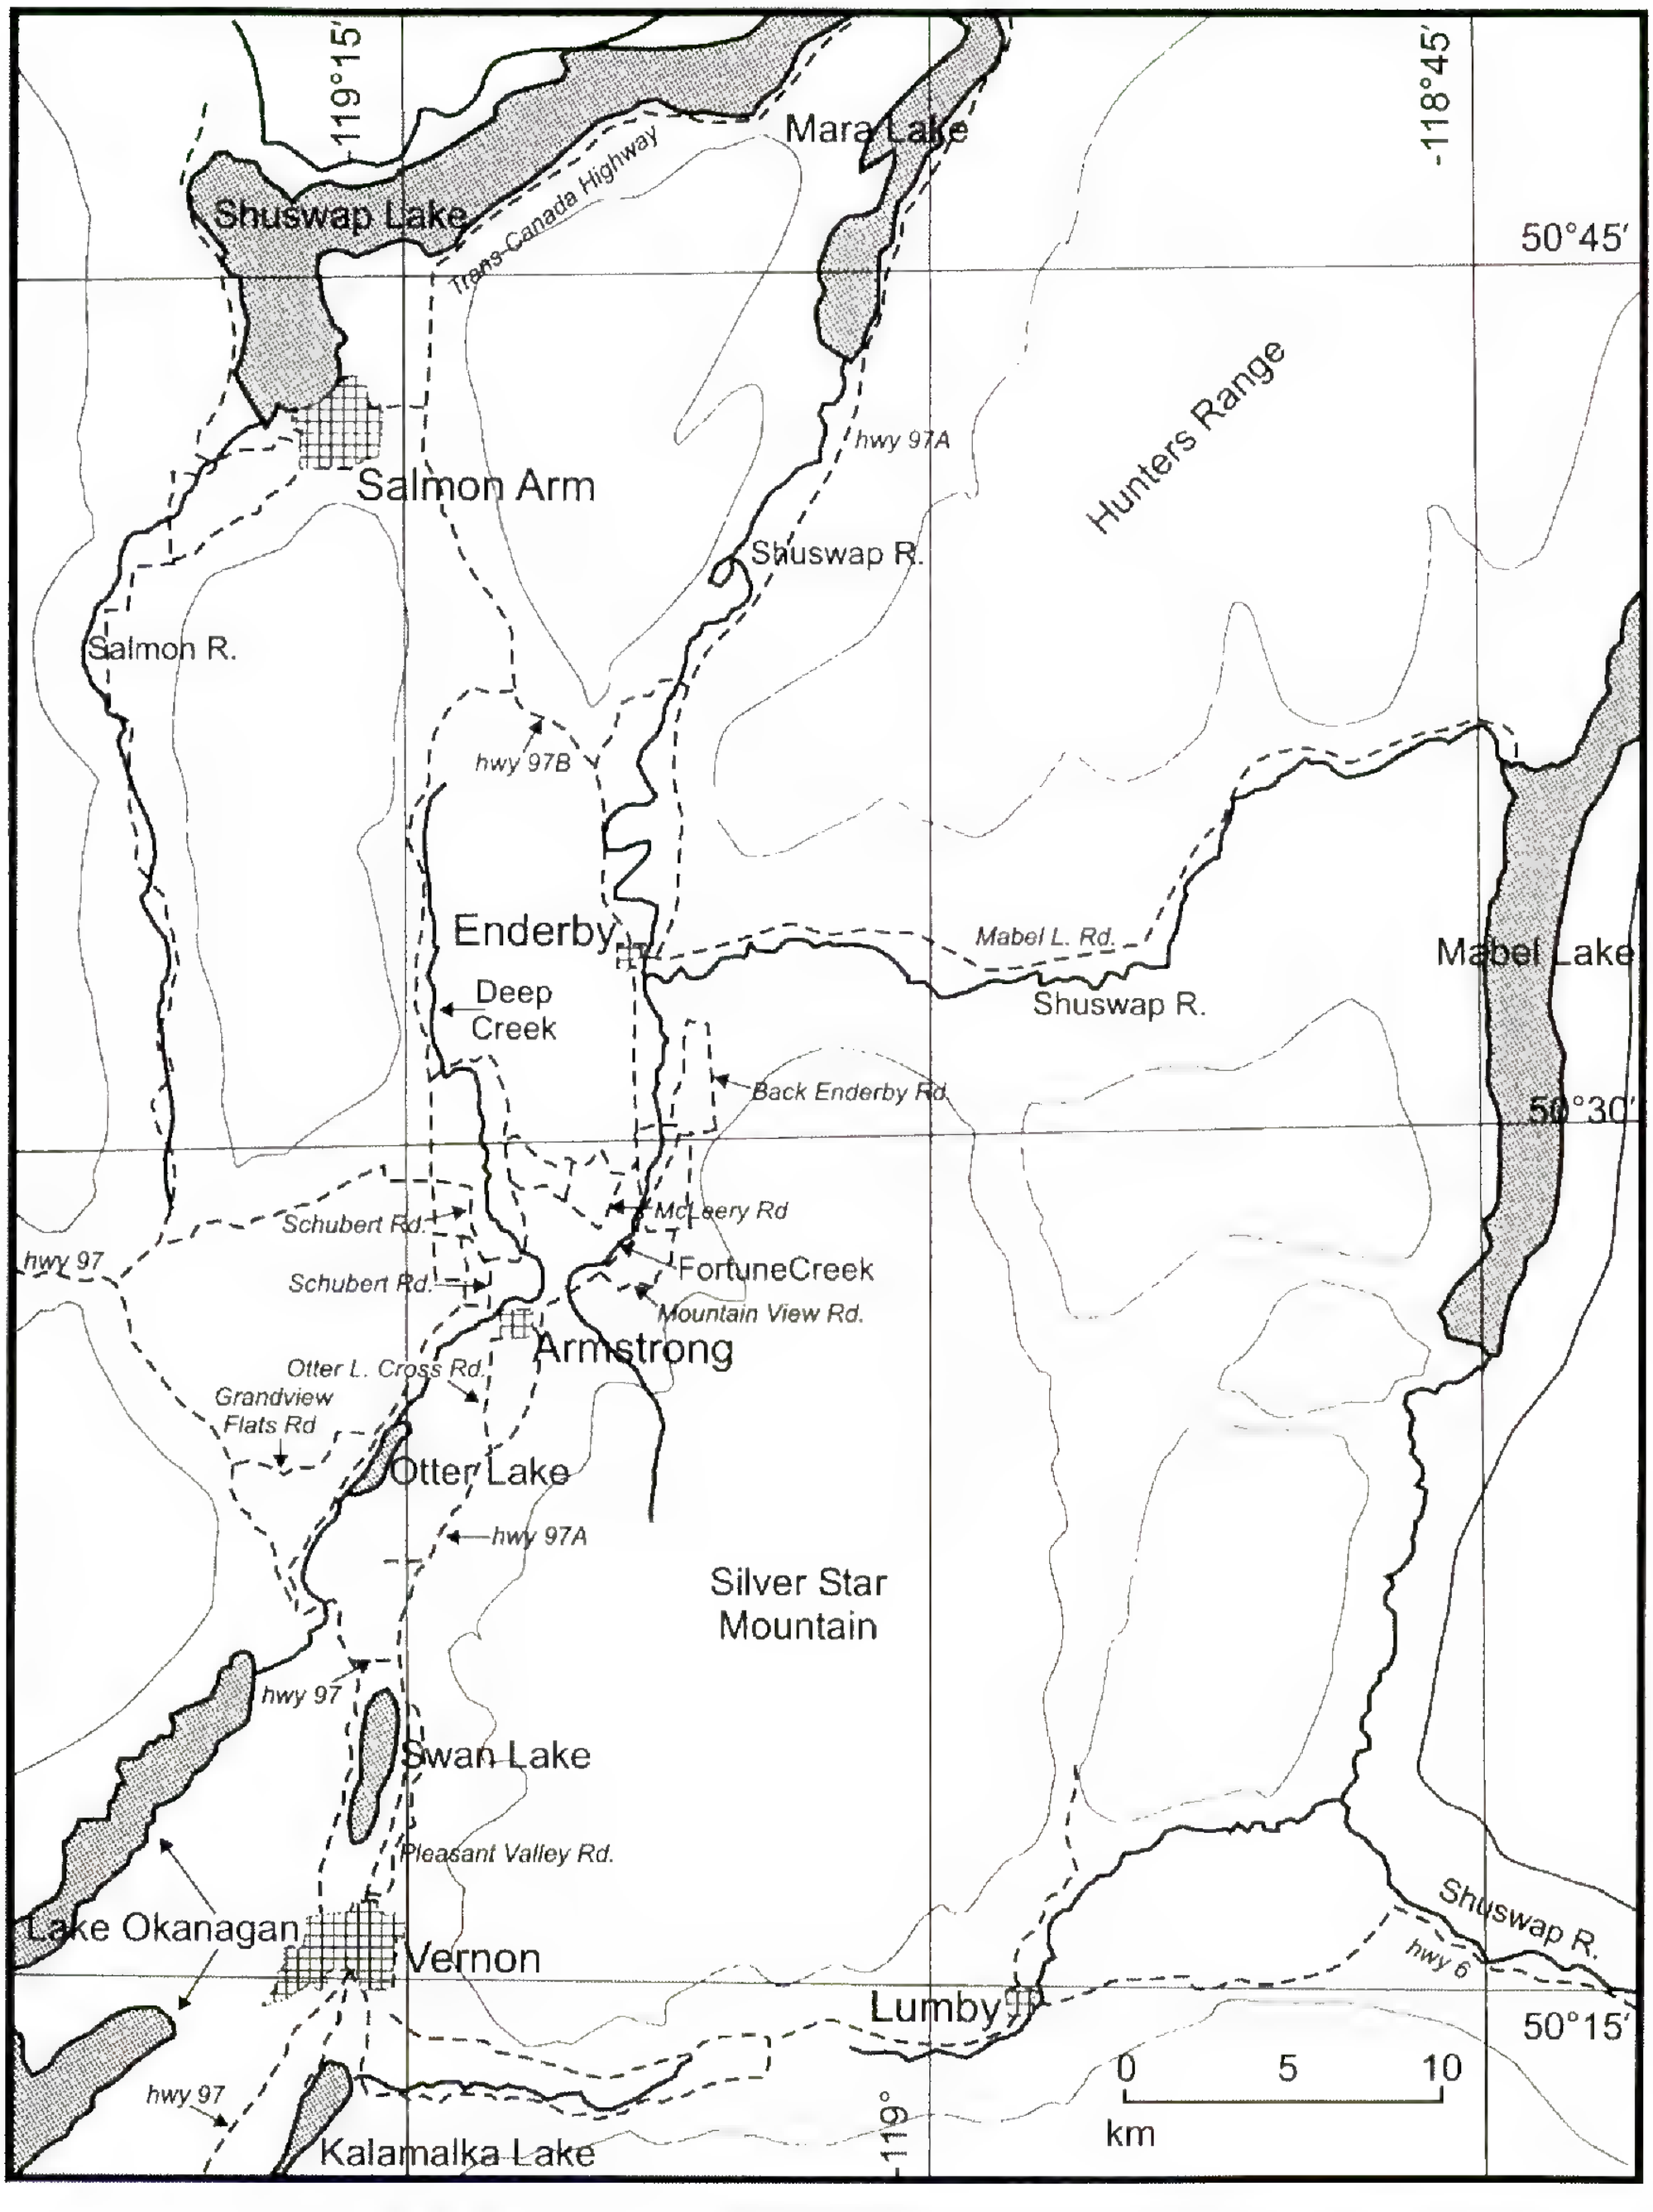

FIG. 2. Detail map of the Okanagan-Shuswap diversity center with its epicenter at Enderby. Unlabelled lines are 500m contours. Use for locating specimens of *Crataegus enderbyensis*, *C. orbicularis*, *C. shuswapensis* and *C. atrovirens*.

species in these series. In the cases of *C. douglasii*, which has been much confused with other hawthorns in the area, and *C. suksdorfii*, both of which, as far as we know, lack modern, detailed species descriptions, we also provide full English descriptions. We also provide amended series descriptions. The depth of lobing of leaves is referred to by term 'leaf incision index' or 'LII' ('IFI' in latin).

Series **Douglasianae** (Rehder ex C.K. Schneid.) Rehder.

Bushes to small trees; 1-year old wood generally tan to deep purple-brown; thorns mostly 1.5–2.5 cm long, dark and shiny when young. Leaves deciduous; petioles fairly short; blades 3–5(–7) cm long, broadly elliptic or elliptic to somewhat obovate in general shape, shallowly (0–)2–3 lobed per side, the lobes obtuse to subacute; margins toothed; venation craspedodromous to nearly fully camptodromous in some unlobed forms; petioles and leaf teeth tips somewhat glandular. Inflorescences 8–20 flowered; branches glabrous or pubescent, bracteolate; anthesis early. Flowers 12–18 mm diam.; calyx-lobes subentire, small; stamens 10 or 20, anthers pink; styles 3–5. Fruit smallish, 0.6–1.0 cm long, ellipsoidal to subspherical, black or dark purple at full ripeness, hairy or glabrous; nutlets 3–5, dorsally furrowed, lateral faces pitted.

This is a small series of ± widespread 'black-fruited' hawthorns of the northwestern USA and adjacent Canada with four species, one of which, *C. douglasii*, extends to the Great Lakes area. Series *Douglasianae* are notable for their laterally pitted nutlets, short thorns and dark purple to black fruits at full maturity in which they resemble Eurasian ser. *Nigrae*. We add one new species to this group and amend the key.

KEY TO SPECIES

1. Stamens 20; leaf-blades often unlobed, if lobed, lobes generally obtuse to subacute; when lobeless venation semi-camptodromous _____ **1. C. suksdorfii**
1. Stamens 10; leaf-blades usually lobed; lobes of leaves subacute to acute; venation craspedodromous.
   2. Inflorescence branches glabrous; thorns on twigs always single; fruit longer than broad, generally chestnut, dark purple or black in late August.
      3. Thorns 2–3.5 cm long; flowers 12–15 mm diam.; fruit ellipsoid, usually deep purple or even black by late August, very bloomy at this time _____ **2. C. douglasii**
      3. Thorns 1.5–2 cm long; flowers 15–18 mm diam.; fruit ampulliform, chestnut or burgundy in late August, generally not very bloomy _____ **3. C. okennonii**
   2. Inflorescence branches and hypanthium ± pubescent; thorns on twigs occasionally paired or in triads; fruit subglobose to depressed, passing through crimson lake (purplish-crimson) to burgundy in late August _____ **4. C. castlegarensis,** sp. nov.

1. Crataegus suksdorfii (Sarg.) Kruschke, Milwaukee Public Mus. Public. Bot. 3:163. 1965.

Crataegus douglasii Lindl. var. *suksdorfii* Sarg., Bot. Gaz. 44:65. 1907.

Bushes, often 3–5 m tall, perhaps larger; one-year old twigs tan, older grayish; thorns 1.5–2.5 cm long, recurved or straight, glossy dark brown when young.

Leaves deciduous; petioles 0.75–1.5 cm long, glabrous, eglandular westwards, in Montana glandular; blades ± rhomb-elliptic to ellipt-obovate in general shape, 3–6 cm long, tapered to the base, unlobed to irregularly sharply to very bluntly 2–3 lobed per side; margins toothed, the teeth in Montana glandular; venation craspedodromous to semi-campdodromous in blunt-lobed western specimens; appressed hairy above, ± glabrate below except pubescent near the veins in Oregon. Inflorescences 7–15 flowered, branches glabrous, punctate, bearing small, early caducous, linear, membranous, gland-margined bracteoles. Flowers ca. 15–17 mm diam.; hypanthium glabrous externally; calyx-lobes ca. 4 mm long, triangular, abaxially glabrous, margins minutely and sparingly glandular-serrate; petals ± circular, white; stamens 20, anthers pink; styles 4–5. Fruit 1 cm long, subglobose to broad-ovoid in the few specimens seen, black at maturity, dull vinous purple a month before; calyx-lobes reflexed; nutlets 4–5, dorsally grooved, sides erose.

Crataegus suksdorfii occurs mainly along the coast and ranges from California northwards to Vancouver Island, the Queen Charlotte Islands and coastal Alaska to around Anchorage. It is also scattered sporadically inland east to Montana. *Crataegus suksdorfii* is by far the most northerly occurring *Crataegus* in North America at 61° N lat. It is diploid according to Brunsfeld and Johnson (1990).

In the relatively few specimens I have studied, the fruit is smaller and more globose than in *C. douglasii*. It is most convincingly differentiated from *C. douglasii* by stamen number and perhaps by fruit shape and early color, but like *C. douglasii*, it also has a variety of leaf shapes and a venation type which lie generally outside the range of that species. The glandular leaf-teeth and petiole make the Montana specimens distinct. Some of the deeply dissected, pointed lobed, ± delt to rhomb-ovate leaved forms from the western US appear very distinctive.

2. Crataegus douglasii Lindl., Bot. Reg. 21: pl. 1810. 1835.

Crataegus columbiana Howell, Fl. Northw. Amer. 1:163. 1898.

Bushes 4–6 m tall, thorny; thorns ± stout, 1.5–3.5 cm long, straight or slightly recurved, deep brown and shiny when young; one-year old twigs deep tan to dark mahogany, somewhat shiny when young, older branches gray to dark gray, often showing brown or alternatively tan-brown eastwards. Leaves deciduous; petioles 0.75–1.5 cm long, slightly glandular and pubescent in youth; blades 4–7 cm long × 2–3 cm wide, somewhat variable in shape but generally elliptic to broad-elliptic or sub-rhombic, generally with 2–4 coarse lobes per side, alternatively elliptic-obvate with much smaller lobes; margins coarsely and sharply toothed, the teeth tipped with small glands when young; venation craspedodromous with 4–5 lateral veins per side; quite densely appressed short-pubescent above, below usually glabrous except on the veins. Inflorescences 10–25 flowered; branches usually glabrous, bearing caducous, membranous,

linear, gland-margined bracteoles. Flowers 12–15 mm diam.; hypanthium externally glabrous; the calyx-lobes very short, 3–4 mm long, fairly broad triangular, adaxially glabrous, the margins with a few tiny glands distally; petals ± circular, white; stamens 10, anthers pink; styles 3–4. Fruit 6–8 mm diam., ellipsoid, dull black when fully ripe, though vinous when younger, generally very bloomy until maturity; calyx-lobe remnants short, blunt, reflexed; nutlets 3–4, dorsally grooved, laterally excavated.

Douglas hawthorn is a common, somewhat variable bush of southern and western British Columbia up to the panhandle of Alaska which ranges south to northern California (Shasta Co.) and inland to the Rocky Mountains of Idaho, Montana and sw Alberta. Further east, disjunct populations occur in the Cypress Hills (AB & SK), Black Hills (WY & SD), and around the northern Great Lakes. In western North America *Crataegus douglasii* is found mainly near water in drier areas but in more mesic localities in a good variety of open woodland. In the Great Lakes area it mainly occurs in old pastures and on fence lines.

Crataegus douglasii is distinguished from *C. suksdorfii* which has 20 stamens, semi-camptodromous venation and little lobed, ± obtuse leaves, and from the taller *C. okennonii* which has generally shorter thorns, usually straight single trunk, ampulliform-orbicular fruit and crimson-lake autumnal foliage color. *Crataegus douglasii* is mainly tetraploid (Brunsfeld et al. 1990).

3. Crataegus okennonii J.B. Phipps, Sida 18:170. 1998.

This species commenced flowering 10–14 days later than *C. douglasii* in the northern Okanagan in 2002.

4. Crataegus castlegarensis J.B Phipps & O'Kennon, sp. nov. (**Fig. 3**). TYPE: UNITED STATES. IDAHO. Lemhi Co.: US 93, E side, 14.5 rd. mi N of Salmon, roadside ditch next to irrigated field, alt. ca. 3950 ft, bush, 5 m tall, foliage dull, dark, coriaceous, fruit strongly clustered, red-burgundy, with short pedicels, 20 Aug 1996, *J.B. Phipps & O'Kennon 7396* (HOLOTYPE: UWO; ISOTYPES: BRIT, CAN, MO, MONTU, TRT, UBC, V, WS).

Frutices, 2.5–5.0 m alti, uno vel pluribus truncis erectis; rami patentes; ramuli unius anni brunnei; spinae 2–3 cm longae, mediana crassitudine, rectae vel leviter recurvatae, nitenter atrobrunneae, apice atro in juventute. Folia decidua; petioli 0.75–1.5 cm longi, varie pilosi, eglandulosi; laminae 3.5–6.0 cm longae, oblanceolatae vel ovato-rhombeae in forma generali; apex late triangularis, basis late cuneata vel cuneata; vix lobatae vel 3–4 lobatae per latus; aliquantum coriaceae; venatio craspedodroma, 4–5 nervatae per latus; margines serrati; facies adaxialis conspicue appresso-pilosa in juventute, aliquantum glabrescens in vena centrali, abaxialis rare pubescens vel glabra venis exceptis. Inflorescentiae 8–20 florae; pedicelli leviter vel dense pubescentes, bracteolis caducis, linearibus, membranaceis, glandulo-marginatis. Flores ca. 12–15 mm diam.; hypanthium plerumque glabrum extrinsecus; lobi calycis 3 mm longi, triangulares, paene glandulo-serrati; petala ± circularia; stamina 10, antheris roseis; styli 3–4. Fructus 10–12 mm diam., orbiculares aliquantum oblati, recedentes in juncturis cum pedicellis, sparsim pilosi, carmesini vel coloris pruni rubentis et postremo atropurpurei; lobi calycis patento-reflexi, ± erosi; pyrenae 3–4, dorsaliter sulcatae, superficiebus lateralibus plerumque foveolatis.

Shrubs, 2.5–5.0 m tall with one or more erect stems; branches spreading; 1-year old twigs brown; thorns 2–3 cm long, of medium stoutness, straight to slightly

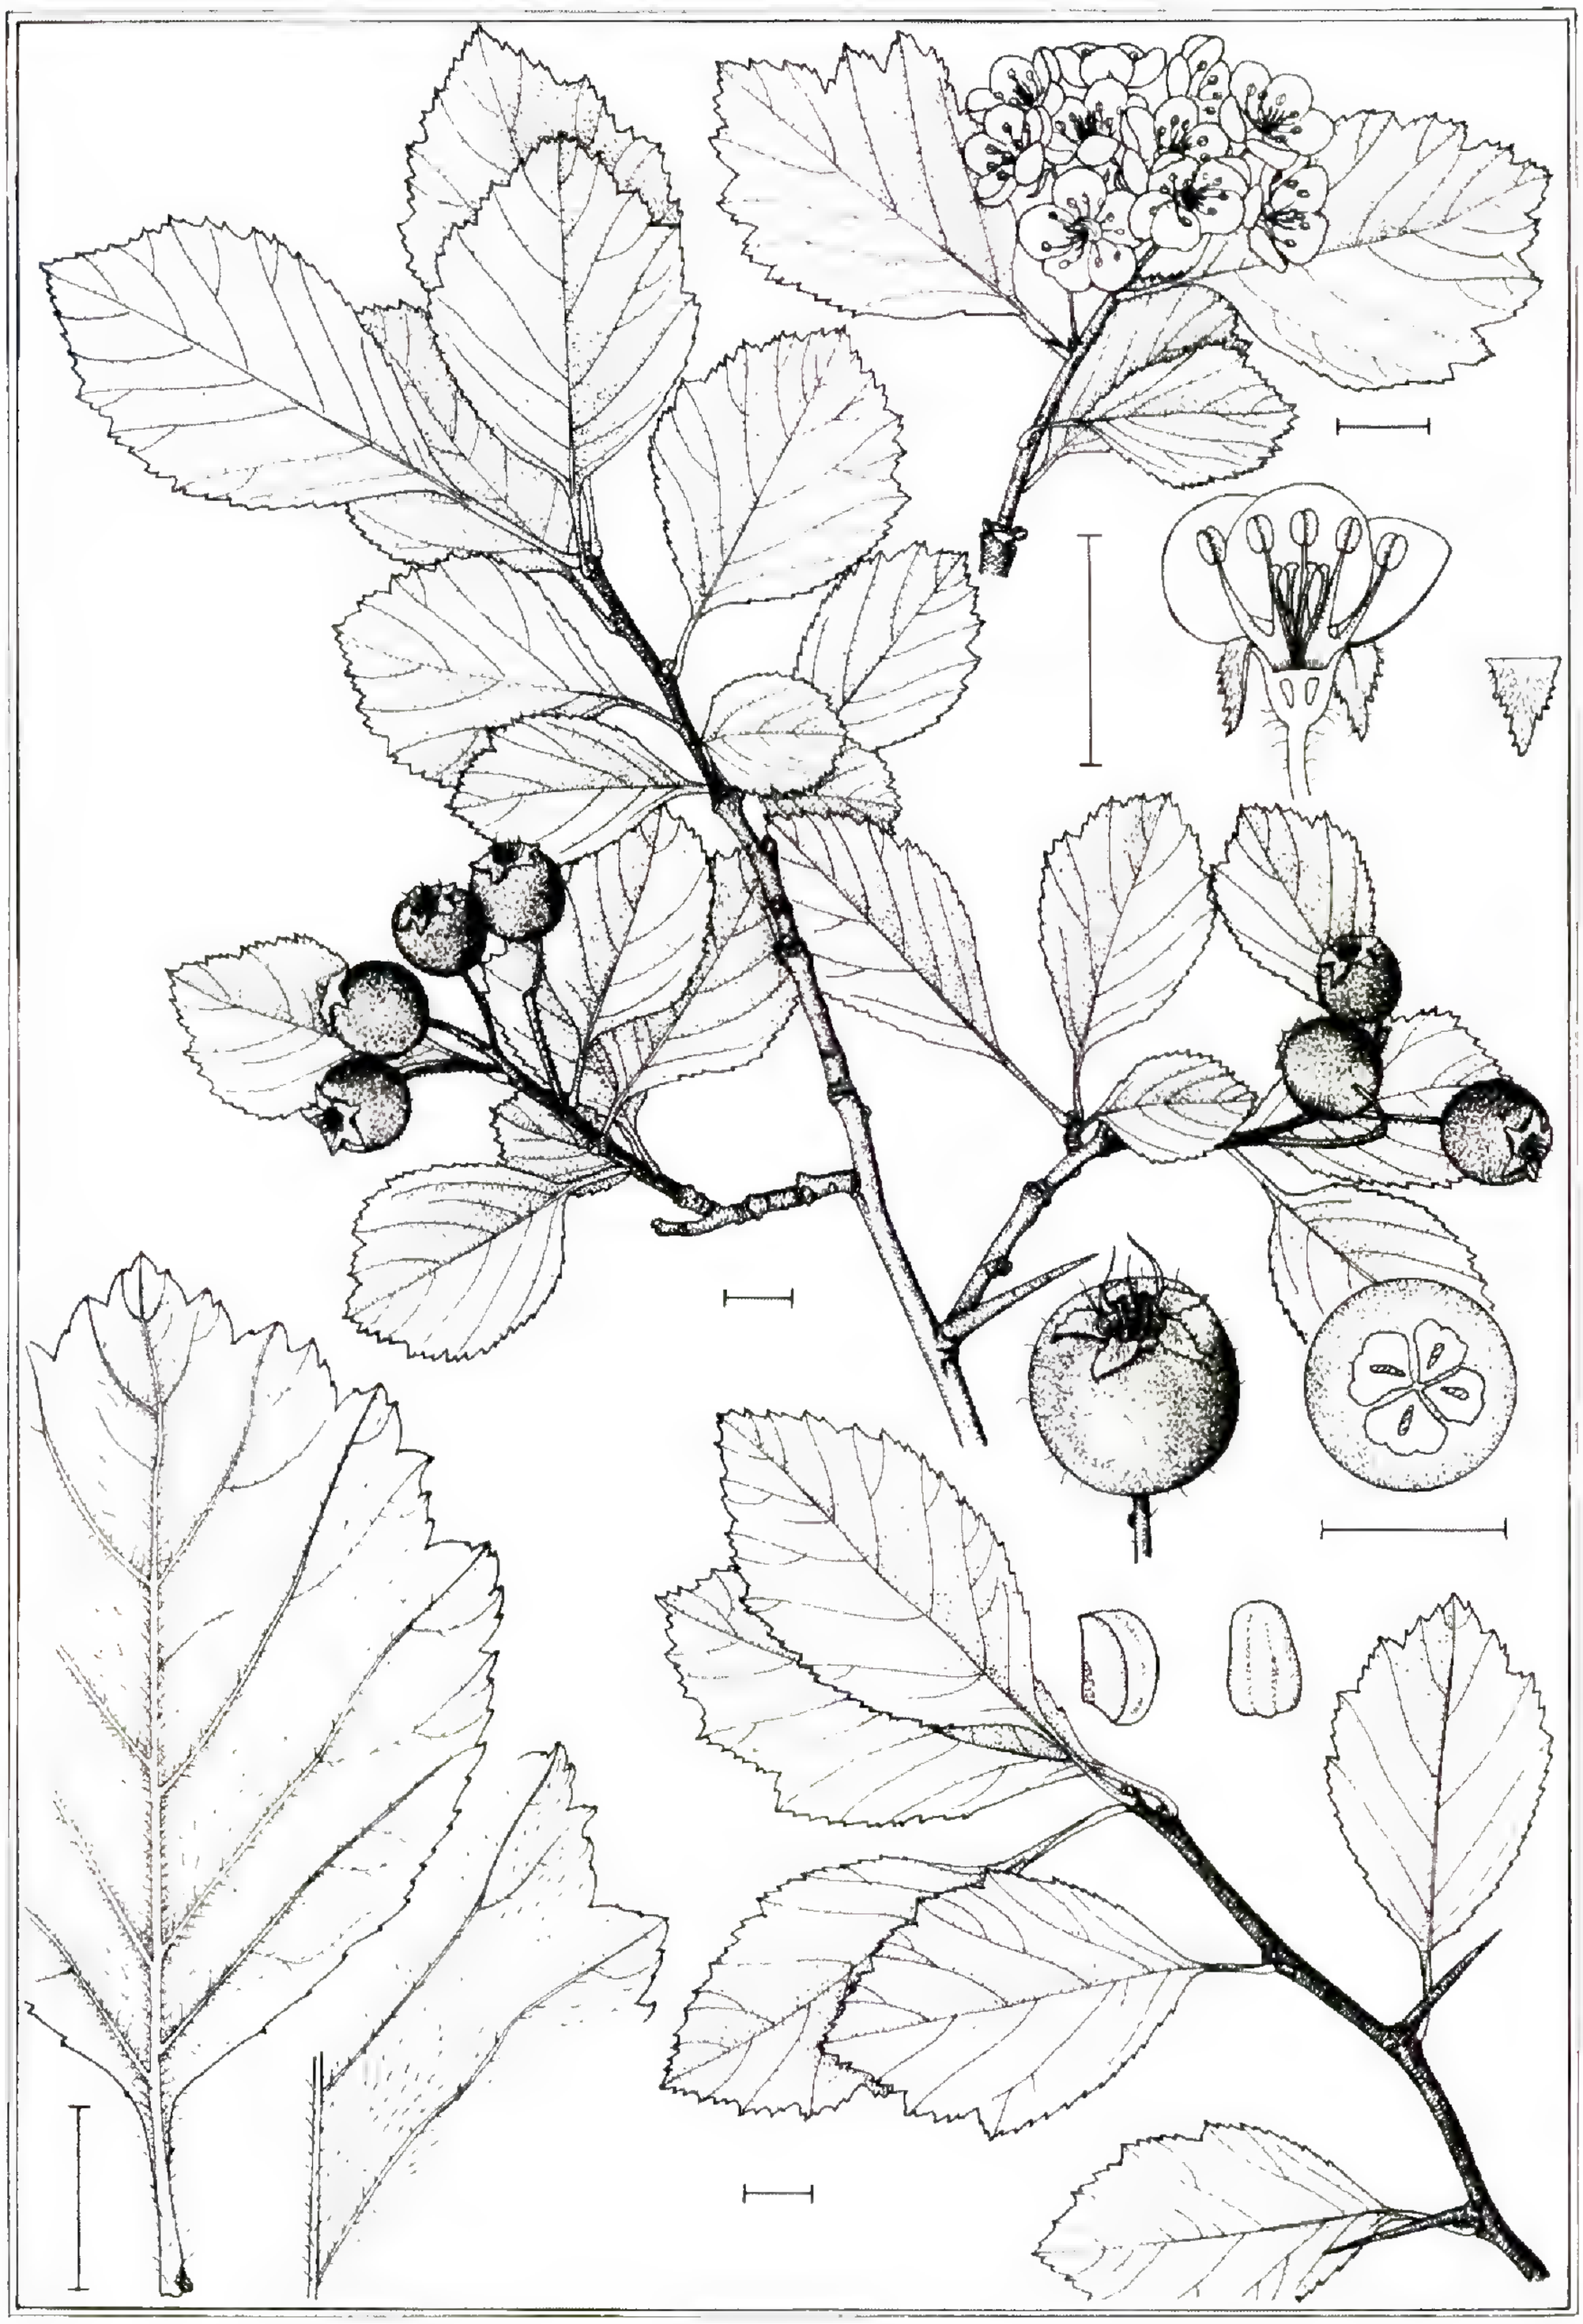

FIG. 3. Line drawing of *Crataegus castlegarensis*. Scale bars = 1 cm.

recurved, shiny dark or reddish-brown with blackish tips when young. Leaves deciduous; petioles 0.75–1.5 cm long, eglandular, variably hairy; blades 3.5–6.0 cm long, oblanceolate to ovate-rhombic in general shape; the tip broad-triangular, base broad-cuneate to cuneate; scarcely lobed to 3–4 lobed; margins toothed, teeth with fine gland-tips when young; venation craspedodromous, each side 4–5 nerved; conspicuously appressed hairy above when young, somewhat glabrescent except on the mid-nerve above, thinly pubescent to glabrous below except on the veins, somewhat coriaceous. Inflorescences 8–20 flowered; branches thinly to densely pubescent, bearing caducous, linear, membranous, gland-margined bracteoles. Flowers ca. 12–15 mm diam.; hypanthium generally glabrous externally; calyx lobes 3 mm long, triangular, remotely glandular-serrate; petals ± circular; stamens 10, anthers pink; styles 3–4. Fruit 10–12 mm diam., ± orbicular, often somewhat oblate, recessed at junction with pedicel, thinly pilose, crimson turning to reddish-plum or ultimately blackish purple; calyx-lobes patento-reflexed, + erose; nutlets 3–4, dorsally grooved, lateral faces usually pitted.

Crataegus castlegarensis has a wide range (Fig. 4) from the John Day (South Fork) R. basin of Oregon and the Okanagan of British Columbia eastwards to the Flathead drainage of northwestern Montana, thence south down the mountains to northeastern Utah and west-central Wyoming. We have also recently recorded it from the Cypress Hills of Alberta and Saskatchewan but those specimens are not cited. It is most abundant north of Kelowna, British Columbia and in the Flathead drainage in Montana and is found in brushy places in the valleys, particularly near ditches and natural waterways. Fine specimens of this species occur on the grounds of Selkirk College, Castlegar, British Columbia, where several were collected for us by Peter Wood, then a professor at that institution. It was here that the authors first became aware of the distinctness of this taxon and we are pleased to name it after the town of Castlegar.

Like a good number of *Crataegus* species from the Pacific Northwest *C. castlegarensis* has been collected but overlooked and the few specimens that we have encountered other than our own collections have been variously assigned to *C. douglasii* and *C. columbiana*. *Crataegus castlegarensis* is apparently the most closely related of ser. *Douglasianae* to *C. douglasii*. It differs in the fruit shape (± orbicular/turbinate in *C. castlegarensis*; ellipsoid in *C. douglasii*), fruit color at comparable period of ripening (often dull plum blotched green early, then burgundy to crimson, finally deep purple and not very bloomy in *C. castlegarensis*; starting about the third week of August as for the former species, usually already full black and remaining very bloomy unless abraded in *C. douglasii*); inflorescence branches and hypanthium, also, often fruit, proximally (pubescent to dense pubescent in *C. castlegarensis*; glabrous in *C. douglasii*). Pubescence of parts may abrade through the season and one may have to look

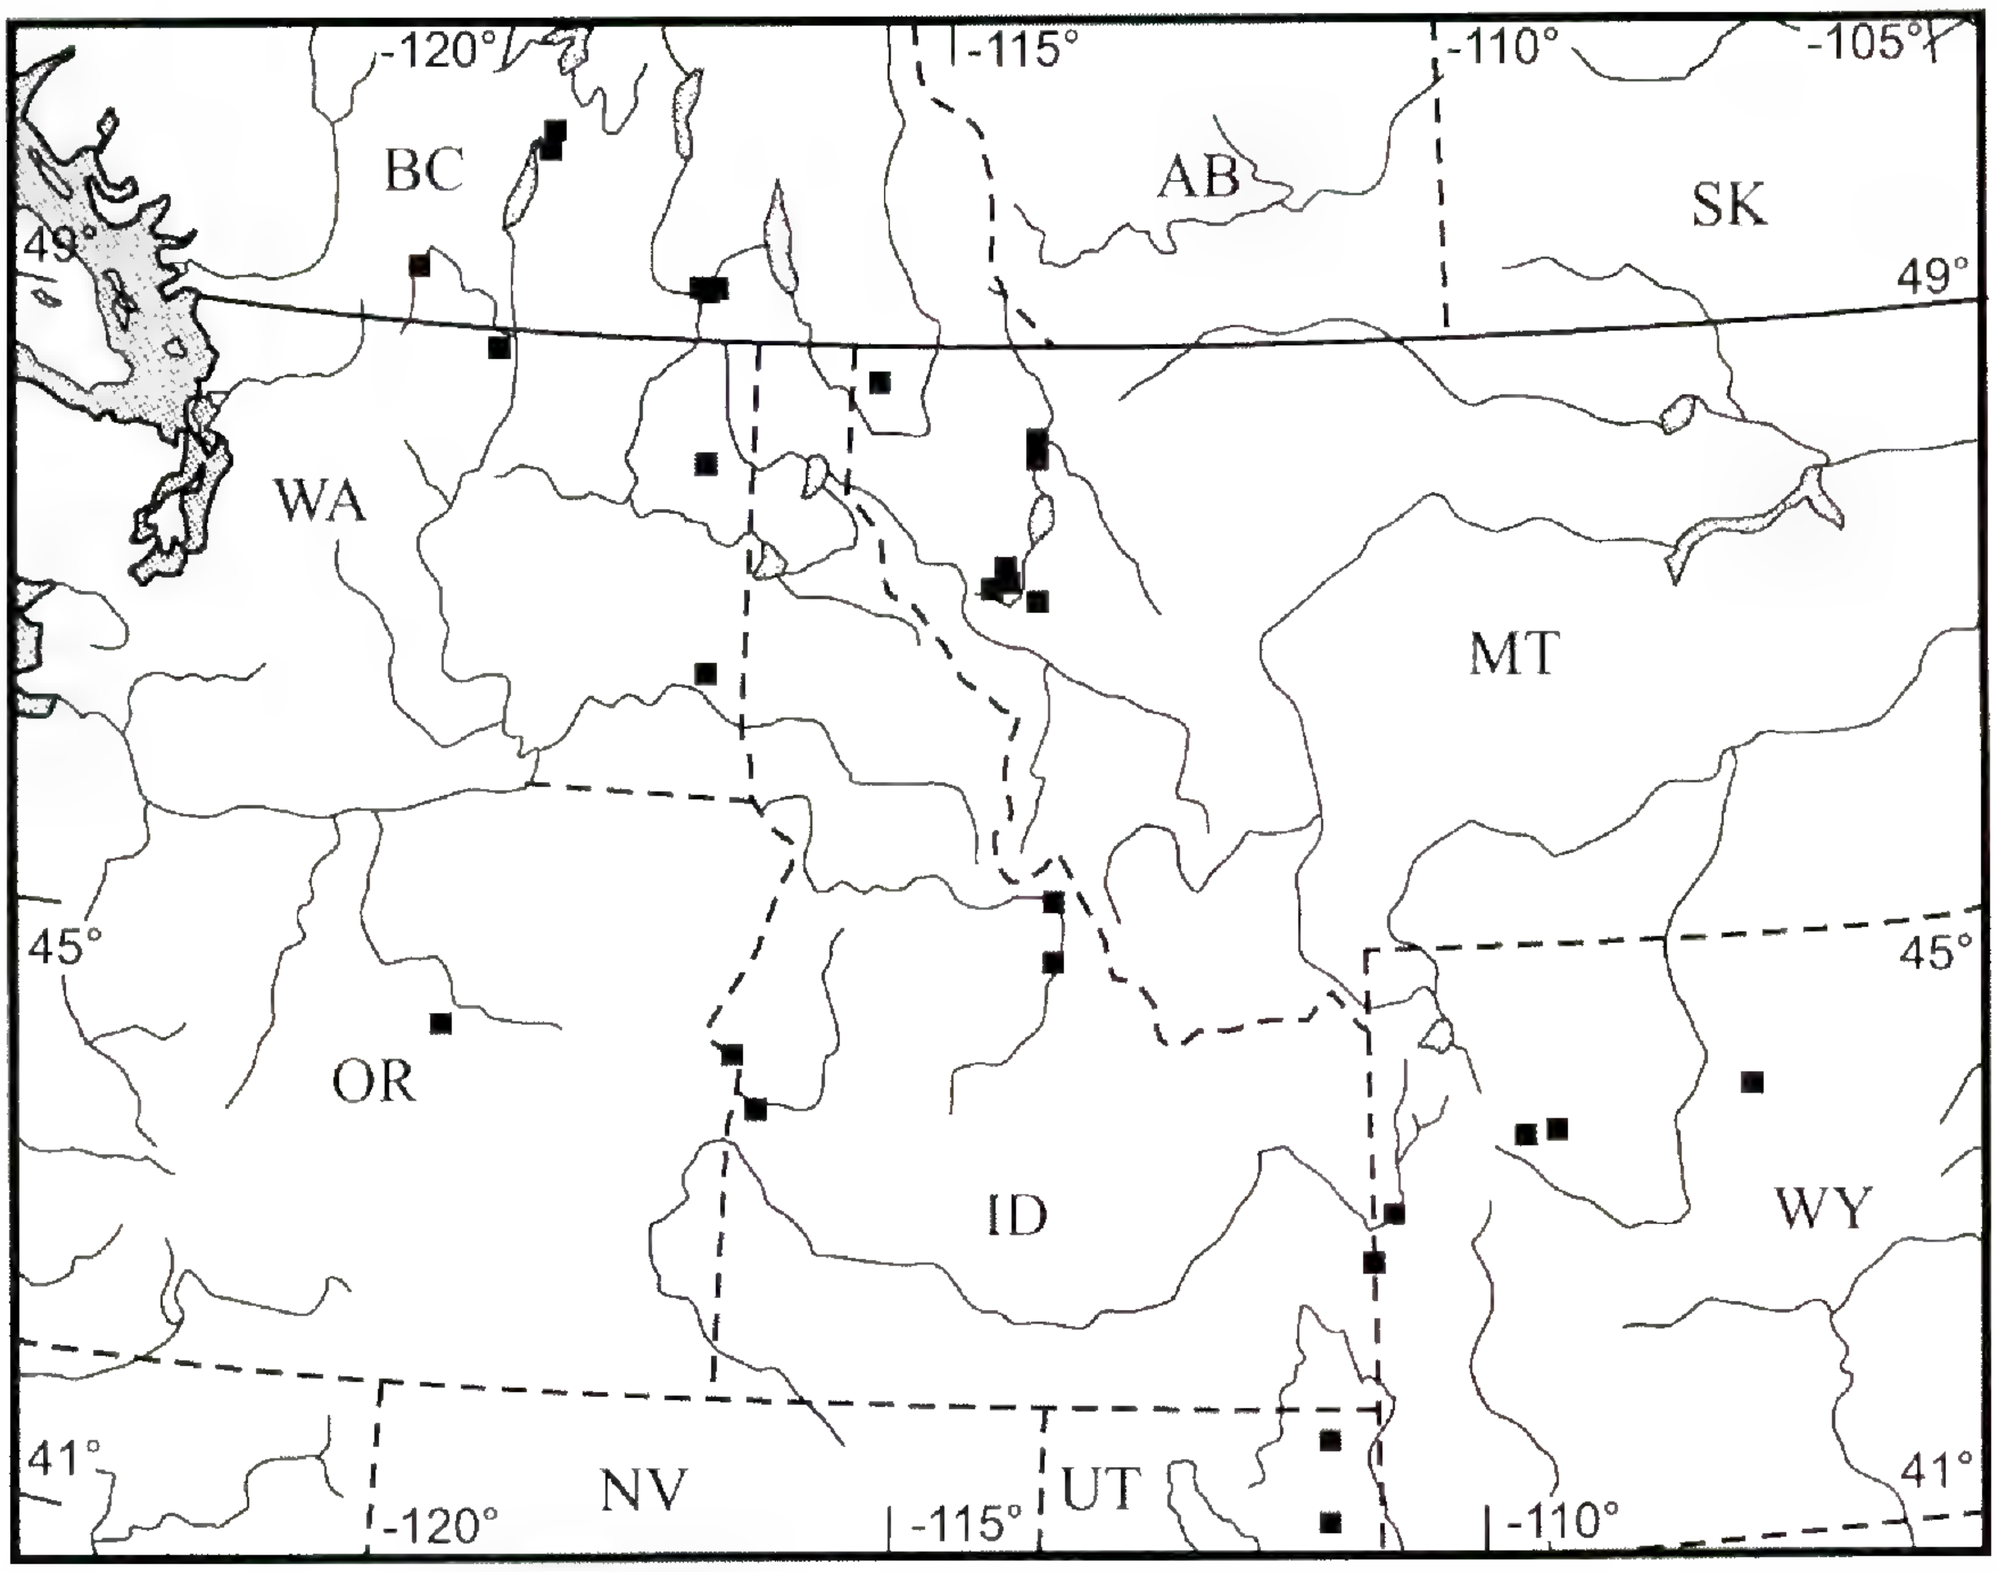

FIG. 4. Distribution map of *Crataegus castlegarensis* from collated records.

very carefully to discern it on fruiting pedicels. The junction of the fruit to the pedicel, often recessed like an apple, is also a characteristic of the new species. It came into flower about a week later than *C. douglasii* in the northern Okanagan in 2002.

A very interesting feature that we record is branched thorns (double to quadruple) on the young twigs. This feature is not known to us in other hawthorns except for the mutation of *C. monogyna*, cv. Horrida and occasional specimens of *C. enderbyensis*. On some of the bushes this multiple thorniness was abundant, in others more sporadic. We did not deliberately collect for this feature, indeed were not conscious of its relationship with *C. castlegarensis* early on, so it is possible that a more thorough check in the field of many of the collected bushes may have yielded more material like this. Branched thorn specimens are asterisked in the list of exsiccatae.

Additional specimens examined: **CANADA. BRITISH COLUMBIA:** Castlegar, N side of Frank Beinder Drive, ca. 10 ft down the embankment below the roadway, alt. 1550 ft, slender hawthorn, thorns 2.5–2.7 cm long, anthers creamy pink, 15 May 1995, *Peter Wood 1* (UWO). Castlegar, top of Frank Beinder Rd. to Selkirk College, opposite airport, scrubby small ravine, alt. 487 m, bush, 5 m tall, narrow-lanceolate leaves & obtuse lobes, purple fruit in dense clusters, 26 Sep 1993, *J.B. Phipps & R.J. O'Kennon*

*6823** (BRIT, CAN, ID, MONTU, RM, UBC, UT, UWO, V). Pleasant Valley Rd. NNE of Vernon, E side of road, ca. 0.5 mi N of Vowle's property, in bottom of ravine in apple orchard, 5 m bush, black fruit, 3-forked thorns, 25 Sep 1993, *J.B. Phipps & R.J. O'Kennon 6818** (BRIT, UWO). Castlegar, Selkirk College, top of wooded steep slope near Peter Wood's office, alt. 1000 ft, collection of different leaves from 4 m bush, 27 Sep 1993, *J.B. Phipps & R.J. O'Kennon 6825* (UWO). Okanagan Valley, ca. 8 km NNE of center of Vernon, Pleasant Valley Rd., behind Vowle's residence, hedge at S boundary of Burke's PYO, alt. 380 m, dense, broad, mature hedge dominated by hawthorns, bush 2.5 m tall, anthers 10, pink, 02 May 1994, *J.B. Phipps 6881** (BRIT, UBC, UWO). Kalamalka L. Provincial Park, along road ca. 25 m SW of red gate, brushy roadside, alt. ca. 1450 ft, bush, 5 m tall, fruit burgundy turning black, foliage large (equals *JBP 6888*), 18 Aug 1994, *J.B. Phipps & R.J. O'Kennon 6980** (UWO). Northern Okanagan, Kalamalka Provincial Park, roadside near red gate, bush, 6 m tall, fruit burgundy, ± spherical to short turbinate, locally abundant, 26 Aug 2000, *J.B. & S.R. Phipps 8187** (UWO). Castlegar, top of Frank Beinder Rd. to Selkirk College, opposite airport in bottom of scrubby roadside ravine, alt. +87 m, bush, 5 m, stamens 5, anthers small, pink, (=*JBP & RO'K 6823*), 06 May 1994, *J.B. Phipps 6925* (UBC, UWO). Castlegar, top of Frank Beinder Rd. to Selkirk College, opposite airport, bush 2 m tall, half-way up slope before 'curve road' sign, stamens 5, anthers pink, 06 May 1994, *Phipps, J.B. 6926* (UWO). 6.7 rd. mi SW of Princeton on BC3, edge of Typha marsh on SE side of hwy, alt. 2800 ft, bush, 3.5 m tall, fruit orbicular, burgundy, beginning to be taken by waxwings, lvs thin, coriaceous, shiny (=*JBP & RO'K 6774*), 17 Aug 1994, *J.B. Phipps & R.J. O'Kennon 6972* (BRIT, CAN, MONTU, TRT, UBC, UWO, V). Castlegar, Frank Beinder Drive, scrubby slopes with aspens, ca. 250 m E of campus gate, alt. 1550 ft, tree, 6 m tall, fruit ± orbicular, reddish-plum to deep purple, 23 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7053* (BRIT, UBC, UWO). Castlegar, Frank Beinder Drive, scrubby slopes with aspens, ca. 75 m E of campus gate & behind pine, alt. 1550 ft, bush 2 5 m tall with purple-black globose fruit, 23 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7055* (BRIT, UBC, UWO). Castlegar, Frank Beinder Drive, opposite airport entrance, at top of little ravine virtually within reach of road, alt. 1600 ft, bush, 5 m tall, fruit orbicu lar, turning burgundy from reddish plum, 23 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7054* (BRIT, UWO, V). Ca. 8 road mi SW of Princeton on BC3, edge of large dried up marsh on E side of hwy, bush 10 ft tall, leaves reddish, fruit black-burgundy, 23 Sep 1993, *J.B. Phipps & R.J. O'Kennon 6774* (UWO). Salmon Arm, large hawthorn pasture just N of railroad and west of central business section, alt. ca. 1900 ft, bush, 4 m tall, fruit deep burgundy, ± spherical, 20 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7030* (UWO). Vernon, Y Lake, open aspen grove near pond, 10 May 1970, *T.M. Brayshaw & D. Laidman s.n.** (UWO, V) [numerous triple and quadruple thorns—J.B.P.].

U.S.A. IDAHO: Lemhi Co.: US 93, 4 mi S of 45° N lat sign and 18 road mi S of Salmon, 4600 ft, gravelly banks of Salmon R, bush 5 m tall, 17 May 1997, *J.B. Phipps & R.J. O'Kennon 7532* (BRIT, UT, UWO); US 93, 17.5 mi S of Salmon, brushy banks of Salmon R., bush, 4 m tall, flowers 16 mm diam., 17 May 1997, *J.B. Phipps & R.J. O'Kennon 7535* (BRIT, ID, UWO); US 93, 14.5 mi N of Salmon, E of side road, fenceline against pasture, alt. 4300 ft, bush, 5 m tall, inflorescence very pubescent, tight cluster of flowers, flowers diameter greater than or equal to 15 mm, anthers 10, pink, some paired thorns, (equals *JBP 7396*), 17 May 1997, *J.B. Phipps & R.J. O'Kennon 7537** (BRIT, ID, MONTU, UWO); US 93, 17 rd. mi N of Salmon, brushy banks of South Fork, Salmon R., alt. 3900 ft, bush 4 m tall, 17 May 1997, *J.B. Phipps & R.J. O'Kennon 7540* (BRIT, ID, MONTU, UT, UWO); US 93, at bottom of gravel slope near Salmon River, ca. 18 rd. mi S of Salmon and ca. 4 mi S of 45° N lat. sign, alt. 4600 ft, several-stemmed bush 5 m tall, frt. variably ripe: green light red dull red-burgundy, + oblate-spherical, with marked depression at pedicel, lvs coriaceous, blue-green, broad, lobed, frt. in dense clusters, short pedicels, small green bracteoles, 20 Aug1996, *J.B. Phipps & R.J. O'Kennon 7394* (BRIT, ID, MONTU, UT, UWO); US 93, 8 mi N of Salmon, 2.5 mi S of Tower Creek, in field, alt. ca. 4300 ft, dense bush, 4 m tall, leaves narrow-obovate, blue-green, somewhat cupped, fruit orbicular with recessed pedicel, green to dull red, 20 Aug 1996, *J.B. Phipps & R.J. O'Kennon 7395* (ID, UT, UWO); US 93, 17.4 rd. mi N of Salmon, west side, roadside ditch, alt. 3900 ft, bush, 2 m tall, fruit dull purple-red, 20 Aug 1996, *J.B. Phipps & R.J. O'Kennon 7397* (UWO). Payette Co.: Hwy. 53 roadside, in floodplain of Payette River, ca. 9 rd. mi SE of

Payette, alt. 2300 ft, slightly swampy fields, 27 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7094* (UWO) **Washington Co.:** US 95 at Monroe Creek, ca. 5.6 mi N of Weiser (MP 88.4), alt. ca. 2700 ft, brushy area, bush, 5 m tall, fruit large, spherical, red changing to burgundy, 27 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7095* (BRIT, ID, MONTU, RM, UT, UWO). **MONTANA: Flathead Co.:** Hwy 35, ca. 0.5 mi SE of Creston, alt. 3050 ft, dense bush 3 m tall, fruit orbicular, dull red, 25 Aug 1994, *J.B Phipps & R.J. O'Kennon 7071* (MONTU, RM, UWO). Junction of state road 35 and unpaved road to Fish Hatchery, small hawthorn thicket in old pasture, alt. ca. 2800 ft, bush, 3 m tall, flowers at popcorn, anthers pink, 20 May 1997, *J.B. Phipps & R.J. O'Kennon 7589* (MONTU, UWO). Flathead River Valley, 1 mi E of 206, ca. 3 mi SE of Columbia Falls center on dirt extension of S end Berne (Jensen) Rd., 3100 ft, large 6 m bush near pond, (=*JBP & RO'K #6838*), stamens 10, anthers pink, coll. 8 May, buds forced, 08 May 1994, *J.B. Phipps 6938* (BRIT, ID, MONTU, RM, UBC, UWO). Flathead River Valley, 1 mi E of 206, 3 m SE Columbia Falls center at extreme S end of Jensen Rd., by pond, alt. 3100 ft, 5 m bush, fruit orbicular, purple-black, 27 Sep 1993, *J.B. Phipps & R.J. O'Kennon 6838* (BRIT, ID, MONTU, RM, UBC, UWO). **Lake Co.:** State Road 35 E of Polson, between Turtle Lake Road and Ducharme, Indian Agency lands with stream, mature ponderosa pine and mown grass, along water edge, alt. 2950 ft, bush, 6 m tall, twigs with some bi-thorns, in bud, anthers pale pink, 19 May 1997, *J.B. Phipps & R.J. O'Kennon 7581** (UWO); Old Freight Rd., off US 93 W of St. Ignatius, hawthorn thickets in creek beds between dry grassland, at roadside, alt. 2900 ft, bush 4 m tall, leaves rhomb ovate, little lobed, badly rusted, fruit broad-ampulliform to suborbiculate, red to purple-black, common, Aug 21 1996, *J.B. Phipps & R.J. O'Kennon 7409* (BRIT, MONTU, RM, UWO); Old Freight Rd., off US 93 W of St. Ignatius, hawthorn thickets in creek beds between dry grassland, at roadside, alt. 2900 ft, bush, 4 m tall, leaves rhomb-ovate, little lobed, badly rusted, fruit broad-ampulliform to suborbiculate, red to purple-black, common, 21 Aug 1996, *J.B. Phipps & R.J. O'Kennon 7410* (UWO); ca. 0.5 km up Old Freight Rd. from US 93, hawthorn thickets along creek, alt. 3000 ft, 17 May 1997, *J.B. Phipps & R.J. O'Kennon 7552* (MONTU, UWO); Old Freight Road off Hwy 93, within sight of Hwy 93, milepost 30.4, 3 mi N of Ravalli, 10 pink anthers, 15–22 flowers per inflorescence, pedicels pubescent, calyx glabrous, medium thorns, 18 May 1995, *R.J. O'Kennon 13162* (UWO); Old Freight Road off Hwy 93, within sight of Hwy 93, milepost 30.4, 3 mi N of Ravalli, 17–22 flowers per inflorescence, 10 pink anthers, pedicels pubescent, calyx glabrous, looks like 13162, 18 May 1995, *R.J. O'Kennon 13164* (UWO); Old Freight Road off Hwy 93, within sight of Hwy 93, milepost 30.4, 3m N of Ravalli, 17–22 flowers per inflorescence, 10 pink anthers, full flower, pedicels and calyx pubescent, 18 May 1995, *R.J. O'Kennon 13165* (UWO). **Lincoln Co.:** Hwy 93, between Roosville & Eureka, W side of rd., ca. 1.0 mi N of junction with 37, seepage slopes below irrigation channel, on hillside, alt. 2850 ft, bush 4 m, crus-galli like foliage, frt. orbicular, crimson changing to burgundy, 24 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7062* (BRIT, MONTU, UWO). **Sanders Co.:** Banks of Little Bitterroot R. near confluence with Flathead R., alt. 2700 ft, bush 4 m tall, fruit ± orbicular, deep red, 21 Aug 1996, *J.B. Phipps & R.J. O'Kennon 7418* (ID, MONTU, UWO); 7 km direct NE of center of Camas Prairie Basin on road from Little Bitterroot Valley, close to Schmilz Lookout access road, seepage zone in prairie, alt. 3000 ft, bush, 4 m tall, anthers 10, pink, 18 May 1997, *J.B. Phipps & R.J. O'Kennon 7576* (BRIT, MONTU, UWO); at Little Bitterroot R., at eastbound road crossing exactly 20 km SE of Hot Springs, Evan Melton ranch, thickets at edge of water, alt. ca. 2800 ft, bush, 4 m tall, anthers 10, pink, 18 May 1997, *J.B. Phipps & R.J. O'Kennon 7571* (BRIT, MONTU, RM, UWO). Ca. 24 km (direct) SE of Hot Springs, hawthorn thickets along banks of Little Bitterroot R., alt. 2800 ft, bush, 3 m tall, anthers 10, pink, 18 May 1997, *J.B. Phipps & R.J. O'Kennon 7570* (BRIT, MONTU, RM, UWO); ca. 24 km (direct) SE of Hot Springs, hawthorn thickets along banks of Little Bitterroot R., alt. 2800 ft, bush, 3 m tall, anthers 10, pink, 18 May 1997, *J.B. Phipps & R.J. O'Kennon 7569* (BRIT, ID, MONTU, UT, UWO); hawthorn thickets with pasture along Little Bitterroot R., ca. 24 km SE of Hot Springs, Melton Sr. (grandfather) ranch, alt 2750 ft, bush 3 m tall, leaves broad, fruit burgundy, orbicular, Aug 21 1996, *J.B. Phipps & R.J. O'Kennon 7423** (UWO); hawthorn thickets with pasture along Little Bitterroot R., ca. 24 km SE of Hot Springs, Melton Sr. (grandfather) ranch, alt 2750 ft, bush 3.5 m tall, foliage intermediate, fruit burgundy, orbicular, 21 Aug 1996, *J.B. Phipps & R.J. O'Kennon 7425*

(BRIT, UWO); banks of Little Bitterroot R. ca. half mi S of confluence with Flathead R., bush 3 m tall, 18 May 1997, *J.B. Phipps 7561 & R.J. O'Kennon** (MONTU, UWO); hawthorn thickets along bank of Little Bitterroot R., abt 24 km direct SE of Hot Springs, 2800 ft, bush, 3 m tall, 18 May 1997, *J.B. Phipps & R.J. O'Kennon 7566* (BRIT, MONTU, UWO); hawthorn thickets along bank of Little Bitterroot R., abt 24 km direct SE of Hot Springs, 2800 ft, bush, 3 m tall, 18 May 1997, *J.B. Phipps & R.J. O'Kennon 7568* (BRIT, MONTU, UWO); crossing of Little Bitterroot R. exactly 20 km SE of Hot Springs, thickets at edge of water, Evan Melton ranch, 2800 ft, bush 4 m tall, 18 May 1997, *J..B. Phipps & R.J. O'Kennon 7573* (BRIT, MONTU, RM, UWO); main road SE from Hot Springs along Little Bitterroot River at 5 mi due N of major NS/EW bend (near location of *7420*) at Malinak mailbox, alt 2800 ft, two hawthorns along ditch on west side of road, healthy bush, 4 m tall, 21 Aug 1996, *J.B. Phipps & R.J. O'Kennon 7427* (UWO); Hot Springs-Perma Rd., Camas Prairie Basin, ca. 4 mi S of Camas Prairie, alt. 2850 ft, large bush 6 m tall, fruit burgundy-red, 21 Aug 1996, *J.B. Phipps & R.J. O'Kennon 7429* (UWO); Little Bitterroot River at eastbound road crossing exactly 20 km SE of Hot Springs, road from Hot Springs to Evan Melton ranch, alt. 2790 ft, open thicket of hawthorns in pasture near creek, bush 3 m tall, leaves blue-green, fruit deep burgundy, orbicular, with recessed pedicel, locally frequent, 21 Aug 1996, *J.B. Phipps & R.J. O'Kennon 7420* (MONTU, RM, UWO). **OREGON: Grant Co.:** John Day Valley, S fork, Humphreys, small tree, 30 Apr 1925, *L.F. Henderson 5146** (CAS, DS, photo UWO). **UTAH: Cache Co.:** S of Hyrum Reservoir at 7800, off 400S, fenceline, S side of dirt road, alt. 4800 ft, bush, 5 m tall, small flowers, 10 pink anthers, 15 May 1997, *J.B. Phipps & R.J. O'Kennon 7528* (BRIT,ID,UT,UWO); E side of south end of Hyrum Reservoir across field from intersection of 7000W and 400S, hedgeline, alt. 4800 ft, bush, 4 m tall, flowers small, anthers 10, deep pink, 15 May 1997, *J.B. Phipps & R.J. O'Kennon 7527* (BRIT, ID, MONTU, NY, RM, UBC, US, UT, UWO). **Weber Co.:** Huntsville, on N side of UT 39 ca. 0.5 mi after it turns E of Pineview Reservoir, roadside with ditch backing irrigated fields, bush, 6 m tall, but early, white, forced, 10 pink anthers, 4 green styles, inflorescences more floriferou-s and dense than *C. rivularis*, 15 May 1997, *J.B. Phipps & R.J. O'Kennon 7526* (UWO); UT 39 ca. 1/2 mi after it turns E, E of Pineview Reservoir, roadside with ditch (water flowing) backing on to irrigated field, 2 adjacent bushes, ca. 6 m tall, densely foliaged, lvs. blue-green, young twigs & thorns shiny olive-brown, frt. orbicular, recessed at pedicel contact, green turning light to dull red to vinous to black, on same tree, 18 Aug 1996, *J.B. Phipps & R.J. O'Kennon 7389* (BRIT, ID, MONTU, RM, UT, UWO); ravine to E of S.R. 167 (Trappers' Loop Rd.), along creek, alt. 5200 ft, bush 4 m tall, abundant, 22 May 1997, *J.B. Phipps & R.J. O'Kennon 7608* (BRIT, MONTU, UT). **WASHINGTON: Okanogan Co.:** Chopaka Rd., 2.75 mi from Loomis-Nighthawk Rd. junction, 28 Aug 1994, *J.B. Phipps 7106 & R.J. O'Kennon* (UWO). **Spokane Co.:** S of Deer Park, 0.5 mi S of milepost 179 on US 395, 30 Sep 1993, *J.B. Phipps 6861 & R.J. O'Kennon* (UWO). **Whitman Co.:** Staley Rd., 2 km NE of Chambers, floodplain of small creek, dense small tree 4 m tall, fruit orbicular, red changing to burgundy, 27 Aug 1994, *J.B. Phipps 7097 & R.J. O'Kennon** (BRIT, UBC, UWO, WS, WTU). **WYOMING: Lincoln Co.:** US 89, S of Thayne and 0.4 mi N of Salt River, floodplain pastures with hawthorn thickets, alt. 5950 ft, bush, 4 m tall, inflorescence pubescent, anthers 10, pink, in green bud, forced, 21 May 1997, *J.B. Phipps & R.J. O'Kennon 7597** (BRIT, MONTU, RM, UWO); US 89 S of Thayne at 0.4 mi N of Salt River crossing, fenceline in flood plain, alt. 5950 ft, bush, 3.5 m tall, (– JBP 7462), in tight bud, forced, 16 May 1997, *J.B. Phipps & R.J. O'Kennon 7531** (RM, UWO); US 89, S of Thayne and 0.4 mi N of Salt R. crossing, 2.5 mi N of junction with 238, fencelines in floodplain, alt. 5950 ft, bush, 3.5 m tall, leaves deep green, somewhat lobed fruit red to plum-red, orbicular, held erect, 25 Aug 1996, *J.B. Phipps & R.J. O'Kennon 7462* (BRIT, UWO). **Teton Co.:** Targhee National Forest, US 89, 5.4 mi S of Hoback Jct., flats of Snake River, alt. 6200 ft, dense brushy area with tall trees of cottonwood and pine, bush, 6 m tall, foliage narrow, fruit spherical, colors greenish to red to plum to burgundy, 25 Aug 1996, *J.B. Phipps & R.J. O'Kennon 7460* (BRIT, MONTU, RM, UT, UWO). Targhee National Forest, flats of Snake R., 5.4 mi S of Hoback Jct., alt. 6200 ft, 21 May 1997, *J.B. Phipps 7593a* & R.J. O'Kennon* (UWO). **Washakie Co.:** US 16, 1 mi E of Tensleep, river flats of Tensleep R., in sagebrush country, alt. 4550 ft, bush, 4 m tall, badly rusted, leaves thin, (one bush was non-rusted), fruit suborbicular, plum-colored, 24 Aug 1996, *J.B. Phipps & R.J. O'Kennon 7456* (UWO).

Incertae Sedis

Crataegus shuswapensis J.B. Phipps & O'Kennon, sp. nov. (**Fig. 5**). TYPE: CANADA: BRITISH COLUMBIA: Northern Okanagan, Enderby, ca. 200 m E of bridge over Shuswap River on Mabel Lake Rd., bush, 3.5 m tall, fruit deep purple (=*JBP 6910*), 20 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7009* (HOLOTYPE: UWO; ISOTYPES: BRIT, CAN, DAO, TRT, UBC).

Frutices ad 5 m alti; ramuli unius anni glandulacei vel atrobrunnei; spinae 2–3 cm longae, ± validae, rectae vel leviter recurvatae, in juventute atrobrunneae. Folia decidua; petioli 1.5–2.25 cm longi, sparsim glandulo maculati, leviter pubescentes; laminae 5–7 cm longae, rhombeae in forma generali, lobis acutis, ca. 4-lobatae per latus, cum IFI ad 25%; venatio craspedodroma, venis secondariis 4–5 per latus; margines remote serrati; facies adaxialis aliquantum appresso-pubescens, abaxialis glabra. Inflorescentiae 12–18 florae; ramuli glabri, cum nonnullis bracteolis caducis linearibus, glandulo-marginatis. Flores ca. 15 mm diam., hypanthium extrinsecus glabrum; lobi calcycis 4–5 mm longi, triangulares, minute glandulo-marginati; petala circularia; stamina 10(15–18), antheris pallide vel clare roseis vel rare tyriis; carpelli et styli 2–3. Fructus 12 mm longi, ± late-ellipsoidei, in juventate roseo-vinosi, atropurpurei in maturitate; reliquiae calycis adsunt, patento-recurvatae; pyrenae 2–3, dorsaliter sulcatae, in lateribus planae.

Bushes to 5.5 m tall; one year old twigs tan to deep brown; thorns 2–3 cm long, stoutish, straight or slightly recurved, very dark brown when young. Leaves deciduous; petioles 1.5–2.25 cm long, sparsely gland-dotted, slightly pubescent; laminas 5–7 cm long, rhombic in general shape; ca. 4-lobed per side, LII to 25%; venation craspedodromous, with 4–5 pairs of secondary veins; lobes sharp; margins remotely serrate; somewhat sparsely appressed-pubescent above, glabrous below. Inflorescences 12–18 flowered, the branches glabrous, some linear caducous gland-margined bracteoles present. Flowers ca. 15 mm diam.; hypanthium glabrous externally; calyx-lobes 4–5 mm long, triangular, minutely gland-margined; petals circular; stamens 10(15–18), anthers pale to bright pink or rarely puce; carpels and styles 2–3. Fruit ± broadly ellipsoidal, 12 mm long, claret color at first, deep purple at maturity; calyx remnants present, patento-recurved; nutlets 2–3, grooved dorsally, smooth on sides.

Crataegus shuswapensis is locally common near Enderby in the northern Okanagan and southwestern Shuswap drainage, British Columbia. Collection localities may be identified, at least approximately, on figure 2.

This is a very distinctive hawthorn on account of its rhombic, wide and quite deeply and sharply lobed leaf-blades, stamens with anthers pink or sometimes puce and fairly large suborbicular to broad-ellipsoid purple fruit. The flowers, and to some extent the fruit, are much like *C. douglasii* but other characteristics, the rather long stout thorns, leaf shape, fruit color about the third week in August, 2–3 styles and nutlets point in a different direction. Flowering material with 10 pink stamens from near Polson, Montana, may be the same and fruiting specimens are required to verify this. This species flowers synchronously with *C. castlegarensis* in the northern Okanagan.

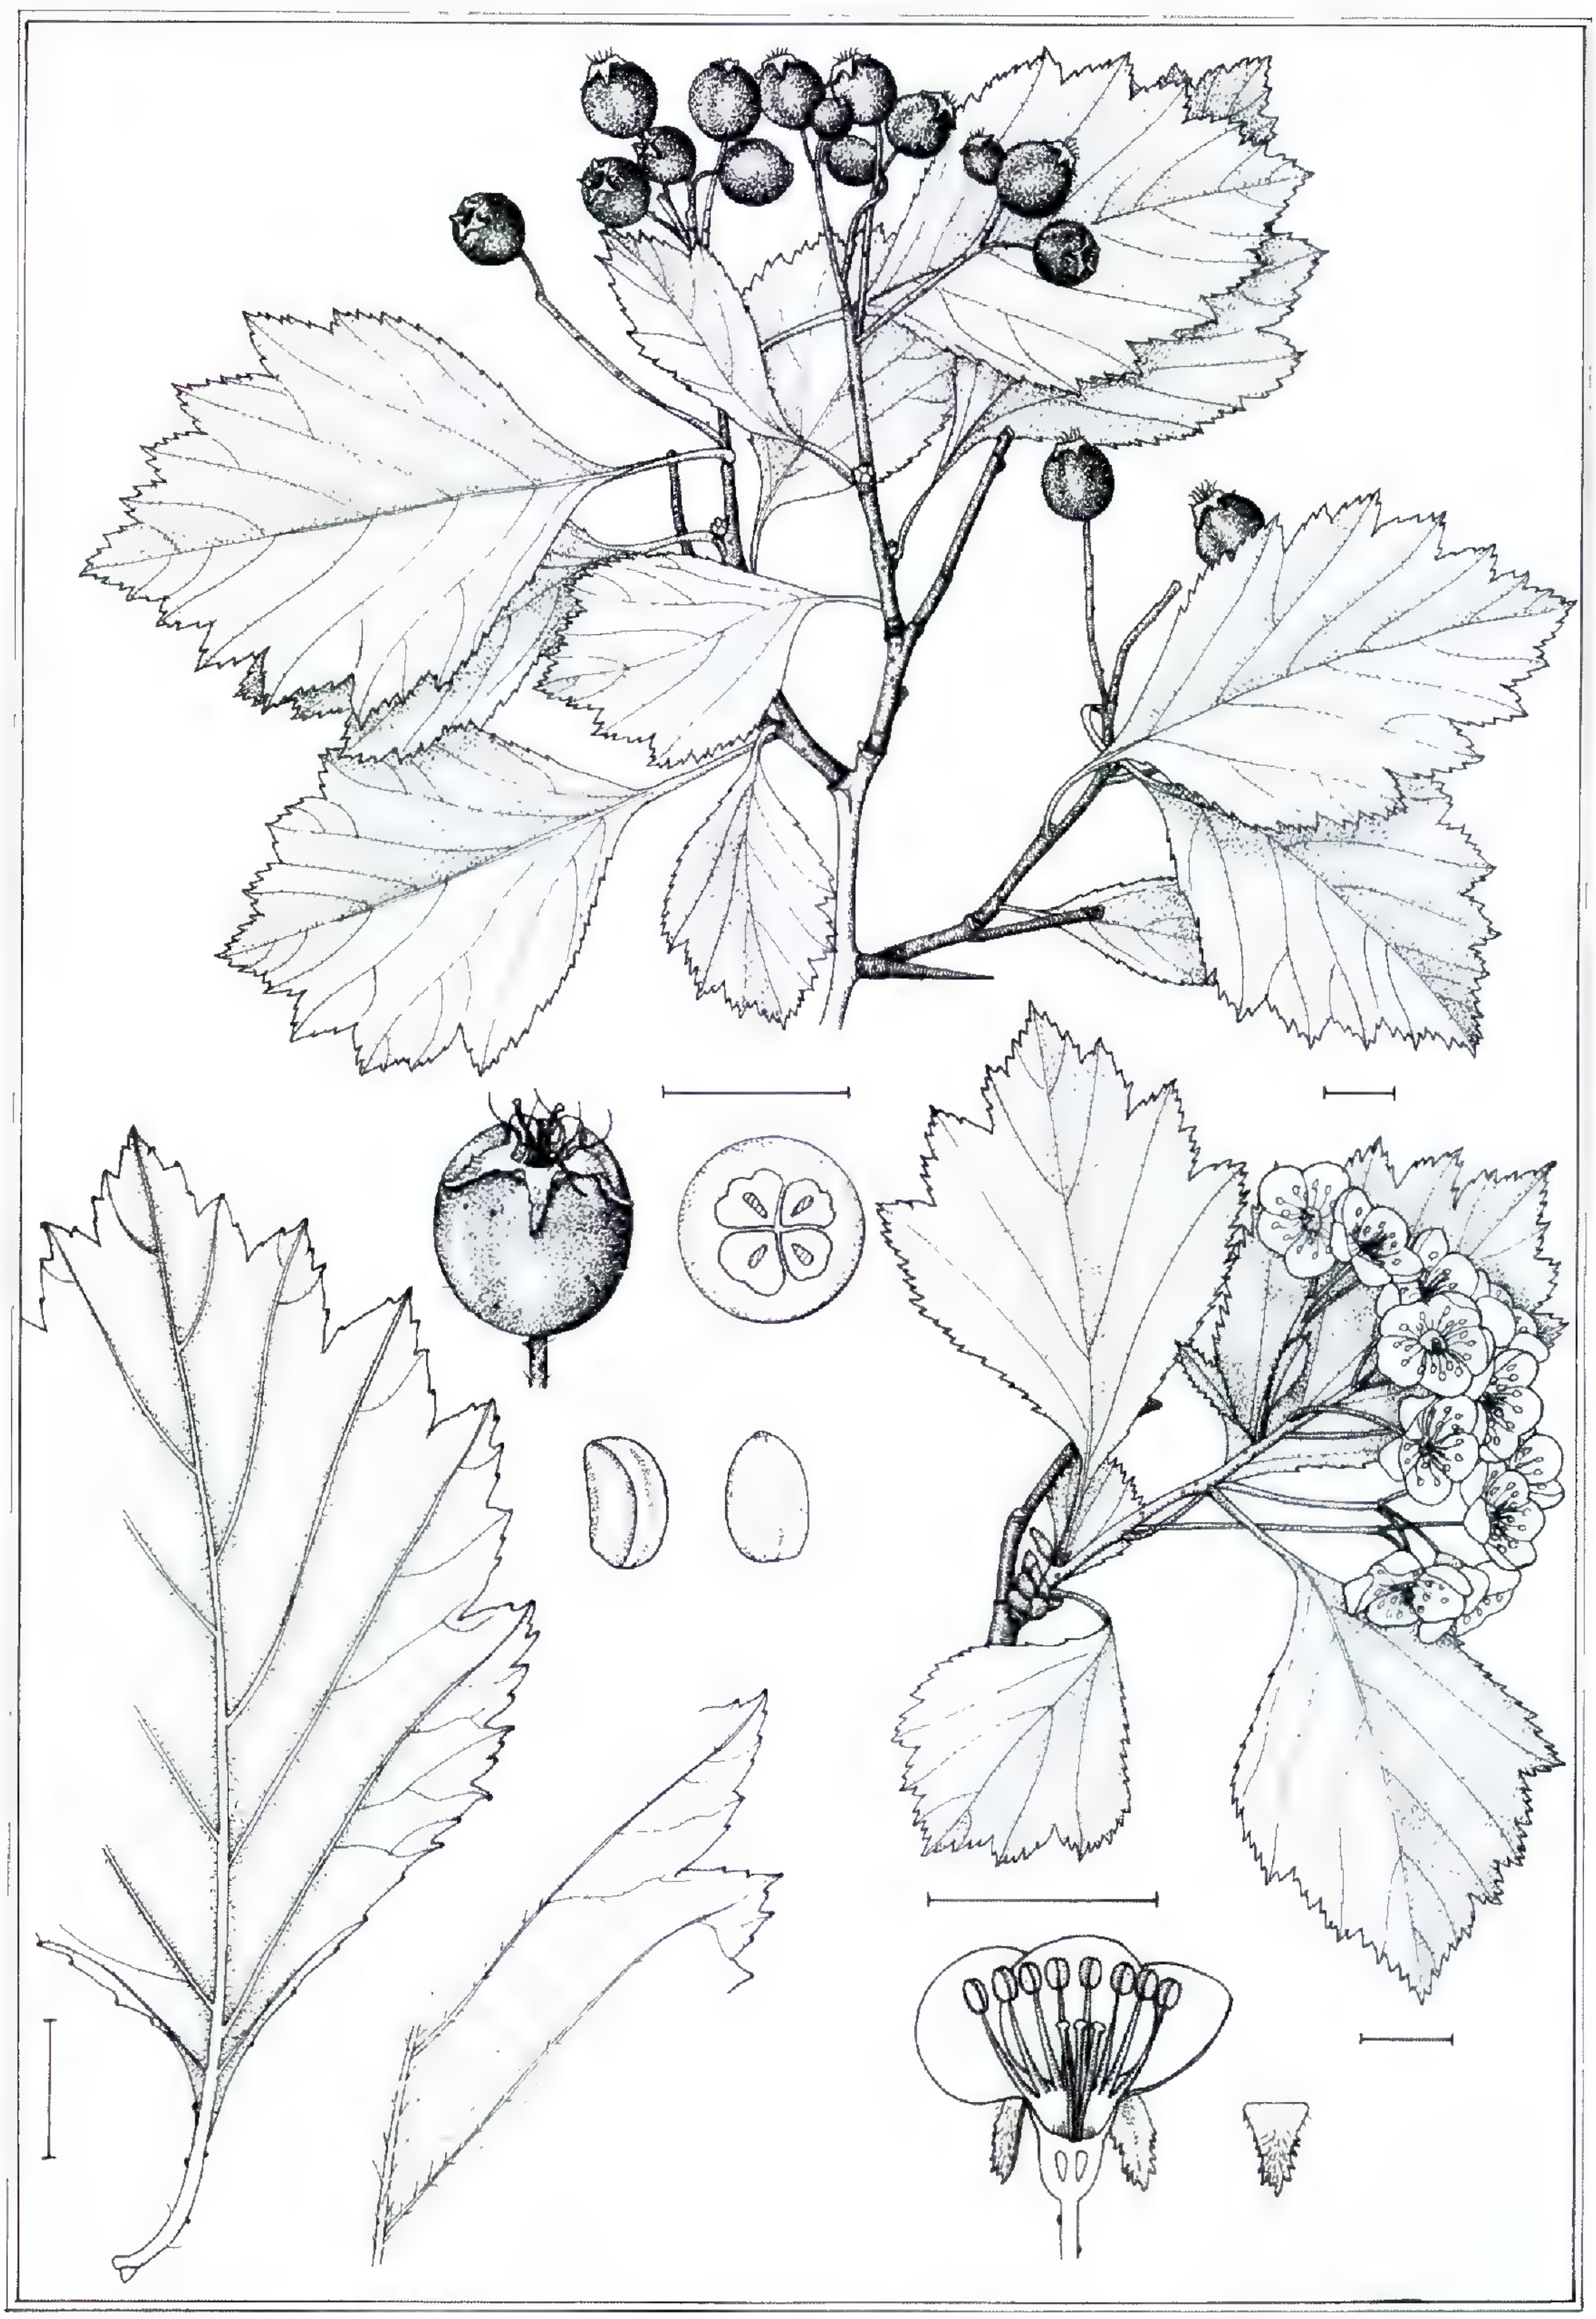

FIG. 5. Line drawing of *Crataegus shuswapensis*. Flower details illustrate rare 15 stamen form. Scale bars = 1 cm.

Additional specimens examined: **CANADA. BRITISH COLUMBIA:** Valley of the Shuswap, 8.0 km E of Enderby, little to E of Brash Creek, road-edge, woodland S side of road, shade, alt. 1270 ft, 4 m tall large bush in shade of balsam poplar, black fruit, 20 Aug 1995, *J.B. Phipps 7172* (UWO); Northern Okanagan, Spallumcheen Municipality, Marshall Road (dead end gravel drive off Mcleery Rd.), alt. 1300 ft, bush, 2.5 m tall, fruit deep plum-purple, ellipsoid, 20 Aug 1995, *J.B. Phipps 7169* (BRIT, UBC, UWO, V); Mabel L. Rd., N side, ca. 150 m E from Shuswap River bridge, 3–3.5 m tall, anthers exhibit slight pink tinge, 15 May 1995, *L.S. & D. Donovan 2755* (UWO); Near Enderby, S end of 97A, E side of Hwy 97A, ca. 150 m from Mabel L. Rd., forest margin, alt. ca. 1250 ft a.s.l., ca. 2.5 m tall, 15–18 pink anthers, spindly, leaves larger, lighter green (shady location?), 15 May 1995, *L.S. & D. Donovan 2754* (UWO); Near Enderby, S end of 97A, E side of Hwy 97A, ca. 150 m from Mabel L. Rd., forest margin, alt. ca. 1250 ft a.s.l., ca. 3 m tall, anthers pink to red, 15–18 stamens, 15 May 1995, *L.S. & D. Donovan 2753* (UWO); S end of 97A, near Enderby, E side of Hwy 97A, ca. 150 m from Mabel L. Rd., forest margin, alt. ca. 1250 ft a.s.l., ca. 1.75 m tall, 15–18 stamens, deeply lobed leaves, anthers pink, 15 May 1995, *L.S. & D. Donovan 2752* (UWO); Rd. to Mabel L. ca. 1.2 mi E of Enderby and between 25 m and 200 m W of "Autobody collision and repairs" sign, hedgerow, alt. 1275 ft, bush 3 m tall, fruit burgundy-red, 20 Aug 1994, *J.B. Phipps & R.J. Okennon 7015* (BRIT, UWO); 1.25 mi E of Enderby on Mabel L. Rd., ca. 200 m E of "Autobody Collision, Repairs & Painting" sign, 1275 ft, hedgerow, bush, 5.5 m tall, 20 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7018a* (BRIT, UWO); Shuswap Valley, ca. 8 km E of center of Enderby on road to Kingfisher, S side of road, 1270 ft, hedge backing small woodlot, bush, 4 m tall, stamens 10, anthers pink, (*=JBP & RO'K 6815*), 05 May 1994, *J.B. Phipps 6922* (BRIT, CAN, UBC, UWO, V); Shuswap Valley, road to Kingfisher, ca. 2 km E of Enderby, opposite sign on N, "Autobody Collision, Repairs & Painting", alt. 1275 ft, hedgerow S side of road, bush 5 m, ca. 18 puce anthers, (*probably = JBP & RO'K 6810*), 05 May 1994, *Phipps, J.B. 6917* (BRIT, UBC, UWO); Shuswap valley, just E of Enderby, across bridge, N side of road at edge of swamp forest, alt. ca. 1250 ft, bush, 3 m tall, thorns medium, dark green foliage, stamens 15, anthers pale pink, 05 May 1994, *J.B. Phipps 6910* (BRIT, UWO); Northern Okanagan, Spalumcheen Municipality, Stepney Cross Rd., lowest point, large bush, 4 m tall, 26 Aug 2000, *J.B. Phipps 8182 & S.R. Phipps* (UWO).

ser. **Purpureofructi** J.B. Phipps & O'Kennon.

Bushes or small trees, generally 3–6 m tall; thorns 2–5 cm long, slender to quite stout, shiny dark brown to purple or black at 2 yrs, usually quite numerous; extending twigs thinly pubescent or glabrous; at 1 year deep reddish-brown or mahogany, older dark gray. Leaves deciduous; petioles 1/4–1/2 length of blade, 1–3 cm long, eglandular or with some small black glands, glabrous to thinly pubescent while young; blades 3–8 cm long, ± rhombic to elliptic-oblong, ovate-rhombic or occasionally suborbiculate in general shape; acute at the apex, cuneate to somewhat rounded at the base; 1–3(–4)-lobed per side, the lobes obscure and shallow to well-defined and acute and with max. LII ca. 20%; margins serrate except at the base, the teeth with small gland-dots; venation craspedodromous, 4–6(–7) per side, ± impressed in the more coriaceous-leaved species; usually scabrate-pubescent on the upper surfaces young, this variably glabrescent (abrading with age), below glabrous on the surface, pubescent or not on the veins; markedly coriaceous to thin; autumnal color generally brilliant. Inflorescences 8–25 flowered; branches glabrous or thinly pubescent, bearing caducous, membranous, linear, gland-margined bracteoles. Flowers 12–18 mm diam.;

hypanthium externally glabrous to pubescent; calyx-lobes 2–4 mm long, narrow, abaxially glabrous, margins finely glandular-serrate; petals ± circular, white; stamens (5)10–12, anthers white or pink; styles 2–4(–5). Fruit 8–10 mm diam., ± orbicular to ellipsoidal or ampulliform, mostly red in late August, deep purple or deep reddish-purple (often nearly black) in late September; calyx-lobes narrow or broad, reflexed to erecto-patent, thinly hairy to glabrous; nutlets 2–4(–5), dorsally furrowed, sides plane to quite deeply pitted.

Six species are now recognized, found from the Okanagan Valley of British Columbia and Washington east to northwest Montana. They are all locally common in suitable habitats. We add three new species and one variety to this series and emend the key.

These include some very handsome hawthorns, particularly in late summer and autumn when their usually abundant fruit turns from bright red to deep purple and the leaves manifest brilliant coloring in bronze, burgundy, yellow etc. These hawthorns have very high ornamental potential but are not yet cultivated outside botanic gardens and arboreta.

KEY TO SPECIES OF SERIES *PURPUREOFRUCTI*

1. Leaf-blades rhomb-elliptic to elliptic in general shape, lobes ± sharp.
   2. Calyx-lobes in fruit us.reflexed, if erecto-patent, very narrow; anthers pink or white; leaf- blades various but never suborbiculate, only rarely broad-elliptic.
      3. Anthers pink; anthesis later than *C. macracantha*; leaves thin; thorns somewhat slender _____ **1. C. williamsii**
      3. Anthers generally cream or white; anthesis with or somewhat before *C. macracantha*; leaves coriaceous; thorns usually ± stout.
         4. Leaf-blades 3.5–6 cm long, coriaceous, without strongly impressed venation above, flattish to strongly concave, generally mid-green until fall; hypanthium glabrous or hairy _____ **2. C. okanaganensis** [incl. var. **wellsii**]
         4. Leaf-blades 4–8 cm long, softly coriaceous, with distinctly impressed venation above, flattish to convex, generally deep green until fall; hypanthium glabrous _____ **3. C. enderbyensis**, sp. nov.
   2. Calyx-lobes in fruit sub-erect, broad, herbaceous; anthers pink; leaf blades elliptic to broad elliptic to suborbiculate, sometimes ovate.
      5. Leaf-blades elliptic to broad elliptic or suborbiculate; mid-green; fruit ca. 8 mm long, glabrous, oblong suborbicular reddish in August, plum in September; inflorescences glabrous _____ **4. C. orbicularis**, sp. nov.
      5. Leaf-blades elliptic to ovate in general shape, deep green; fruit 13–15 mm long, hairy, ampulliform to ellipsoid, deep burgundy in late August, nearly black in September; infloresences pubescent _____ **5. C. atrovirens**, sp. nov.
1. Leaf-blades broad-ovate to ovate elliptic in general shape, lobes subacute to obtuse _____ **6. C. phippsii**

1. Crataegus williamsii Eggl., Bull. Torrey Bot. Club 36:641. 1909. See also J.B. Phipps, Canad. J. Bot. 76:1889. 1998.

2. Crataegus okanaganensis J.B. Phipps & O'Kennon, Sida 18:178. 1998.

KEY TO VARIETIES

Leaf-blades 1.2–1.6 × as long as wide, sharply lobed; fruit flask-shaped ___ **2a.** var. **okanaganensis**

Leaf-blades 1.6–2 × as long as wide, shallowly lobed in distal half only or occasionally essentially unlobed; fruit subspherical ___ **2b.** var. **wellsii**, var. nov.

2a. Crataegus okanaganensis var. **okanaganensis**.

2b. Crataegus okanaganensis var. **wellsii** J.B. Phipps & O'Kennon, var. nov. (**Fig. 6**). TYPE: UNITED STATES: WASHINGTON: Okanogan Co.: Palmer Lake, N side; large bush, 5 m tall, stamens 5, anthers ivory, (equals *J.B.P. & R.J.O'K. 6875*), 4 May 1994, *J.B. Phipps 6905* (HOLOTYPE: UWO; ISOTYPES: BRIT, CAN, DAO, UBC, US, WS).

Frutices grandes vel arbores parvae ad 6 m alti, saepe cum truncis multiplicibus; ramuli unius anni atrospadicei; spinae 2–5 cm longae, in juventute nitenter atro-brunneae, validae, recurvatae. Folia decidua; petioli 1–1.5 cm longi, in juventute supra glandulosi saltem et pubescentes; laminae 3.5–5 cm longae, ellipticae vel ellipt-oblongae vel elliptico-rhombeae vel elliptico-ovatae in forma generali; saepe leviter contractae in petiolum vel cum basi obtusa; apices acutae; saepe ± cum lateribus ± parallelis in parte media; latera nonlobati vel lobis distinctis 1–3, latere distali anguli loborum plerumque + perpendiculari ad venam medianam; margines serratae; venatio craspedodroma, venis secondariis principalibus 4–5 per latus; facies adaxialis breviter appresso-serrata in juventute, abaxialis glabra venis exceptis. Inflorescentiae 8–15 florae; ramuli sparsim pilosi, bracteolis caducis, linearibus, membranaceis, glandulo-marginatis. Flores ca. 15 mm diam.; hypanthium supra glabrum et subter villosum; lobi calycis anguste-triangulares, tenuiter glandulosi; petala ± circularia; stamina (5–)10–12, antheris plerumque eburneis; carpelli et styli 2–3(–4). Fructus ca. 10 mm diam., ± orbiculares, subter pilosi, sanguinei in Augusto exeunte, in maturitate atropurpurei; lobi calycis triangulares, plerumque reflexi; pyrenae 2–3, dorsaliter sulcatae, lateribus planis vel vadositer foveolatis.

Large shrubs to 6 m tall, often with multiple trunks; 1 year old twigs mahogany; thorns 2–5 cm long, shiny dark brown when young, stout, recurved. Leaves deciduous; petioles 1–1.5 cm long, glandular above at least when young, pubescent when young; blades 3.5–5 cm long, elliptic or ellipt-oblong to elliptic-rhombic or elliptic-ovate in general shape; apex acute, base often slightly tapered into petiole or obtuse; often ± parallel-sided at broadest part, unlobed or with 1–3 distinct lobes, distal side of angle of lobes usually ± perpendicular to mid vein; margins serrate; venation craspedodromous with 4–5 main secondary veins per side; short-appressed serrate when young above, glabrous below, except along veins. Inflorescences 8–15 flowered; branches thinly hairy, with early caducous, glandular bracteoles. Flowers 15 mm diam.; hypanthium externally glabrous above and villous below; calyx-lobes narrow-triangular, finely glandular; petals ± circular; stamens (5–)10–12, anthers usually ivory; carpels and styles 2–3(–4). Fruit ca. 10 mm diam., ± orbicular, hairy below, dull deep red at late August, deep purple at full ripeness; calyx-lobes triangular, usually reflexed; nutlets 2–3, dorsally sulcate, sides plane or shallowly pitted.

Crataegus okanaganensis var. *wellsii* is found in the Okanagan valley of British Columbia and Washington and is common around Vernon (Fig. 7). Aboriginal people in Washington recognized this taxon as "stemoq'w" according to R. May's collection notes (cited specimen *May 258RM* from WA).

This variety was first collected by T.C. Wells at Kalamalka Provincial Park,

FIG. 6. Line drawing of *Crataegus okanaganensis* var. *wellsii*. Scale bar = 1 cm.

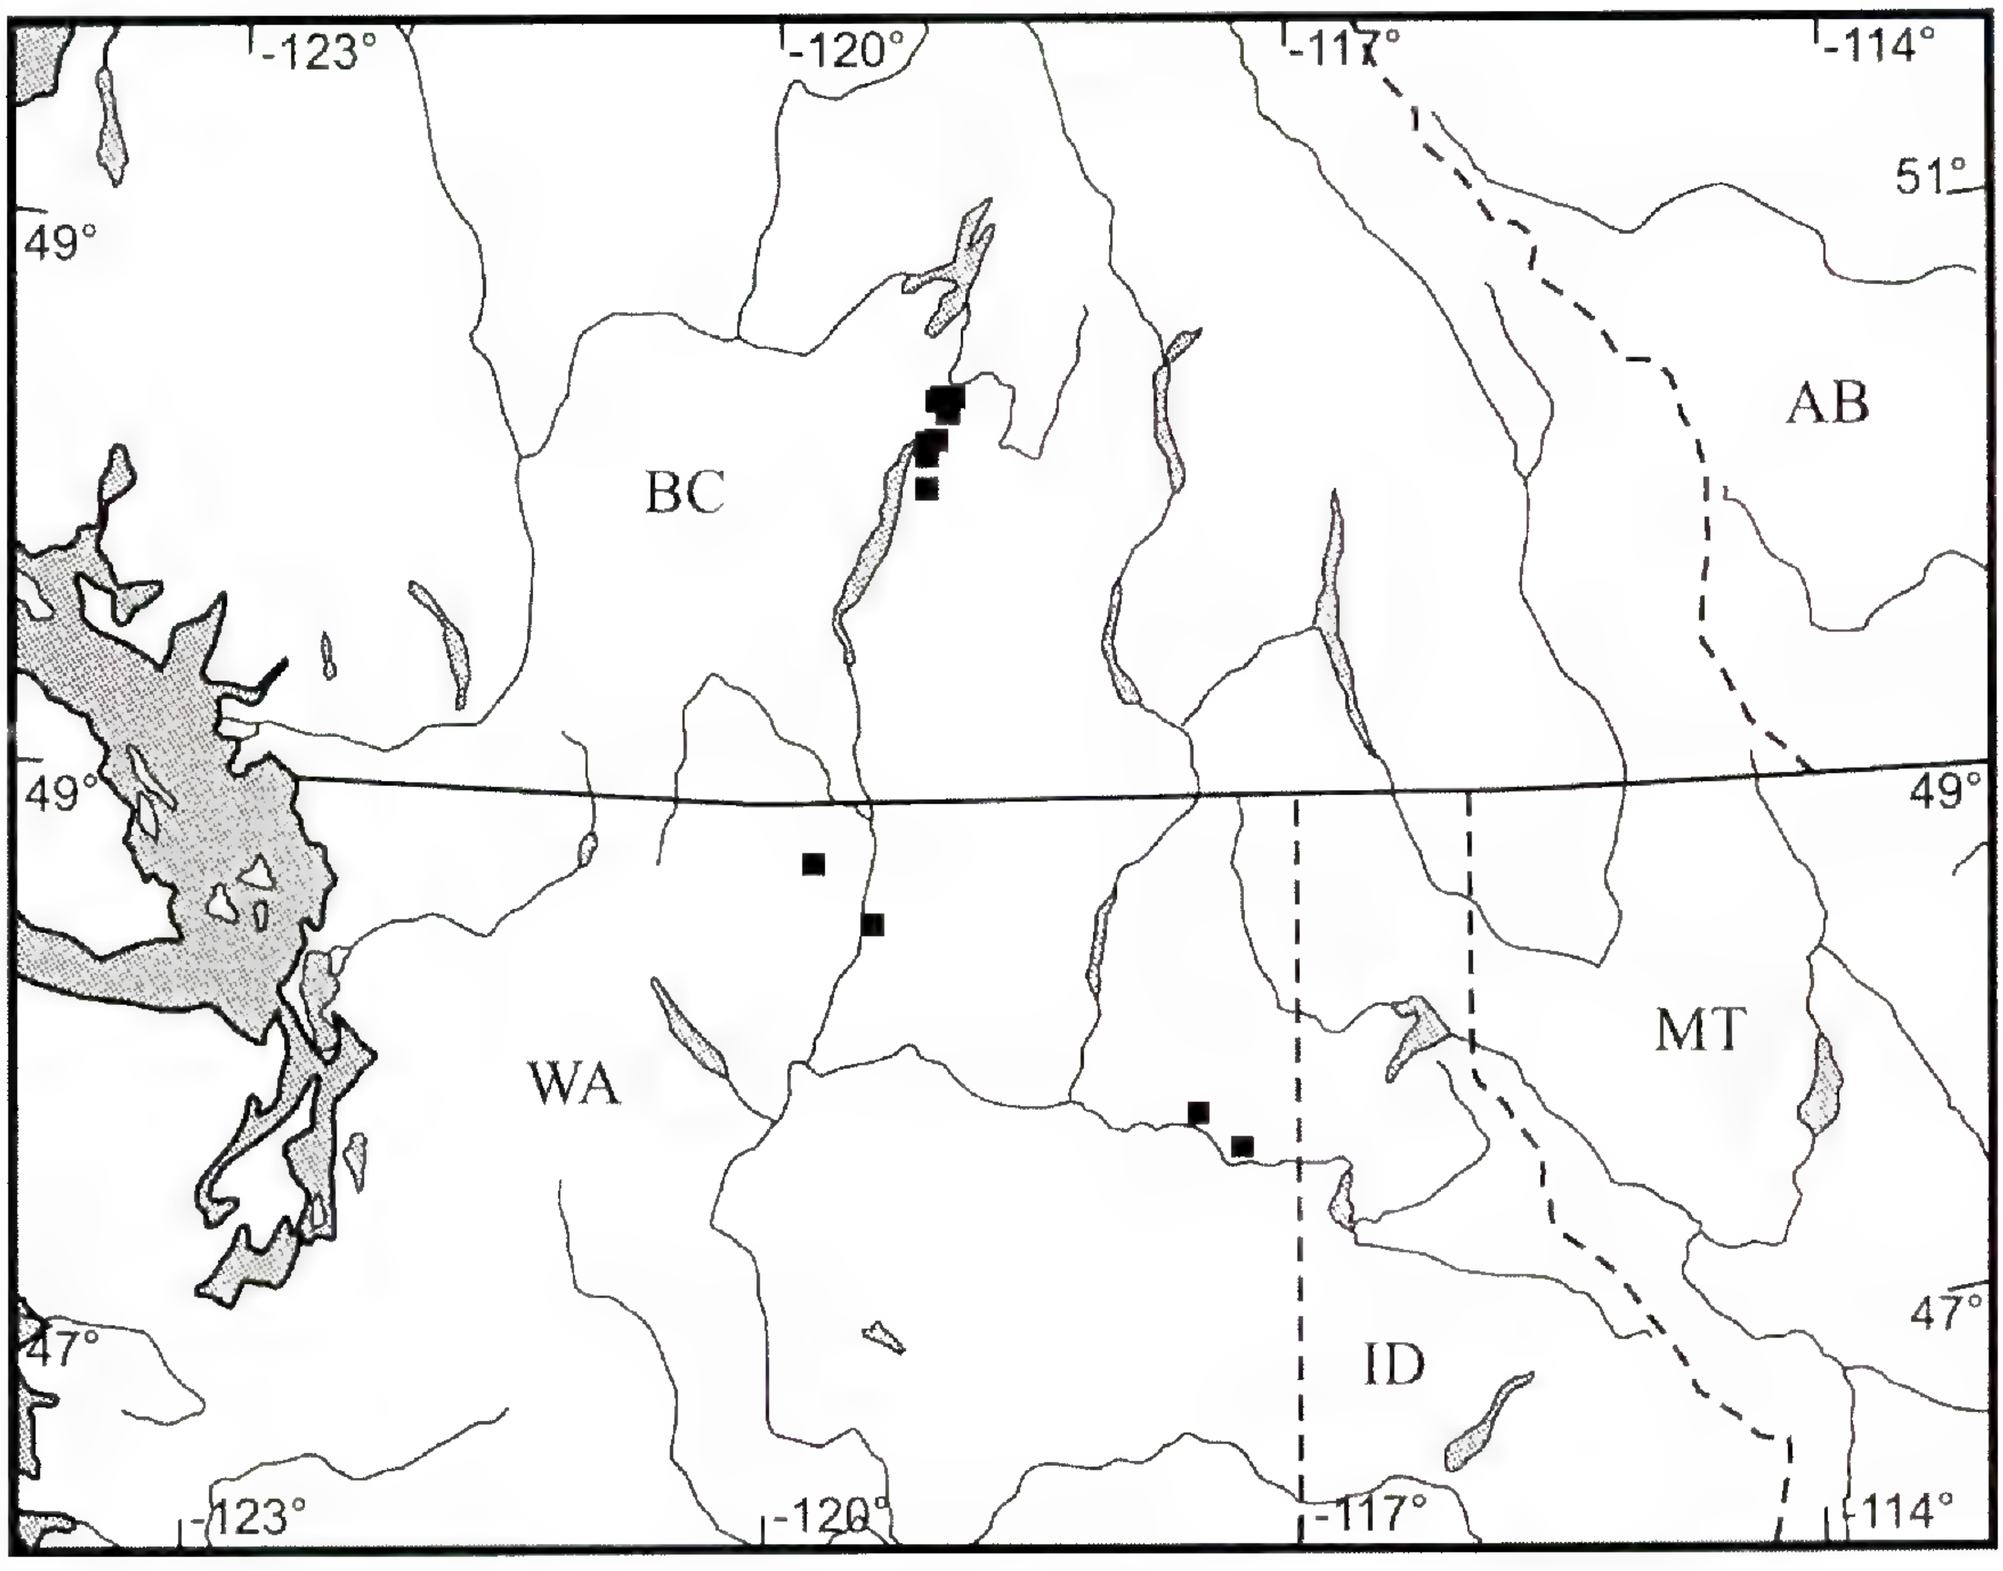

FIG. 7. Distribution map of *Crataegus okanaganensis* var. *wellsii* from collated records.

near Vernon. In its modal form it is very distinct with its unusual leaf-shape (quite differently lobed from var. *okanaganensis*). It also differs from var. *okanaganensis* in its orbicular fruit, fewer nutlets, fewer stamens (in the type), and crimson (or pink-burgundy) fall color versus copper-bronze in var. *okanaganensis*. Fruit may be a somewhat different color than nearby var. *okanaganensis* at the same time in late August, although in the third week of August they are brilliant scarlet. The most extreme form, virtually thornless, was seen at Palmer Lake, northern Washington. In spite of the several differences from var. *okanaganensis* the presence of intermediates prevents a higher rank.

Additional specimens examined: **CANADA. BRITISH COLUMBIA:** Ca. 10 km N of Vernon center on dirt road, N bound into O'Keefe ranch off 97A at L.& A. Cross Rd., boundary hedge along ditch, common component, 3.5 m bush, fruit burgundy, 25 Sep 1993, *J.B. Phipps & R.J. O'Kennon 6804* (UWO). Kalamalka Lake Prov. Park, 2 km SE of Vernon, at southern terminus of Kidston Road, alt. 440 m, in damp low-lying area, in open thicket, 5 m shrub, few thorns, 5 stamens, cream colored anthers), 16 May 1993, *T.C. Wells & M.E. Wells 1799* (UWO). Kalamalka Lake Prov. Park, 2 km SE of Vernon, at southern terminus of Kidston Road, alt. 440 m in damp low-lying area, in open thicket, 4 m shrub, 5 stamens, cream colored anthers, common, 16 May 1993, *T.C. Wells & M.E. Wells 1797* (UWO). Kalamalka Lake Prov. Park, 2 km SE of Vernon, at southern terminus of Kidston Road, alt. 440 m in damp low lying area, in open thicket, 4 m shrub, 5 stamens, essentially thornless, 16 May 1993, *T.C. Wells & M.E.*

Wells 1796 (UWO). Larry Calder property, E of 97, ca. 9 km NNE of Vernon, scrubby partly cleared hillside, alt. ca. 474 m, young 3 m bush, purple fruit, 26 Sep 1993, *J.B. Phipps & R.J. O'Kennon 6819a* (UWO). Okanagan Valley, ca. 10 km N of Vernon off 97A NW bound along dirt road into O'Keefe Ranch, at L. and A. Cross Road, alt. 1270 ft, boundary hedge along ditch, on SW side, bush, 4 m tall, stamens 10, anthers pale pink (=*J.B. Phipps & R.J. O'Kennon 6804*), 03 May 1994, *J.B. Phipps 6893* (UWO). Kalamalka Lake Provincial Park, ca. 10 km SSE of center of Vernon, near parking lot after yellow gate, alt. ca. 1375 ft, large bush 6 m tall, 5 ivory stamens, (= *J.B. Phipps & R.J. O'Kennon 6798*), 03 May 1994, *J.B. Phipps 6885* (TRT, UBC, UWO, V). Ca.10 km N of Vernon center on dirt road N into O'Keefe Ranch off 97A at L. & A. Cross Road, alt. 1270 ft, boundary hedge along ditch, common component, 3.5 m bush, fruit burgundy, 25 Sep 1993, *J.B. Phipps & R.J. O'Kennon 6805* (UWO). Shuswap Valley, just E of Enderby, across bridge, S side of road, top of river bank, alt. ca. 1250 ft, bush 4 m tall, in bud, stamens 5 or 10, anthers ivory, 05 May 1994, *J.B. Phipps 6914* (UWO). Kalamalka L. Prov. Park, 2 km SE of Vernon, Kidston Rd. entrance at red gate, with *Amelanchier alnifolia*, *Symphoricarpus albus*, *Pinus ponderosa*, open thickets, alt. 550 m, 4 m tree, shiny scarlet fruit, common, 18 Aug 1987, *T.C. Wells 689* (UBC # 19422, UWO). Kalamalka L. Prov. Park, 2 km SE of Vernon, Kidston Rd. entrance at red gate, with *Amelanchier alnifolia*, *Symphoricarpus albus*, *Pinus ponderosa*, open thickets: alt. 550 m, 4 m tree, shiny scarlet fruit, common, 18 Aug 1987, *T.C. Wells 690* (UBC # 194423, UWO). Shuswap Valley, just E of Enderby, across bridge, S side of road, top of river bank, alt. ca. 1250 ft, bush 4 m tall in late bud, stamens 10, anthers ivory, 05 May 1994, *J.B. Phipps 6915* (UWO). Kalamalka L. Prov. Park, 2 km SE of Vernon, at S terminus of Kidston Rd. red gate, with *Amelanchier alnifolia*, *Symphoricarpus albus*, *Pinus ponderosa*, open thickets, 550 m, 3 m shrub, heavily fruited, shiny, scarlet frt., common, *T.C. Wells 691* (UWO, UBC 194424); Aug 18, 1987. Shuswap Valley, just E of Enderby, across bridge, S side of road, top of river bank, alt. ca. 1250 ft, bush 6 m tall, in late bud, stamens 10, anthers ivory, 05 May 1994, *J.B. Phipps 6916* (UWO). Spallamcheen Municipality, E side 97A 1/2 mi N of intersection with 97, scrubby slopes rich in *Crataegus*, bush 6 m tall, red fruit, most abundant *Crataegus* here, 19 Aug 1994, *J.B. Phipps & R.J. O'Kennon 6999* (BRIT, UWO, V). Ca. 1 mi S of Enderby, N-trending, downslope gravel driveway bordered with hawthorns, alt. 1300ft, bush, 4 m tall, fruit burgundy, 20 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7006* (BRIT, UBC, UWO). Ca. 10 km N of Armstrong, W of Indian Reservation, alt. ca. 1550 ft, long farm drive with *Crataegus* hedgerow, bush 2 m tall, fruit in various stages of red, 21 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7035* (UWO). Okanagan Valley, Spallumcheen Municipality, L. & A. Cross Road, extreme E end, just W of Hwy 97A, alt. 1270 ft, along driveway N into farm, this species abundant here, shrub 4 m, rather dense fruit, blood-red, ± spherical, *J.B. Phipps 7161* (CAN, ID, TRT, UBC, UWO, V); Aug 17, 1995. Northern Okanagan, Spallumcheen Municipality, Otter Lake Cross Rd., just N of Hales Rd., 19 Aug 1995, *J.B. Phipps 7162* (TRT, UBC, UWO, V). Northern Okanagan, Spallumcheen Municipality, Marshall Rd., alt. 1300 ft, natural hedgerow, 20 Aug 1995, *J.B. Phipps & R.J. O'Kennon 7170* (CAN, TRT, UWO). Between Vernon & Armstrong, intersection of Otter Lake Cross Road & Hales Rd., alt. ca. 1300 ft, in partial shade of Ponderosa Pine and Douglas fir forest, 2 m tall, fresh anthers pink, May 15, 1995, *L.S. & D. Donovan 2749* (UWO). Shuswap Valley, just E of Enderby, across bridge, W side of road, 250 m from gate, alt. ca. 1250 ft, level open field growing along roadside across from cattle feeder, bush 3.5 m tall, fresh anthers cream, 15 May 1995, *L.S. & D. Donovan 2741* (UWO). Kalamalka L. Provincial Park, bushy slopes above red gate, in seepage zone, 1550 ft, same sp. as *Wells 689-691*, bush 4 m tall, leaves coriaceous, shining, mid-green, fruit bright red with long calyx-lobes, 18 Aug 1994, *J.B. Phipps & R.J. O'Kennon 6982* (CAN, UBC, UWO, V). Just E of Enderby after bridge over Shuswap R., rough grass near water, S side of road, alt. 1250 ft, edge of water near oxbow of Shuswap R., bush 5 m tall, burgundy fruit, 25 Sep 1993, *J.B. Phipps & R.J. O'Kennon 6809* (UBC, UWO). E side of 97A, 1/2 mi N of intersection with 97, scrubby slopes with long cleared area, bush 4 m tall, fruit ± spherical, plum-colored, common here, 19 Aug 1994, *J.B. Phipps & R.J. O'Kennon 6997* (BRIT, TRT, UBC, UWO, V). Ca. 1 mi S of Enderby, gravel driveway to NE starting at Indian Cemetery, alt. 1300 ft, bush, 3.5 m tall, fruit bright red, ellipsoid, scarce here, 20 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7007* (UWO). Ca. 1 mi S of Enderby, gravel driveway to NE starting at Indian Cemetery, alt.

1300 ft, bush, 3.5 m tall, fruit ± orbicular, dull red, a few here, 20 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7005* (CAN, UBC, UWO, V). Mabel Lake Rd., 1.3 mi E of Enderby center, opposite house with solid wooden fence, alt. 1275 ft, bush, 5 m tall, fruit bright red, 20 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7020* (UWO). Kalamalka L. Provincial Park, brushy slopes above red gate, in seepage zone, alt. 1600 ft, bush, 4 m tall, leaves coriaceous, shining, mid green, fruit bright red with long calyx-lobes, 18 Aug 1994, *J.B. Phipps & R.J. O'Kennon 6983* (BRIT, UBC, UWO). Northern Okanagan, Spallumcheen Municipality, Marshall Rd., fruit scarlet, spherical, 20 Aug 1995, *J.B. Phipps 7171* (UWO).

U.S.A. WASHINGTON: Okanogan Co.: US 97, 1.1 km S of Ellisforde, hawthorn hedge over RR tracks in grazed field (mostly *C. macracantha*), alt. 275 m, bush, 4 m tall, dense, fruit deep red, + round, 23 Aug 1995, *J.B. Phipps 7176* (UWO, WS, WTU); Westside Rd. ca. 4 km N of Tonasket, huge hawthorn stand along riverside, 975 ft alt., bush, 7 m tall, fruit burgundy, spherical, 30 Sep 1993, *J.B. Phipps & R.J. O'Kennon 6868* (BRIT, UWO, WS, WTU); Palmer Lake, N side, alt. 1150 ft: thornless 7 m bush, fruit burgundy, 1 Oct 1993, *J.B. Phipps & R.J. O'Kennon 6873* (UWO, WS, WTU); Palmer Lake, N end, open hawthorn thicket along gravel beach, just E of Chopata Lodge, alt. 1150 ft, bush 7 m tall, thornless, burgundy fruit, 1 Oct 1993, *J.B. Phipps & R.J. O'Kennon 6875* (BRIT, UWO, WS, WTU); Palmer Lake, N side, anthers ivory, 4 May 1994, *J.B.Phipps 6095* (UWO, WS, WTU). **Spokane Co.:** Spokane, 03 Sep 1896, *C.V. Piper 2387* (WS). **Stevens Co.:** West End, Wellpinit, variety with maroon, barely hairy, softer berry, 12 Sep 1976, *R. May 258RM* (V).

3. Crataegus enderbyensis J.B. Phipps & O'Kennon, sp. nov. (**Fig. 8**). TYPE: CANADA: BRITISH COLUMBIA: just E of Enderby after bridge over Shuswap R., S side of road, rough grass near water; alt. ca. 1250 ft, large bush 5m tall, burgundy-red fruit, 25 Sep 1993, *J.B. Phipps & R.J. O'Kennon 6808* (HOLOTYPE: UWO; ISOTYPES: BRIT, CAN, DAO, UBC).

Frutices grandes vel arbores parvae, 5–6 m alti; ramuli unius anni purpureo-brunnei, veteriores atro-cinerei; spinae 2.5–3.5 cm longae, crassae, recurvatae, nitenter spadiceae in juventute. Folia decidua; petioli 1–2 cm longi, ± glabri; laminae 4–8 cm longae, ovato-rhombeae vel late ellipt-rhombeae in forma generali; forma plerumque convexae; basis late cuneata vel + rotudata; latera ca. 3-lobatae per latus, LFI max. ca. 20%; venatio craspedodroma (3–)4–5 venis per latus distincte impressis; margines leviter dentatae; textura coriacea, et color atrovirens in maturitate. facies adaxialis appresso-pubescens, abaxialis ± glabra, coloribus in autumno praeclaris. Inflorescentiae 15–25 florae; ramuli villosi, bracteolis caducis, linearibus, membranaceis, glandulo-marginatis. Flores 15 mm diam.; hypanthium extrinsecum glabrum; lobi calycis anguste-triangulares, tenuiter glandulo-marginati, abaxialiter glabri; petala circularia; stamina 10, antheris cremeis; carpelli et styli 3. Fructus 8–10 mm diam., ellipsoideo urceolati, saepe in corymbo magno pendente, cremei in juventute, tum armeniaci tum coccinei, in maturitate purpurei; reliquae calycis angustae, reflexae, pubescentes; pyrenae 3, dorsaliter sulcatae, lateribus planis vel vadositer foveatis.

Large bushes or small trees to 5 or 6 m tall; 1-year old twigs purple-brown, older dark gray; thorns 2.5–3.5 cm long, stout, recurved, shiny mahogany-brown when young. Leaves deciduous; petioles 1–2 cm long, ± glabrous; blades 4–8 cm long, ovate-rhombic to broad elliptic-rhombic in general shape; base broad-cuneate to ± rounded; with ca. 3 lobes per side, largest LFI ca. 20%; margins finely toothed; venation craspedodromous, distinctly impressed, with (3–)4–5 lateral veins per side; leathery and dark green at maturity, also rather convex; appressed-pubescent above, ± glabrous below except on the ± pubescent veins, brilliantly colored in fall. Inflorescences 12–25 flowered; branches villous, bearing caducous, linear, membranous, gland-margined, bracteoles. Flowers ca. 15 mm diam.;

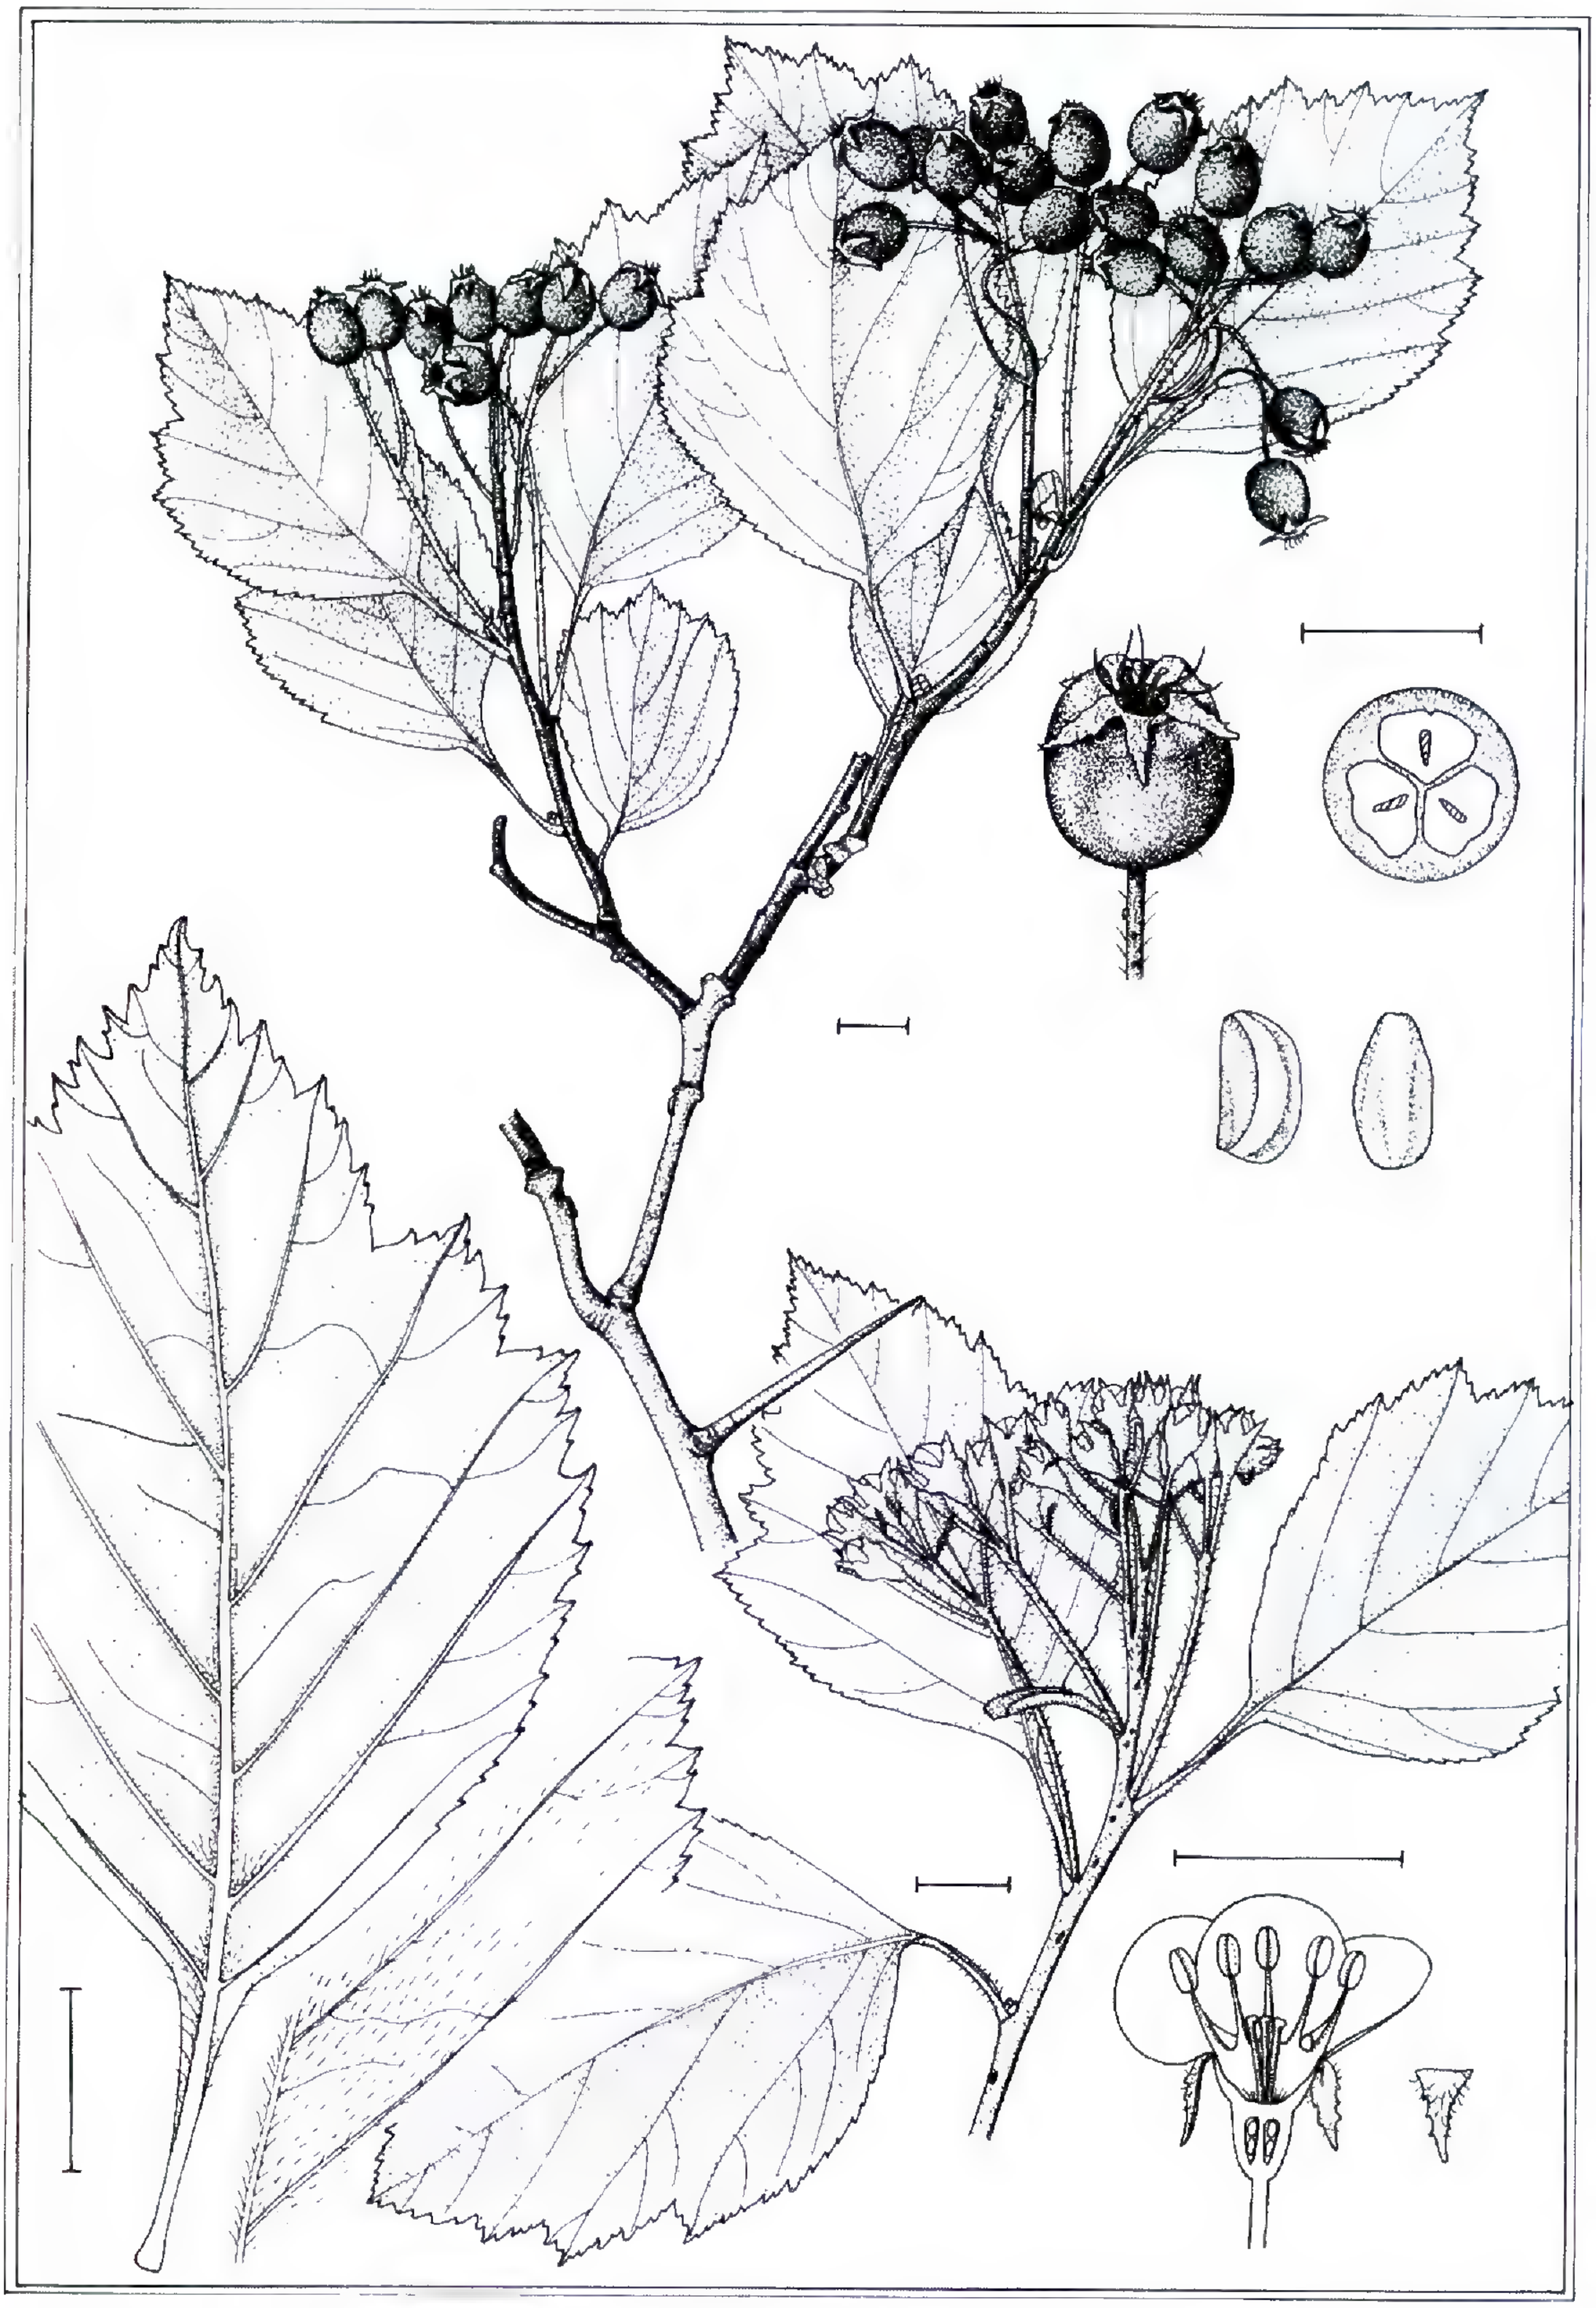

FIG. 8. Line drawing of *Crataegus enderbyensis*. Scale bars = 1 cm.

hypanthium glabrous externally; calyx-lobes narrow triangular, finely gland-margined, glabrous abaxially; petals ± circular; stamens 10, anthers cream; carpels and styles 3. Fruit 8–10 mm diam., ellipsoid-urceolate, often in a large, ± pendant corymb, cream when young, turning to apricot-colored then red, at full maturity purple; calyx-lobe remnants narrow, reflexed, pubescent; nutlets 3, dorsally furrowed, their sides plane or shallowly pitted.

Crataegus enderbyensis is presently only recorded from the Armstrong-Enderby region of the upper Okanagan of British Columbia where it is known from a good number of specimens. Collection localities may be identified, at least approximately, on figure 2.

This species is easily recognised in the field by its handsome, softly leathery, somewhat drooping, convex, dark green foliage, brilliantly colouring in fall, with clearly impressed venation, as well as by its usually large fruiting corymbs with their at first very pale, pendant fruit which become bright red by late August and finally turn purple-black. It is closely related to *C. okanaganensis*.

Additional specimens examined: **CANADA. BRITISH COLUMBIA:** Northern Okanagan, Spallumcheen Municipality, Powerhouse Rd., E side, near Stardel Drive, alt. ca. 1350 ft, hedges, bush, 3.5 m tall, fruit ellipsoid, orange-red, 19 Aug 1995, *J.B. Phipps 7163* (UWO). Between Vernon & Armstrong, intersection of Otter Lake Cross Road and Hales Road, alt. ca. 1300 ft, in partial shade of Ponderosa Pine and Douglas Fir forest, bush 2 m tall, anthers cream, fls. not quite out, 15 May 1995, *L.S. & D. Donovan 2750* (UWO). Between Vernon & Armstrong, intersection of Otter Lake Cross Road & Hales Road, alt. ca. 1300 ft, in partial shade of Ponderosa Pine and Douglas Fir forest, 5 m tall, fresh anthers cream colored, 15 May 1995, *L.S. & D. Donovan 2747* (UWO). Between Vernon & Armstrong, intersection of Otter Lake Cross Rd & Hales Rd., ditch & road edge backing mesic forest, NW side of road near little valley, alt. 1300 ft, forest margins, mesic, bush 3.5 m tall, fruit cream turning salmon, 21 Aug 1994, *J.B. Phipps, & R.J. O'Kennon 7032* (UWO). Ca. 200 m E of bridge over Shuswap Rd. on road Enderby to Mabel Lake, S side of road, alt. 1250 ft, (equals *J.B. Phipps & R.J. O'Kennon 6808*), bush 5 m tall, nearest road, frt. elliptical, pendant, shades of red (pale to deep), 20 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7010* (BRIT, UBC, UWO). Back Enderby Rd., ca. 4 mi SE of Enderby, ca. 200 m N of creek crossing, alt. ca. 1450 ft, dense hedges E side of road, bush, 5 m tall, fruit pale, 21 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7040* (UWO). Ca. 5 km ENE of Armstrong on E-W aligned rd. just ENE of Armstrong airport, hedgerows, S side of road, alt. 1450 ft, bush 5 m tall, 21 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7042* (UWO). Mabel L. Rd, 1.25 mi E of Enderby ca. 200 m E of "Autobody collision, repairs & painting sign," alt. 1275 ft, hedgerow, bush, 5.5 m tall, leaves with deeply impressed veins, very coriaceous, fruit unripe, cream-salmon, 20 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7018* (BRIT, UWO). Shuswap Valley, just E of Enderby, across bridge, S side of rd. on mound by roadside depression, alt. ca. 1250 ft, bush 5 m tall, 10 stamens, ivory anthers, in bud, 05 May 1994, *J.B. Phipps 6911* (UBC,UWO)[also JBP 6914,6915,6916 (UWO)]. Ca. 1.7 mi E of Enderby on Kingfisher Rd, on S side at beginning of S-bend, S of prominent hill, fence line of road backed by woodland, alt. 1280 ft, bush 3 m tall, foliage colors autumnal, fruit purple, 25 Sep 1993, *J.B. Phipps & R.J.O'Kennon 6813* (UWO). Ca. 1.7 mi E of Enderby on Kingfisher Rd on S side at beginning of S-bend, S of prominent hill, fence line of road backed by woodland, alt. 1280 ft, bush 4 m tall, fruit purple, foliage deep green, 25 Sep 1993, *J.B. Phipps & R.J. O'Kennon 6812* (UBC, UWO).

4. Crataegus orbicularis J.B. Phipps & O'Kennon, sp. nov. (**Fig. 9**). TYPE: CANADA: BRITISH COLUMBIA, Northern Okanagan, Spallumcheen Municipality, Back Enderby Rd., ca. 4 mi SE of Enderby, ca. 200 m N of creek crossing, alt. ca. 1450 ft, dense

hedges E side of road, bush 4 m tall, large, orbiculate leaves, fruit pale deep red, 21 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7039* (HOLOTYPE: UWO; ISOTYPES: BRIT, CAN, MO, TRT, UBC).

Frutices, late-patentes, 2–4 m alti; ramuli unius anni in autumno brunnei; rami fusco-brunnei; spinae 3–5 cm longae, graciles, rectae vel plerumque leviter recurvatae. Folia decidua; petioli 1.25–2.0 cm longi, adaxialiter breviter pilosi plerumque eglandulati; laminae plerumque 5–8 cm longae, ellipticae vel fere circulares, latioribus curvatis per basem, angustioribus ± attenuatis; venatio craspedodroma, venis secondariis 5–6(–7) per latus; lobi 3–4 per latus, breves, triangulares IFI ≤ 10%; margines cum dentibus brevissimis praeter basim; facies adaxialis breviter appresso-pilosa, abaxialis sparse pilosa, magis pubescentibus in venis. Inflorescentia 10–18 florae, ramulis subglabris distaliter, sparsim villosis proxime, bracteolis caducis, linearibus, membranaceis, glandulo-marginatis. Flores ca. 18 mm diam.; hypanthium extrinsecum sub-glabrum; lobi calycis 2–3 mm longi, anguste-triangulares, tenuiter glandulo-marginati; stamina 10, antheris roseis; carpelli et styli 3–4. Fructus 8 mm diam., oblongi, glabri, coccinei vel purpurei, in infructescentiis insignibus; lobi calycis conspicui, ± erecto-patentes; pyrenae 3–4, dorsaliter sulcatae, lateribus ± planis vel vadositer foveolatis.

Wide-spreading bushes, 2–4 m tall; 1 year old twigs strong mid-brown, branches dull gray; thorns 3–5 cm long, slimmish, straight or more usually slightly recurved; Leaves deciduous, petiolate; petioles 1.25–2.0 cm long, adaxially shortly hairy, usually eglandular; blades mainly 5–8 cm long, broadly elliptic to nearly orbicular, the broader ones curved across the base, the narrower somewhat attenuated; venation craspedodromous, with 5–6(–7) secondary veins per side; with 3–4 short triangular lobes, LII ≤ 10 %; margins with very small teeth except near the base; shortly appressed hairy above, thin-hairy below, more pubescent on veins. Inflorescences 10–18 flowered; branches sub-glabrous distally, sparsely villous proximally, bearing caducous, linear, membranous, gland-margined bracteoles. Flowers ca. 18 mm diam.; hypanthium sub-glabrous externally; calyx-lobes 2–3 mm long, narrow-triangular, finely gland-margined; stamens 10, anthers pink; carpels and styles 3–4. Fruit 8 mm diam., oblong, glabrous, red, later changing to plum when fully ripe, in showy infructescences; calyx-lobes very conspicuous, erecto-patent; nutlets 3–4, dorsally sulcate, their sides ± plane or shallowly and smoothly pitted.

This is a very attractive species so far only known within a few miles of Enderby, B.C. and easily recognized by the foliage shape, thorn-type and fruit (color, conspicuous calyx-lobes). *Crataegus orbicularis* stands out in early spring with its light green, tinted eau-de-nil, foliage and handsome clusters of large flowers. Collection localities may be identified, at least approximately, on figure 2.

Additional specimens examined: **CANADA. BRITISH COLUMBIA:** Northern Okanagan, Spallumcheen Municipality, Back Enderby Road, hedges, E side, alt. ca. 1450 ft, same as *J.B. Phipps & R.J. O'Kennon 7039* but leaves smaller this year, bush 3.5 m tall, fruit lake, 19 Aug 1995, *J.B. Phipps 7166* (BRIT, MONTU, UBC, UWO). Northern Okanagan, Spallumcheen Municipality, Mountain View Road, N end, E side, alt. ca. 1500 ft, 19 Aug 1995, *J.B. Phipps 7165* (BRIT, UBC, UWO, V). Ca. 10 km N of Armstrong, W of Indian Reservation, alt. ca. 1550 ft, long farm drive with *Crataegus* hedgerow, bush, 2 m tall, fruit in various shades of red, 21 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7036* (BRIT, UBC, UWO, V). Mabel Lake Rd., 1.3 mi E of Enderby center, opposite house with solid wooden fence, alt. 1275 ft, bush, 3 m

Fig. 9. Line drawing of *Crataegus orbicularis*. Scale bars = 1 cm.

tall, foliage large, fruit pale-medium red, 20 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7019* (BRIT, MONTU, UBC, UWO, V). Shuswap Valley, ca. 2.8 km E of Enderby on Kingfisher Rd., in hedgerow on S side road opp. house with wooden fence on N side, alt. ca. 1280 ft, bush 3 m tall, large flowers, 10 stamens, pink anthers, (possibly =*J.B. Phipps & R.J. O'Kennon 6813*), 05 May 1994, *J.B. Phipps 6920* (UWO). Northern Okanagan, Spallumcheen Municipality, Back Enderby Rd., 21 Sep 1998, *W.J.T. Phipps a & c* (UWO).

5. Crataegus atrovirens J.B.Phipps & O'Kennon, sp. nov. (**Fig. 10**). TYPE: CANADA: BRITISH COLUMBIA: Northern Okanagan, Spallumcheen Municipality, Otter Lake Cross Road, 22 Aug 2000, *J.B. Phipps 8171 & S.R. Phipps* (HOLOTYPE: UWO; ISOTYPES: BRIT, CAN, MO, TRT, UBC, US).

Frutices 2–5 m alti, caulis multiplicibus suberectis vel erectis. Ramuli elongati pubescentes, illi unius annus brunnei nitentes, veteriores atrocinerei; spinae 3–5 cm longae, numerosi, ± rectae vel leviter curvatae, nitentes atrobrunneae, ad apices nigrae, veteriores atrocinereae. Folia decidua; petioli longitudine 15–20% illius laminarum, dense pubescentes in sulco adaxiali, in maturitate sparse pubescentes, eglandulosi vel cum paucis, parvis glandibus praecipue distalibus; laminae 4–6(–7) cm longae, anguste-ovatae ad late elliptico-rhombeas vel late ellipticas in forma generali; apex acutus vel subacutus, basis cuneata; latera cum 3–4 lobis parvis subacutis vel obtusis, IFI sinus maximi ca. 10%; margines tenuiter serrati, dentibus acutis vel subacutis, ferentes glandes minusculas ad apices; venatio craspedodroma, venis 3–5 per latus; indumentum appresso-scabrum adaxialiter, abradens in maturitate, abaxialiter fere glabrum; in maturitate color atrovirens et ± coriacea, colore in autumno glandulacea. Inflorescentiae 8–15 floratae; rami ± dense patente-pubescentes. Flores 10–13 mm diam.; hypanthium extrinsecus pubescens; lobi calycis anguste-triangulares, marginibus glandulo-serratis ad glandulo-laciniatis; petala alba; stamina 10, antheris roseis; styli 2–3. Fructus 13–15 mm alti, 10 mm lati, ± ellipsoidei, vinacei in mense Augusto exeunte, atropurpurei in mense Septembro, ± villosi; caro dulcis, aurantiaca; lobi calycis valde prominentes, suberecti; pyrenae 2–3, dorsaliter sulcata, in lateribus foveolatis.

Shrubs, 2–5 m tall, with multiple, mainly suberect to erect stems. Extending branches of the season pubescent; at 1 yr glossy brown; older dark gray; thorns 3–5 cm long, numerous ± straight to very slightly curved, at 2 yr. glossy dark brown, black at the tip, older deep gray. Leaves deciduous; petioles 15–20 % length of blades, densely pubescent at maturity in the adaxial groove, sparsely pubescent elsewhere, eglandular to with a few small glands mainly distally; blades 4–6(–7) cm long, narrow-ovate to broadly ellipt-rhombic or broad-elliptic in general shape; tip acute to subacute, base cuneate; sides with 3–4 small subacute to obtuse lobes, LII of largest sinus ca. 10%; margins finely toothed, teeth acute to subacute, bearing minute glands at their tips; venation craspedodromous, 3–5 veins per side; adaxially with scabrous appressed pubescence, abrading with age, abaxially nearly glabrous; dark green and somewhat coriaceous at maturity, in fall turning bronze-brown. Inflorescences 8–15 flowered; branches with a fairly dense spreading pubescence. Flowers 10–13 mm diam.; hypanthium externally pubescent; calyx lobes narrow-triangular, margins glandular-serrate to glandular-laciniate; petals white; stamens 10, anthers pink; styles 2–3. Fruit 13–15 mm high, 10 mm wide, ± ellipsoid, burgundy in late August, blackish-purple a month later; variably hairy; flesh soft orange color; calyx-lobes very prominent, suberect; nutlets 2–3, dorsally grooved, pitted on the sides.

FIG. 10. Line drawing of *Crataegus atrovirens*. Flowers were not available when the drawing was prepared. Scale bars = 1 cm.

Crataegus atrovirens is now known from about 20 collections and many more specimens on the ground from an area of about 10 miles north and south of Enderby, British Columbia, where it is locally common to abundant in natural hedgerows and other brushy sites in the valley. Collection localities may be identified, at least approximately, on figure 2. This taxon appears quite distinct from other sympatric kinds and is often recognizable in habit alone.

Of species known to date from the northern Okanagan, *C. shuswapensis*, also newly described in this paper, is the one most likely to be confused with *C.*

atrovirens. The coloring of *C. shuswapensis* is similar, but it has a finer, more wide-branching growth habit, and a glabrous inflorescence, redder fruit in the fourth week of August, much smaller and more recurved calyx-lobes in fruit, whose margins rather than being serrato-laciniate, are merely minutely glandular. In addition, the leaves of *C. shuswapensis* are more sharply lobed. *Crataegus atrovirens* is probably more closely related to *C. okanaganensis*, but is easily differentiated from that species in the field by the much darker coloring of foliage, fruit and bark, as well as by its pink anthers. Compared to *C. orbicularis* the fruit is conspicuously larger and more hairy in *C. atrovirens* and is soft and ripe in the fourth week of August when it is hard and unripe in *C. orbicularis*. It is a dull hawthorn, sombre in appearance, contrasting markedly with more flashy congeners such as *C. okanaganensis*. It appears to be more xeromorphic than other fairly large Okanagan hawthorns.

Additional specimens examined: **CANADA. BRITISH COLUMBIA:** Okanagan Valley, NNE of Vernon, Pleasant Valley Rd., hedge behind Vowle's residence, alt. 380 m, natural hedge, bush 3 m tall, 19 Aug 1994, *J.B. Phipps 6996 & R.J. O'Kennon* (UWO). Northern Okanagan, Spallumcheen Municipality, Stepney Cross-Road, bush 5 m tall, 26 Aug 2000, *J.B. Phipps 8184 & S.R. Phipps* (UWO). Northern Okanagan, Spallumcheen Municipality, Back Enderby Rd., ca. 1 mi N of S end, bush 5 m tall, 26 Aug 2000, *J.B. Phipps 8181 & S.R. Phipps* (UWO, V). Northern Okanagan, Spallumcheen Municipality, Back Enderby Rd., 1/4 mi from S end, bush, 2.5 m tall, 26 Aug 2000, *J.B. Phipps 8179 & S.R. Phipps* (UBC, UWO). Northern Okanagan, Spallumcheen Municipality, Back Enderby Rd., near S end, bush, 3 m tall, *J.B. Phipps 8180 & S.R. Phipps* (CAN, UWO). Northern Okanagan, Spallumcheen Municipality, Marshall Rd., bush, 4 m tall, *J.B. Phipps 8186 & S.R. Phipps* (UWO). Northern Okanagan, Hwy. 6 E of Vernon, ca. 2 mi W of Lumby, bush, 12 ft tall, 26 Aug 2000, *J.B. Phipps 8188 & S.R. Phipps* (UWO). Shuswap Valley, ca. 3 mi NNE of Enderby, Anderson Rd., bush, 3 m tall, 26 Aug 2000, *J.B. Phipps 8185 & S.R. Phipps* (BRIT, UWO). Enderby, 6 Aug 1898, *J.R. Anderson s.n.* (UWO, V). Hwy 97, ca. 2.5 km S of Enderby (S of Indian Cemetery), roadside, E side, backing alfalfa field, alt. 1320 ft, dense shrub, 3 m tall, coriaceous leaves, deep green, fruit purple, abundant here, 20 Aug 1994, *J.B. Phipps & R.J. O'Kennon 7008* (UWO).

6. Crataegus phippsii O'Kennon, Sida 18:185. 1998.

ACKNOWLEDGMENTS

The line drawings were prepared by Susan Laurie-Bourque of Hull, Quebec who is thanked by the authors for the beauty of her realisations and her meticulous attention to detail. Susan Laurie-Bourque also artistically improved the rather crude output of Range-Mapper by using Corel Draw. The work was largely funded by grants to the first author by the National Sciences and Engineering Research Council of Canada. We also wish to thank Laurie Donovan of Okanagan University College, Vernon, British Columbia, for collection of critical flowering material at times when we were unable to be present and Antony Littlewood, Dept. of Classical Studies, The University of Western Ontario, for critically checking the Latin diagnoses.

NEW COMBINATION IN *XYLORHIZA* (ASTERACEAE: ASTEREAE)

Guy L. Nesom

Botanical Research Institute of Texas
509 Pecan Street
Fort Worth, TX 76102-4060, U.S.A.

ABSTRACT

Xylorhiza glabriuscula var. *linearifolia* is treated within *Xylorhiza* at specific rank as ***Xylorhiza linearifolia*** (T.J. Wats.) Nesom, comb. nov. *Xylorhiza linearifolia* is geographically isolated from *X. glabriuscula* sensu stricto, but it does overlap and apparently hybridize with *X. tortifolia* var. *imberbis*.

ABSTRACT

Xylorhiza glabriuscula var. *linearifolia* se trata dentro *Xylorhiza* a nivel específico como ***Xylorhiza linearifolia*** (T.J. Wats.) Nesom, comb. nov. *Xylorhiza linearifolia* está aislada geográficamente de *X. glabriuscula* sensu stricto, pero se solapa y aparentemente se hibrida con *X. tortifolia* var. *imberbis*.

Watson (1977) described *Xylorhiza glabriuscula* Nutt. var. *linearifolia* T.J. Wats. from the region of Moab in east-central Utah. Cronquist (1994) observed that it "appears to form a distinctive local taxon with a range more than 60 km long" and treated it at specific rank, but he placed it within a broadly defined *Machaeranthera*. Welsh et al. (1993) followed Watson's treatment. For the treatment of Asteraceae in the developing Flora of North America, this taxon is recognized at specific rank and the following combination is required to place it within *Xylorhiza*.

Xylorhiza linearifolia (T.J. Wats.) Nesom, comb. nov. BASIONYM: *Xylorhiza glabriuscula* Nutt. var. *linearifolia* T.J. Wats., Brittonia 29:215. 1977. *Machaeranthera linearifolia* (T.J. Wats.) Cronq., Intermountain Fl. 5:274. 1994. TYPE: UNITED STATES. UTAH. Grand Co.: 6 mi NW of Moab on US Hwy 160, 21 May 1971, *T.J. Watson 679* (HOLOTYPE: TEX!; ISOTYPES: COLO, GH, MO!, MONTU, NY, UC).

Xylorhiza glabriuscula, *X. linearifolia*, and *X. venusta* (M.E. Jones) Heller are closely morphologically similar among themselves and presumably are closely interrelated. All three have diploid populations; *X. venusta* and *X. linearifolia* also have tetraploid populations (Watson 1978). Within *X. linearifolia*, the two cytotypes "grow intermixed over the small range of the taxon" (Watson 1978); four populations of diploids and four of tetraploids were found, all within Grand County, Utah. According to Stockton (1983), the diploids and tetraploids of *X. linearifolia* differ in minor ways, but the present study (following Watson) finds no variation that would require further nomenclatural differentiation.

Watson (1977, p. 215) observed that *Xylorhiza linearifolia* (as var. *linearifolia*) "overlaps morphologically" with *X. glabriuscula* (var. *glabriuscula*) but the

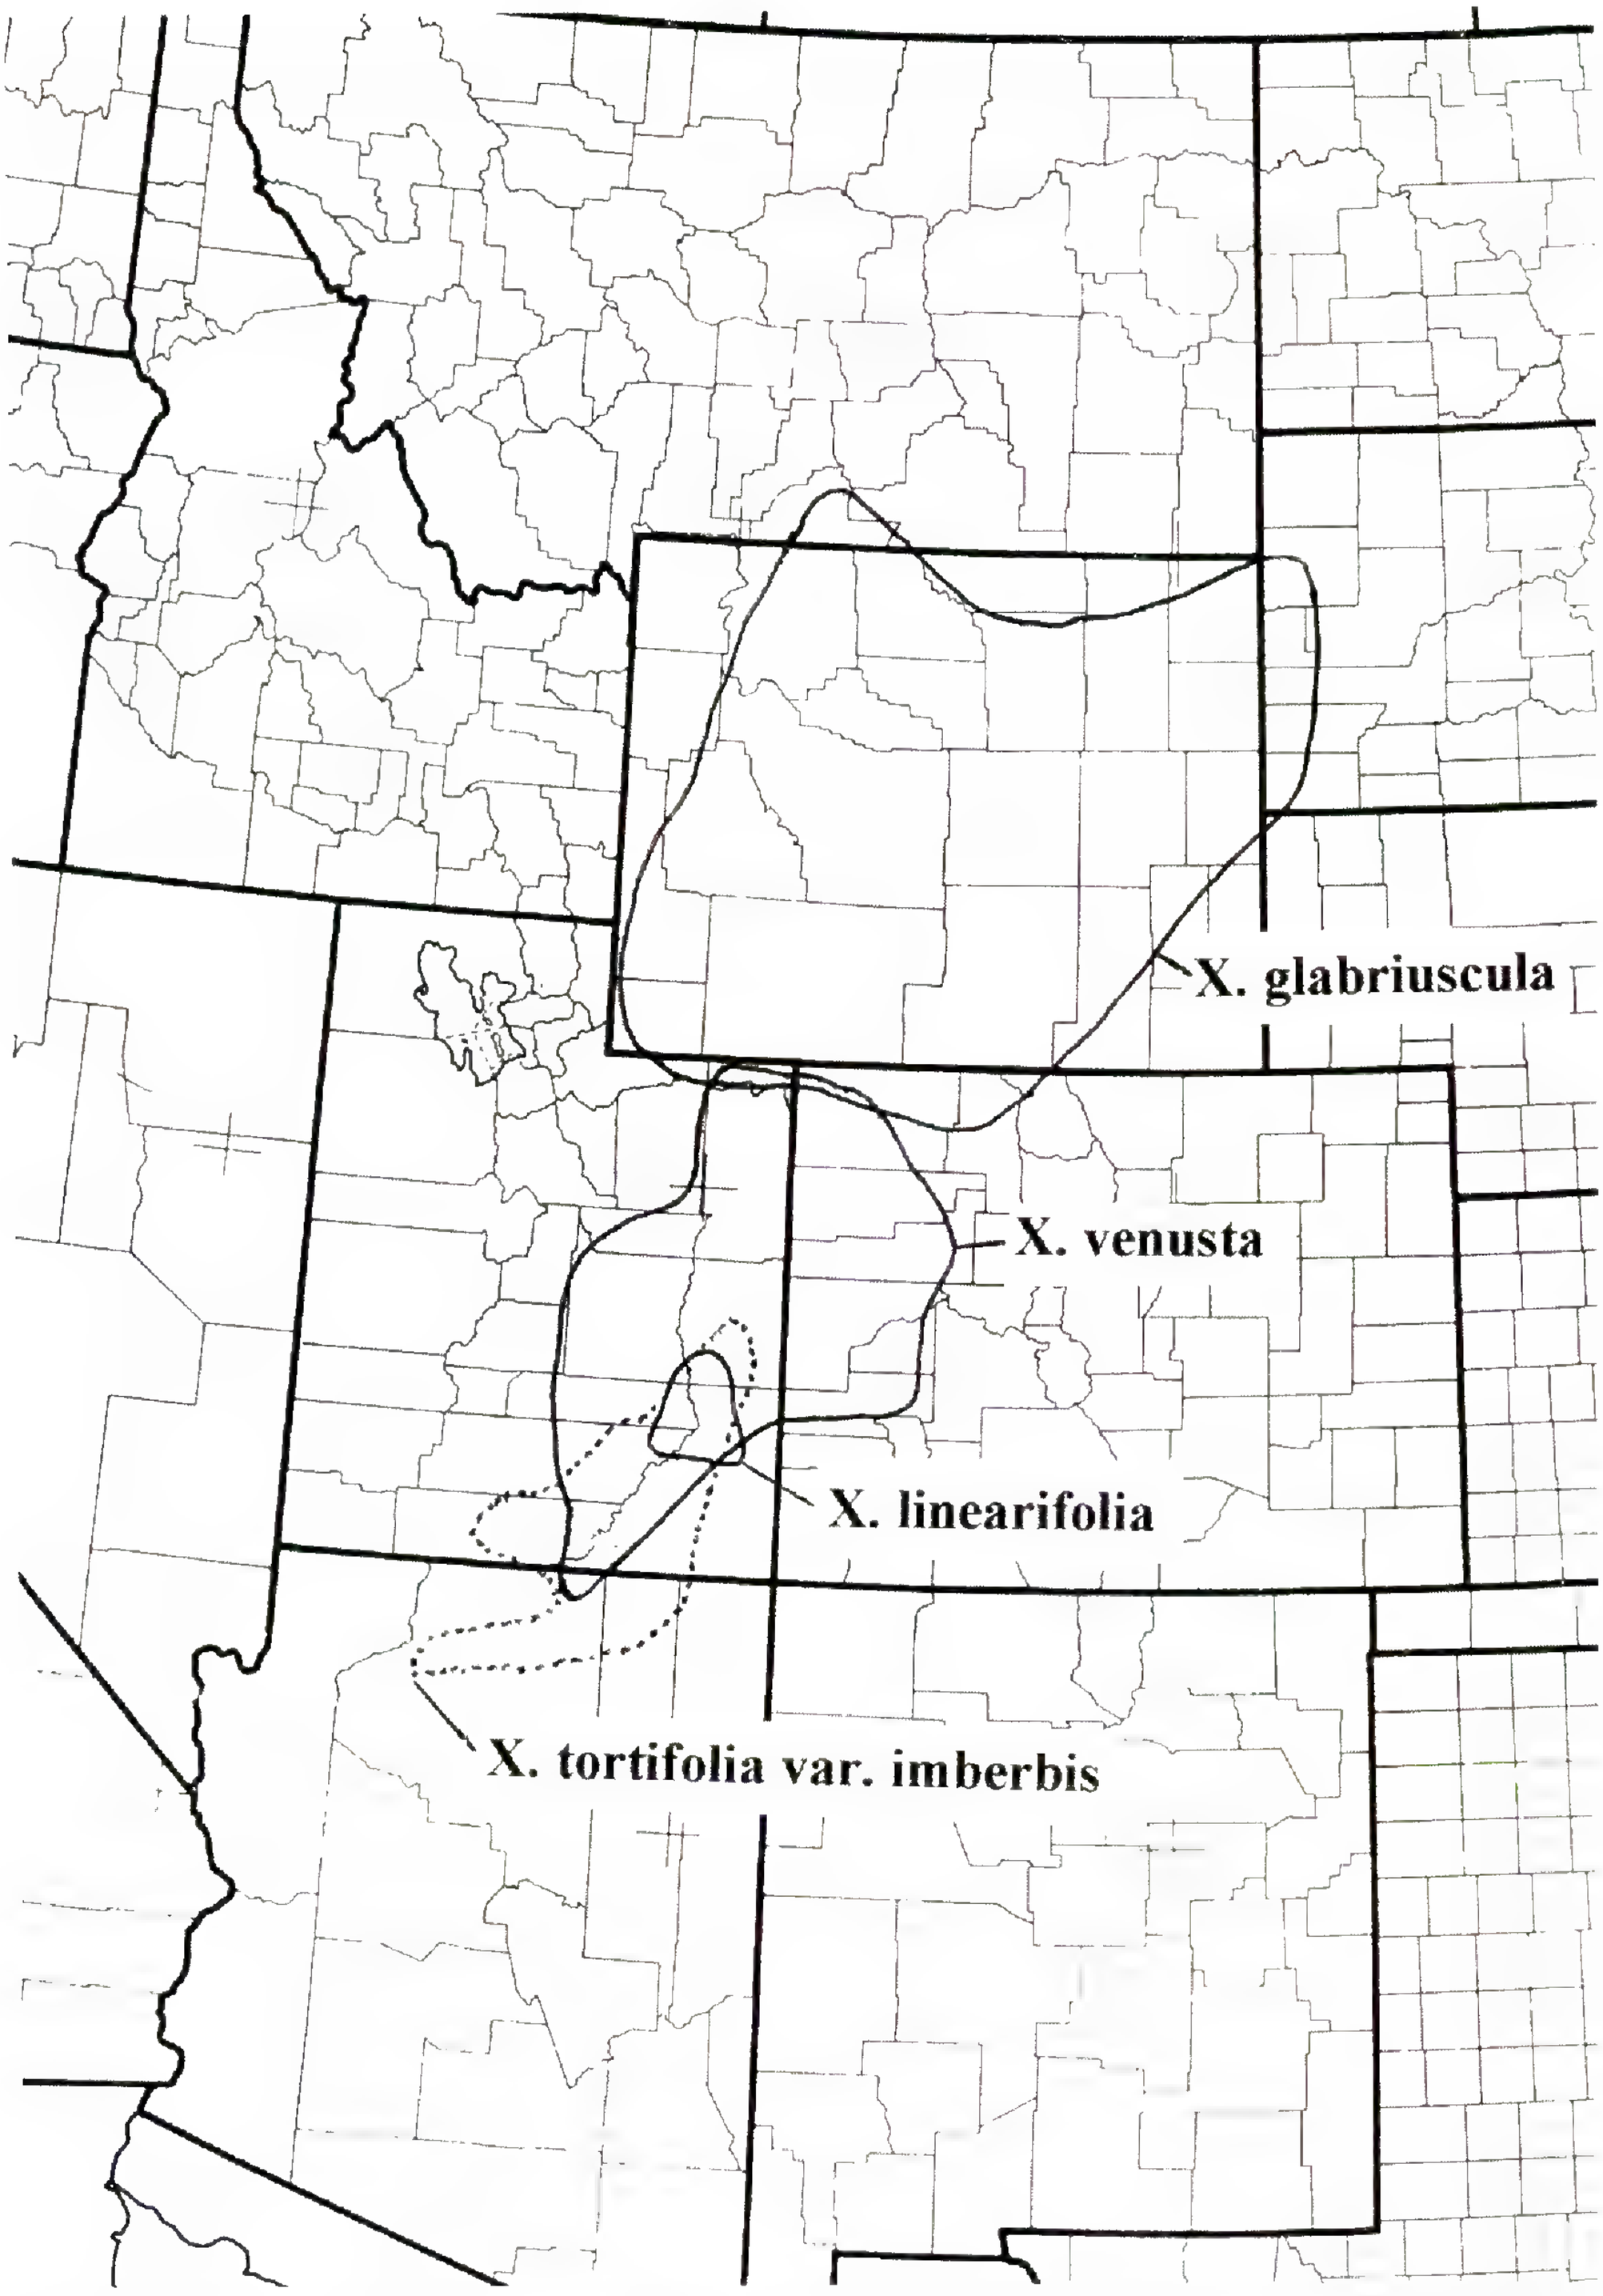

FIG. 1. Geographic distribution of *Xylorhiza linearifolia*, *X. glabriuscula*, *X. venusta*, and *X. tortifolia* var. *imberbis*. Outlines of the species ranges were derived from data from collections at BRIT-SMU, TEX-LL, MO, and published sources, primarily Watson (1977) and Albee et al. (1988). The Arizona record for *X. venusta* was not reported by Watson (1977): Coconino Co., Lee's Ferry, 6 Jun 1927, *Cottam C2611* (LL!).

present study notes that *X. linearifolia* similarly overlaps with *X. venusta*. *Xylorhiza linearifolia* differs from both taxa in its leaf morphology, as outlined by the following key.

1. Leaves linear-oblong, truncate or rounded-auriculate at the base _____ **Xylorhiza linearifolia**
1. Leaves oblanceolate to oblong-spatulate, tapering at the base.
   2. Stems leafy for more than 2/3 of their length, peduncles 2–6 cm long; leaves 2.5–8 mm wide; involucres 7–14 mm long, 12–25 mm wide _____ **Xylorhiza glabriuscula**
   2. Stems leafy in the lower 1/2–2/3 of their length, peduncles 6–20 cm; leaves 2.5 15 mm wide; involucres 12–20 mm long, 20 35 mm wide _____ **Xylorhiza venusta**

Xylorhiza glabriuscula and *X. venusta* have slightly overlapping ranges in northeastern Utah and northwestern Colorado (Fig. 1) and intermediates, presumably of hybrid origin, occur in that region (Watson 1977). The range of *X. linearifolia* is essentially imbedded within that of *X. venusta*, but no evidence of hybridization between these two taxa has been reported. *Xylorhiza linearifolia* apparently is reproductively isolated from both of its close relatives.

In contrast to the isolation of *Xylorhiza linearifolia* from *X. glabriuscula* and *X. venusta*, the range of *X. tortifolia* var. *imberbis* (Cronq.) T.J. Wats. contacts that of *X. linearifolia* from the south and these two taxa grow intermixed within a few localities. "In these zones of contact, intermediates (suggesting hybridization) are found" (Watson 1977, p. 215).

Stockton (1983) noted that *Xylorhiza linearifolia* is intermediate in morphology and habitat between *X. glabriuscula* sensu stricto and *X. tortifolia* var. *imberbis* and suggested that *X. linearifolia* may be "a stabilized hybrid derivative" between them, presumably from an earlier time when the putatively parental species were sympatric. Further evidence that would test this hypothesis is lacking.

ACKNOWLEDGMENTS

I am grateful to the staffs at MO and TEX-LL for help during recent visits there and to John Semple and Eric Lamont for review comments.

BOOK REVIEW

B.G. Bowes. 2000. **A Color Atlas of Plant Structure.** (ISBN 0-8138-2693-4, pbk.). Iowa State Press, 2121 State Avenue, Ames, IA 50014, U.S.A. (Orders: 1-800-862-6657, 1-515-292-3348 fax; www.iowastatepress.com). $49.95, 192 pp, numerous color plates, 7 3/4" × 10 1/4".

The amount of information generated in the many fields of plant science is growing at an exponential rate. The detailed study of plant anatomy should be a vital component in the training for any student of plant biology. However, with the advent of new analytical techniques in molecular biology, biochemistry, and physiology, many students cannot find the time in their program of study to include a course in basic plant anatomy. In fact, in some botany programs it is even difficult to find a faculty member who has sufficient training in this field to provide students with a solid background.

This book provides a long-awaited solution to both of these problems. One of the most difficult tasks for instructors teaching beginning botany students is to teach them how to understand plant anatomy using microscopic cross-sections of the various organs. Part of that difficulty lies either with the student's inexperience in using microscopes, or in the poor quality of microscopes used in teaching many undergraduate laboratories.

Bryan Bowes' *Color Atlas of Plant Structure* is a beautifully illustrated and concise introduction to the fascinating world of plant anatomy. Each chapter consists of several pages of text, with abundant references to illustrations on the following pages. The text is concise and to the point, leaving much of the detailed description to be presented with the illustrations themselves. Those illustrations are captioned with a wealth of information. Structures referred to in the captions are numbered, not lettered or labeled, which makes each photograph easier to understand.

The organization of the book follows that presented in many basic botany courses. The first chapter provides an overview of the major Divisions of vascular and non-vascular plants, and concludes with a brief introduction to the gross morphology of flowering plants. Chapters 2–4 provide a discussion of plant cells, tissues and embryology. Chapters 5–8 deal with leaf, stem, root, and floral anatomy.

The illustrations themselves are beautifully done, and each is labeled to indicate the type of microscopy used to create the photograph. There are two or three photographs on each page, and the captions are arranged in such a way that it is easy to determine which caption refers to which photo. The only difficulty this reviewer had with the illustrations was that occasionally the numbers referring to salient points, were difficult to see on the photographs.

This book is a wonderful reference for anyone involved in the plant sciences. It should be a required text or at least an available reference in all basic botany and taxonomy classes, and deserves a place in the personal libraries of botanists, horticulturalists, naturalists and natural history artists alike.—*Debra Trock, Collections Manager, Botanical Research Institute of Texas, Fort Worth, TX 76102-4060, U.S.A.*

LECTOTYPIFICATION OF *PSEUDOGNAPHALIUM BIOLETTII* (GNAPHALIEAE: ASTERACEAE)

Guy L. Nesom

Botanical Research Institute of Texas
509 Pecan Street
Fort Worth, TX 76102-4060, U.S.A.

Pseudognaphalium biolettii A. Anderb. [nom. nov.], Opera Bot. 104:147. 1991. *Gnaphalium bicolor* Bioletti, Erythea 1:16. 1893 [non *Gnaphalium* (*Helichrysum*) *bicolor* (Lindl.) Schultz-Bip., Bot. Zeit. 3:171. 1845; nec *Gnaphalium bicolor* Franch., J. Bot. (Morot) 10:411. 1896]. TYPE: U.S.A. **California**. Without designating a type, Bioletti (1893, p. 17) noted that "The description is drawn up from dried specimens from San Diego and from a plant growing in the Garden of Native Plants at the University of California. ... Common in low thickets among the coast hills about San Diego, according to Prof. Greene. ..." At UC, there are at least two specimens of *Gnaphalium bicolor* that might represent the material referred to by Bioletti: San Diego, 25 Mar 1891, *G.W. Dunn s.n.* (UC 31964); San Diego Co, Witch Creek, 1893, *R.D. Alderson s.n.* (UC 31965). Two ND-G specimens, however, apparently more clearly represent authentic type material—they are labeled "*Gnaphalium bicolor*, Bioletti, Erythea 1.16. Berkeley, Bot. Garden, 1892," without other information (lectotype, designated here: ND-G 59203, photocopy!; isolectotype: ND-G 59205, photocopy!). These two large branches were broken above the base, without roots, and their similarity suggests they may have been collected from a single plant. The morphology of the ND-G types indicates that this species consistently has been identified correctly.

Perennial herbs, taprooted, fragrant, the stems 2–7(–12) dm tall, much-branched at the base and commonly lignescent, eglandular, persistently tomentose above, glabrescent or not below. Leaves oblanceolate to oblong-oblanceolate, mostly 1.5–5(–8) cm long, 4–10(–15) mm wide, the upper becoming lanceolate, widely to narrowly auriculate-clasping, not decurrent, strongly bicolored, bright green and usually densely glandular above, persistently white-tomentose beneath, sometimes the upper leaves glandular but those toward the base eglandular. Capitula 5–5.5(–6) mm high; phyllaries shiny opaque-white, sometimes slightly pinkish, strongly graduated, apex rounded to nearly truncate, apiculate. Pistillate flowers 41–73. Bisexual flowers 5–13. Cypselae shallowly ridged, not papillate.

Pseudognaphalium biolettii occurs in the southern/southwestern half of California and in adjacent Mexico (Baja California and Baja California Sur), at elevations of 5–1200 meters (under 600 meters in California) on rocky slopes, sandy plains with *Larrea*, coastal strand, matorral, and chaparral.

ACKNOWLEDGMENTS

Barbara Hellenthal provided information and photocopies of the relevant ND-G

specimens of *Gnaphalium bicolor* and John Strother provided information regarding material of *G. bicolor* at UC and JEPS. Review comments of K. Gandhi and J. McNeill also are much appreciated.

BOERHAVIA COULTERI VAR. *PALMERI*, A NEW VARIETAL COMBINATION FOR *BOERHAVIA* (NYCTAGINACEAE) OF SOUTHWESTERN NORTH AMERICA

Richard Spellenberg

Biology Department
New Mexico State University
Las Cruces, NM 88003-8001, U.S.A.

ABSTRACT

Boerhavia coulteri (Hook. f.) S. Wats. var. *palmeri* (S. Wats.) Spellenb., comb. nov., based on *B. spicata* Choisy var. *palmeri* S. Wats., from the vicinity of Guaymas, Sonora, Mexico, is proposed for a *Boerhavia* that differs from the var. *coulteri* in its small fruits and flowers, and its with sparsely-fruited spicate inflorescences. The variety ranges from the Channel Islands of California to the Big Bend region of Texas near the Río Grande, and is very common on the Sonoran Desert. The two varieties are often sympatric, and they intergrade to a slight extent. A key is presented to distinguish the species of *Boerhavia* with spicate inflorescences in the United States.

RESUMEN

Boerhavia coulteri (Hook. f.) S. Wats. var *palmeri* (S. Wats.) Spellenb., comb. nov., basada en *B. spicata* Choisy var. *palmeri* S. Wats., de la vecindad de Guaymas, Sonora, México, se propuso para una forma de *Boerhavia* que difiere de la variedad *coulteri* por su frutos y flores pequeños, y su frutos esparcidos en inflorescencias espiciformes. La variedad se extiende desde las Islas Canales de California hasta la región del "Big Bend" del Río Bravo del Norte de Texas, y es muy común en el Desierto Sonorense. Las variedades a menudo son simpátricas, y se intergradan un poco. Se presenta una clave para distinguir las especies con inflorescencias espigadas de *Boerhavia* de los Estados Unidos de América.

The species of *Boerhavia* with spicate inflorescences have proven taxonomically difficult for the past century, the variation presented by the complex resulting in very different taxonomic treatments. At one extreme is that of Standley (1911) where nine species were recognized. In 1918 Standley submerged *B. watsoni* as a synonym of *B. coulteri*, but maintained the other taxa he had recognized. At the other extreme is Reed's (1969) treatment, in which five of the species Standley recognized [*B. coulteri* (Hook. f.) S. Wats., *B. rosei* Standl., *B. spicata* Choisy in D.C., *B. torreyana* (S. Wats.) Standl., *B. watsoni* Standl.] were placed as synonyms in one variable species, *B. spicata*. Most authors of floras that include all or part of the Sonoran Desert region have followed Standley (1918) in recognizing *B. coulteri*, and also *B. spicata*, and *B. torreyana* if they were present in the area of concern (Spellenberg 1993; Martin & Hutchins 1980; Kearney & Peebles 1964; Munz & Keck 1968; Wiggins 1964). In contrast, Felger (2000) recognized some plants included in *B. coulteri*, as broadly constructed by those authors, as *B. spicata* var. *palmeri* S. Wats. It is this taxon that is recognized as a variety of *B. coulteri* in this paper.

SIDA 20(1): 151 – 155. 2002

While studying the complex for an upcoming treatment for the Flora of North America North of Mexico, I noted that *B. torreyana* was conspicuously papillate in the sulci between the ribs of the fruit, a character previously unpublished. None of the other *Boerhavia* taxa in the complex are at all papillate. Watson (1889) cited no specimens when he coined the name *Boerhavia spicata* var. *torreyana* S. Wats., but specimens from western Texas collected during the mid-19th century Boundary Survey, very likely seen by him, have papillate fruits (specimens from Torrey Herbarium, NY, have been seen; relevant specimens from GH on loan to ENCB have not been seen). The character of papillae on the fruit is consistent in populations from western Texas, New Mexico, southeastern Arizona at higher elevations, throughout much of Arizona north of the Mogollon Rim, and extreme south-central Utah (= *B. spicata* by Welsh et al. 1987). On very similar appearing plants from the Sonoran Desert region, some of which are identified as *B. torreyana* in collections, but which actually represent *B. coulteri* var. *palmeri* (as proposed below), papillae are absent and sulci are much narrower and less rugose. That *B. torreyana* is clearly distinguishable from other spicate *Boerhavia* has helped to clarify the complex. This is particularly so in Arizona and Sonora where three or four very similar taxa occur within the region.

In 1889 Watson transferred *Senkenbergia coulteri* Hook. f. to *Boerhavia*, and he stated that the collection upon which the name was based was *Coulter 1425*. He noted that the perianth was one line in length (= 1/12", ca. 2 mm) and that fruits were clavate, 1–1.5 lines long, truncate, and acutely angled. Only one such specimen exists in the Hooker Herbarium at Kew. It is labeled as having come from "Alta Sonora, Mexico," and is here considered the holotype (photo and photocopies at NMC). Its fruits are clearly in irregularly fasciculate clusters in the spicate inflorescence, and they are truncate at the apex. On the same page of his 1889 publication, Watson stated that his new variety, *Boerhavia spicata* var. *palmeri*, based on the collection *Palmer 141* from Guaymas, Sonora, in 1887, had perianths 0.5 line long, and fruits clavate-oblong, a line long, obtuse, obtusely angled. He also noted the inflorescence to be "open and very slender." *Palmer 141* is represented by two specimens at GH! (on loan to ENCB, lectotype not selected; fragment at DS!). In raising this taxon to specific status, Standley (1909) had to adopt a new name (*B. watsoni*) because the binomial *B. palmeri* S. Wats. was occupied. He noted that Arizona plants were placed there somewhat doubtfully, suggesting that geography would place them with *B. coulteri*. Relative to other plants in the complex, the plants he identified as *B. watsoni* have smaller, more widely spaced, less clustered fruits (if at all clustered), and seem to have had stems that were decumbent-spreading.

It is proposed here that the populations Standley recognized as *B. watsoni*, and that Watson described as *B. spicata* var. *palmeri*, are part of the *B. coulteri* complex and can be recognized at the varietal level. The following combination is proposed:

Boerhavia coulteri (Hook. f.) S. Wats. var. **palmeri** (S. Wats.) Spellenb., comb. nov.
Boerhavia spicata Choisy var. *palmeri* S. Wats., Proc. Amer. Acad. 24:70. 1889.

The differences the two varieties of *B. coulteri* that Watson, and later Standley, noted by their classifications are very apparent in the field in their extreme states, but intergradient plants occur. Occasionally *B. coulteri* var. *coulteri* and var. *palmeri* are intermixed in populations (e.g., *Spellenberg & Zucker 12954* = var. *palmeri*, *12955* = var. *coulteri*, AZ, Pima Co., ca. 10 air km SW of Marana, Anway Rd. 1 km S of Avra Valley Rd., 16 Aug. 1999; NMC). In the two mixed populations I have seen, the taxa differed in habit, the stems of var. *coulteri* decumbent at the immediate base, then strongly ascending or erect, contrasting to the more decumbent-spreading habit of var. *palmeri*, but habit is very likely to be influenced by ecological conditions and density of populations. Some mono-varietal populations of the var. *coulteri* have decumbent-spreading stems. The var. *coulteri* also has larger flowers, a denser inflorescence, and fruits in irregular fasciculate clusters, whereas the var. *palmeri* usually has minute flowers, and well-spaced, smaller fruits, the clusters much less pronounced. Plants are most often present in monomorphic populations representing only one variety. The flower of *B. coulteri* var. *palmeri* is illustrated in Spellenberg (2000, fig. 1), but is labelled as *B. torreyana*; the complex was not understood at the writing of that article.

Inflorescences of all the spicate species (*B. coulteri* included) I have observed are visited by various insects in the morning when flowers are open and producing nectar, the insects moving from inflorescence to inflorescence, and from plant to plant. Larger-flowered species are visited more frequently (Spellenberg 2000). In mixed populations, particularly, inter-taxon pollination is very likely, and hybridization is presumed possible. Both varieties of *B. coulteri* are weedy, responding positively to disturbance, and with the advent of increased human impact in arid areas of the Southwest, may have come into increased contact.

Boerhavia coulteri var. *coulteri* is geographically the more restricted of the two varieties in the southwestern United States (ranges in Mexico have not been determined), occurring from the eastern to the western borders of Arizona, south of the Mogollon Rim. A population discovered in south-central New Mexico in a well-collected area and may be the result of a recent introduction (N.M., Doña Ana Co., e Las Cruces along University Ave. e of Telshor Drive, 1 km e of IH-25, in gravel planting strip between sidewalk and road, 24 Aug 2001, *Spellenberg and Brouillet 13267*, DUKE, MT, NMC). The var. *palmeri* occurs throughout the Sonoran region in the United States, from southeastern California to southeastern Arizona. It occurs on Santa Catalina Island in the Channel Islands of California (Standley, 1909, cited as *B. watsoni*, *Orcutt s.n.*, 12 Sep. 1889, US!)., where it may have been introduced. In Texas the var. *palmeri* is known from a few collections on or near the Río Grande, the eastern most being from the eastern side of present day Big Bend National Park (*M. S. Young, s.n.*, muddy

bank of Río Grande, near San Vicente [5 mi SW of Boquillas], 26 Aug 1915, TEX [2], LL [1]). On one of these Texas collections, all identified originally as *B. torreyana*, is pencilled, "but looks just like *B. spicata* Choisy Arizona," the writer probably alluding to its similarity to *B. coulteri* var. *palmeri* of Arizona, as here recognized. Because this is the first report of this taxon for Texas, the two other collections seen are cited here: *L.C. Hinckley 1505*, Presidio Co., Capote Canyon 1 mi. below falls, 28 May 1941, US; *C.H. Muller 8438*, Presidio Co., along washes of rolling Río Grande Plain, 4 mi SE of Ruidosa, 28 Jul 1945, LL. In southwestern New Mexico the var. *palmeri* is occasional and weedy; in the vicinity of Las Cruces it is always in disturbed areas. It may be introduced there, but if so, it is long-established in the region (e.g., *Wooton & Standley 3905*, NM, Doña Ana Co., mesa W of Organ Mts., 4000 ft, 5 Oct 1907, LL, TEX, US).

The spicate taxa of *Boerhavia* in the United States may be distinguished by the following key. In this key the range of fruit length-to-width ratios is given in the format (length/diam. = 1.3–2.1).

1. Fruits usually 4-angled (rarely 5-angled), broadly obovoid (length/diam. = 1.3–2.1); branches of inflorescence usually densely glandular villous, without sticky internodal bands _____ **B. wrightii** A. Gray
1. Fruits 5-angled, broadly to narrowly obovoid (length/diam. = 1.7–3.1); branches of inflorescence glabrate to puberulent but not glandular, usually with sticky internodal bands.
2. Surface of sulci of mature fruit papillose, otherwise smooth or somewhat rugose, the edges of the ridges along sulci strongly rugose _____ **B. torreyana**
2. Surface of sulci not papillose, instead smooth or sometimes rugose, the edges of the ridges along sulci not rugose to strongly rugose
3. Fruits broadly obovoid (length/diam. = 1.7–2.1), usually overlapping in inflorescence; sulci and ribs slightly rugose; sulci usually about 0.5 times as wide as base of ribs _____ **B. spicata**
3. Fruits narrowly obovoid or obpyramidal (length/diam. – 2.1–3.1), overlapping in inflorescence or remote; sulci and ribs slightly rugose to smooth; sulci 0.1–0.2 times as wide as base of ribs.
4. Inflorescence with fruits often overlapping 50 100% of their length, commonly ± fasciculate in groups of 2–4, each fruit 2.5–3.6 mm long, truncate, round-truncate, bluntly conic, or round apically _____ **B. coulteri** var. **coulteri**
4. Inflorescence with fruits remote or some overlapping 1–50% of their length, infrequently 2–3 in a cluster, each fruit 2–2.4 mm long, occasionally longer, usually rounded apically _____ **B. coulteri** var. **palmeri**

ACKNOWLEDGMENTS

I acknowledge with gratitude the help of Brian Stannard (K), who sent photocopies and a photographic print of the holotype of *Senkenbergia coulteri* Hook. f. I also thank curators of herbaria who loaned specimens for this study, and to Richard Felger for various e-mail "chats" regarding this taxon.

BOOK REVIEW

RICHARD L. DUBLE. 2001. **Turfgrasses: Their Management and Use in the Southern Zone, Second Edition.** (ISBN 1-58544-161-9, pbk.) Texas A&M University Press. John H. Lindsey Building, Lewis Street, 4354 TAMU, College Station, TX 77843-4354. (Orders: www.tamu.edu/upress, 979-458-3982, 800-826-8911, 979-847-8752 fax). $27.95, 336 pp, 51 color photos, 15b/w photos, 68 line drawings, 7" × 9".

Although monotypic plantings of an exotic grass species might evoke fear or loathing in those concerned with biodiversity, few would dispute the impact turfgrasses have on our economy or our quality of life. Gulf courses, municipal parks, residential landscapes and interstate roadways are all dependent in some form on turfgrass culture and management. *Turfgrasses* capitalizes on their importance and seeks to provide comprehensive information on how to grow and maintain lawns.

This volume comprises a revision of first edition in 1989. Chapters include the contributions of turfgrasses, the turfgrass plant, growth and development of turfgrasses, southern turfgrasses, specification for turfgrass establishment, cultural practices, weed control in turf, turfgrass diseases, managing turfgrass insects and turfgrass maintenance programs. The second chapter gives a brief, yet clear introduction to grass morphology. In following chapter, Duble elaborates on the growth and development of turfgrasses, covering such topics as seed germination, dormancy and vigor, leaf growth and thatch, and cultural practices affecting root growth. Chapter four is devoted exclusively to southern turfgrasses, dividing them into warm-season and cool-season. For each group of grasses (example: Bermudagrass), he includes information on the origin and distribution of species, a species description, adaptation and uses, horticultural varieties, propagation, management and pest problems. Within the chapter on cultural practices, the author includes obvious topics like mowing, water management and fertilization. A handy worksheet for water budgeting guides the reader in estimating total cost for irrigation. Special cultural practices address vertical mowing, aerification, spiking and topdressing, to name a few. The section on weed control identifies undesirable plants in turf with both descriptions and line drawings and suggests herbicides for control. After reading this book, one should be able to identify and treat turf diseases and insects since the chapters pertaining to these topics seem comprehensive. The final chapter has the commercial turf manager in mind with topics like putting greens and playing fields.

Overall, this is a well-written and thorough tome. I have but a few quibbles. First, many of the references cited seem a bit dated. I noticed only a handful of the citations were published after 1990 with the majority published before 1980. Thus, it seems that some of the material presented herein is outdated. Turfgrass is big business and big money and the demand for current information should be reflected with research. While the both the black and white and color photos are clear and representative, the line drawings of turfgrass species and turf weeds are of poor quality. The drawing of a staminate Buffalograss (p. 72), for instance, could easily be mistaken for *Bouteloua* and Kentucky bluegrass (p.84) looks more like Johnsongrass. It is likely that the target audience would not be familiar with all the species discussed in this book. A clear illustration could be a strong confirmation tool for identification.

This book is appropriately written with the commercial turfgrass manager in mind. Those working in this field should not be without a copy of this book.—*Amy Trauth Nare, Botanical Research Institute of Texas, Fort Worth, TX, 76102-4060, U.S.A., amy_trauth@yahoo.com*

LECTOTYPIFICATION OF *MENTZELIA TEXANA* AND *M. LINDHEIMERI* (LOASACEAE) WITH AN ASSESSMENT OF THEIR BIOLOGICAL STATUS

Billie L. Turner

Plant Resources Center
Biolabs 311; University of Texas
Austin, TX 78712, U.S.A.
and
Box 1110, Alpine, TX 79831, U.S.A.
billie@uts.cc.utexas.edu

In their monograph of the family Loasaceae, Urban and Gilg (1900) treated the genus *Mentzelia* as having 36 taxa, two of these, *M. lindheimeri* and *M. texana*, proposed as new. The purpose of the present paper is to typify each and provide an evaluation of their biologic status.

Mentzelia lindheimeri Urban & Gilg, Monogr. Loas. 54. 1900. TYPE: U.S.A. TEXAS: UVALDE CO.: Jun 1885, *Reverchon 1650* (LECTOTYPE, here designated: MO!; ISOLECTOTYPE: US!).

Urban and Gilg in their protologue of this species cited five specimens gathered by five different collectors, three of these from Texas, two from northern Mexico. All of the specimens cited by these two authors were said to be from European herbaria, namely "Berol., Boisser-Barbey, Canby, Lips., Paris., J.D. Smith, Vindobon." I have examined duplicates of all of the sheets concerned and select the following from among these as adequate lectotypes: U.S.A. Texas: Uvalde Co.: Jun 1885, *Reverchon 1650* (lectotype: MO!; isolectotype: US!). Darlington (1934) also listed this collection as belonging to his concept of *M. lindheimeri*. Urban and Gilg listed the locality of *Reverchon 1650* as "in planitiebus arenosus montis Upper Guadelupe" but the locality on the lectotype is that given here.

Ideally, a lectotype should be selected from among the specimens examined by its original author or authors, but the European collections cited by Urban and Gilg, who worked out of the herbarium at Berlin (B), were unavailable to me. Because of this, I find it appropriate (as permissible under Art 9.10 of the current Code), to designate lectotypes from American syntypes. I have also applied this same reasoning in the typification of the following taxon.

Mentzelia texana Urban & Gilg, Monogr. Loas. 52. 1900. Without specific locality, May–Oct, 1849, *Wright 210* (LECTOTYPE, here designated: GH; ISOLECTOTYPES: GH, US).

In the protologue of this taxon, which I consider to be a synonym of *M. lindheimeri*, Urban and Gilg noted that, so far as known, it was confined to

Texas, citing three specimens: *Drummond 91* (from sandy soils between Victoria and Gonzales, Texas; *Trecul 1220* (dry sites between Turkey Creek and the San Pedro [Devils River]; and *Wright 210* (in part, mixed with *M. oligosperma* Nutt.). They also noted that material of their new species, presumably those cited, were based upon specimens " in herb. Berol., Boisser-Barbey, Candolle, Delessert, Kew., Paris., Vindobon."

Darlington (1934) retained the species, citing two of the above mentioned type elements (*Drummond 202* and *Wright 202*). She also cited three additional specimens from the state of Pueblo, Mexico. I take the latter to be misidentifications of the more southern *M. hispida* Willd., or some close relative having relatively short petals. Correll and Johnston (1970), following Darlington, retained *M. texana* in their treatment of *Mentzelia* for the flora of Texas.

In a recent study of *Mentzelia* for Texas I have examined duplicates of two of the three collections cited by Urban and Gilg in their protologue (*Drummond 91* and *Wright 210*) and have selected *Wright 210* as an appropriate element for lectotypification, largely because duplicate specimens of this collection are currently housed at GH! and US!

The type locality of *M. texana* is moot. According to label data on *Wright 210* (US!) the specimen concerned was collected "May–Oct, 1849." But other than this time span, no other information relating to its collection is given. According to Johnston (1940), on June 28, 1849, Charles Wright collected an unnamed species of *Mentzelia* (Wright's field number *541*) on the hills of Turkey Creek in western Uvalde County. Since Gray often renumbered and/or combined Wright's collections (cf. Johnston 1940), it is likely that *Wright 210* is the number assigned by Gray to Wright's field collection *541*; at least I encountered no Wright collection so numbered in the present study.

The positioning of *M. texana* in synonymy with the simultaneously published *M. lindheimeri* is based upon the study of numerous specimens from ten or more herbaria, and field work over a number of years in the areas concerned. Urban and Gilg, in their key to species, distinguished *M. texana* from *M. lindheimeri* by its shorter petals (7–9 mm vs. 12–14 mm) and sessile or shortly pedicellate fruits (vs always clearly pedicellate). I find these two quantitative characters to be quite variable within the *M. lindheimeri* complex and have little hesitancy in reducing *M. texana* to synonymy. Finally, it should be noted that Darlington (1934) listed the lectotype of *M. texana* (*Wright 210*) among his "Specimens examined:" as a sheet of *M. lindheimeri*, which agrees with the present authors disposition.

ABSTRACT

Infrageneric taxa in *Panicum* and *Dichanthelium* have a long history of usage, but at least eight of these taxa have not been validly published previously. The new taxa published here are *Panicum* sect. *Antidotalia*, *P.* sect. *Hemitoma*, *Dichanthelium* sect. *Clandestina*, *D.* sect. *Linearifolia*, *D.* sect. *Macrocarpa*, *D.* sect. *Nudicaulia*, *D.* sect. *Pedicellata*, and *D.* sect. *Strigosa*. Fifty-two new combinations, made for a forthcoming treatment of these two genera, are as follows: *D.* sect. *Angustifolia*; *D.* sect. *Ensifolia*; *D.* sect. *Lancearia*; *D.* sect. *Lanuginosa*; *D.* sect. *Oligosantha*; *D.* sect. *Sphaerocarpa*; *D. aciculare* subsp. *angustifolium*, subsp. *fusiforme*, subsp. *neuranthum*; *D. acuminatum* subsp. *columbianum*, subsp. *fasciculatum*, subsp. *implicatum*, subsp. *leucothrix*, subsp. *lindheimeri*, subsp. *longiligulatum*, subsp. *sericeum*, subsp. *spretum*, subsp. *thermale*; *D. chamaelonche* and subsp. *breve*; *D. commutatum* subsp. *ashei*, subsp. *equilaterale*, subsp. *joori*; *D. dichotomum* subsp. *lucidum*, subsp. *mattamuskeetense*, subsp. *microcarpon*, subsp. *nitidum*, subsp. *roanokense*, subsp. *yadkinense*; *D. ensifolium* subsp. *curtifolium*; *D. oligosanthes* subsp. *scribnerianum*; *D. ovale* subsp. *praecocius*, subsp. *pseudopubescens*, subsp. *villosissimum*; *D. portoricense* subsp. *patulum*; *D. strigosum* subsp. *glabrescens*, subsp. *leucoblepharis*; *D. tenue*; *P. amarum* subsp. *amarulum*; *P. anceps* subsp. *rhizomatum*; *P. capillare* subsp. *hilmanii*; *P. dichotomiflorum* subsp. *bartowense*, subsp. *puritanorum*; *P. hallii* subsp. *filipes*; *P. hirticaule* subsp. *sonorum*, subsp. *stramineum*; *P. philadelphicum* subsp. *gattingeri*, subsp. *lithophilum*; and *P. rigidulum* subsp. *abscissum*, subsp. *combsii*, subsp. *elongatum*, subsp. *pubescens*.

RESUMEN

Los táxones infragenéricos en *Panicum* y *Dichanthelium* han sido usados durante mucho tiempo, pero por lo menos ocho de estos táxones no han sido publicados válidamente. Los nuevos táxones aquí publicados son *Panicum* sect. *Antidotalia*, *P.* sect. *Hemitoma*, *Dichanthelium* sect. *Clandestina*, *D.* sect. *Linearifolia*, *D.* sect. *Macrocarpa*, *D.* sect. *Nudicaulia*, *D.* sect. *Pedicellata*, y *D.* sect. *Strigosa*. Cincuenta y dos nuevas combinaciones, designadas en un futuro tratamiento de estos dos géneros, son: *D.* sect. *Angustifolia*; *D.* sect. *Ensifolia*; *D.* sect. *Lancearia*; *D.* sect. *Lanuginosa*; *D.* sect. *Oligosantha*; *D.* sect. *Sphaerocarpa*; *D.* sect. *Angustifolia*; *D.* sect. *Ensifolia*; *D.* sect. *Lancearia*; *D.* sect. *Lanuginosa*; *D.* sect. *Oligosantha*; *D.* sect. *Sphaerocarpa*; *D. aciculare* subsp. *angustifolium*, subsp. *fusiforme*, subsp. *neuranthum*; *D. acuminatum* subsp. *columbianum*, subsp. *fasciculatum*, subsp. *implicatum*, subsp. *leucothrix*, subsp. *lindheimeri*, subsp. *longiligulatum*, subsp. *sericeum*, subsp. *spretum*, subsp. *thermale*; *D. chamaelonche* y subsp. *breve*; *D. commutatum* subsp. *ashei*, subsp. *equilaterale*, subsp. *joori*; *D. dichotomum* subsp. *lucidum*, subsp. *mattamuskeetense*, subsp. *microcarpon*, subsp. *nitidum*, subsp. *roanokense*, subsp. *yadkinense*; *D. ensifolium* subsp. *curtifolium*; *D. oligosanthes* subsp. *scribnerianum*; *D. ovale* subsp. *praecocius*, subsp. *pseudopubescens*, subsp. *villosissimum*; *D. portoricense* subsp. *patulum*; *D strigosum* subsp. *glabrescens*, subsp. *leucoblepharis*; *D. tenue*; *P. amarum* subsp. *amarulum*; *P. anceps* subsp. *rhizomatum*; *P. capillare* subsp. *hilmanii*; *P. dichotomiflorum* subsp. *bartowense*, subsp. *puritanorum*; *P. hallii* subsp. *filipes*; *P. hirticaule* subsp. *sonorum*, subsp. *stramineum*; *P. philadelphicum* subsp. *gattingeri*, subsp. *lithophilum*; y *P. rigidulum* subsp. *abscissum*, subsp. *combsii*, subsp. *elongatum*, subsp. *pubescens*.

SIDA 20(1): 161 – 174. 2002

In preparing the treatment of *Panicum* and *Dichanthelium* for Volume 25 of *The Flora of North America* (Barkworth et al. [eds.], in prep.), we find it necessary to describe eight new infrageneric taxa and make fifty-two new combinations. Editorial policy for this volume requires that infraspecific taxa be treated as subspecies rather than as varieties.

INFRAGENERIC NAMES

The genus *Panicum*, as recognized by Linnaeus (1753), included 20 species in two groups: *Spicata* and *Paniculata*. Most of these species have been tranferred subsequently to other genera, including *Digitaria*, *Echinochloa*, *Oplismenus*, *Paspalum*, *Pennisetum*, and *Setaria*. The segregation of *Dichanthelium* from *Panicum* by Gould (1974) on characters of anatomy and photosynthetic pathways is supported by a recent molecular phylogeny of the Panicoideae (Giussani et al. 2001).

Bentham and Hooker (1883) treated *Panicum* as a relatively broad genus and published several infrageneric taxa. Nash (1903) treated *Panicum* in a narrower sense. He named and described nine unranked groups of *Panicum* in Small, *Flora of the Southeastern United States*. Even though no infrageneric rank was indicated, these names were validly and effectively published, and eight of these names can serve as basionyms in *Panicum* or *Dichanthelium*. Hitchcock revised the Gramineae for Robinson and Fernald (1908) in *Gray's Manual of Botany, ed. 7*. He divided *Panicum* in this treatment into two sections, the rank indicated by the double-s sign, which Robinson and Fernald define on p. 32 as indicating a section. He divided section *Eupanicum* into six unranked names, presumably subsections, and added 14 names, presumably series, within the "subsection" *Dichotoma*. Although these 20 infrasectional names are unranked, these names were also validly published and can also serve as basionyms.

Hitchcock and Chase (1910) added 13 additional unranked groups in *Panicum* and effectively published descriptions of these groups. Several subsequent taxonomists (e.g. Fernald 1936, 1938, 1947; Hsu 1965) have treated their group names as sectional or subsectional names. Hitchcock and Chase, however, explicitly stated (page 17) that they did not consider these groups to be formal taxonomic entities. They used the same group names in their later publications (Hitchcock 1913, 1915, 1935, 1951; Hitchcock and Chase 1915) but never suggested that they had changed their minds with respect to the taxonomic status of the groups. Article 34.1 of the *International Code of Botanical Nomenclature* (Greuter et al. 2000) states that a name is not validly published when it is not accepted by the author in the original publication. It seems likely that, had Hitchcock changed his mind regarding these group names, he or Chase would have included that information in one of their later publications for Hitchcock was a very active participant in the development of the nomenclatural code (Hitchcock 1919; Lawrence 1951) and hence must have been aware of the need

to make a clear statement of such a change of mind. Therefore, if the Hitchcock and Chase groups added in the 1910 paper are to be recognized as formal taxa, they must subsequently be validly published. We have indicated that we are deriving our section names from these group names in the 1910 paper by using "Hitchcock & Chase ex Freckmann & Lelong" for those groups which retain the Hitchcock and Chase group name and circumscription.

Pilger (1931) named new sections in *Panicum*, indicating these as "*nov. sect.*," meeting all requirements that apply to a 1931 publication. He also apparently published validly, but inadvertently, as sections two of the Hitchcock and Chase groups by reference to the Hitchcock and Chase names in the 1910 and 1915 papers, even though he did not indicate these as "*nov. sect.*"

Hsu (1965) is often cited as validating Hitchcock and Chase names or as publishing new combinations based on these names, but no types were cited, as required after 1 January 1958 by Article 37.1 of the Code. Gould (1974) raised subgenus *Dichanthelium* to a genus, making new combinations for 17 species and three varieties, but he did not treat subgenera or sections. Brown in Brown and Smith (1975) elevated two sections of *Panicum* to subgenus status in *Dichanthelium*. Zuloaga (1987) returned to a broader concept of *Panicum* and published four new sections, each with a Latin description and citation of a type. He also changed the status of three of Hitchcock's group names to sections, citing types and validly publishing these names.

NEW TAXA

Panicum sect. **Antidotalia** Freckmann & Lelong, sect. nov. TYPUS: *Panicum antidotale* Retz.

Plantae perennes rhizomatibus crassis. Culmi erecti duri robusti, e nodis medius ramosi. Ligulae mebranaceae ciliatae. Paniculae pyramidalis, plus minusve laxae, multiflorae, spiculis distincte pedicellatis. Spiculae ovoideae glabrae; gluma inferior circa dimidiam longitudinem spiculae attingens, 3–5 nervia; gluma superior et lemma inferior 7-nervia; anthoecium inferius staminiferis; anthoecium superius glabrum, nitidum.

Plants perennial, with thick rhizomes. Culms erect, robust, hard, branching at the middle nodes. Ligule a ciliate membrane. Panicle pyramidal, more or less lax, many-flowered, with spikelets on long pedicels. Spikelets ovoid, glabrous; first glume about 1/2 as long as the spikelet, 3- or 5-nerved; second glume and lower lemma 7-nerved; lower floret staminate; upper floret smooth, shiny. x = 9.

Panicum sect. **Hemitoma** Hitchc. & Chase ex Freckmann & Lelong, sect. nov. TYPUS: *Panicum hemitomon* Schult.

Plantae perennes rhizomatibus, plus minusve aquaticae. Culmi erecti vel reclinati, saepe sterilis. Ligulae membranaceae, ciliatae vel laceratae. Paniculae angustae; rami pauci erecti spiciformes spiculis secundis subsesillibus. Spiculae anguste ovoideae vel lanceolatae lateraliter compressae, glabrae. Anthoecium inferius staminiferis; lemma superior tenuis, flexilibus, albida, involuta non nisi prope basin.

Plants perennial, semi-aquatic, with extensive rhizomes or stolons. Culms erect or sprawling, often sterile. Ligule a ciliate or lacerate membrane. Panicle narrow; branches few, spiciform, erect, with subsessile to short-pedicelled, secund spikelets. Spikelets narrowly ovoid to lanceolate, laterally compressed, glabrous. Lower floret staminate; upper lemma thin, flexible, whitish, rolled over the palea only near the base.

Dichanthelium sect. **Clandestina** Freckmann & Lelong, sect. nov. TYPUS: *Panicum clandestinum* L.

Plantae perennes rhizomatibus crassis vel caudicibus. Culmi 50–150 mm alti; culmi autumnali e nodis medius et superioribus ramosi, ramulosi, saepe fasciculos axillares formantes, paniculis clandestinis intra foliorum vaginas. Folia basilaria rosulam hiemalem formantes. Vagina tumida, maculata, papillosa-hispida vel pubescentia et viscida, ore constricta. Lamina basilaria grandis, ovata-lanceolata; laminae caulinae 6–14. Spiculae ellipsoideae vel ovoideae, acutae, 2.2–3.6 mm longa, nervis prominibus.

Plants perennial, from a thick rhizome or caudex. Culms 50–150 cm; autumnal culms with branches arising from the middle and upper nodes, rebranching and often forming dense axillary fascicles, the panicles enclosed in the sheaths. Basal leaves forming a winter rosette. Sheath usually swollen, mottled, papillose-hispid or pubescent and viscid, constricted at summit; basal blades large, ovate-lanceolate; cauline blades 6–14. Spikelets ellipsoid to ovoid, pointed, 2.2–3.6 mm long, with prominent veins.

Dichanthelium sect. **Linearifolia** Freckmann & Lelong, sect. nov. TYPUS: *Panicum linearifolium* Scribn. ex Nash.

Plantae perennes caespitosae. Culmi erecti vel effusi vel cernui; internodia inferna brevissima; internodia supera saepe manopere elongata. Culmi autumnali e nodis prope basin ramosi, paniculas condensatas minus quam 5 cm super terram vel culmos steriles formantes. Laminae basilares angustae, erectae vel ascendes, laminas caulinas infernas simulans; laminae superae plerumque erectae, rigidae, 1–5 mm latae, 15–60 ·plo longiora quam latiora. Spiculae ovoideae, ellipsoideae, vel obovoideae, 2.0 ·4.3 mm longa, glabrae vel pubescentae.

Plants perennial, tufted. Culms erect to spreading or drooping, the lower internodes very short, the upper 2–4 internodes often much elongated. Autumnal culms branching from the nodes near the base, producing condensed panicles within about 5 cm of the ground or sterile shoots. Basal blades narrow, erect or ascending, resembling the lower cauline ones; cauline blades usually erect, stiff, the upper ones 1–5 mm wide and 15–60 times as long. Spikelets ovoid, ellipsoid, or obovoid, 2.0–4.3 mm long, glabrous or pubescent.

Hitchcock and Chase (1910) used the group name "Depauperata" for most of the species in this section. However, because Pilger (1931) published section *Depauperata* for certain Old World species of *Panicum* and because *Dichanthelium* is often included in *Panicum*, we prefer to avoid creating a homonym if these genera are combined.

Dichanthelium sect. **Macrocarpa** Freckmann & Lelong, sect. nov. TYPUS: *Panicum macrocarpon* LeConte ex Torr.

Plantae perennes rhizomatibus brevibus vel caudicibus, raro rhizomatibus elongatibus. Culmi principales 20–110 cm alti, plus minusve erecti, sparse ramosi, fasciculos axillares densos non faciens; culmi secundarii interdum autumnali, parviores. Folia basilaria rosulam hiemalem formantes. Foliorum vaginae glabrae vel pubescentiae, non viscidae; laminae caulinae 3–7. Paniculae saltem partim exsertae. Anthoecium inferius saepe staminiferis.

Plants perennial, from a knotted rhizome, a caudex, or rarely an elongated rhizome. Main culms 20–110 cm, ascending to erect, sparsely rebranching, not producing dense axillary fascicles; additional culms (sometimes arising in autumn) smaller. Basal leaves forming a winter rosette. Sheaths glabrous or pubescent, not viscid; cauline blades 3–7. Panicle at least partly exserted. Lower floret often staminate.

Nash (1903) published the infrageneric name *Latifolia* within *Panicum*, indicating that this name was based on *Panicum latifolium* L. However, it is evident from his description ("much branched shrubs...outer [spikelet] scales woolly-tipped") that this name was based on a misapplication of *Panicum latifolium*, referring instead to *Panicum* (=*Lasiacis*) *divaricatum* L. According to Art. 7.4 of the Code a name is typified by the type of the basionym, even though it may have been applied to a taxon now considered not to include that type. However, in the case of an unranked infrageneric name, a modern author may publish a new name at a definite rank. We prefer to avoid confusion over the application of *Latifolia* by basing this section name on a different type.

Dichanthelium sect. **Nudicaulia** Hitchcock & Chase ex Freckmann & Lelong, sect. nov. TYPUS: *Panicum nudicaule* Vasey.

Plantae perennes caesptosae. Culmi 20–60 cm alti, inferme ascendes, glabri; culmi autumnale e nodis prope basin ramosi. Laminae planae vel rigide involutae, ascendes, basi aggregatae, superiores multum redactae. Folia basilaria rosulam hiemalem formantes. Panicula longa-exserta, pauciflora. Spiculae anguste ellipsoideae, 2.4–2.9 mm longa, glabrae.

Plants perennial, tufted. Culms 20–60 cm, weakly ascending, glabrous; autumnal culms branching from the base. Blades flat to stiffly involute, ascending, crowded at the base, the uppermost ones much reduced. Basal leaves not forming a distinct winter rosette. Panicle long-exserted, few-flowered. Spikelets narrowly ellipsoid, 2.4–2.9 mm long, glabrous.

Dichanthelium sect. **Pedicellata** Hitchc. & Chase ex Freckmann & Lelong, sect. nov. TYPUS: *Panicum pedicellatum* Vasey.

Plantae perennes basibus duris cormiformibus et rhizomatibus gangliiformibus. Culmi erecti vel effusi; culmi autumnali divaricate ramosi ante maturitem paniculae ad finem decumbes. Folia basilaria rosula hiemalem non formantes. Ligulae membranaceae ciliatae. Laminae papillatae ciliatae. Spiculae obovoideae vel obpyriformes, 3.2–4.4 mm longa, papillatae pubescentae, basi attenuatae. Anthoecium superius ad apicem puberulum, acutum vel attenuatum.

Plants perennial, from a hard, corm-like base and a knotted rhizome. Culms

erect or spreading; autumnal culms freely divaricate-branching before the primary panicle matures, ultimately decumbent. Basal leaves not forming a winter rosette. Ligule a ciliate membrane. Blades papillose-ciliate. Spikelets obovoid to obpyriform, 3.2–4.4 mm long, papillose-pubescent, attenuate at the base. Upper floret pointed to attenuate, puberulent at the apex.

Dichanthelium sect. **Strigosa** Freckmann & Lelong, sect. nov. TYPUS: *Panicum strigosum* Muhl. in Elliott.

Plantae perennes dense caespitosae. Culmi principales graciles; internodia inferna breves; 3–5 internodia supera elongata. Culmi autumnali pulvinum densum formantes. Laminae molles pallidovirens vel flavovirens, plerumque marginibus ciliatis. Laminae basilares grandes laminas caulinas infernas simulans. Spiculae late ellipsoideae vel obovoideae, 1.1–2.3 mm longa, glabrae vel pubescentae.

Plants perennial, densely tufted. Main culms slender, the lower internodes short, the upper 3–5 internodes elongated. Autumnal culms forming a dense cushion. Blades soft, pale green or yellowish, usually with ciliate margins. Basal blades large, scarcely separable from the lower cauline blades. Spikelets broadly ellipsoid to obovoid, 1.1–2.3 mm long, glabrous to pubescent.

Bentham and Hooker (1883) created the section *Laxiflora* to include certain Old World species of their subgenus *Eupanicum*, but not including *P. laxiflorum* Lam. To avoid creating a later homonym if *Dichanthelium* is treated as part of *Panicum*, we are basing the section name on *Panicum strigosum* Muhl. in Elliott, rather than *P. laxiflorum*.

NEW COMBINATIONS

Dichanthelium sect. **Angustifolia** (Hitchc. in B.L. Rob. & Fernald) Freckmann & Lelong, stat. nov. BASIONYM: *Panicum* (unranked) *Angustifolia* Hitchc. in B.L. Rob. & Fernald, Gray's Man. Bot. Ed. 7:106. 1908. TYPE: *Panicum angustifolium* Elliott.

Dichanthelium sect. **Ensifolia** (Hitchc.in B.L. Rob. & Fernald) Freckmann & Lelong, stat. nov. BASIONYM: *Panicum* (unranked) *Ensifolia* Hitchc. in B.L. Rob. & Fernald, Gray's Man. Bot, ed. 7:113. 1908. TYPE: *Panicum ensifolium* Baldwin ex Elliott.

Dichanthelium sect. **Lancearia** (Hitchc. in B.L. Rob. & Fernald) Freckmann & Lelong, stat. nov. BASIONYM: *Panicum* (unranked) *Lancearia* Hitchc. in B.L. Rob. & Fernald, Gray's Man. Bot, ed. 7:114. 1908. TYPE: *Panicum lancearium* Trin.

Dichanthelium sect. **Lanuginosa** (Hitchc. in B.L.Rob. & Fernald) Freckmann & Lelong, stat. nov. BASIONYM: *Panicum* (unranked) *Lanuginosa* Hitchc. in B.L. Rob. & Fernald, Gray's Man. Bot, ed. 7:109. 1908. TYPE: *Panicum lanuginosum* Elliott.

Dichanthelium sect. **Oligosantha** (Hitchc. in B.L.Rob. & Fernald) Freckmann & Lelong, stat. nov. BASIONYM: *Panicum* (unranked) *Oligosanthia* Hitchc. in B.L. Rob. & Fernald, Gray's Man. Bot, ed. 7:114. 1908. TYPE: *Panicum oligosanthes* Schult.

Dichanthelium sect. **Sphaerocarpa** (Hitchc. in B.L.Rob. & Fernald) Freckmann & Lelong, stat. nov. BASIONYM: *Panicum* (unranked) *Sphaerocarpa* Hitchc. in B.L. Rob. & Fernald, Gray's Man. Bot, ed. 7:113. 1908. TYPE: *Panicum sphaerocarpon* Elliott.

Dichanthelium aciculare subsp. **angustifolium** (Elliott) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum angustifolium* Elliott, Sketch Bot. S. Carolina & Ga. 1:129. 1816. *Panicum nitidum* var. *angustifolium* (Elliott) A. Gray, N. Amer. Gram. 2:112. 1835. *Chasea angustifolia* (Elliott) Nieuwl., Amer. Midl. Naturalist 2:64. 1911. *Dichanthelium angustifolium* (Elliott) Gould, Brittonia 26:59. 1974. *Panicum aciculare* var. *angustifolium* (Elliott) Wipff & S.D. Jones, Phytologia 77:457. 1994. TYPE: U.S.A. SOUTH CAROLINA: May, *S. Elliott s.n.* (HOLOTYPE: CHARL, fragment US!).

Dichanthelium aciculare subsp. **fusiforme** (Hitchc.) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum fusiforme* Hitchc., Contr. U.S. Natl. Herb. 12:222. 1909. *Dichanthelium fusiforme* (Hitchc.) Harvill, Castanea 42:177. 1977. TYPE: CUBA: western Cuba, 1863, *C. Wright 3454* (HOLOTYPE: GOET, fragment US!).

Panicum neuranthum var. *ramosum* Griseb., Cat. Pl. Cub. 232. 1866. *Dichanthelium aciculare* var. *ramosum* (Griseb.) Davidse, Novon 2:104. 1992.

Dichanthelium aciculare subsp. **neuranthum** (Griseb.) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum neuranthum* Griseb., Cat. Pl. Cub. 232. 1866. TYPE: CUBA: eastern Cuba, 1860, *C. Wright 3453* (HOLOTYPE: US 2209346!).

Panicum pinetorum Swallen, Proc. Biol. Soc. Wash. 55:93. 1942.

Dichanthelium acuminatum subsp. **columbianum** (Scribn.) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum columbianum* Scribn., U.S.D.A. Div. Agrost. Bull. 7:78, f. 6. 1897. *Dichanthelium columbianum* (Scribn.) Freckmann, Phytologia 39:270. 1978. *Panicum acuminatum* var. *columbianum* (Scribn.) Lelong, Brittonia 36:270. 1984. TYPE: U.S.A. DISTRICT OF COLUMBIA: 14 Jul 1894 *F.L. Scribner s.n.* (HOLOTYPE: US 743463!).

Dichanthelium acuminatum subsp. **fasciculatum** (Torr.) Freckmann & Lelong, comb & stat.. nov. BASIONYM: *Panicum dichotomum* var. *fasciculatum* Torr., Fl. North. & Mid. U. S. 1:145. 1824. *Panicum huachucae* var. *fasciculatum* (Torr.) F.T. Hubb., Rhodora 14:171. 1912. *Panicum lindheimeri* var. *fasciculatum* (Torr.) Fernald, Rhodora 23:228. 1921. *Panicum lanuginosum* var. *fasciculatum* (Torr.) Fernald, Rhodora 36:77. 1934. *Dichanthelium lanuginosum* var. *fasciculatum* (Torr.) Spellenb. Madroño 23:145. 1975. *Dichanthelium acuminatum* var. *fasciculatum* (Torr.) Freckmann, Phytologia 48:108. 1981. *Panicum acuminatum* var. *fasciculatum* (Torr.) Lelong, Brittonia 36:269. 1984. TYPE: U.S.A. NEW JERSEY: sandy fields, *J. Torrey s.n.* (HOLOTYPE: NY!).

Dichanthelium acuminatum subsp. **implicatum** (Scribn. ex Nash) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum implicatum* Scribn. ex Nash in Britton & A. Br., Illust. Fl. 3:498, f. 267a. 1898. *Panicum unciphyllum* var. *implicatum* (Scribn. ex Nash) Scribn. & Merr., Rhodora 3:123. 1901. *Panicum lindheimeri* var. *implicatum* (Scribn. ex Nash) Fernald, Rhodora 23:228. 1921. *Panicum lanuginosum* var. *implicatum* (Scribn. ex Nash) Fernald, Rhodora 36:77. 1934. *Dichanthelium acuminatum* var. *implicatum* (Scribn. ex Nash) Gould & C.A. Clark, Ann. Missouri Bot. Gard. 65:1126. 1979 [imprint date 1978]. *Panicum acuminatum* var. *implicatum* (Scribn. ex Nash) Beetle, Phytologia 48:192. 1981. TYPE: U.S.A. MAINE: low marshy ground, Cape Elizabeth, 26 Jul 1895, *F.L. Scribner s.n.* (HOLOTYPE: US 742896!).

Dichanthelium acuminatum subsp. **leucothrix** (Nash) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum leucothrix* Nash, Bull. Torrey Bot. Club 24:41. 1897. *Dichanthelium leucothrix* (Nash) Freckmann, Phytologia 48:101. 1981.

Panicum acuminatum var. *leucothrix* (Nash) Lelong, Brittonia 36:271. 1984. TYPE: U.S.A. FLORIDA: Lake Co.: low pineland at Eustis, 16-31 Jul 1894, *G.V. Nash s.n.* (HOLOTYPE: NY!).

Dichanthelium acuminatum subsp. **lindheimeri** (Nash) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum lindheimeri* Nash, Bull. Torrey Bot. Club 24:196. 1897. *Panicum lanuginosum* var. *lindheimeri* (Nash) Fernald, Rhodora 36:77. 1934. *Dichanthelium lindheimeri* (Nash) Gould, Brittonia 26:60. 1974. *Dichanthelium lanuginosum* var. *lindheimeri* (Nash) Freckmann, Phytologia 39:270. 1978. *Dichanthelium acuminatum* var. *lindheimeri* (Nash) Gould & C.A. Clark, Ann. Missouri Bot. Gard. 65:1127. 1979 [imprint date 1978]. *Panicum acuminatum* var. *lindheimeri* (Nash) Beetle, Phytologia 48:193. 1981. *Panicum lindheimeri* var. *typicum* Fernald, Rhodora 23:227. 1921. TYPE: U.S.A. TEXAS: springs, banks of the Guadeloupe, near New Braunfels, 1846, *F.J. Lindheimer* 565 (HOLOTYPE: NY!).

Dichanthelium acuminatum subsp. **longiligulatum** (Nash) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum longiligulatum* Nash, Bull. Torrey Bot. Club 26:574. 1899. *Dichanthelium acuminatum* var. *longiligulatum* (Nash) Gould & C.A. Clark, Ann. Missouri Bot. Gard. 65:1127-1128. 1979 [imprint date 1978]. *Dichanthelium longiligulatum* (Nash) Freckmann, Phytologia 48:102. 1981. *Panicum acuminatum* var. *longiligulatum* (Nash) Lelong, Brittonia 36:270. 1984. TYPE: U.S.A. FLORIDA: Apalachicola, 1892, *G.R. Vasey* (HOLOTYPE: NY!).

Dichanthelium acuminatum subsp. **sericeum** (Schmoll) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum ferventicola* var. *sericeum* Schmoll, Madroño 5:92. 1939. *Dichanthelium lanuginosum* var. *sericeum* (Schmoll) Spellenb., Madroño 23:150. 1975. *Dichanthelium acuminatum* var. *sericeum* (Schmoll) Freckmann, Phytologia 48:107. 1981. Type: U.S.A. WYOMING: Mammoth Hot Springs, Yellowstone National Park, in wet ground about hot springs, *A. Nelson 6037* (HOLOTYPE: RM 20108).

Dichanthelium acuminatum subsp. **spretum** (Schult.) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum spretum* Schult., Mant. 2:248.1824. *Dichanthelium spretum* (Schult.) Freckmann, Phytologia 48:102. 1981. TYPE: U.S.A. New England, moist ground, Muhlenberg's *Panicum* No. 37 (HOLOTYPE: PH).

Dichanthelium acuminatum subsp. **thermale** (Bol.) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum thermale* Bol., Proc. Calif. Acad. Sci. 2:181. 1862. *Dichanthelium lanuginosum* var. *thermale* (Bol.) Spellenb., Madroño 23:151. 1975. *Dichanthelium acuminatum* var. *thermale* (Bol.) Freckmann, Phytologia 48:107. 1981. TYPE: U.S.A. CALIFORNIA. Sonoma Co.: northern part of Sonoma County, on hot rocks and in hot water flowing from Geyser Springs and Geyser Mountains, *H.N. Bolander 3941* (HOLOTYPE: GH).

Dichanthelium chamaelonche (Trin.) Freckmann & Lelong, comb. nov. BASIONYM: *Panicum chamaelonche* Trin., Gram. Panic. 242. 1826. TYPE: U.S.A. "AMER. BOR.": *Enslin s.n.* (HOLOTYPE: LE; fragment and photograph US!).

Dichanthelium chamaelonche subsp. **breve** (Hitchc. & Chase) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum breve* Hitchc. & Chase, Contr. U.S. Natl. Herb. 15:271. 1910. *Dichanthelium dichotomum* var. *breve* (Hitchc. & Chase) Gould & C.A. Clark, Ann. Missouri Bot. Gard. 65:1120. 1979 [imprint date 1978]. *Panicum chamaelonche* var. *breve* (Hitchc. & Chase) Lelong, Brittonia 36:267.

1984. *Dichanthelium ensifolium* var. *breve* (Hitchc. & Chase) B.F. Hansen & Wunderlin, Ann. Missouri Bot. Gard. 75:1646. 1989 [imprint date 1988]. *Panicum ensifolium* var. *breve* (Hitchc. & Chase) Wipff & S.D. Jones, Phytologia 77:460. 1994. TYPE: U.S.A. FLORIDA: Jensen, low pine woods between scrub hills, among palmetto, 5 Apr 1906, *A.S. Hitchcock 734* (HOLOTYPE: US 558435!).

Dichanthelium commutatum subsp. **ashei** (G. Pearson ex Ashe) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum ashei* G. Pearson ex Ashe, J. Elisha Mitchell Sci. Soc. 15:35 (1898). *Panicum commutatum* var. *ashei* (G. Pearson ex Ashe) Fernald, Rhodora 36:83 (1934). TYPE: U.S.A. NEW YORK: Ithaca, Jul 1898, *W.W. Ashe s.n.* (LECTOTYPE [ISOTYPE] US!, [designated by Hitchc. & Chase, Contr. U.S. Natl. Herb. 15:301. 1910.]).

Dichanthelium commutatum subsp. **equilaterale** (Scribn.) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum equilaterale* Scribn., U.S.D.A. Div. Agrost. Bull. 11:42. 1898. TYPE: U.S.A. FLORIDA: Lake Co.: scrubby hammock lands, Eustis, 16-25 Aug 1894, *G.V. Nash 1674* (LECTOTYPE: US 743929! [designated by Hitchcock & Chase, Contr. U.S. Natl. Herb. 15:310. 1910.])

Dichanthelium commutatum subsp. **joori** (Vasey) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum joori* Vasey, U.S.D.A. Div. Agrost. Bull. 8:31.1889. TYPE: U.S.A. LOUISIANA: East Baton Rouge Par., near Baton Rouge, creek bank, in dense tufts, 1 Oct. 1885, *J.F. Joor 39* (HOLOTYPE: US!). *Panicum divergens* Kunth *in* H.B.K. has been used by Zuloaga et al. (1993) to replace *P. commutatum*. However, Davidse & Zuloaga (2000) in proposing rejection of *P. divergens* note that the provenance of the type collection is uncertain and that the name had never been applied previously to *P. commutatum*.

Dichanthelium dichotomum subsp. **lucidum** (Ashe) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum lucidum* Ashe, J. Elisha Mitchell Sci. Soc. 15:47. 1898. *Panicum dichotomum* var. *lucidum* (Ashe) Lelong, Brittonia 36:265. 1984. *Dichanthelium lucidum* (Ashe) LeBlond, Sida 19(4):831. 2001. TYPE: U.S.A. NORTH CAROLINA: deep shady swamps bordering Lake Mattamuskeet, 10 Jun-6 Jul 1898, *W.W. Ashe s.n.* (LECTOTYPE: fragment US! [designated by Hitchcock & Chase, Contr. U.S. Natl. Herb. 15:198. 1910.]).

Dichanthelium dichotomum subsp. **mattamuskeetense** (Ashe) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum mattamuskeetense* Ashe, J. Elisha Mitchell Sci. Soc. 15:45. 1898. *Panicum dichotomum* var. *mattamuskeetense* (Ashe) Lelong, Brittonia 36:265. 1984. *Dichanthelium mattamuskeetense* (Ashe) LeBlond, Sida 19:832. 2001. TYPE: U.S.A. NORTH CAROLINA: around Lake Mattamuskeet, 10 Jun-6 Jul 1898, *W.W. Ashe and G. Pearson s.n.* (LECTOTYPE: US 2808955! [designated by Hitchcock & Chase, Contr. U.S. Natl. Herb. 15:186. 1910.]).

Dichanthelium dichotomum subsp. **microcarpon** (Muhl. ex Elliott) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum microcarpon* Muhl. ex Elliott, Sketch Bot. S. Carolina 1:127. 1816. TYPE: U.S.A. GEORGIA, *A.A. Baldwin s.n.* (LECTOTYPE: CHARL [designated by Hitchc. & Chase, Contr. U.S. Natl. Herb. 15:181.1910.]).

Dichanthelium dichotomum subsp. **nitidum** (Lam.) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum nitidum* Lam., Tabl. Encycl. 1:172. 1791. *Panicum dichotomum* var. *nitidum* (Lam.) Alph. Wood, Class-book bot., ed. *s.n. [b]*, 786. 1861. *Dichanthelium dichotomum* var. *nitidum* (Lam.) LeBlond, Sida 19(4):829. 2001. TYPE: U.S.A. "CAROLINA": eastern Carolina, *J. Fraser s.n.* (HOLOTYPE: P, fragment US!).

Dichanthelium dichotomum subsp. **roanokense** (Ashe) Freckmann & Lelong, comb. & stat. nov. BASIONYM: *Panicum roanokense* Ashe, J. Elisha Mitchell Sci. Soc. 15:44. 1898. *Panicum dichotomum* var. *roanokense* (Ashe) Lelong, Brittonia 36:265. 1984. *Dichanthelium dichotomum* var. *roanokense* (Ashe) LeBlond, Sida 19(4):831. 2001. TYPE: U.S.A. ACKNOWLEDGMENTS

We are very grateful to Mary E. Barkworth for her continuous support and encouragement of our efforts to produce new treatments of *Panicum* and *Dichanthelium* and for her assistance in preparing this manuscript. We are also very grateful to K.N. Ghandhi for his extensive and meticulous search of the literature for infrageneric names and for his help in interpreting the application of the Code to some difficult nomenclatural problems.

A NEW SPECIES OF *SENECIO* (ASTERACEAE) FROM DURANGO, MEXICO

B.L. Turner

Plant Resources Center
University of Texas
Austin, TX, 78713, U.S.A.

ABSTRACT

Senecio sandersiana B.L. Turner, sp. nov., is described and illustrated from near El Salto, Durango, Mexico. It occurs in pine-oak woodlands at relatively high elevations (ca. 2720 m) and is said to be common locally on shady slopes and along ledges. The species is believed to be closely related to *S. tolucannus* DC. but differs in leaf shape and features of the capitulescence.

RESUMEN

Se describe y se ilustra **Senecio sandersiana** B.L. Turner, sp. nov., de cerca de El Salto, Durango, México. Aparece en bosques de pino-encino en elevaciones relativamente altas (ca. 2720 m) y se dice que es común localmente en las laderas umbrías y a lo largo de cornisas. Se cree que la especie está emparentada con *S. tolucannus* DC. pero difiere en la forma de la hoja y características de la capitulescencia.

Routine identification of Mexican Asteraceae has revealed the follow novelty:

Senecio sandersiana B.L. Turner, sp. nov. (**Fig. 1**). TYPE: MEXICO. DURANGO: Mpio. El Salto, "rim of plateau W of La Ciudad, 3.1 km NW of Hwy 40 ... off Neveros rd. upper Arroyo Tascanto watershed," 2720 m, 19 Apr 1999, *A.C. Sanders et al. 22680* (HOLOTYPE: TEX!; ISOTYPE: UCR).

Similis *S. tolucanno* DC. sed laminas foliorum definite cordatis, petiolis angustioribus (2–4 mm vice 3–10 mm), et pedunculis elongatis cum solum 1 -2(–3) capitulis.

Perennial subscapose *herbs* to 60 cm high. *Leaves* glabrous or nearly so, 15–25 cm long, 3.0–8.5 cm wide, forming a persistent basal rosette; petioles of well-developed leaves alate, mostly 10–15 cm long, 2–4 mm wide; blades broadly ovate to cordate, the margins decidedly serrulate. *Heads* 1–3 at the apices of elongate nearly naked scapes (bearing 2–4 much-reduced, bract-like leaves). *Involucres* calyculate, the calyculae grading into the involucral bracts; inner bracts ca. 21 in a single series, ca. 8 mm long, 1.5 mm wide, sparsely glandular-pubescent along the margins, otherwise glabrous. *Receptacle* plane to concave, epaleate, glabrous, ca. 4 mm across. *Ray florets* 11–13, sterile; corollas yellow, glabrous; tubes ca. 6 mm long; ligules 4–6 nervate, 6–8 mm long, 2–3 mm wide. *Disk florets* 40–60, fertile; corollas yellow, glabrous, ca. 7 mm long, the tube ca. as long as the cylindrical throat, the lobes 5, deltoid, ca. 0.5 mm long. *Style branches* linear, truncate, minutely hispidulous apically. *Achenes* (immature) ca. 2.5 mm long, glabrous; pappus of numerous white bristles somewhat longer than the disk corollas.

This taxon is closely related to the widespread species, *S. tolucannus* of the

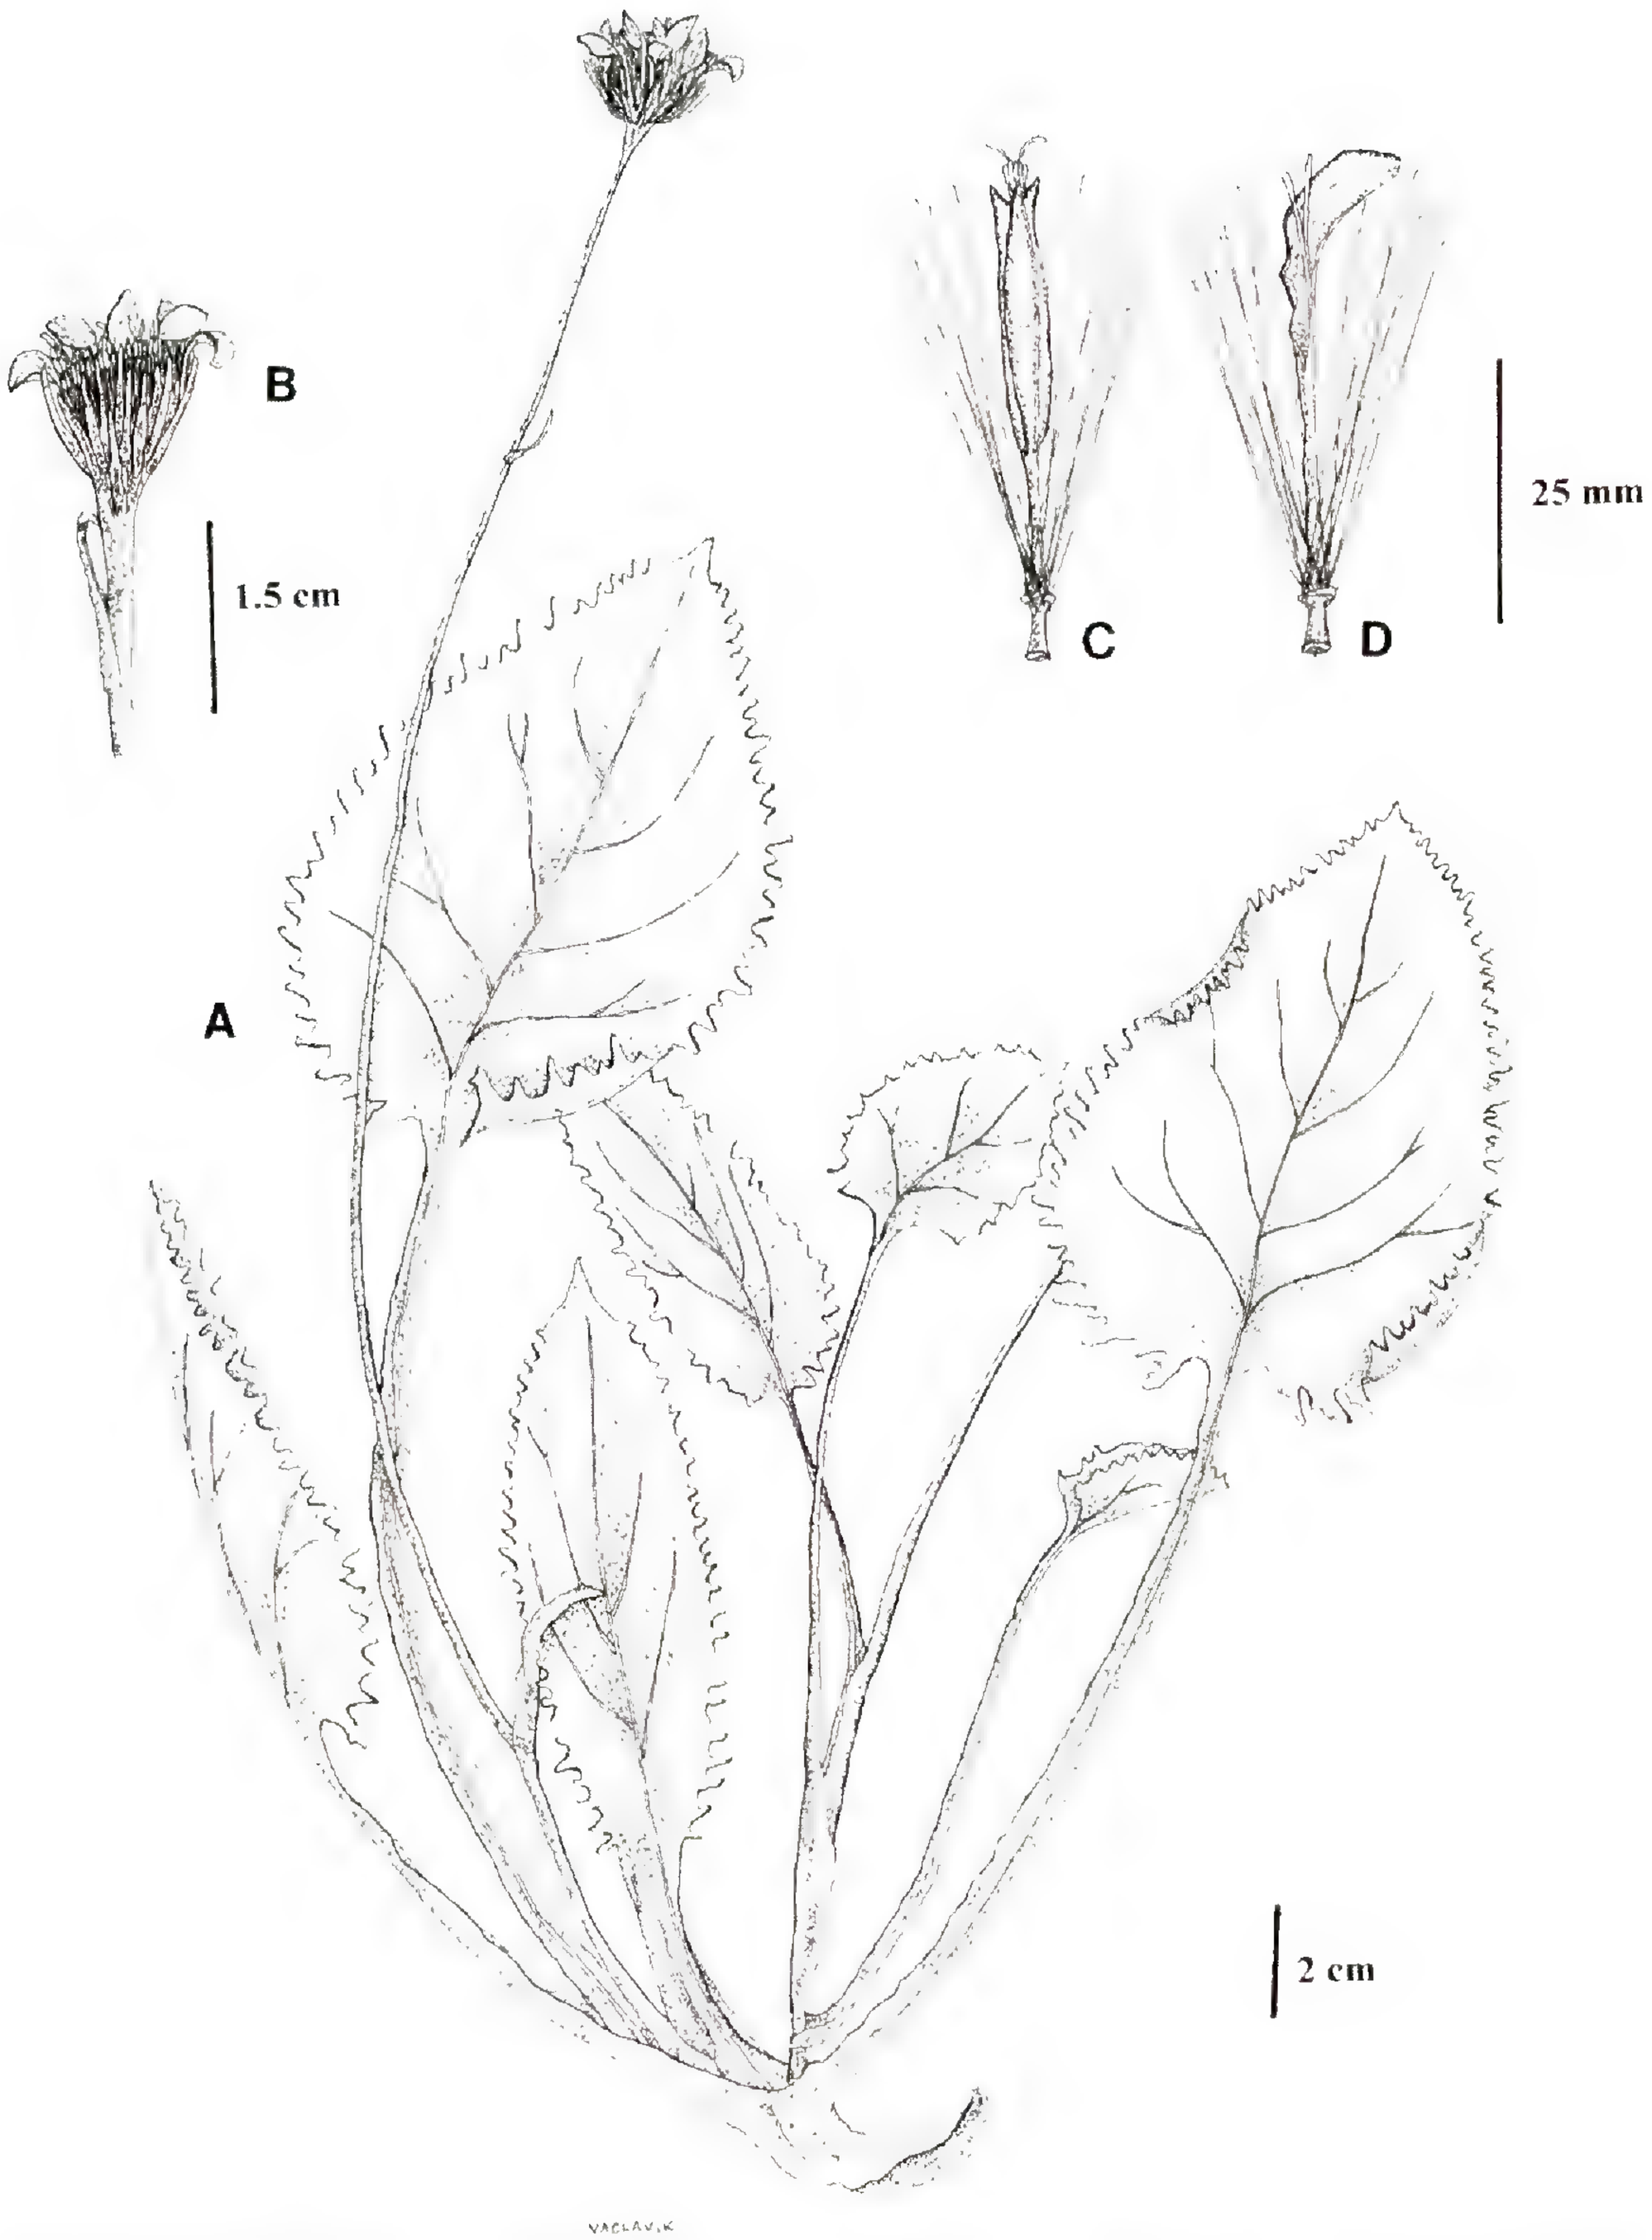

FIG. 1. *Senecio sandersiana*, from holotype.

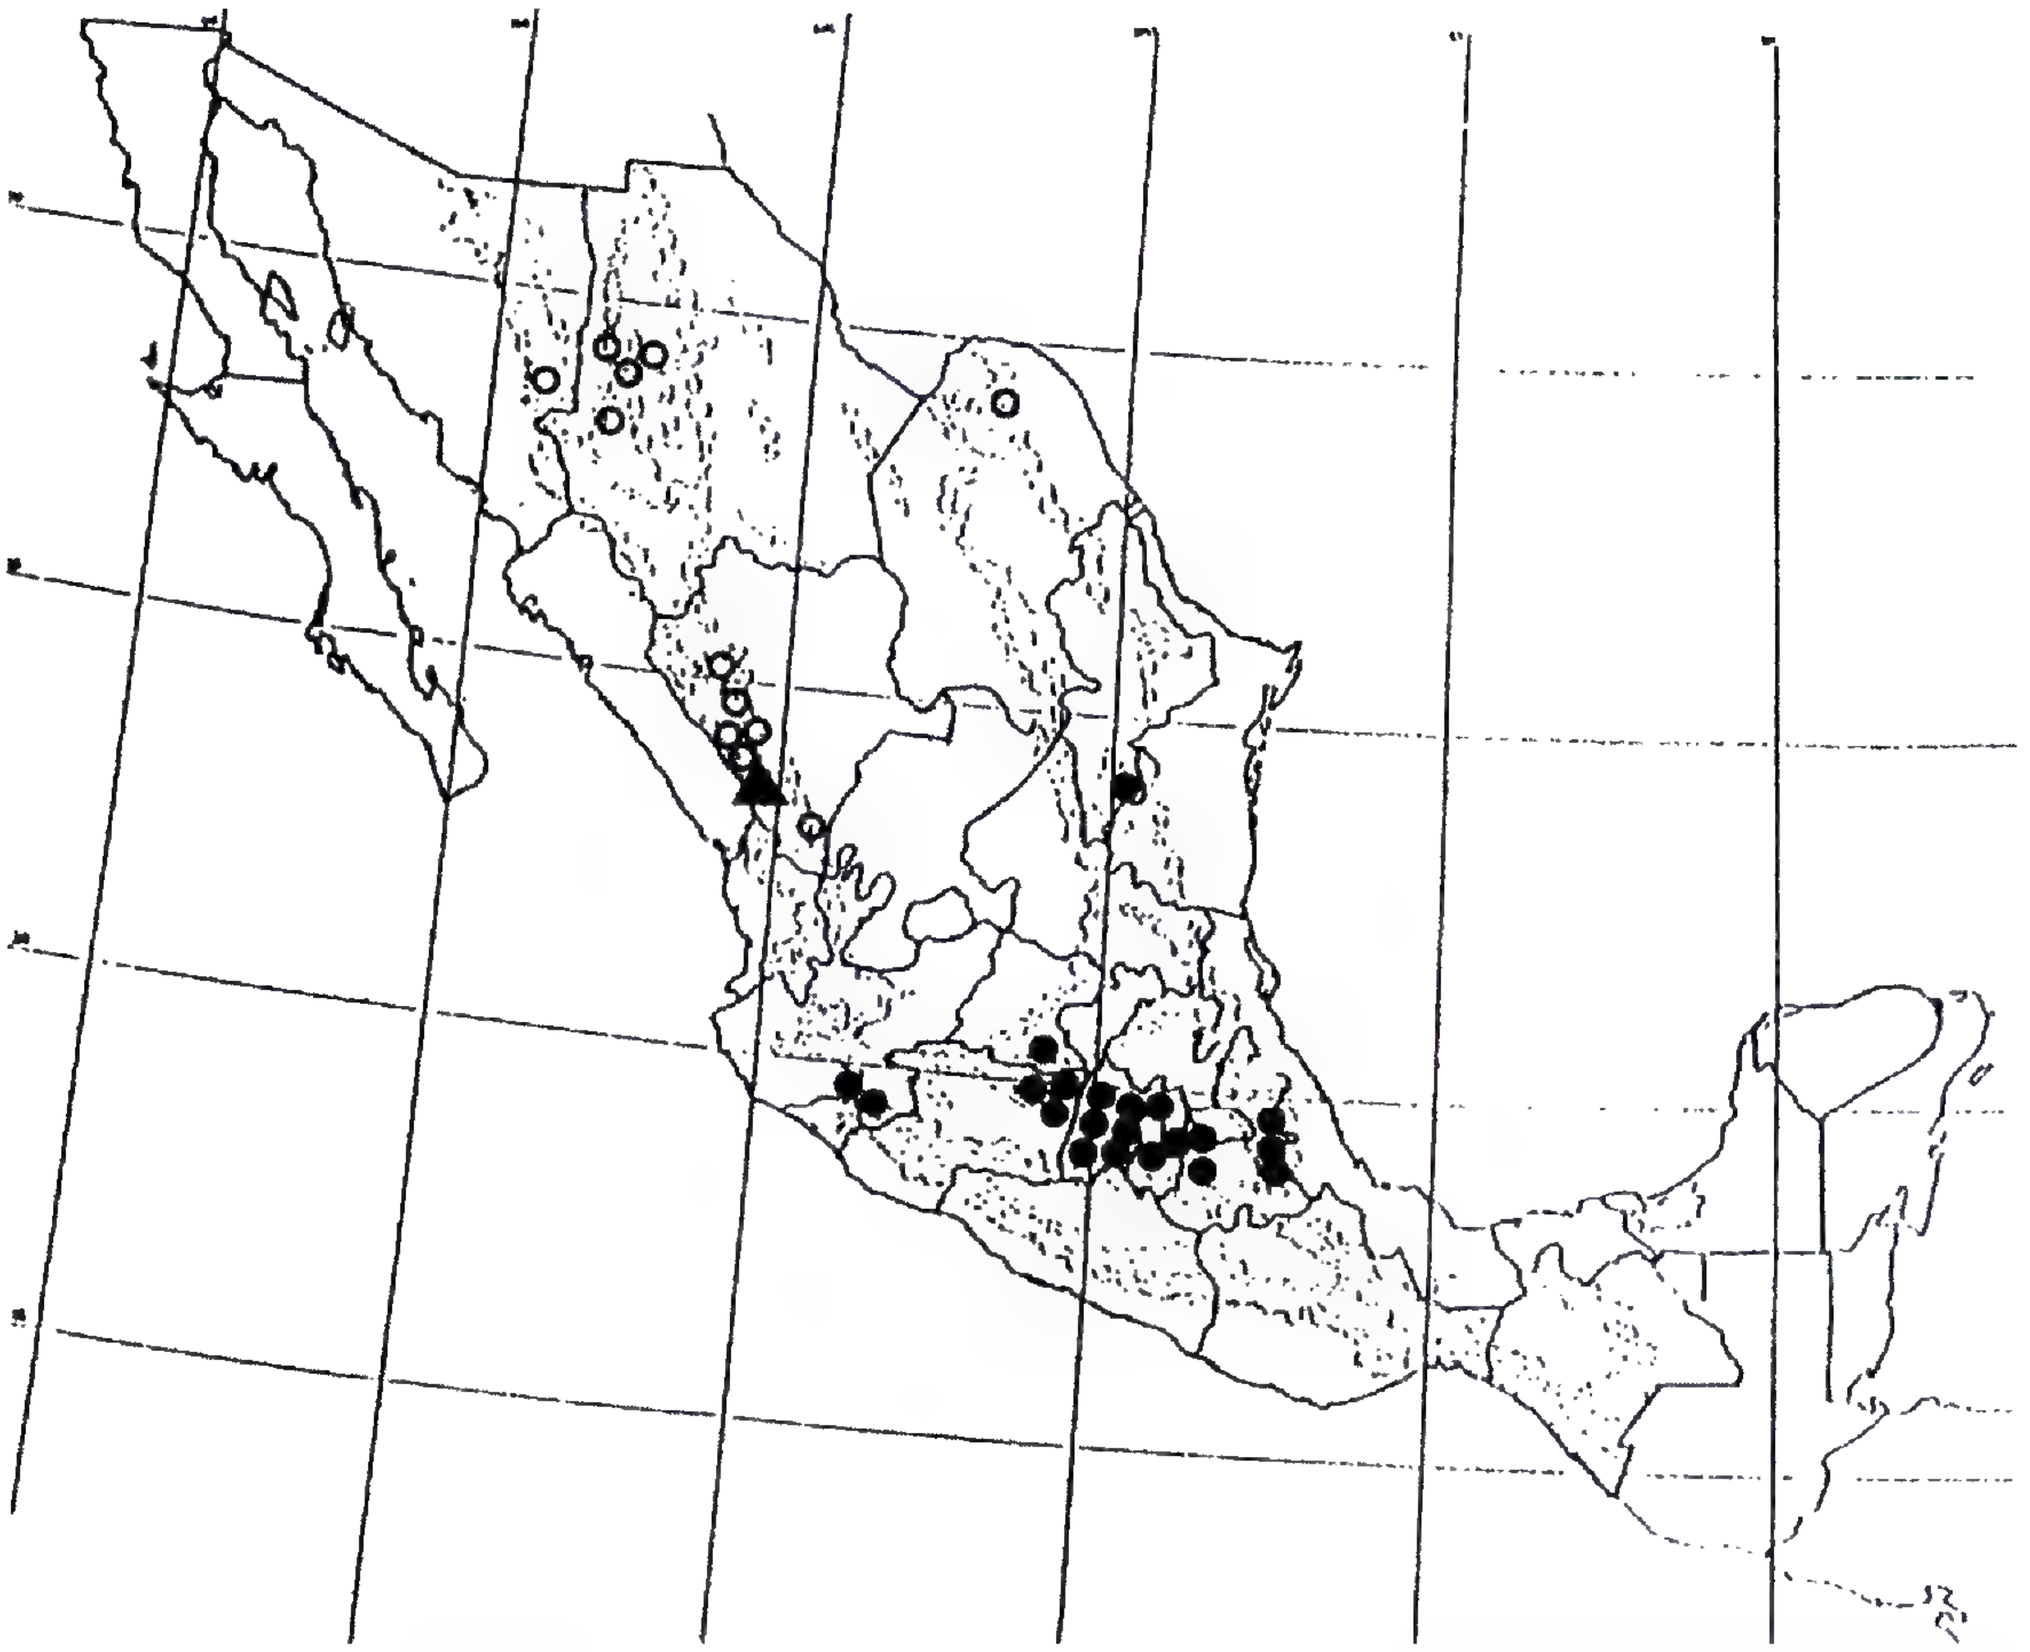

FIG. 2. Distribution in Mexico of *Senecio tolucannus* (closed circles), *S. wootonii* (open circles), and *S. sandersiana* (triangle).

Sec. Lugentes of *Senecio*. It might also be compared with *S. wootonii* Greene of the southwestern U.S.A. and closely adjacent northwestern Mexico. *Senecio sandersiana* differs from both in having fewer heads to a capitulescence and markedly cordate leaf blades. The distribution of these several taxa in Mexico is shown in Fig. 2.

Etymology.—The species is named for its primary collector, A.C. Sanders, Curator at UCR, an intrepid field worker. When informed of its possible novel status, he remarked via email:

"I knew that 22680 was something good when I found it and so I collected plenty. I'd never seen anything like it and was just very interested in the plant as an attractive object. This was the *Senecio* I was most interested in hearing about....I have 5 more sheets. It was very common where I found it: I had to walk through beds of it on the shaded slopes to find other things."

ACKNOWLEDGMENTS

I am grateful to my wife, Gayle Turner, for the Latin diagnosis. Susan Vaclavik provided the illustration.

BOOK REVIEWS

PAT HALLIDAY. 2001. **The Illustrated Rhododendron.** (ISBN 0-88192-510-1, hbk.). Timber Press, Inc., 133 S.W. Second Avenue, Suite 450, Portland, OR 97204-3527, U.S.A. (Orders: www.timberpress.com, 800-327-5680, 503-227-2878, 503-227-3070 fax). $69.95, 274 pp., 120 color illustrations, 4 line drawings, 8 1/4" × 11 3/4".

The author writes that, "this is primarily a book of 'pretty pictures.'" It is certainly a great deal more than that. The author, a staff member at Kew Gardens for more than 40 years, has culled from its archive an example of almost every subsection of every section of the genus Rhododendron. In a few cases, new plates were commissioned, or line drawings were prepared from herbarium material. Illustrations are arranged according to the author's classification system. The result is a comprehensive study with an updated text for each specimen and a discussion of the cultivation of rhododendrons.

Of particular interest is the fact that the original illustrations were taken from the pages of Curtis's Botanical Magazine, which has been in existence for 213 years and has published over 11,000 illustrations. There is a short essay on the history of the magazine, and because of the time spanned, the illustrations themselves provide a short history of botanical illustration.

This is a beautiful book which can be enjoyed by the rhododendron enthusiast, the admirer of botanical illustration, and the casual reader.—*Ruth Ginsburg, Fort Worth, Texas.*

NANCY KOBER. 2000. **With Paintbrush & Shovel.** (ISBN 0-8139-1969-X, hbk.). The University Press of Virginia. Charlottesville and London. (Orders: www.upress.virginia.edu). Price not given, 280 pp., 8 photographs, 1 map, 222 plates. 8 1/2" × 10".

In this story of the creation, between 1935 and 1940, of the Lee Park Wildflower and Bird Sanctuary in Petersburg, Virginia, the author has woven threads of many colors and textures into a fascinating tapestry. Under the auspices of the Works Progress Administration, thirty-three women, black and white, unemployed female heads of households, were hired to create a place where the natural heritage of the state would be preserved. This book is both a botanical and sociological study. There are sketches of the women who were involved, a description of the method of work and a discussion of the species and their habitat. There is a longer biography of the illustrator.

As the project developed, botanists recognized that some plants and habitats were already dis appearing. A herbarium was established to preserve a record of the region, and a watercolorist was commissioned to illustrate each species. Two hundred and twenty of these are reproduced in the book, arranged by habitat

This is an extremely interesting book on several levels and a tribute to the human spirit.—*Ruth Ginsburg, Fort Worth, Texas.*

TWO NEW SPECIES OF *WEINMANNIA* (CUNONIACEAE: CUNONIEAE) FROM SOUTHERN ECUADOR

Zachary S. Rogers

Missouri Botanical Garden
P.O. Box 299
St. Louis, MO 63166 0299, U.S.A.
zachary.rogers@mobot.org

ABSTRACT

Two new species of Cunoniaceae, ***Weinmannia bradfordiana*** Z. Rogers and ***Weinmannia condorensis*** Z. Rogers are described and illustrated. Both sclerophyllous species are known only from their type localities and were collected from the Cordillera del Cóndor mountain range in the province of Morona Santiago, Ecuador.

KEY WORDS: Cunoniaceae, Cunonieae, Ecuador, Neotropics, South America, *Weinmannia*

RESUMEN

Se describe y se ilustra ***Weinmannia bradfordiana*** Z. Rogers y ***Weinmannia condorensis*** Z. Rogers. Estas dos especies esclerofilas son conocidas únicamente de las localidades de los tipos, y fueron colectadas en la región de la Cordillera del Cóndor en la provincia de Morona Santiago, Ecuador.

INTRODUCTION

The family Cunoniaceae is composed of 26 genera and about 300 species (Bradford & Barnes 2001). The australly-distributed genus *Weinmannia* L. accounts for about 150 species in five sections (Bradford 1998; Bradford 2002). All American species are in section *Weinmannia*, with the greatest species richness found in northwestern South America (i.e. Venezuela, Colombia, Ecuador and Peru) (Bernardi 1961; Harling 1999).

Weinmannia bradfordiana and *Weinmannia condorensis* were collected by the late Alwyn H. Gentry (1945–1993) on his last major expedition, and were filed in a "family indeterminate" folder for a number of years, despite the good quality of the specimens in flower and fruit. Later, while sorting Gentry's collections, Ron Liesner (MO) came across the specimens but did not initially consider the specimens as belonging to the family Cunoniaceae because of their uncharacteristically short inflorescences, but he did notice a few small fruits that looked remarkably like the septicidal capsules of *Weinmannia*. Ron then showed the material to Jason Bradford, who was studying Neotropical *Weinmannia* at the time, and Jason confirmed that they were, in fact, Cunoniaceae and annotated the specimens as new species of *Weinmannia* (Ron Liesner and Jason Bradford, pers. comm.).

Both species, as well as another recently described species of *Weinmannia*

from the Cóndor (Rogers 2002), have adapted extremely sclerophyllous habits due to the very wet and windy weather conditions and the very thin, nutrient-poor sandstone substrate. Many other woody genera on the summits of the Cordillera del Cóndor have similar sclerophyllous adaptations, and many of these species will also turn out to be new and locally endemic to the range.

Weinmannia bradfordiana and *Weinmannia condorensis* are known only from their types and are probably closely related, due to their similar leaf morphology and ecology and because they were collected from sites about 10 km apart, but significant differences exist between the two including: leaf size, leaflet shape, number of flowers per inflorescence, and trichome density and distribution on the stems, leaves, stipules and sepals. Based upon experience with other recognized species of *Weinmannia* and character variation within and among species, the differences observed from these specimens suggest they represent distinct species. This analysis is based entirely on a subjective study of the type collections and available herbarium specimens, so more collections will be needed to elucidate the patterns of variation in these species. At this time, the type localities are unable to be revisited because the sites have been covered by deadly land mines since the border dispute between Ecuador and Peru in January 1995, which was about 18 months after the types were originally collected. The mine field will not be cleared for at least several more years, but when the situation is resolved, further exploration will be needed and may expose intermediates that support a notion expressed by one reviewer (David Neill), who felt that both collections could represent a single species.

These new species can be easily distinguished from other Ecuadorian species by their small trifoliolate (rarely unifoliolate) compound leaves on short petioles that can appear to be simple and sessile to the naked eye, and by their extremely short inflorescences (i.e. pseudoracemes) due to inconspicuous peduncles. The highly reduced inflorescences are very uncharacteristic of the genus because almost all *Weinmannia* have elongated inflorescence axes measuring several cm or more in length.

Color images of the type collections can be found on the W3 TROPICOS database at: <http://mobot.mobot.org/W3T/Search/vast.html>.

Weinmannia bradfordiana Z. Rogers, sp. nov. (**Fig. 1**). TYPE: ECUADOR. MORONA SANTIAGO: Cantón Gualaquiza: Campamento Achupalla, Cordillera del Cóndor, 15 km E of Gualaquiza, tepui-like bromeliad sward with scattered, small trees, 03° 27'S, 78° 22'W, 2090 m, 21 Jul 1993 (fl., fr.), *Gentry 80312* (HOLOTYPE: QCNE-092179; ISOTYPES: AAU, GB-186976, MO-5544000, NY, US).

Haec species ad *Weinmanniam cochensem* Hieron. et *W. mariquitae* Szyszyl. maxime accedit, sed a hac inflorescentia subsessili, ab illa foliis multo minoribus ut videtur simplicibus sessilibusque propter petiolum perbrevem atque foliolis integris, ab ambabus foliis plerumque trifoliolatis interdum unifoliolatis distinguitur, a *W. condorensi* inflorescentia ex pseudoracemo fasciculis 2– ad 8 floris constante atque foliolis minoribus secus margines apicem versus trichomatibus plus quam 20 ciliatis distinguitur.

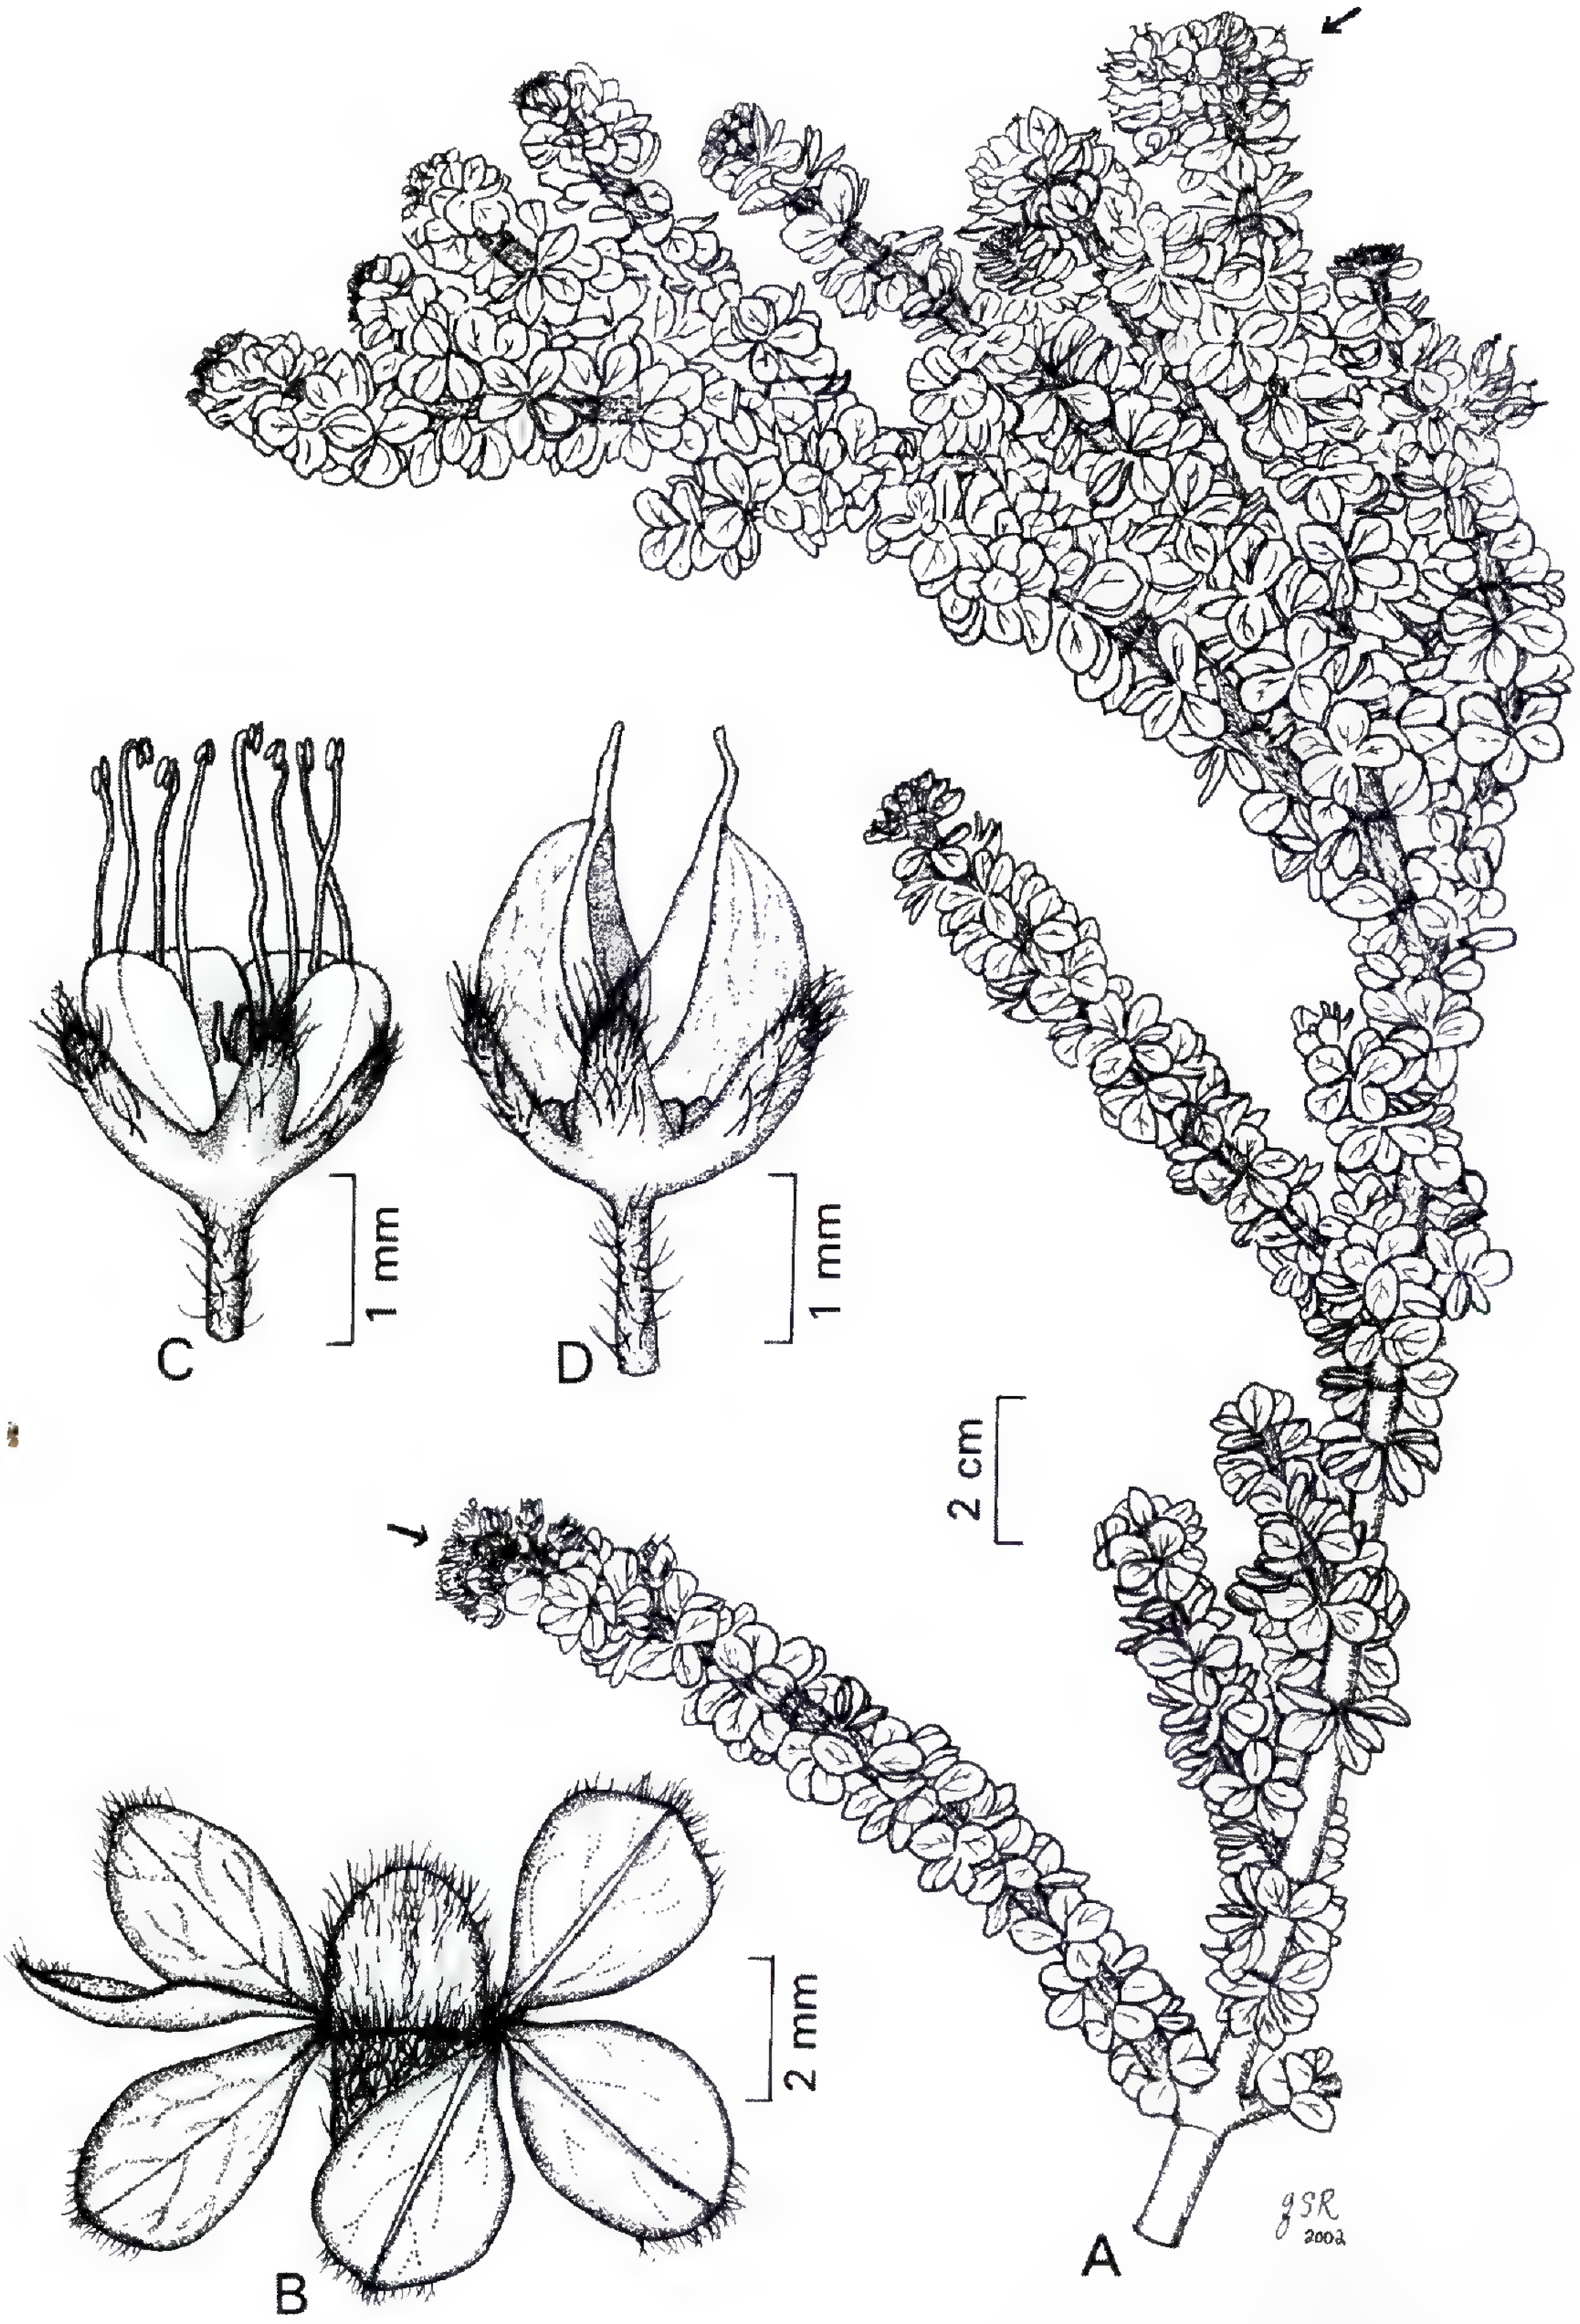

FIG. 1. *Weinmannia bradfordiana* Z. Rogers. A. Habit. B. Trifoliolate leaves showing the lower surfaces of the leaflets on the left side of the stem and the upper surfaces on the right. C. Flower. D. Septicidal capsule at maturity. Arrows point to inflorescences. All illustrations drawn by the author from the MO isotype (*Gentry 80312*).

Shrubs to 1 m; *young stems* covered with dense lanate or tomentose trichomes, the trichomes to 1.3 mm long, simple, unicellular, matted, stiff, white, nodes densely hirsute. *Leaves* to 5.3 mm long, opposite, compound, trifoliolate (rarely unifoliolate), densely congested; leaflets 2.0–4.9 × 1.4–3.3 mm, broadly obovate to nearly orbicular, broadly boat-shaped to nearly planar, upturned at apex, all leaflets similar in size and shape, coriaceous, thick, membranous and thin along the margins, shiny, drying dark brown on the upper surface and light brown on lower surface, midvein raised on upper and lower surface, thicker near the base, secondary veins 3–5 pairs per side, slightly raised to nearly inconspicuous on the upper surface, prominently raised on the lower surface, blade surfaces glabrous, usually lanate or tomentose along the upper one-third of the apical margins (usually more than 20 trichomes per apex), the trichomes are similar to those found on the young stems, 0.4–1.0 mm long, upper surface scrobiculate, lower surface scrobiculate and rugose, base cuneate to slightly oblique, margin entire, apex obtuse to slightly apiculate; petioles 0.1–0.4 mm long, reduced to inconspicuous or indiscernible protuberances, obscured by the dense pubescence at the nodes, dark red or black, densely hirsute or tomentose; petiolules 0.1–0.4 mm long, swollen, dark red or black, glabrous, rugulose; stipules 2.2–3.6 mm × 1.8–2.7 mm, interpetiolar, paired, free, broadly ovate to suborbicular, membranous to subcoriaceous, dark red or brown, outer surface densely lanate or tomentose, becoming more dense towards the apex and along the margin, trichomes to 1.1 mm long, similar to those found on the young stems, inner surface glabrous, base truncate, margin entire, apex rounded to obtuse, caducous. *Pseudoracemes* paired, unbranched, densely compacted, axillary on young growth at the terminus of the stem; peduncles to 0.9 mm long, reduced to inconspicuous protuberances, densely lanate or hirsute; fascicles (2–)4–8-flowered, densely compacted and congested; pedicels to 0.9 mm long in flower, to 1.9 mm long in fruit, sparsely lanate or hirsute; bracteoles not seen. *Flowers*, actinomorphic, bisexual, diplostemonous, recorded as white in color on the label; sepals 4, 1.0–1.2 × 0.5–0.9 mm in flower, to 1.4 mm long in fruit, ovate, subcoriaceous, adaxial surface glabrous, abaxial surface densely lanate to sparsely tomentose, denser near the apex and along the margin; petals 4, 1.0–1.2 × 0.8–1.0 mm, broadly elliptical to broadly obovate, membranous, white, midvein conspicuous, slightly raised and dark, glabrous, base truncate, margin entire and ciliated along the upper portion, apex rounded; stamens 8; filaments 0.8–2.0 mm long, 0.4–0.6 mm wide at base, flattened, slender at apex, glabrous; anthers 0.3–0.4 × 0.4–0.5 mm, orbicular, introrse, dorsifixed, longitudinally dehiscent; nectary disk annular with 8 concrescent lobes, surrounding the ovary, persistent in fruit; ovary 0.7–0.9 × 0.3–0.5 mm, superior, bicarpellate, syncarpous, red or brown, glabrous; styles 2, 0.2–0.4 mm long in flower, 0.6–0.9 mm long in fruit, divergent near the apex of the carpels, persistent in fruit; stigma simple, capitate. *Fruits* 1.9–2.4 × 1.4–1.8 mm (length measurement not includ-

ing the persistent styles), septicidal capsules, orbicular, occasionally widely ovate, dark red or brown, costate longitudinally, glabrous; seeds not seen.

Distribution and Habitat.—*Weinmannia bradfordiana* is known only from the type locality, collected near one of the summits of the Cordillera del Cóndor at about 2100 m elevation, and located about 15 km SE of the town of Gualaquiza. The Cóndor mountain range is covered by "dwarf-forest" vegetation consisting of many species of shrubs and small trees that have evidently adapted sclerophyllous habits due to thin, nutrient-poor sandstone substrate, and extremely wet and windy weather on the ridge.

Etymology.—The epithet was chosen in honor of Dr. Jason C. Bradford, who has spent a number of years in the field collecting Cunoniaceae, and who has made valuable contributions to our knowledge of the family through his continuing research efforts.

Weinmannia condorensis Z. Rogers, sp. nov. (**Fig. 2**). TYPE: ECUADOR. MORONA SANTIAGO: Cantón Gualaquiza: Crest of Cordillera del Cóndor, ridge top 15 km ENE of Gualaquiza, high montane forest and bromeliad sward. 03°22'S, 78°20'W, 2500 m, 26 Jul 1993 (fl., fr.), *Gentry 80465* (HOLOTYPE: QCNE-092303; ISOTYPES: AAU, MO-5613306, NY).

Haec species ad *Weinmanniam cochensem* Hieron. et *W. mariquitae* Szyszyl. maxime accedit, sed a hac inflorescentia subsessili, ab illa foliis multo minoribus ut videtur simplicibus sessilibusque propter petiolum perbrevem atque foliolis integris, ab ambabus foliis plerumque trifoliolatis interdum unifoliolatis distinguitur; a *W. bradfordiana* inflorescentia ex pseudoracemo fasciculis 1- ad 2-floris atque foliolis majoribus secus margines apicem versus glabris vel trichomatibus 5 vel minus ciliatis distinguitur.

Trees to 3 m; *young stems* covered with dense lanate or hirsute trichomes, the trichomes to 1.1 mm long, simple, unicellular, matted, stiff, white, nodes densely hirsute. *Leaves* to 7.6 mm long, opposite, compound, trifoliolate (rarely unifoliolate), congested; leaflets 3.6–6.8 × 1.9–4.5 mm, obovate to elliptical, broadly boat-shaped to nearly planar, upturned at apex, all leaflets similar in size and shape, coriaceous, thick, membranous and thin along the margins, drying dark brown, shiny, midvein prominently raised on upper and lower surface, thicker near the base, darker than blade, secondary veins 2–5 pairs per side, raised to nearly inconspicuous on the upper surface, more prominently raised on the lower surface, blade surfaces glabrous, infrequently having a few sparse trichomes at the apical margins (usually 5 or fewer trichomes per apex when pubescent), the trichomes are similar to those found on the young stems, 0.1–0.4 mm long, upper and lower surface scrobiculate and rugose, base cuneate to slightly oblique, margin entire, apex obtuse to slightly apiculate; petioles 0.7–1.2 mm long, often inconspicuous, obscured by the dense pubescence at the nodes, dark red or black, sparsely hirsute or tomentose; petiolules 0.3–0.6 mm long, swollen, dark red or black, glabrous, rugulose; stipules 2.2–3.5 mm × 2.0–3.0 mm, interpetiolar, paired, free, ovate to suborbicular, membranous to sub-

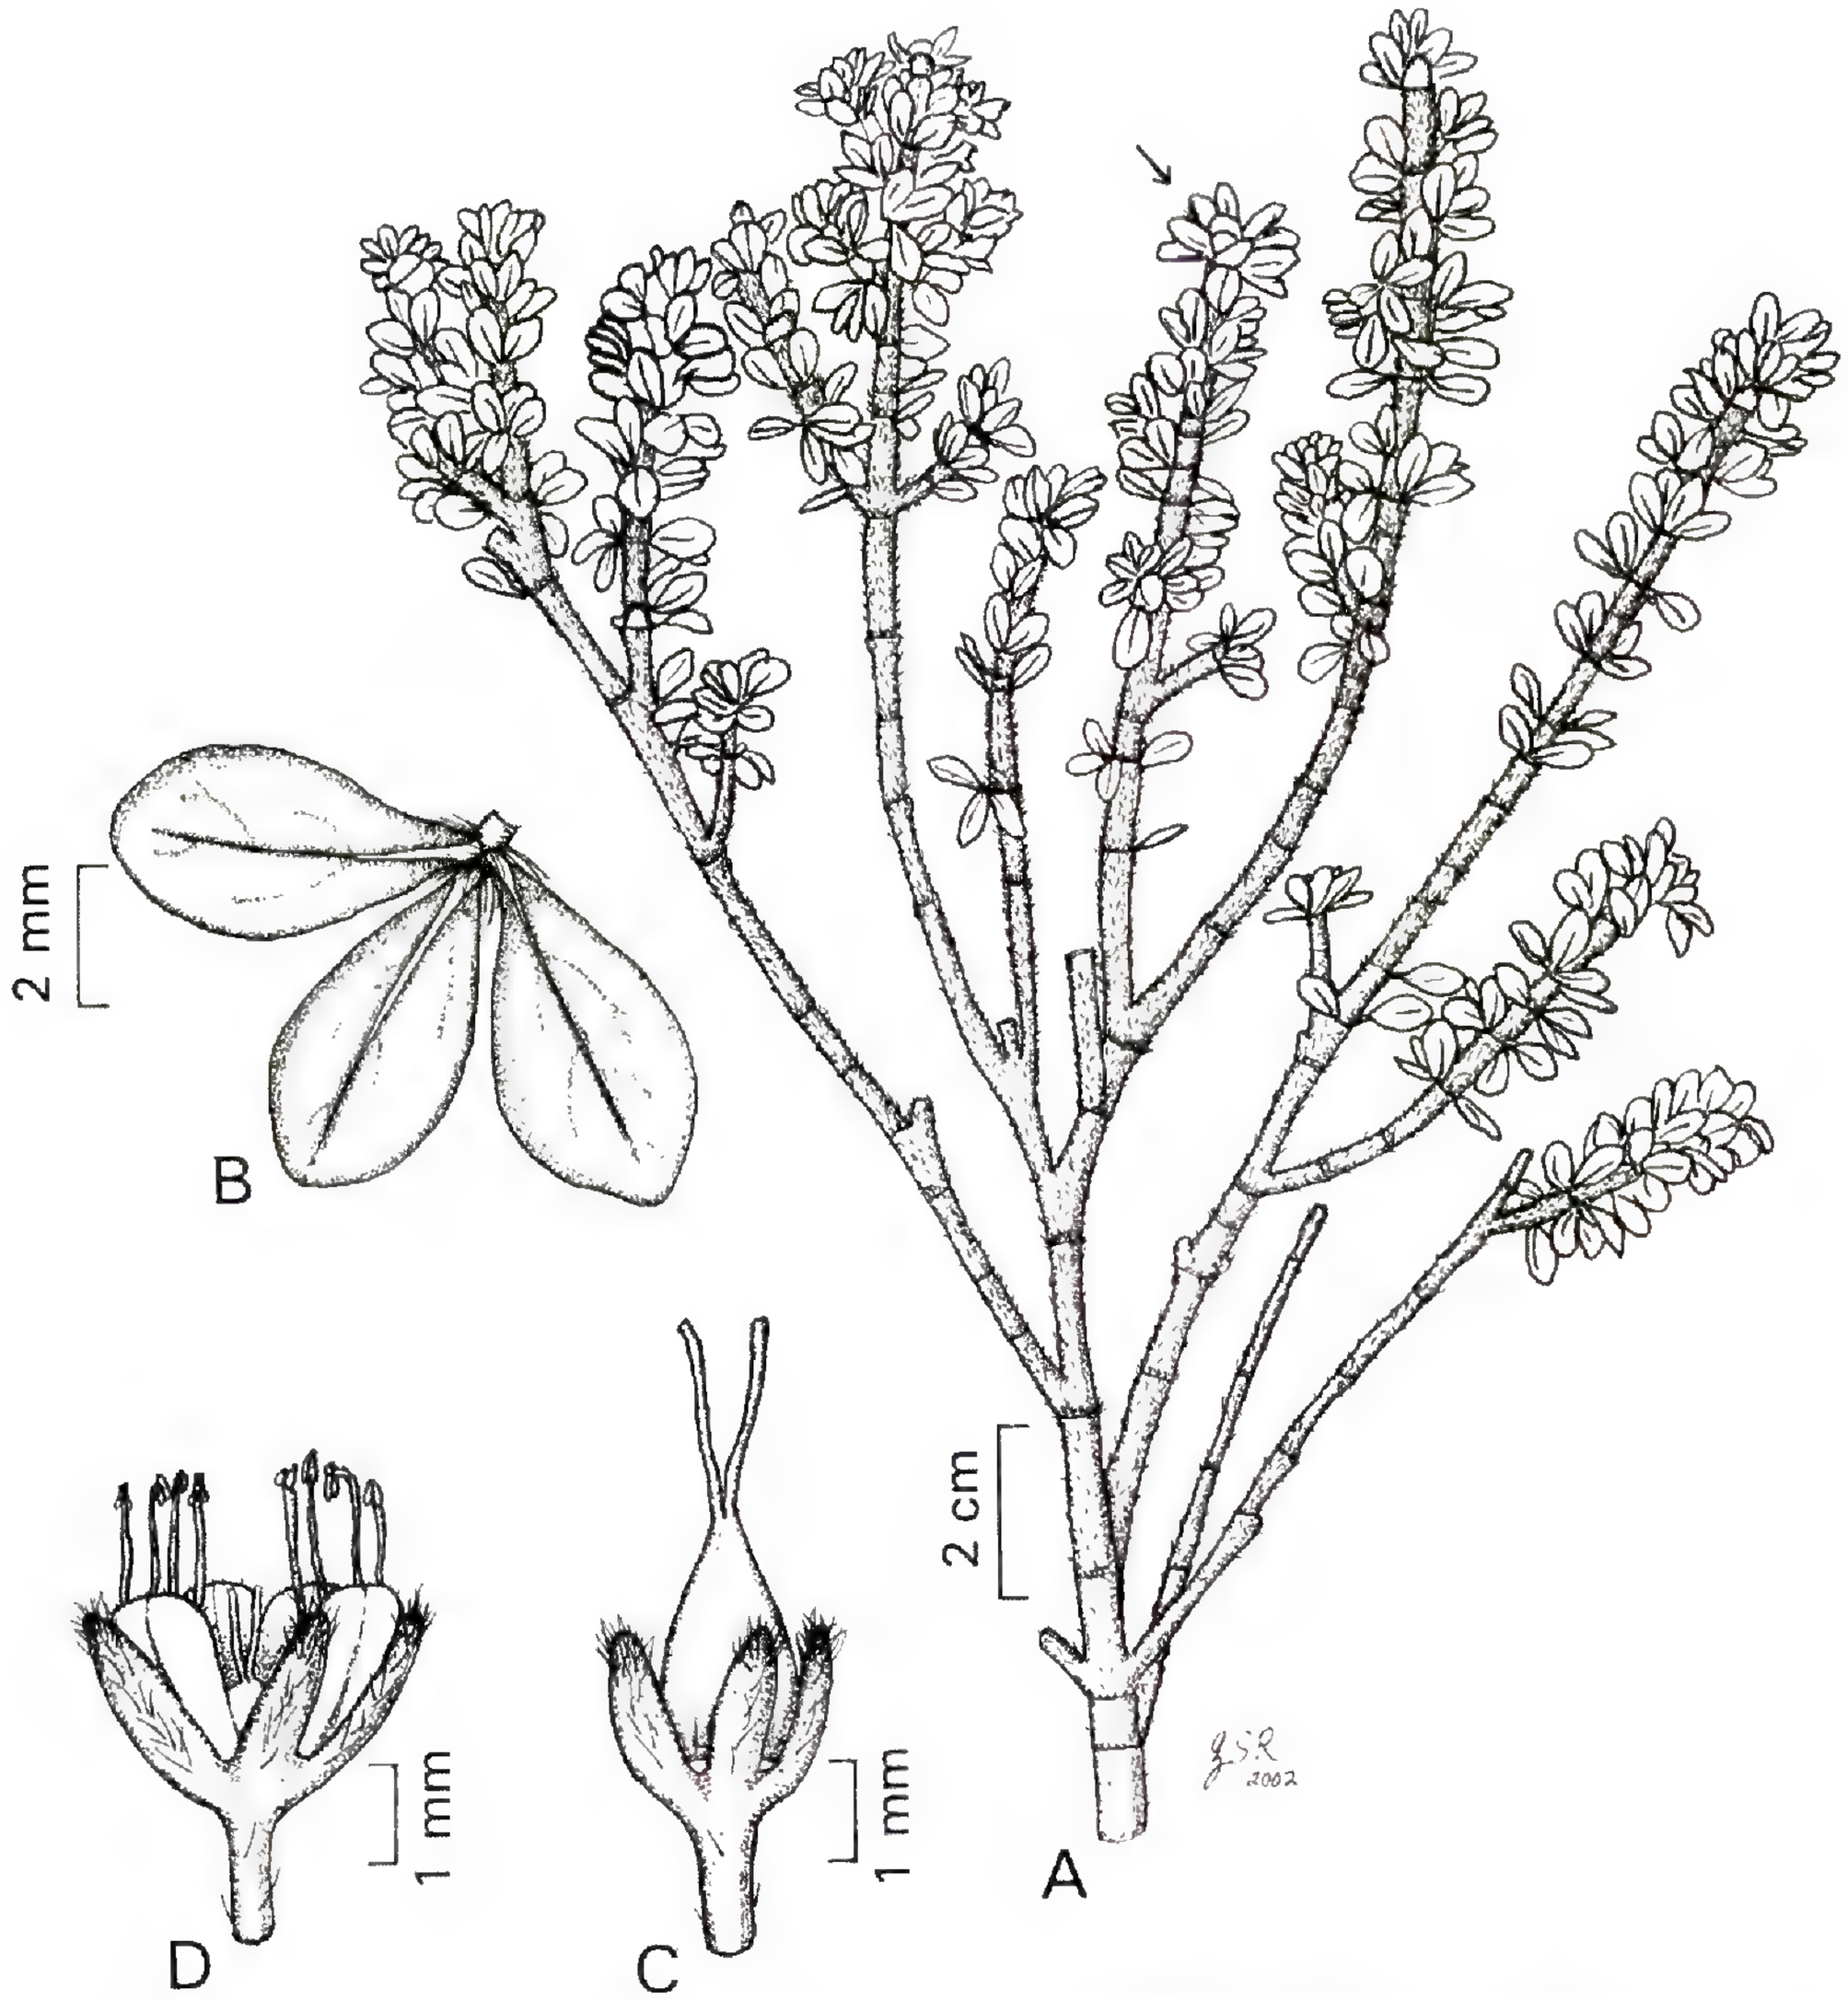

FIG. 2. *Weinmannia condorensis* Z. Rogers. A. Habit. B. Trifoliolate leaf. C. Immature capsule. D. Flower. The arrow points to the inflorescence. All illustrations drawn by the author from the type collection (*Gentry 80465*).

coriaceous, dark red or brown, outer surface glabrous to sparsely hirsute, densely hirsute along the margin, denser near the apex, trichomes 0.6–1.0 mm long, similar to those found on young stems, inner surface glabrous, base truncate, margin entire, apex rounded to obtuse, caducous. *Pseudoracemes* paired, unbranched, densely compacted, axillary on young growth, developing at 2 or more subsequent nodes at the terminus of the stem; peduncles to 0.4 mm long, reduced to inconspicuous protuberances in the leaf axils, lanate or hirsute, the trichomes are similar to those found on the young stems; fascicles 1- or 2-flowered, compacted and congested; pedicels to 1.2 mm in flower, sparsely hirsute; bracteoles not seen. *Flowers* actinomorphic, bisexual, diplostemonous, recorded as white

in color on the label; sepals 4, 1.6–2.4 × 0.8–2.0 mm, broadly ovate, subcoriaceous, adaxial surface glabrous, abaxial surface lanate, denser near the apex and along the midvein; petals 4, 1.6–2.0 × 1.2–2.2 mm, broadly elliptical to broadly obovate, membranous, white, midvein conspicuous, slightly raised and dark, glabrous, base truncate, margin entire and ciliated, apex rounded; stamens 8; filaments 0.8–2.5 mm long, 0.3–0.5 mm wide at base, flattened, slender at apex, glabrous; anthers 0.3–0.4 × 0.2–0.4 mm, orbicular, introrse, dorsifixed, longitudinally dehiscent; nectary disks annular with 8 concrescent lobes, surrounding the ovary, persistent in fruit; ovary to 0.9 mm long, to 0.6 mm wide, superior, bicarpellate, syncarpous, red or brown, glabrous; styles 2, to 2.1 mm long, divergent near the apex of the carpels, persistent in fruit; stigma simple, capitate. Fruits (immature) 1.8–2.5 mm long (measurement not including the persistent styles), septicidal capsules, ovate, dark red or brown, glabrous; seeds not seen.

Distribution and Habitat.—*Weinmannia condorensis* is known only from the type locality, collected on a ridge-top of the Cordillera del Cóndor mountain range at about 2500 m elevation, and located about 15 km ENE of the town of Gualaquiza. The site, as in the case of *W. bradfordiana*, is covered by "dwarf-forest" vegetation consisting of many species of shrubs and small trees with similar sclerophyllous adaptations.

Etymology.—The specific epithet refers to locality of the type collection.

Affinities.—According to the key for the Cunoniaceae in the Flora of Ecuador (Harling 1999), *W. bradfordiana* and *W. condorensis* would fit between the couplet *W. cochensis* Hieron. and *W. mariquitae* Szyszyl. because they have small compound leaves measuring less than 5 cm in length, but *W. mariquitae* is very different morphologically because it has much larger leaves with 4–8 leaflet pairs per leaf. On the other hand, *W. bradfordiana* and *W. condorensis* can be easily distinguished from the most morphologically similar species from Ecuador, *W. cochensis*, because they have smaller, trifoliolate (rarely unifoliolate) leaves with smaller, entire-margined leaflets, and inconspicuous peduncles. No other currently described species of *Weinmannia* in Ecuador has such highly reduced compound leaves and peduncles.

Weinmannia bradfordiana can be vegetatively distinguished from *W. condorensis* by its smaller leaves, its smaller, more broadly obovate to suborbicular leaflets, by the presence of 20 or more trichomes found along the apical margins of most leaflets, and by its densely pubescent stipules. The inflorescences of *W. bradfordiana* are more congested by more numerous flowers, and have slightly longer, more globular peduncles than *W. condorensis*. In contrast, most leaflets of *W. condorensis* are typically larger, narrowly obovate to elliptical and glabrous. *Weinmannia condorensis* also has inflorescences that are reduced to only 1 or 2 flowers, and stipules that are mostly glabrous except for a dense apical pubescence.

Another novel and distinctive character separating the two species is that *W. condorensis* has a rare inflorescence architecture, where pairs of racemes develop at two successive nodes near the terminal end of the main stem. The inflorescence of section *Weinmannia* (i.e. all Neotropical species) is limited to a pair of racemes developing from axillary buds at the most distal node, and is a distinctive character of the section. The development of racemes at two subsequent nodes has not been found in other Neotropical members of the genus, but it has been observed in a small group of species from Madagascar and the Comores (Bradford, pers. comm.). Patterns in inflorescence architecture are relatively stable in *Weinmannia*, and in many cases, can be more helpful than plastic vegetative characters, which often prove to be similar among many closely related species (Bradford 1998). The interesting inflorescence architecture of *W. condorensis* will definitely warrant further investigation once more collections are made available.

KEY TO MORPHOLOGICALLY SIMILAR SPECIES OF *WEINMANNIA* IN ECUADOR

1. Leaves 10–20 mm long, margins crenate at apex, usually 3–5 teeth, rarely 0; petioles 2–4 mm long; peduncles to 15 mm long _____ **Weinmannia cochensis**
1. Leaves to 7.6 mm long, margins entire; petioles inconspicuous to 1.2 mm long; peduncles inconspicuous to 0.9 mm long.
   2. Leaflets broadly obovate, margins usually covered by a dense apical pubescence (20 or more trichomes); stipules densely pubescent throughout; inflorescences (2–)4–8-flowered, only developing at the most distal node of the terminal end of the main stems _____ **Weinmannia bradfordiana**
   2. Leaflets narrowly obovate to elliptical, margins usually glabrous, or rarely with about 5 or fewer trichomes at the apices; stipules pubescent, trichomes concentrated along the apices and along the midvein; inflorescences 1- or 2-flowered, developing at two or more successive nodes at the terminal end of the main stems _____ **Weinmannia condorensis**

ACKNOWLEDGMENTS

The author thanks Jason Bradford (MO-DAV), Richard Barnes (HO) and David Neill (MO-QCNE) for their helpful review suggestions on the manuscript. The author would also like to thank Ron Liesner (MO) and Jon Ricketson (MO) for their comments, Roy Gereau (MO) for his preparation of the Latin diagnoses, Barney Lipscomb (BRIT) for waving the publication costs of this manuscript, and Uno Eliasson (GB) for expeditiously providing loan material.

BOOK REVIEWS

HOWARD GARRETT with ODENA BRANNAM. 2001. **Herbs for Texas.** (ISBN 0-292-78713-3, hbk.). University of Texas Press, P.O. Box 7819, Austin, TX 78713-7819, U.S.A. (Orders: 800-252-3206, 800-687-6046 fax). $60.00, 280pp. 8 photographs, 1 map, 222 plates. 8 1/2" × 11".

In this fully illustrated, easy to use guide, expert advice is offered by Garrett and veteran herbalist Odena Brannam on growing nearly 150 herbs suited to Texas and Southwestern gardens. Included is detailed information on each plant's landscape, culinary, medicinal, and other uses.

Individual entries give each herb's common and scientific names and instructions for planting, growing, harvesting, and storing it. The entries also include ideas for using each herb in gardening and cooking, with occasional recipes, and discuss its medicinal uses. Unique is the special "insight" entries that offers intriguing and little-known facts about the herbs. Each herb has a color photo.—*Gary Jennings, Botanical Research Institute of Texas, Fort Worth, TX 76102-4060, U.S.A.*

NANCY LEYS STEPAN. 2001. **Picturing Tropical Nature.** (ISBN 0-8014-3881-0, hbk.). Cornell Univ. Press, 512 East State St., Ithaca, NY 14850, U.S.A. (Orders: 607-277-2211, 607-277-6292 fax). $35.00, 243 pp., numerous b&w photos, 6" × 9 1/4".

"Tropical nature as jungle is an artifact of history and culture. .." This is essentially what historian Nancy Leys Stepan proves in a well-documented account of how the tropics have been depicted historically in descriptive writings, art, literature, and landscape design. The focus is on Brazil (the name of which comes from the name of a plant), beginning with the accounts, verbal and pictorial, of Humboldt, Bates, Darwin, and Wallace, who described the "radical otherness" of the jungles. The tropics were jungle, full of lush growth, of an infinite variety of plants and animals not yet described, of virgin lands for the explorer and scientist. The scenes were romantic if in reality arguments for colonization. With the arrival of European colonists, the infiltration of these lands by armies and their teams of medical doctors and closer association with the indigenous peoples, the perception was soon to change, especially as tropical diseases such as malaria and yellow fever took their toll. The jungle became "dark;" disease and death lurked everywhere.

A kind of racial science developed along with medical science. The native peoples were exploited photographically, in part by such investigators as Agassiz whose intent was to refute theories of evolution, and in part to show sexuality. Medical science was to prove that strange physiologies were abnormalities caused by disease. Indeed research and advances in microscopic photography aided in isolating the pathogens of diseases and identifying their vectors and resulted in an entirely different form of visual iconography. The story of Carlos Chagas, his resolving the mystery of the disease that bears his name, and his later failures is an engrossing one.

The work of Roberto Burle Marx, Brazilian botanist and landscape designer, is of special interest, as he embellished the cities of Sao Paulo and Rio with parks, gardens, and open spaces, bringing in native plants from the rain forest. (*Heliconia burle marxii* was one of his discoveries). His concepts were ecologically sound, visually impressive, and influential in concepts of landscaping..

In this work, Stepan offers much to the reader in social, cultural, and medical history. She also peruses the various contemporary concepts and philosophies of "nature" and "natural history." Not least are her notes included with extensive references, which are in themselves rewarding.—*Joann Karges, retired librarian, Texas Christian University, Fort Worth, TX.*

THE TAXONOMY AND MORPHOLOGY OF *MACRANTHERA FLAMMEA* (OROBANCHACEAE)

Jill D. Alford and Loran C. Anderson

Department of Biological Science
Florida State University,
Tallahassee, FL 32306-4370, U.S.A.
anderson@bio.fsu.edu.

ABSTRACT

Macranthera flammea (Bartr.) Pennell is a rare, biennial species endemic to the pine flatwoods of the lower coastal plain of the southeastern United States. Field, experimental garden, and herbarium studies were used to update the species description. The taxonomic history of the species is reviewed. Recognition of more than one taxon in the genus is not warranted because differences in calyx length and lobing are due to the placement of flower units within the architecture of the inflorescence on individual plants. A map of the species' range is provided.

RESUMEN

Macranthera flammea (Bartr.) Pennell es una especie rara, bienal endémica de los pinares de la llanura costera inferior del sudeste de los Estados Unidos. Se hicieron estudios de campo, jardín experimental, y herbario para poner al día la descripción de la especie. Se revisa la historia taxonómica de la especie. No se necesita reconocer más de un taxon en el género ya que las diferencias en la longitud del cáliz y lobulación se deben a la colocación de las unidades florales en la arquitectura de la inflorescencia en los distintos individuos. Se aporta un mapa del área de las especies.

INTRODUCTION

Macranthera is monotypic; the single species *M. flammea* is endemic to the southeastern coastal plain of the United States and is commonly referred to as "flame flower" or "hummingbird flower." It is listed as endangered by the state of Florida (Coile 2000). The genus was formerly placed in the Scrophulariaceae, but recent studies have shown that family to be a heterogenous group (Olmstead et al. 2001); the hemiparasitic taxa are better placed in the Orobanchaceae.

Here, an updated species description and range map are provided. More detail on the life history and pollination biology is documented by Alford (2000).

NOMENCLATURAL HISTORY

The many names that have been proposed for this species indicate the difficulty that early botanists had in understanding the taxon and its generic placement (Table 1). William Bartram (1791) first described *M. flammea* as *Gerardia flammea* during his travels through the southeastern states during 1773–1777.

In 1834, after examining an unlabeled specimen in the herbarium of the Academy of Natural Sciences, Philadelphia (PH), Nuttall published the genus

SIDA 20(1): 189 – 204. 2002

TABLE 1. Synonyms for *Macranthera flammea*.

Synonym	Year
Gerardia flammea W. Bartram	1791
Conradia fuchsioides Nutt.	1834
Macranthera fuchsioides (Nutt.) Benth.	1836
Macranthera lecontei Torr.	1837
Russelia flammea (Bartr.) Raf.	1837
Flamaria coccinea Raf.	1837
Toxopus gymnanthes Raf.	1837
Toxopus calycinus Raf.	1837
Tomilix bracteata Raf.	1837
Dasystoma tubulosa Bertol.	1853
Macranthera fuchsioides var. *lecontei* (Torr.) Chapman	1860
Conradia lecontei (Torr.) Kuntze	1891
Macranthera flammea (Bartr.) Pennell	1913

Conradia as a dedication to the late Solomon W. Conrad, a Professor of Botany at the University of Pennsylvania. Nuttall proposed the name *Conradia fuchsioides*, because "the corolla and long exerted stamens put one in mind of some gigantic *Fuchsia*" (Nuttall 1834).

Bentham (1835) applied the name *Macranthera fuchsioides* (Nutt.) Benth., because *Conradia* had been previously applied to a genus of Gesneriaceae by Martius. The name *Macranthera* means "long anther." Bentham and LeConte were both originally cited as authors for the genus (Hooker 1835), although Bentham (1835) felt that Torrey alone should receive credit for the generic name.

Torrey (1837) described a second species, *M. lecontei* (sometimes spelled *lecontii*), from a specimen collected in Georgia in 1831 by LeConte. He believed it was distinct because the segments of the calyx were entire, linear-lanceolate, and approximately one-third the length of the corolla. In *M. fuchsioides* the segments of the calyx are dentately lobed and often as long as the corolla tube [on LeConte's specimen (NY), Torrey applied the name Conradia *lecontei* Torr., along with a note stating the segments of the calyx are entire]. The specimen itself is damaged, but an attached illustration depicts the entire sepals. Torrey actually published the species (1837) not as *C. lecontei*, but as *M. lecontei*, since Bentham (1835) had determined that *Conradia* was already in use.

Pennell (1935) questioned the authenticity of the collection site of *M. lecontei*, which was purportedly along the Altamaha River in Liberty County, Georgia, because that site was far removed from other known occurrences of the species. However, the species has been observed along the Altamaha River as recently as 1997 (M. Hopkins, pers. comm.).

Rafinesque (1837) proposed many new names for *Macranthera* (see Table 1).

Macranthera flammea Raf. was proposed on the basis of Bartram's original description.

However, Rafinesque thought the genus name *Macranthera* was inappropriate because he did not believe the anthers to be of considerable length, and he suggested the name *Toxopus*, meaning "incurved peduncles." He substituted *Toxopus gymnanthes* Raf. for *M. lecontei* Torr. and *Toxopus calycinus* Raf. for *M. fuchsioides* (Nutt.) Benth. He further proposed the genus *Tomilix* meaning "cut calyx" for *M. fuchsioides*, suggesting that this species be treated as either a subgenus or new genus because of the condition of the calyx and the presence of what he felt to be a bifid style. He proposed the binomial *Tomilix bracteata* Raf. as an additional name for *M. fuchsioides* (Nutt.) Benth. The new genus *Flamaria*, as in *Flamaria coccinea* Raf., was also proposed

Bertoloni (1853) described a new genus and species, *Dasystoma tubulosa*, after examination of collections in GH, NY, and PH. Chapman (1860) treated *M. lecontei* as a variety of *M. fuchsioides*, and Kuntze (1891) resurrected the genus *Conradia* on the basis of the type specimen that Torrey had originally identified as *C. lecontei*.

Pennell (1913) combined the two species of *Macranthera* into one, writing: "this difference [in the calyx] is due wholly to age of the flower, as may be readily seen in the field; young flowers are as in *lecontei*, while with age the sepals continue growing and become lobed while the corolla shrivels and shortens in situ, so bringing about the *fuchsioides* state." Pennell suggested that, because Bartram originally described the species, the accepted name must become *Macranthera flammea* (Bartr.) Pennell. He argued that Bartram named his species for its "flame-coloured" flowers which is a fitting description. *Gerardia* was rejected as a generic name because it is a synonym for *Agalinis*.

Later, many were concerned about the validity of Bartram's binomials (Fernald 1944; Rickett 1944; Merrill 1945). Rickett (1944) argued that Bartram's binomials are inappropriate because they appear in a publication that is not always consistent with the Linnean system of binomial nomenclature. Merrill (1945) defended Bartram's binomials, writing: "the proportion of binomials to polynomials, 358 to 2, is too great in favor of the former to justify the elimination of Bartram's work." Wilbur (1971) argued that, if a Bartram binomial is accompanied by an adequate description, the publication of the binomial should be considered valid.

Additional controversy surrounds Bartram's description of his collection site. He probably confused the locality of his specimen of *Macranthera* with that of the mint *Calamintha coccinea* (Nutt.) Benth. While traveling along the Tensaw River near "Taensa" (near or in Baldwin Co, Alabama), Bartram (1791) recounts the following observations: "These stony gravelly heights produce a variety of herbaceous plants, but one in particular I shall mention on account

of its singular beauty. I believe it is a species of *Gerardia* (*Gerardia flammea*); it grows erect, a single stem from a root, three or four feet in height, branching very regularly from about one half its length upwards, forming a cone or pyramid, profusely garnished with large tubular labiated scarlet or flame coloured flowers, which give the plant a very splendid appearance even at a great distance." This description closely describes, for the most part, the form and appearance of *M. flammea*, but the locale and scarlet flower color are more appropriate for the mint *Calamintha coccinea* (Merrill 1945). Unlabeled specimens of both plants were found in Bartam's collection at the Natural History Museum in London (Pennell 1935). Bartram's description is applicable in part to both plants (Table 2), but Pennell (1935) believed Bartram's description to be most applicable to *M. flammea*.

SPECIES DESCRIPTION

Macranthera flammea is generally an herbaceous biennial of the Orobanchaceae Rosette leaves on juvenile plants are oblanceolate to spatulate. Leaves are glabrous with entire or pinnately lobed margins, depending on developmental stage. Rosettes are variable in leaf number and leaf size, having 3–46 leaves per rosette with lengths of 3–33 cm and widths of 0.8–3.6 cm (Fig. 1).

Plants may be more appropriately classified as monocarpic perennials because they may remain in the rosette phase for more than one year. Rosettes that have attained a critical size are triggered to reproductive states by an increase in day length. Before a rosette bolts into a flowering adult, it begins to produce pinnately lobed leaves.

Reproductive plants of *M. flammea* are mostly 15–30 dm tall, with stems that are obtusely four-angled and essentially nonbranching below the candelabralike spreading inflorescence. Cauline leaves are opposite and sessile or have short, winged petioles. Lower leaves are 8.5–16 cm long and 2–6 cm wide, lanceolate to ovate, and pinnately lobed. Leaves are progressively reduced upward along the stem; the uppermost are 4–7 cm long and 1–2.5 cm wide, slightly lobed, and toothed or entire. Blades are glabrous, or with minutely ciliate margins. Rosettee and lower leaves are usually shed by the time of anthesis.

The paniculate inflorescence contains long, indeterminate, racemose branches (Fig. 2). Flowers are axillary to a reduced, usually entire, foliar bract (see illustration in Godfrey and Wooten 1981). Pedicels are 1–2 cm long, becoming reflexed in fruit. The calyx is fused with five short lobes that are equal and linear and 7.5–15 mm long. The corolla is bright orange, fleshy, 2–2.5 cm long, short pubescent without, and glabrous or slightly pubescent at the base within. A whitish nectar chamber at the corolla base is 4 mm long.

The corolla turns brown to black with age. The tube is cylindrical and much longer (20–23 mm) than the two-lipped lobes (3–4.5 mm), with an adaxial lip

TABLE 2. Similarities of Bartram's description of *Macranthera* and *Calamintha*.

	Macranthera	*Calamintha*
Habitat	wet boggy thickets	*stony gravelly heights*
Plant branching	*regular, in upper half*	intricately, from base
Plant shape	*tall pyramidal cone*	low spreading
Plant height	3–8 feet	*3–4 feet*
Corolla shape	*tubular labiated*	*tubular labiated*
Corolla color	*flame colored*	*scarlet*

that is two-lobed and erect and a three-lobed, spreading abaxial lip. The four contiguous stamens are equal in length and exerted. The filaments are orange and become about twice as long as the corolla tube, up to 46 mm. The ovary is ovoid and has a slender style that is to 46 mm and a linear-clavate stigma. Mature bicarpellate capsules are 9.5–13 mm long, 7.5–10.5 mm wide, loculicidal, and slightly pubescent. The seeds are brownish black, 2.5–3 mm long, half as wide, irregular in shape (angular-lunate to triangular) with two or three fluted membranous wings. Specimens of *M. flammea* become black upon drying (due to presence of orobanchin or iridoid compounds as in related parasitic taxa).

The species description is verified by examination of collections (Appendix 1) from major and regional herbaria: Angus K. Gholson (personal collection designated AKG; it will eventually become part of FLAS), University of Florida (FLAS), Florida State University (FSU), Gray Herbarium (GH), University of Southern Mississippi (no official abbreviation, designated HATT here for convenience), Jacksonville State University (JSU), Louisiana State University (LSU), Missouri Botanical Garden (MO), New York Botanical Garden (NY), Old Dominion University (OD), Academy of Natural Sciences of Philadelphia (PH), Smithsonian Institution (US), University of Georgia (GA), University of Mississippi (MISS), University of South Alabama (USAM), Valdosta State University (VSC), and Vanderbilt University (VDB).

The species description is also supplemented by measurements taken from several plants at two field sites: Thomas Co., Georgia, at Greenwood or GWD (*Alford 1077* at FSU) and Liberty Co., Florida, in the Apalachicola National Forest or ANF (*Alford 1064* at FSU).

Range and Habitat.—The range of *M. flammea* (Fig. 3) extends along the lower coastal plain from Georgia to southeast Louisiana. This species requires mesic habitats of bogs and thickets and is ecotonal, occurring in the sandy acid soils of pine flatwoods along the margins of seepage slopes and shrub-tree bogs or bays (Small 1933). It can occasionally be found in shallow water of cypress-gum ponds or depressions (Godfrey & Wooten 1981). It does not tolerate standing water and can only be found in areas where water flow is sufficient (Determann et al. 1997).

Macranthera flammea

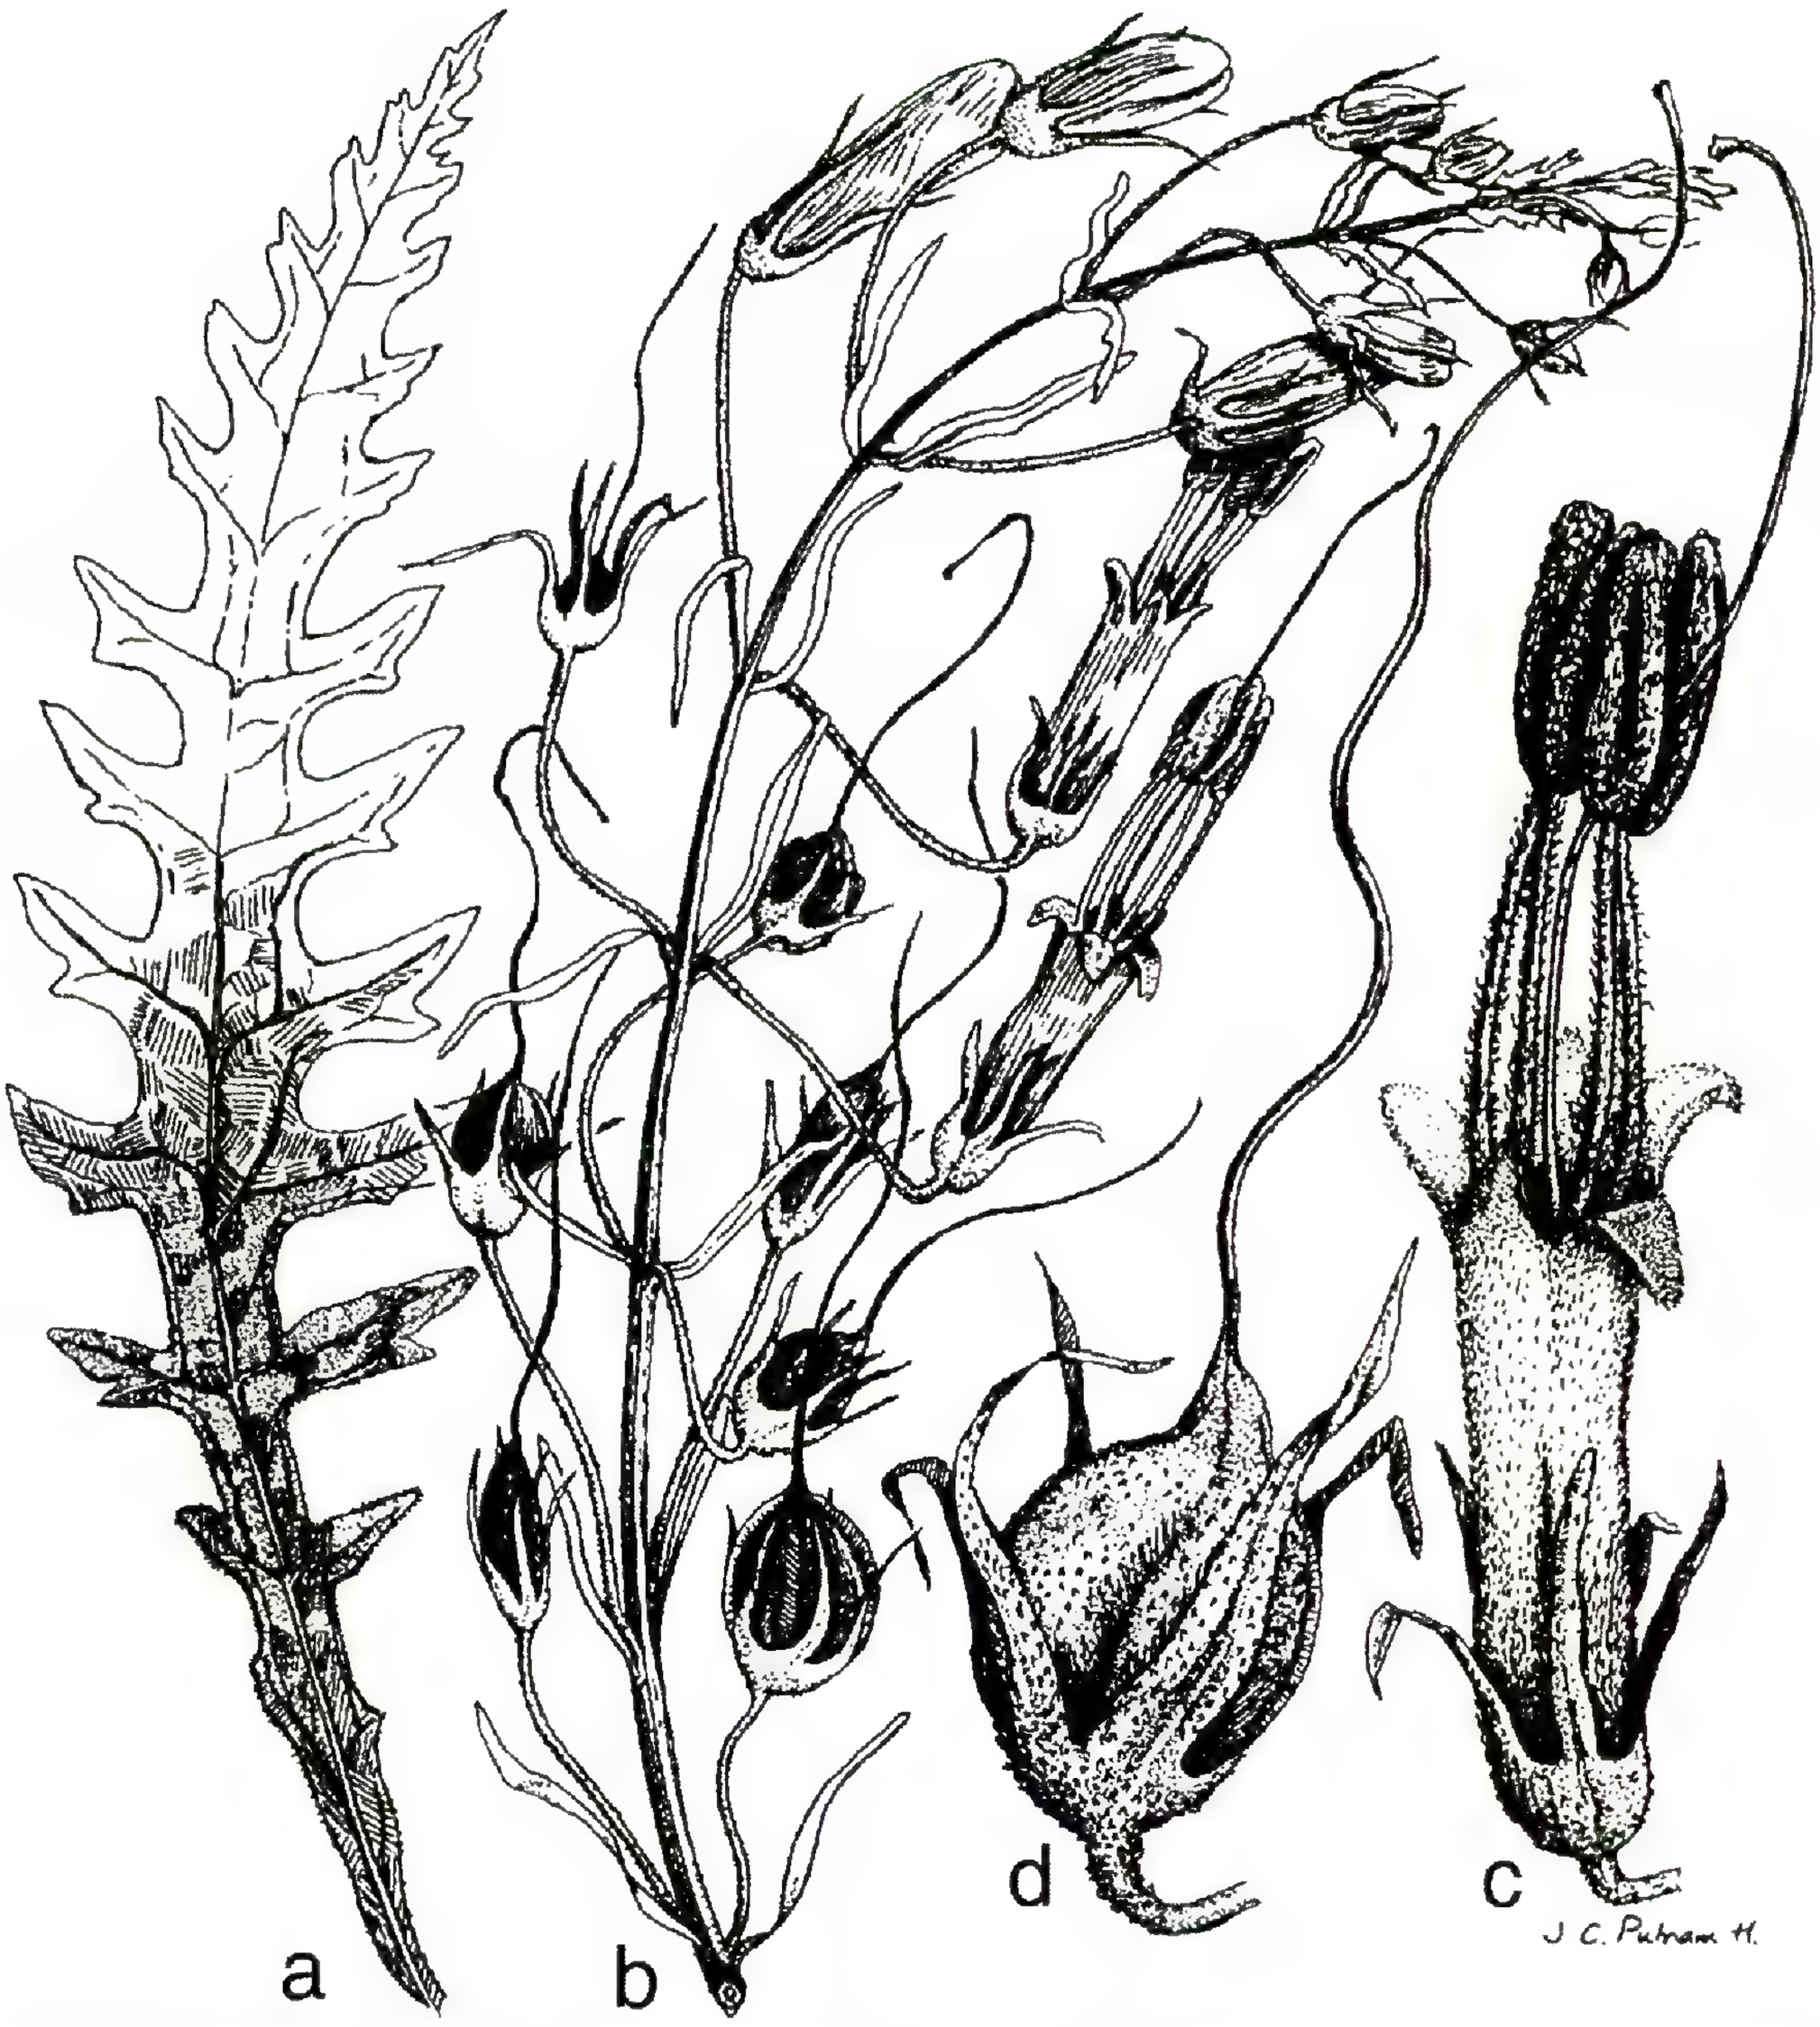

FIG. 1. *Macranthera flammea*. a, lower cauline leaf; b, branch of inflorescence; c, flower with exserted stamens and style; d, fruit with persistent style. Modified from drawing by Jean C. Putnam-Hancock in Chafin (2000); used by permission.

Woody plants associated with *M. flammea* include: *Acer rubrum* L., *Aronia arbutifolia* (L.) Ell., *Clethra alnifolia* var. *tomentosa* (Lam.) Michx., *Cliftonia monophylla* (Lam.) Britt. ex Sarg., *Cyrilla racemiflora* L., *Fraxinus caroliniana* Mill., *Ilex coriacea* (Pursh) Chapm., *Ilex glabra* (L.) Gray, *Itea virginica* L., *Liriodendron tulipifera* L., *Lyonia lucida* (Lam.) K. Koch, *Magnolia virginiana* L., *Myrica cerifera* L., *Nyssa sylvatica* var. *biflora* (Walt.) Sarg., *Persea palustris*

(Raf.) Sarg., *Pinus elliottii* Engelm., *Pinus palustris* Mill., *Pinus serotina* Michx., *Rhododendron viscosum* (L.) Torr., *Viburnum nudum* L. Herbaceous associated taxa include: *Andropogon virginicus* L., *Aristida stricta* Michx., *Arnoglossum sulcatum* (Fern.) H. Robins., *Arundinaria gigantea* (Walt.) Muhl., *Coreopsis gladiata* Walt., *Elephantopus nudatus* Gray, *Erianthus giganteus* (Walt.) Muhl., *Eryngium integrifolium* Walt., *Helianthus angustifolius* L., *Hypericum cistifolium* Lam., *Hypericum galioides* Lam., *Hypericum tetrapetalum* Lam., *Hyptis alata* (Raf.) Shinners, *Juncus validus* Coville, *Ludwigia hirtella* Raf., *Osmunda cinnamomea* L., *Panicum scoparium* Lam., and *Pteridium aquilinum* (L.) Kuhn.

Common Name.—This species is commonly referred to as flame flower or hummingbird flower. In at least one instance, it was referred to as Spanish princess (Pickens 1955). Flame flower is an appropriate name for *M. flammea*. It is representative of the specific epithet because of the flame-like appearance of the orange-yellow corolla (and the candelabra branching habit lends a flame shape to the inflorescence). Hummingbird flower is less desirable as is could be applied to any number of species that have red or orange tubular corollas.

FIG. 3. Documented range of *Macranthera flammea* in the southeastern United States.

EXAMINATION OF MORPHOLOGICAL VARIABILITY

Taxonomists base plant descriptions on the morphology of repeating modular units of construction, i.e. leaves, flowers, etc. because, although the number of units and size of the whole plant can vary greatly with age and environmental conditions, genetic control maintains consistent size and form of modular units (Harper 1977). Differences between species depend on the morphological form of repeating units. Variation in characters may exist across the range of a species, within a single population, and even within a single individual.

Macranthera inflorescences are indeterminate as defined by Harper (1977). Meristems continue to produce new flowers and leaves, and the position of an individual flower on the inflorescence reflects its age. By measuring changes in floral characters through time, we determined how each individual flower is affected by its location within the architecture of an individual plant and whether Pennell (1913) was correct in stating that the differences (in calyx

length and lobing) between the two species recognized at that time (*M. fuchsioides* and *M. lecontei*) were in fact attributable to age.

We examined herbarium specimens (Appendix 1) to determine the extent of variability of morphological characters across the species' range. Characters considered were calyx length, corolla tube length, corolla lobe length, corolla width, pedicel length, bract length, fruit length, and fruit width. Because it was not always possible to know which part of the plant was represented by the herbarium specimen, we standardized measurements by choosing floral buds at the stage of development just prior to the separation of the corolla lobes. Lengths and width of mature fruits and, when available, the length and width of the lower and uppermost (just below the inflorescence) stem leaves were measured.

To examine the extent of variability within a population and also within a single plant, we randomly selected five plants from the established study site at GWD in Thomas Co., Georgia, that represented the range of environmental conditions for the site. Three flower buds (upper, median, and lower) were marked on each of three racemes of the inflorescence (terminal, upper axillary, and lower axillary), for a total of nine measured buds per plant (Fig. 4). Characters previously mentioned were then measured on marked buds every four days for a period of one month. We measured fruit and foliage on 12 plants randomly selected from the population.

Means and standard deviations were calculated for all measured characters from herbarium specimens (Table 3). Means and standard deviations of floral characters from the GWD sample population were calculated from characters measured on 28 August 1997 in order to determine the amount of variability for characters within the plant architecture at a given time (Table 3).

The standard deviations of measured characters (Table 3) for herbarium specimens reveal that although the floral tissue components (corolla tube) of the flower show little variability, variability is higher in the chlorophyll containing components (calyx, pedicel, and bract). The GWD population exhibited more variability overall in corolla tube and calyx lengths than the herbarium specimens because smaller and larger buds were included.

Plant 59 of the GWD sample population was selected to illustrate growth changes over time in corolla tube length (Fig. 4) and calyx length (Fig. 5) for each bud position of the three racemes examined. For each raceme, the corolla tube expanded rapidly (Fig. 4). On the terminal and lower axillary racemes, the tubes expanded to 22–24 mm before anthesis. Those of the upper axillary raceme reached only 20–22 mm. Corolla tube width was between 4 and 5 mm for all flowers examined.

The calyces of the lower and median buds on the terminal raceme (Fig. 5, a) had nearly reached their limits of expansion at the initial measuring, but

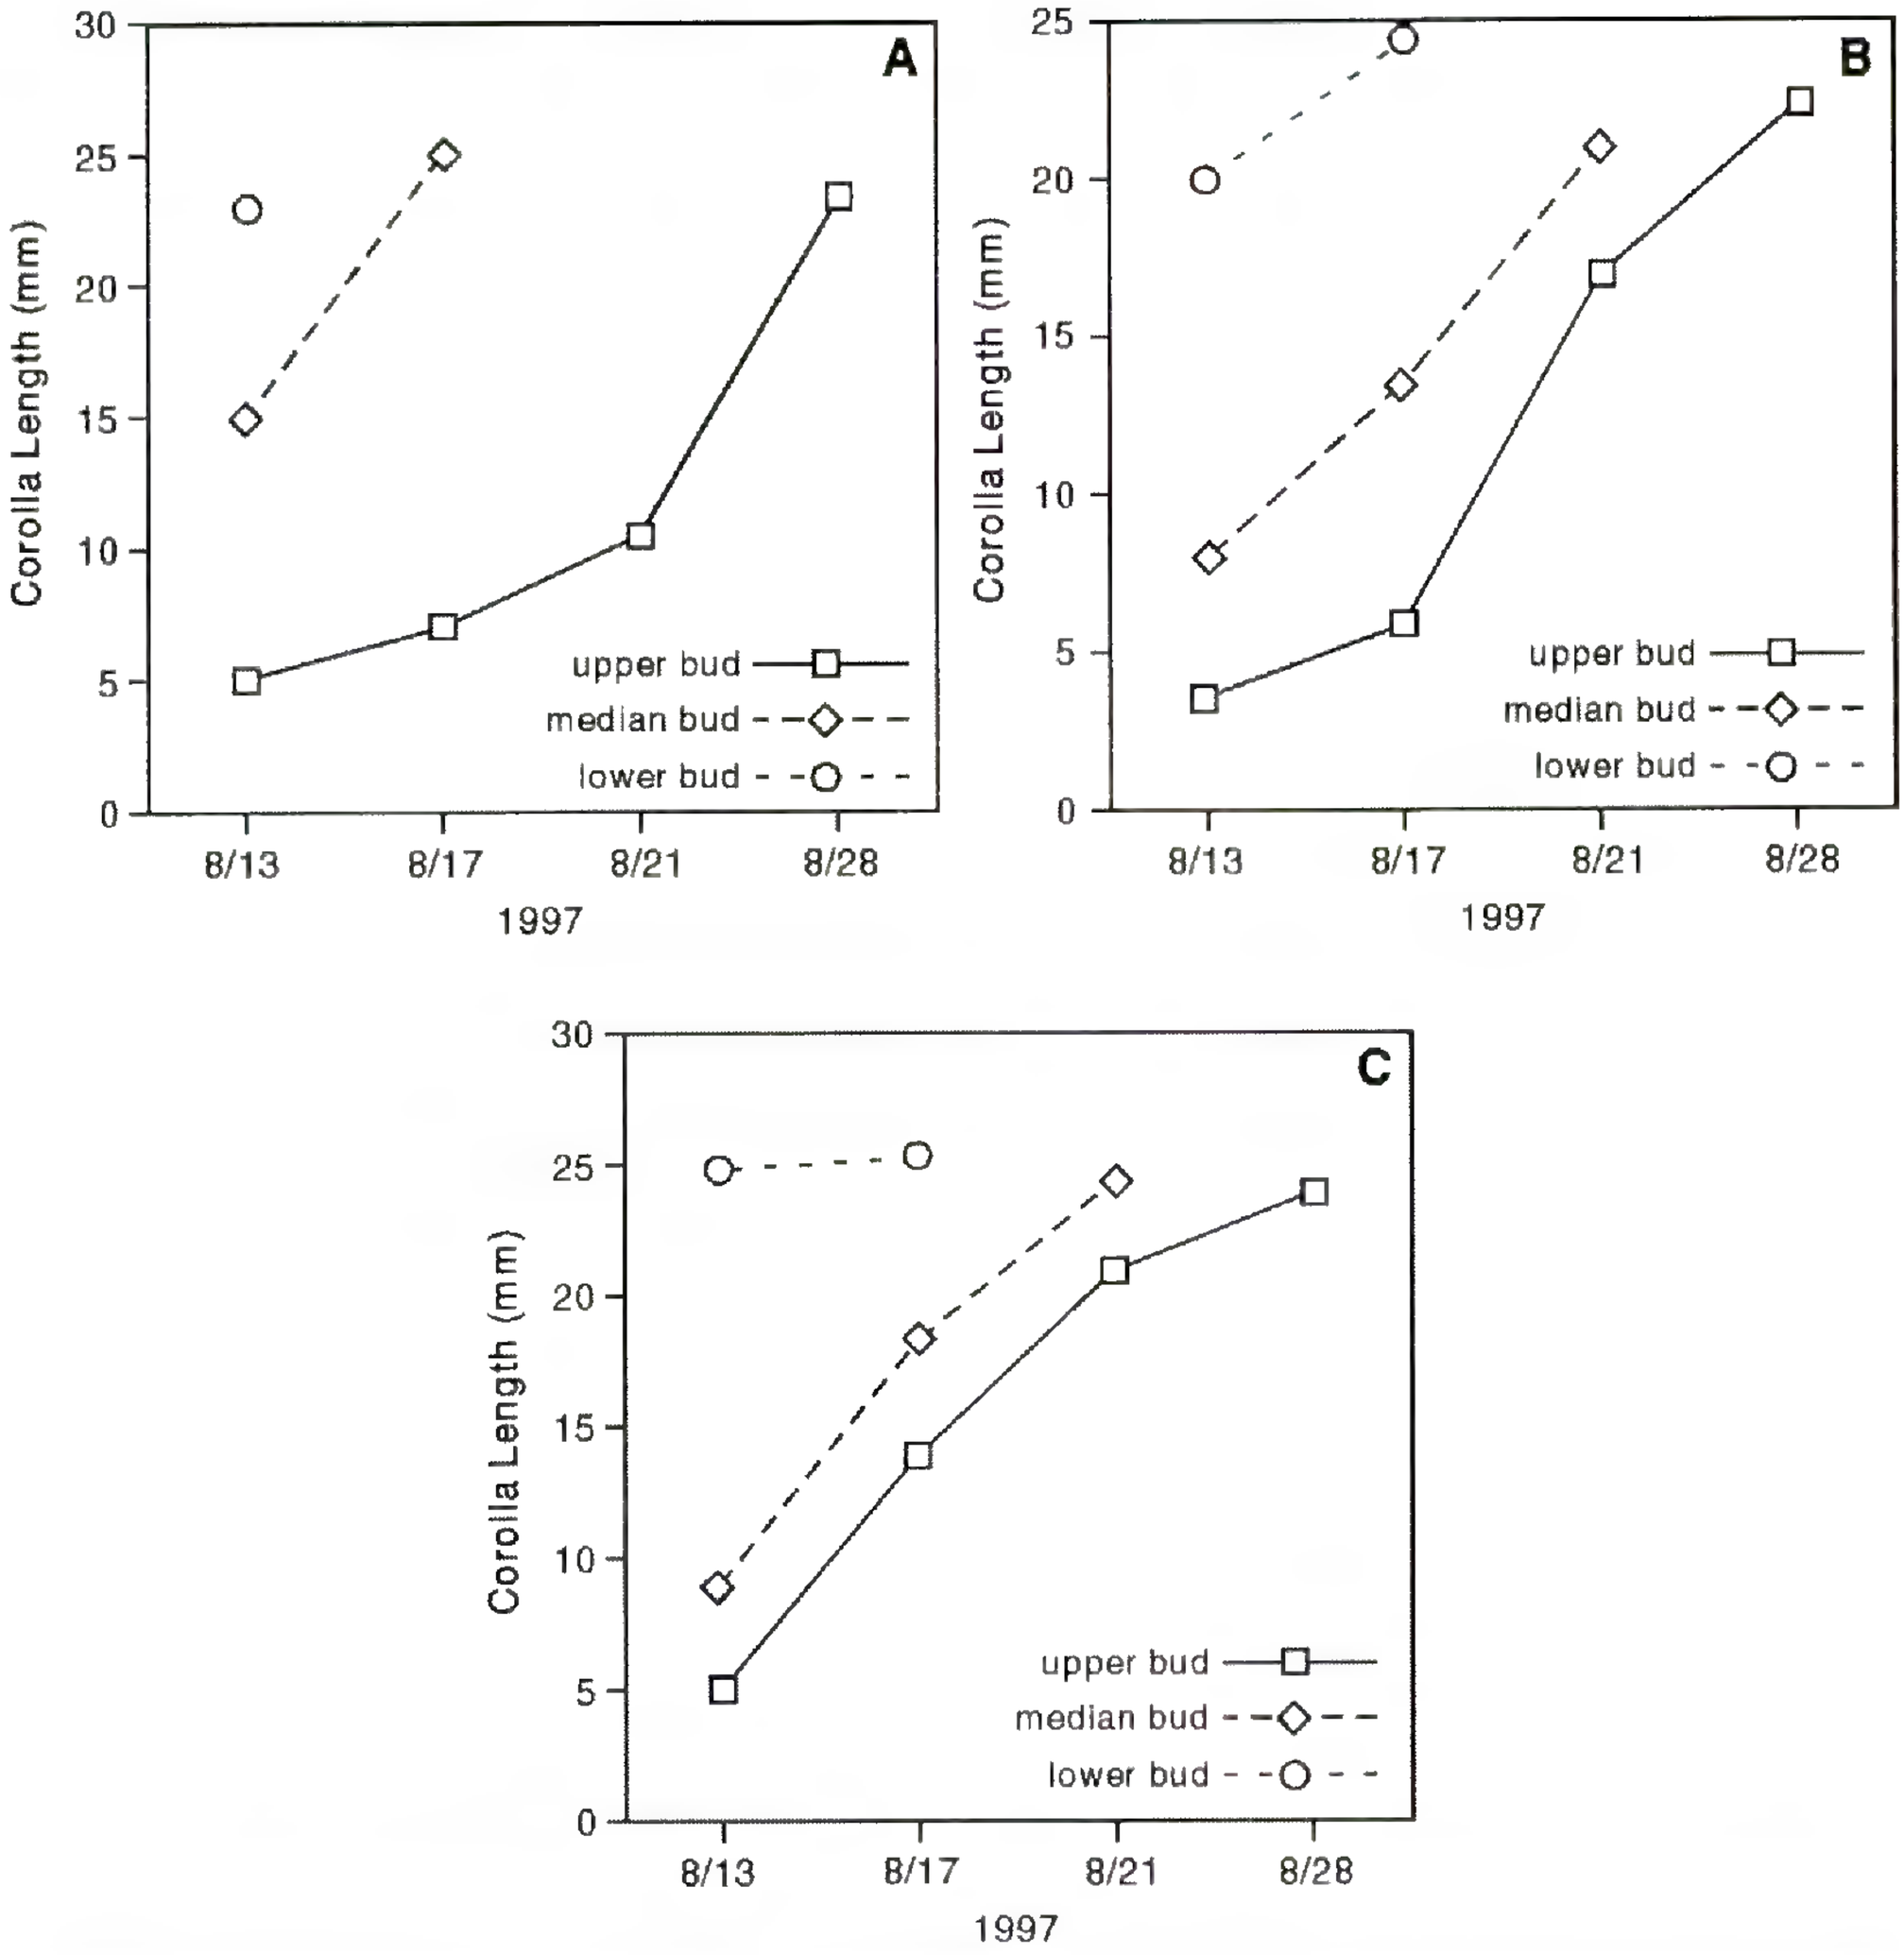

FIG. 4. Changes in corolla lengths from different positions on plant 59 at GWD during August 1997. A, terminal raceme; B, upper axillary raceme; C, lower axillary raceme.

calyx growth on the upper bud exhibited rapid elongation before reaching a plateau. Calyces of buds on the upper and lower axillary racemes (Fig. 5, b–c) also demonstrated rapid expansion before leveling off. The calyces of the upper buds were much shorter than those of the median and lower buds for all racemes examined.

Figure 6 illustrates calyx growth for the upper buds of the three racemes for three of the plants comprising the sample population. It shows that the upper axillary raceme had shorter calyces than did the lower axillary and terminal racemes for plants of the sample population.

Pedicels exhibited the same growth pattern as calyces. Bracts generally did not expand further once anthesis had occurred for an individual bud. Bracts

did exhibit very rapid growth during bud expansion, and some of the bract lengths reached 50 mm for lower buds.

To produce more valid assessment of the amount of variation in calyx and corolla tube lengths observed in the GWD population (Table 3), we selected buds at various positions within the inflorescence and did not standardize to stage of development. The mean lengths of calyx, corolla, pedicel, and bract were greater in the GWD sample population because lower buds were included. Fruits measured in the GWD population tended to be shorter, narrower, and less variable than those in the herbarium specimens.

In general, variation was minimal in length and width of the corolla (Table 3, Fig. 4). Recent publications (Campbell et al. 1996; Smith et al. 1996; Temeles 1996) suggest that corolla width is the floral character selectively influenced by hummingbirds, a major pollinator of *M. flammea* (Pickens 1927).

The position of a flower within the framework of the inflorescence reflects its age (Harper 1977). Calyx length is determined by the position of a flower within the framework and is therefore determined by age of the flower. Observations (Figs. 5, 6) indicate calyces reach a plateau in their growth and do not continue to grow after flowering begins.

Pennell (1913) was correct in stating that the differences in the lengths of calyx lobes are due to the age of flowers. However, because lobes do not grow after anthesis, the position of the flower unit within the architecture of the inflorescence accounts for observed differences in calyx lengths. These growth characteristics are typical for plants with indeterminate inflorescences. Sepals, bracts, and pedicels are shorter for bud units at the tip of the raceme and longer for those near the bottom. Internodes at the tip of the raceme are truncated, those at the bottom elongated. Differences in the upper axillary branching po-

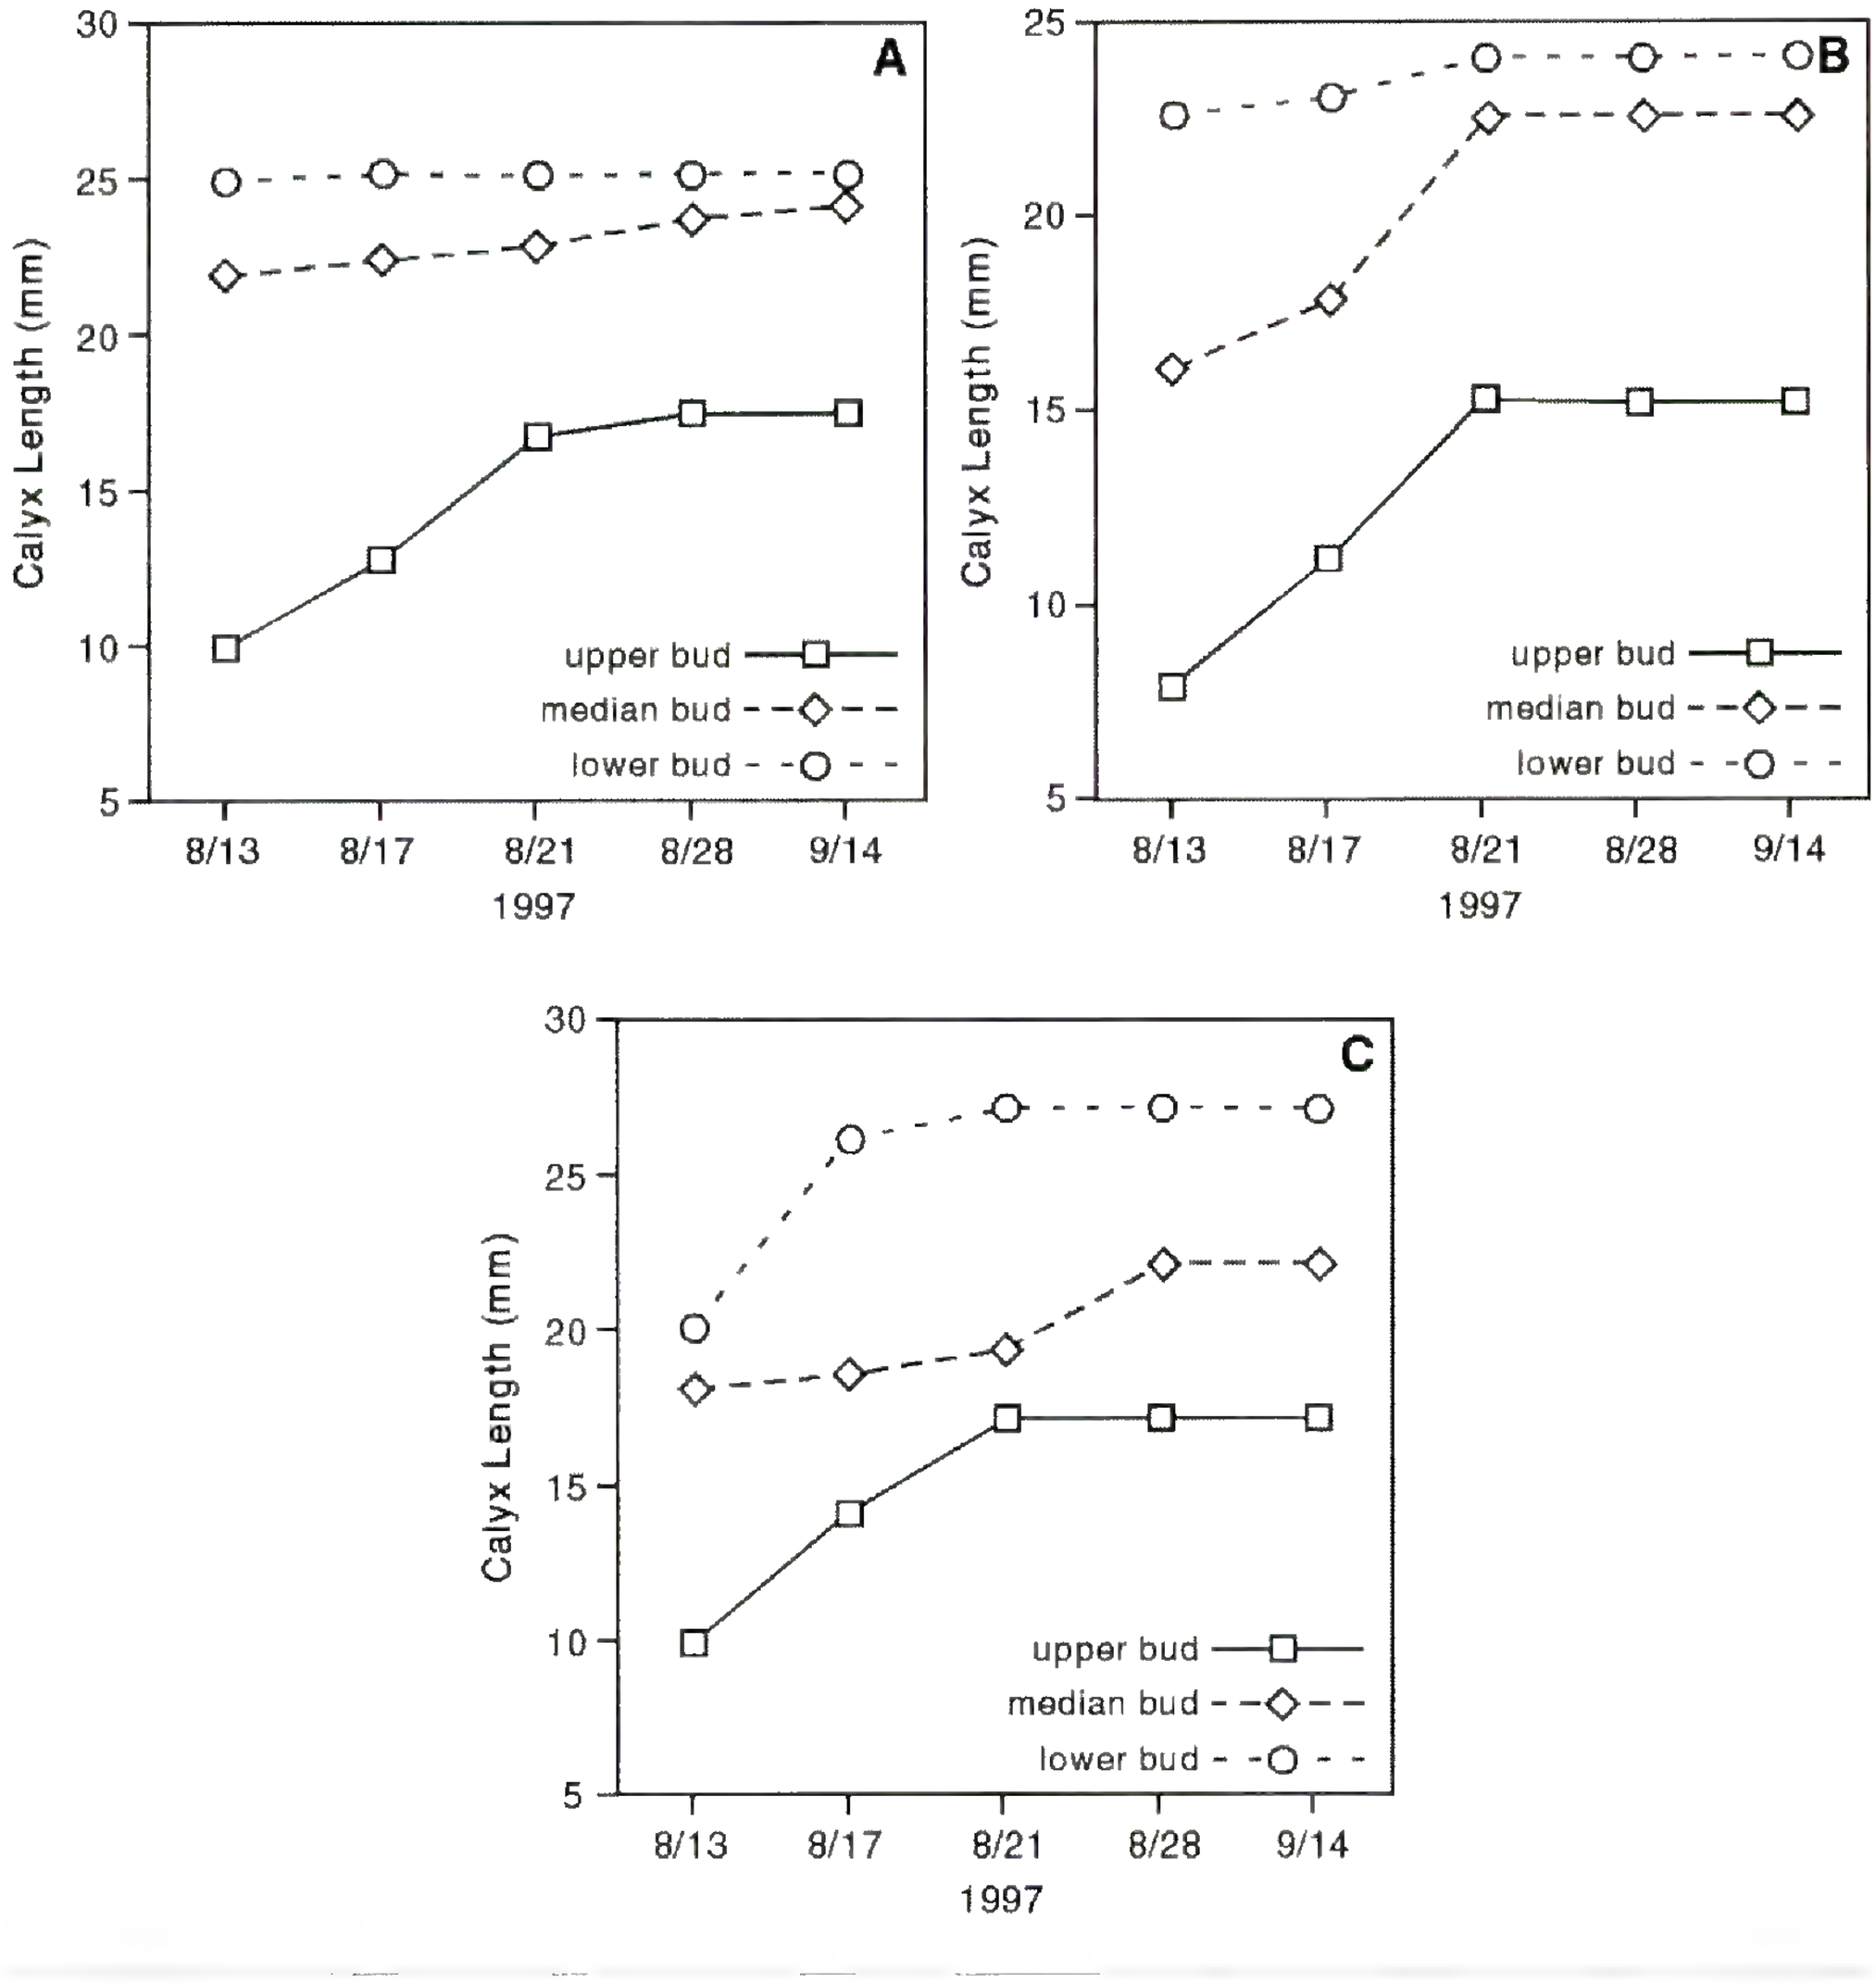

FIG. 5. Changes in calyx lengths from different positions on plant 59 at GWD during August 1997. A, terminal raceme; B, upper axillary raceme; C, lower axillary raceme.

sitions can be attributed to apical dominance. The terminal racemes are always the first to flower, followed closely by the lower axillary racemes. The racemes flower upwards on the inflorescence so that the upper axillary racemes are the last to reach anthesis (Fig. 2).

In general, as much variation appears to occur within a single plant or population as throughout the entire range. Observed variation in the characters of calyx, pedicel, and bract length can all be attributed to position effects within the architecture of the plant. Age determines the placement of individual flower units within an expanding inflorescence and therefore influences character morphology.

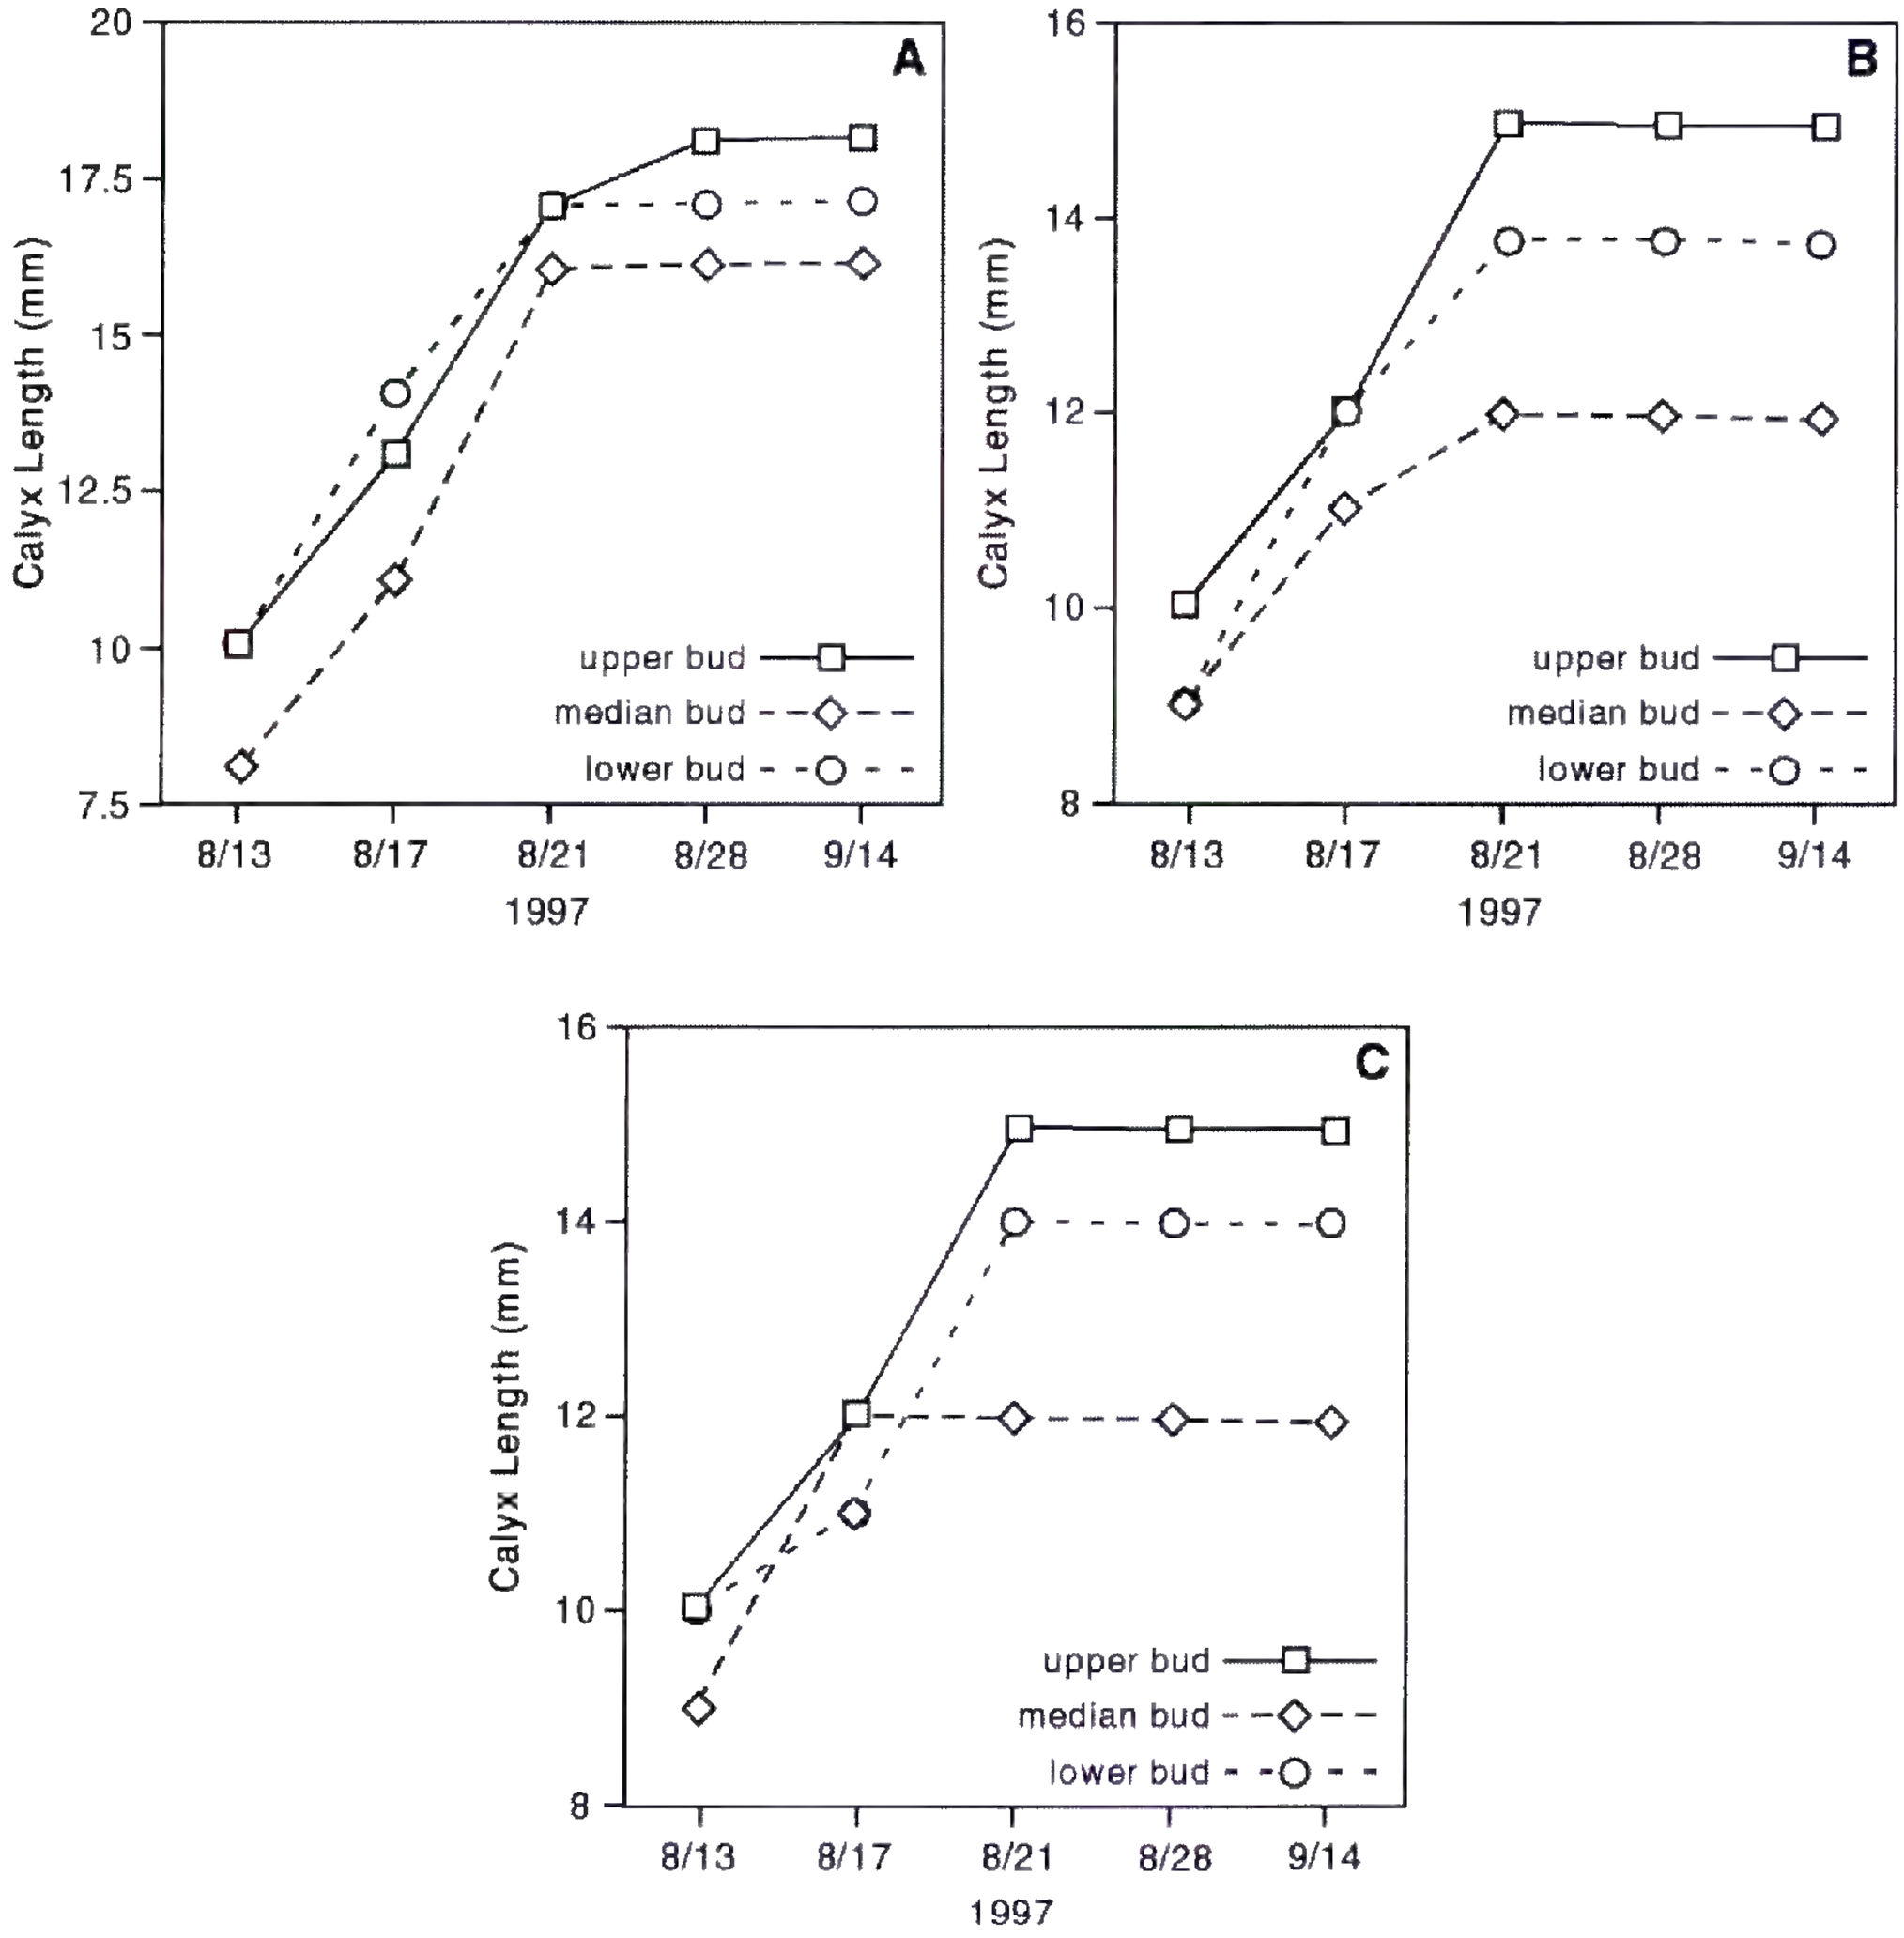

FIG. 6. Changes in calyx lengths from different positions on three separate plants at GWD during August 1997. A, terminal raceme; B, upper axillary raceme; C, lower axillary raceme.

Observations of herbarium specimens and the GWD population do not yield sufficient evidence of distinct variation in any character to warrant recognition of subspecific categories in *M. flammea*.

APPENDIX 1

Specimens examined and annotated documenting known range and morphological variability of *Macranthera flammea* (exact localities omitted because of species' rareness).

ABSTRACT

The Atlantic forest is one of the ecosystems of Brazil that has suffered the greatest destruction and it is still imperiled, especially in the Northeast. Sergipe is one of the states where the Atlantic forest has been most greatly reduced, but it still has some fragments varying in size and degree of conservation. Despite their importance, botanical studies within these fragments are still greatly needed. In this paper we report for the first time the occurrence of four species of *Campomanesia* in Sergipe: *C. aromatica*, *C. dichotoma*, *C. guaviroba*, and *C. viatoris*. The last, formally thought to be known from only two collections from Alagoas, has a relatively wide distribution in Sergipe, and is found in forest and restinga areas of different districts. *Campomanesia guaviroba* is reported for the first time from the Northeast of Brazil. We hope that studies on the composition of these remnants may contribute to the local preservation of this ecosystem and help future programs of forest restoration. We emphasize the need for a greater collecting effort, more studies on plant taxonomy, and the training of new specialists.

RESUMO

A mata atlântica é um dos ecossistemas brasileiros mais destruídos e ainda hoje ameaçado, sendo a sua devastação mais pronunciada no Nordeste do Brasil. Um dos estados com menor área de mata atlântica, Sergipe apresenta ainda hoje alguns fragmentos florestais com tamanho e grau de conservação variáveis. Apesar de sua importância, os estudos botânicos nesses fragmentos são ainda insuficientes. Nesse trabalho registra-se a ocorrência inédita de quatro espécies de *Campomanesia* em Sergipe: *C. aromatica*, *C. dichotoma*, *C. guaviroba* e *C. viatoris*. Esta última, anteriormente conhecida apenas por duas coletas, ambas em Alagoas, apresenta uma distribuição relativamente ampla no Estado, sendo encontrada em áreas de mata e restinga de diversos municípios. Registra-se, ainda, a ocorrência de *C. guaviroba* pela primeira vez na região Nordeste. Espera-se que estudos sobre a composição desses fragmentos possam contribuir para a preservação desse ecossistema a nível regional e subsidiar programas futuros de recomposição florestal. Salienta-se a necessidade de um esforço de coletas mais intenso, de mais estudos sistemáticos e da formação de novos especialistas.

KEY WORDS: *Campomanesia*, Myrtaceae, Sergipe, Atlantic rainforest fragments

INTRODUCTION

The objective of this note is to report the occurrence in Sergipe, Brazil of four species of *Campomanesia* Ruiz et Pavón (Myrtaceae), usually known locally as "guabirobas" or a variant of this name (e.g., guavirobas, gobiraba, gabiroba). None

[1]Universitat Bremen, UFT-AG Heyser, D-28359, Bremen, GERMANY. Email: landim@uni-bremen.de

of these species, nor any other species of *Campomanesia*, was known for Sergipe when Landrum (1986) monographed the genus, and one species (*C. guaviroba*) has not been reported before in Brazil's Northeast region (Maranhão, Piauí, Ceará, Rio Grande do Norte, Paraíba, Pernambuco, Alagoas, Sergipe, Bahia). The fact that recent floristic exploration can reveal so much is an indication of the importance of continuing efforts in this field.

Despite the great biological diversity of the Brazilian coastal forests, little of its original cover still persists. At the time of the European discovery such forest covered about 1,000,000 km^2 of Brazil, while today its area has been reduced to an estimated 5% (Consórcio Mata Atlântica 1992), 6% (Prance et al. 2000), or 8% (INPE and IBAMA 1990) of its original size. In spite of being protected by law, destruction of coastal forest still continues. The remaining areas consist of fragments varying in size and degree of conservation and are "typically small, isolated and highly disturbed" (Viana et al. 1997). Ranta et al. (1998) recently studied the degree of fragmentation in the Northeast Atlantic forest of Brazil, and emphasize the importance of fragment size and shape for the long-term survival of biodiversity. Smaller fragments and more irregularly shaped fragments have a higher proportion of their areas in edges, which are more vulnerable to plant extinction. Because fragmentation in Sergipe has progressed so far, extinction is more imminent.

The historical pattern of almost complete elimination of the native forest covering in Brazil's Northeast is explained by the relative gentle relief of the landscape and ease of access to all areas. Farther south, the mountainous terrain of the Serra do Mar makes access more difficult, and thus greater portions of Atlantic rainforests there are relatively protected. Sergipe, the smallest of the Brazilian states, originally had about 41% its area covered by forests (Campos 1912), but its forest covering today is estimated to be less than 1%. For this reason, Sergipe has been excluded in some mappings of the remnants of Atlantic forest carried out at the national level. However, floristic surveys in areas of Atlantic forest in the state (Landim et al. 1998) have shown it to be a forest with unique floristic and structural characteristics. Additional studies are urgently needed that contribute to knowledge of the forest's composition, structure and dynamics, with the aim being a knowledge base for reforestation initiatives.

The family Myrtaceae is mainly a tropical and subtropical family (Heywood 1993), with about 3500 species and approximately 100 genera, with two main centers of development: tropical America and Australasia (Barroso et al. 1991). It is a family of great importance in the neotropical forests, being one of the dominant families in Atlantic coastal forest (Barroso & Peron 1994; Leitão-Filho 1993; Mori et al. 1983; Peixoto & Gentry 1990; Reitz et al. 1978). In a study of Atlantic forest in São Paulo, Mantovani (1993) found 38 tree species of Myrtaceae (21% of the total). He considers Myrtaceae to be "the most character-

istic family of arboreal species of Atlantic forest in the south coast of the State of São Paulo, with floristic and structural importance."

In general, species of Myrtaceae are quite common in the Atlantic forest areas of the Northeast, (Siqueira 1994), and this has proved to be true the fragments studied in Sergipe. In a phytosociological study in the Mata do Crasto, in the Municipality of Santa Luzia do Itanhy (Landim et al. 1998), this family accounted for 10.3% of the sampled trees, and was the sixth in basal area, and fifth in importance value index (I.V.I.).

Voucher specimens of collections described below are deposited in the herbaria of the Department of Biology of the Federal University of Sergipe (ASE), the University of Brasília (UB), and Arizona State University (ASU).

RESULTS

Description of *Campomanesia*

Campomanesia can be distinguished from other genera of Myrtaceae by: **1)** ovary with (3–)4–18 locules (Fig. 1D); **2)** ovules several per locule, biseriate, all or all but one aborting in each locule; **3)** locule-wall in the mature fruit chartaceous to slightly woody, strongly glandular, serving as a false seed coat (Fig. 1C). In Sergipe, *Campomanesia* can be distinguished from most other genera of Myrtaceae when in flower by its 5-merous flowers and inflorescences of solitary flowers or dichasia. *Psidium* L. and *Calycolpus* O. Berg can be confused with *Campomanesia* in flowering specimens but generally have coriaceous leaves, whereas *Campomanesia* usually has submembranous to membranous leaves.

Campomanesia is quite distinctive in fruit. There seem to be several seeds in each fruit arranged in a ring, each with a glandular covering (Fig. 1D). However, each of these "seeds" is a locule, and usually only some of them have a seed inside. In others the ovules have all aborted. Other genera of Myrtaceae either have few seeds (e.g., 1 or 2 in *Myrcia*, *Eugenia*, or *Calyptranthes*) or the seeds are numerous and hard (e.g., *Psidium*, *Calycolpus*). In no other American genus of Myrtaceae do the seeds have a glandular covering.

The bark of the trunk of *Campomanesia* is usually rough with numerous narrow, papery plates, unlike most other genera that have smooth to scaly bark. The lateral veins of the leaves are generally prominent and broadly arch near the margin and the smaller veins often show an intricate reticulate pattern (Fig. 2).

KEY TO THE SPECIES OF *CAMPOMANESIA* IN SERGIPE

1. Calyx nearly closed in bud; inflorescence a dichasium with peduncle 2–6 cm long _____ **Campomanesia dichotoma**
1. Calyx open in bud; inflorescence uniflorous or a dichasium with peduncle up to 2 cm long.
   2. Hypanthium attenuate at base, constricted near apex; anthers 1–2 mm long _____ **Campomanesia viatoris**

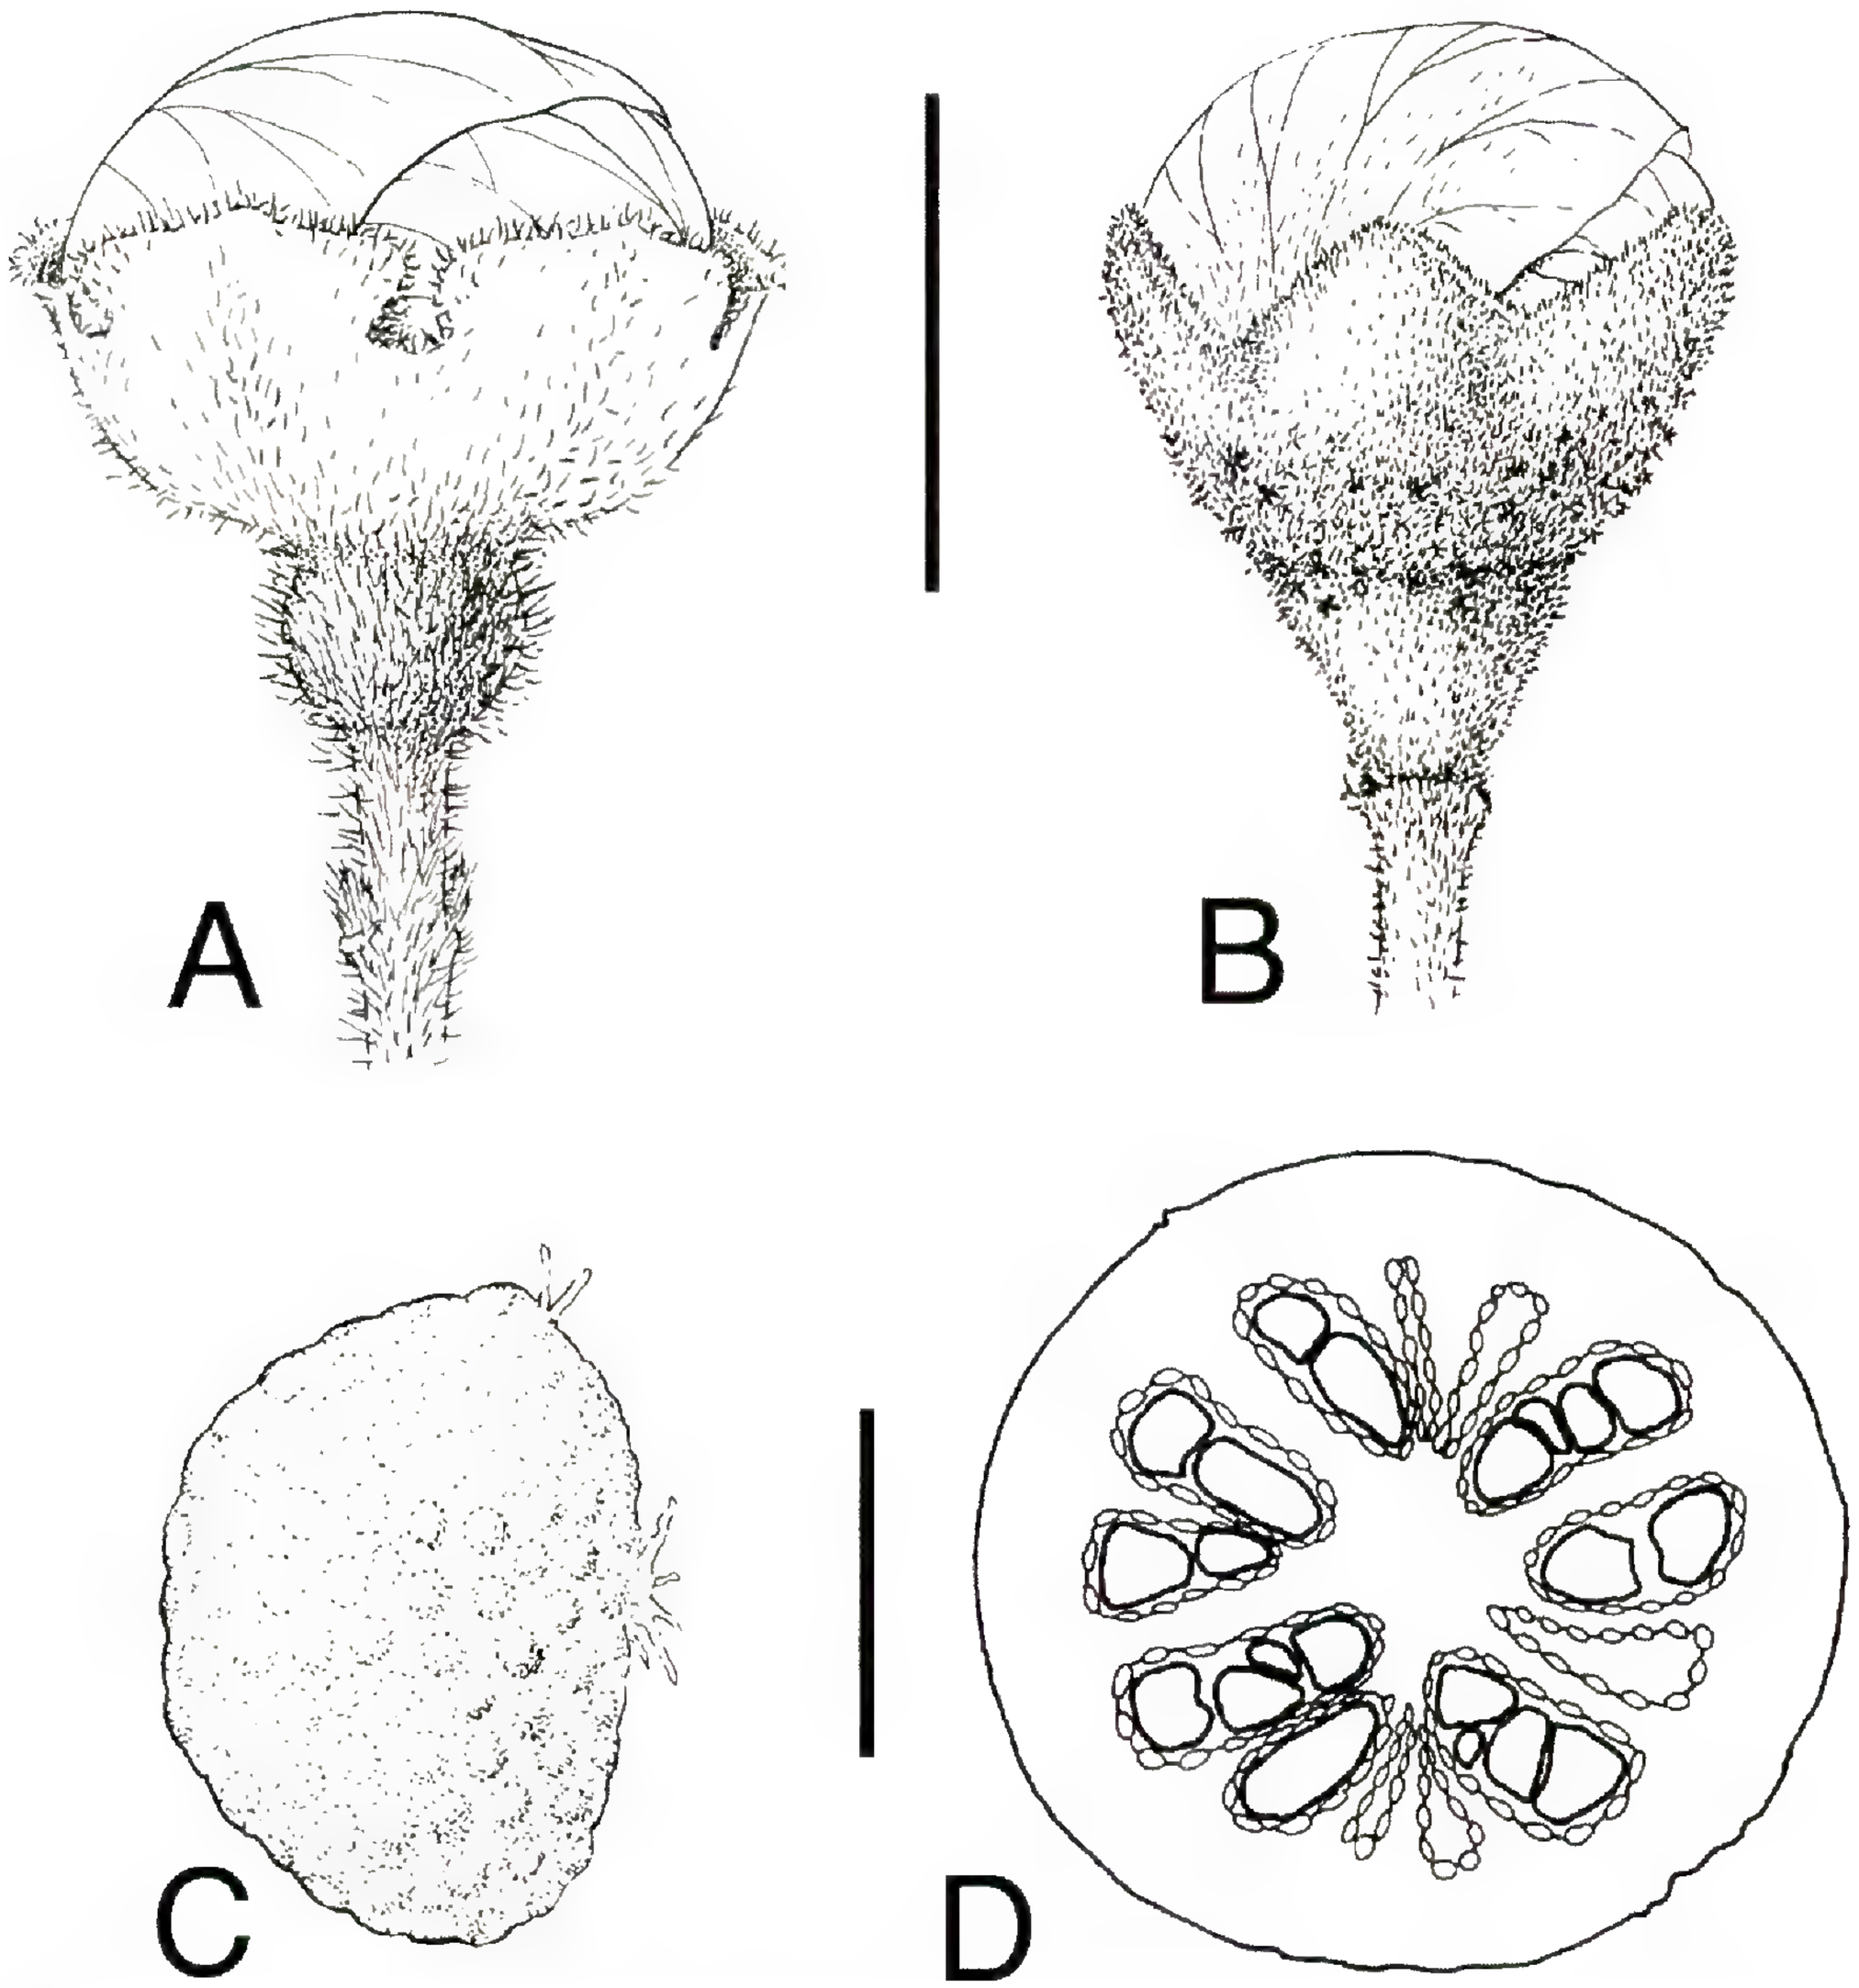

FIG. 1. A, Flower bud of *Campomanesia viatoris*. B, Flower bud of *C. guaviroba*. C, Locule containing a seed showing the glandular locular wall that serves as a false seed coat. D, Cross section of a fruit having 13 locules, each with a glandular wall, but only 8 of which contain seeds. Because the embryos are spiral in form, in section they may be cut in more than one place. Upper bar = 5 mm for A & B. Lower bar = 4 mm for C and 10 mm for D.

2. Hypanthium neither attenuate at base nor constricted near apex; anthers 0.5 1 mm long.
   3. Calyx-lobes hemiorbicular to oblong-truncate, 0.7–2.5 times as long as wide; leaves immature at anthesis; fruit black _____ **Campomanesia aromatica**
   3. Calyx-lobes broadly triangular or broadly rounded, 0.4–0.9 times as long as wide; leaves mature at anthesis; fruit yellow or orangish ____ **Campomanesia guaviroba**

Campomanesia aromatica (Aubl.) Grisebach

Shrub or tree 2–20 m high; leaves immature at anthesis, elliptic, ovate, lanceolate,

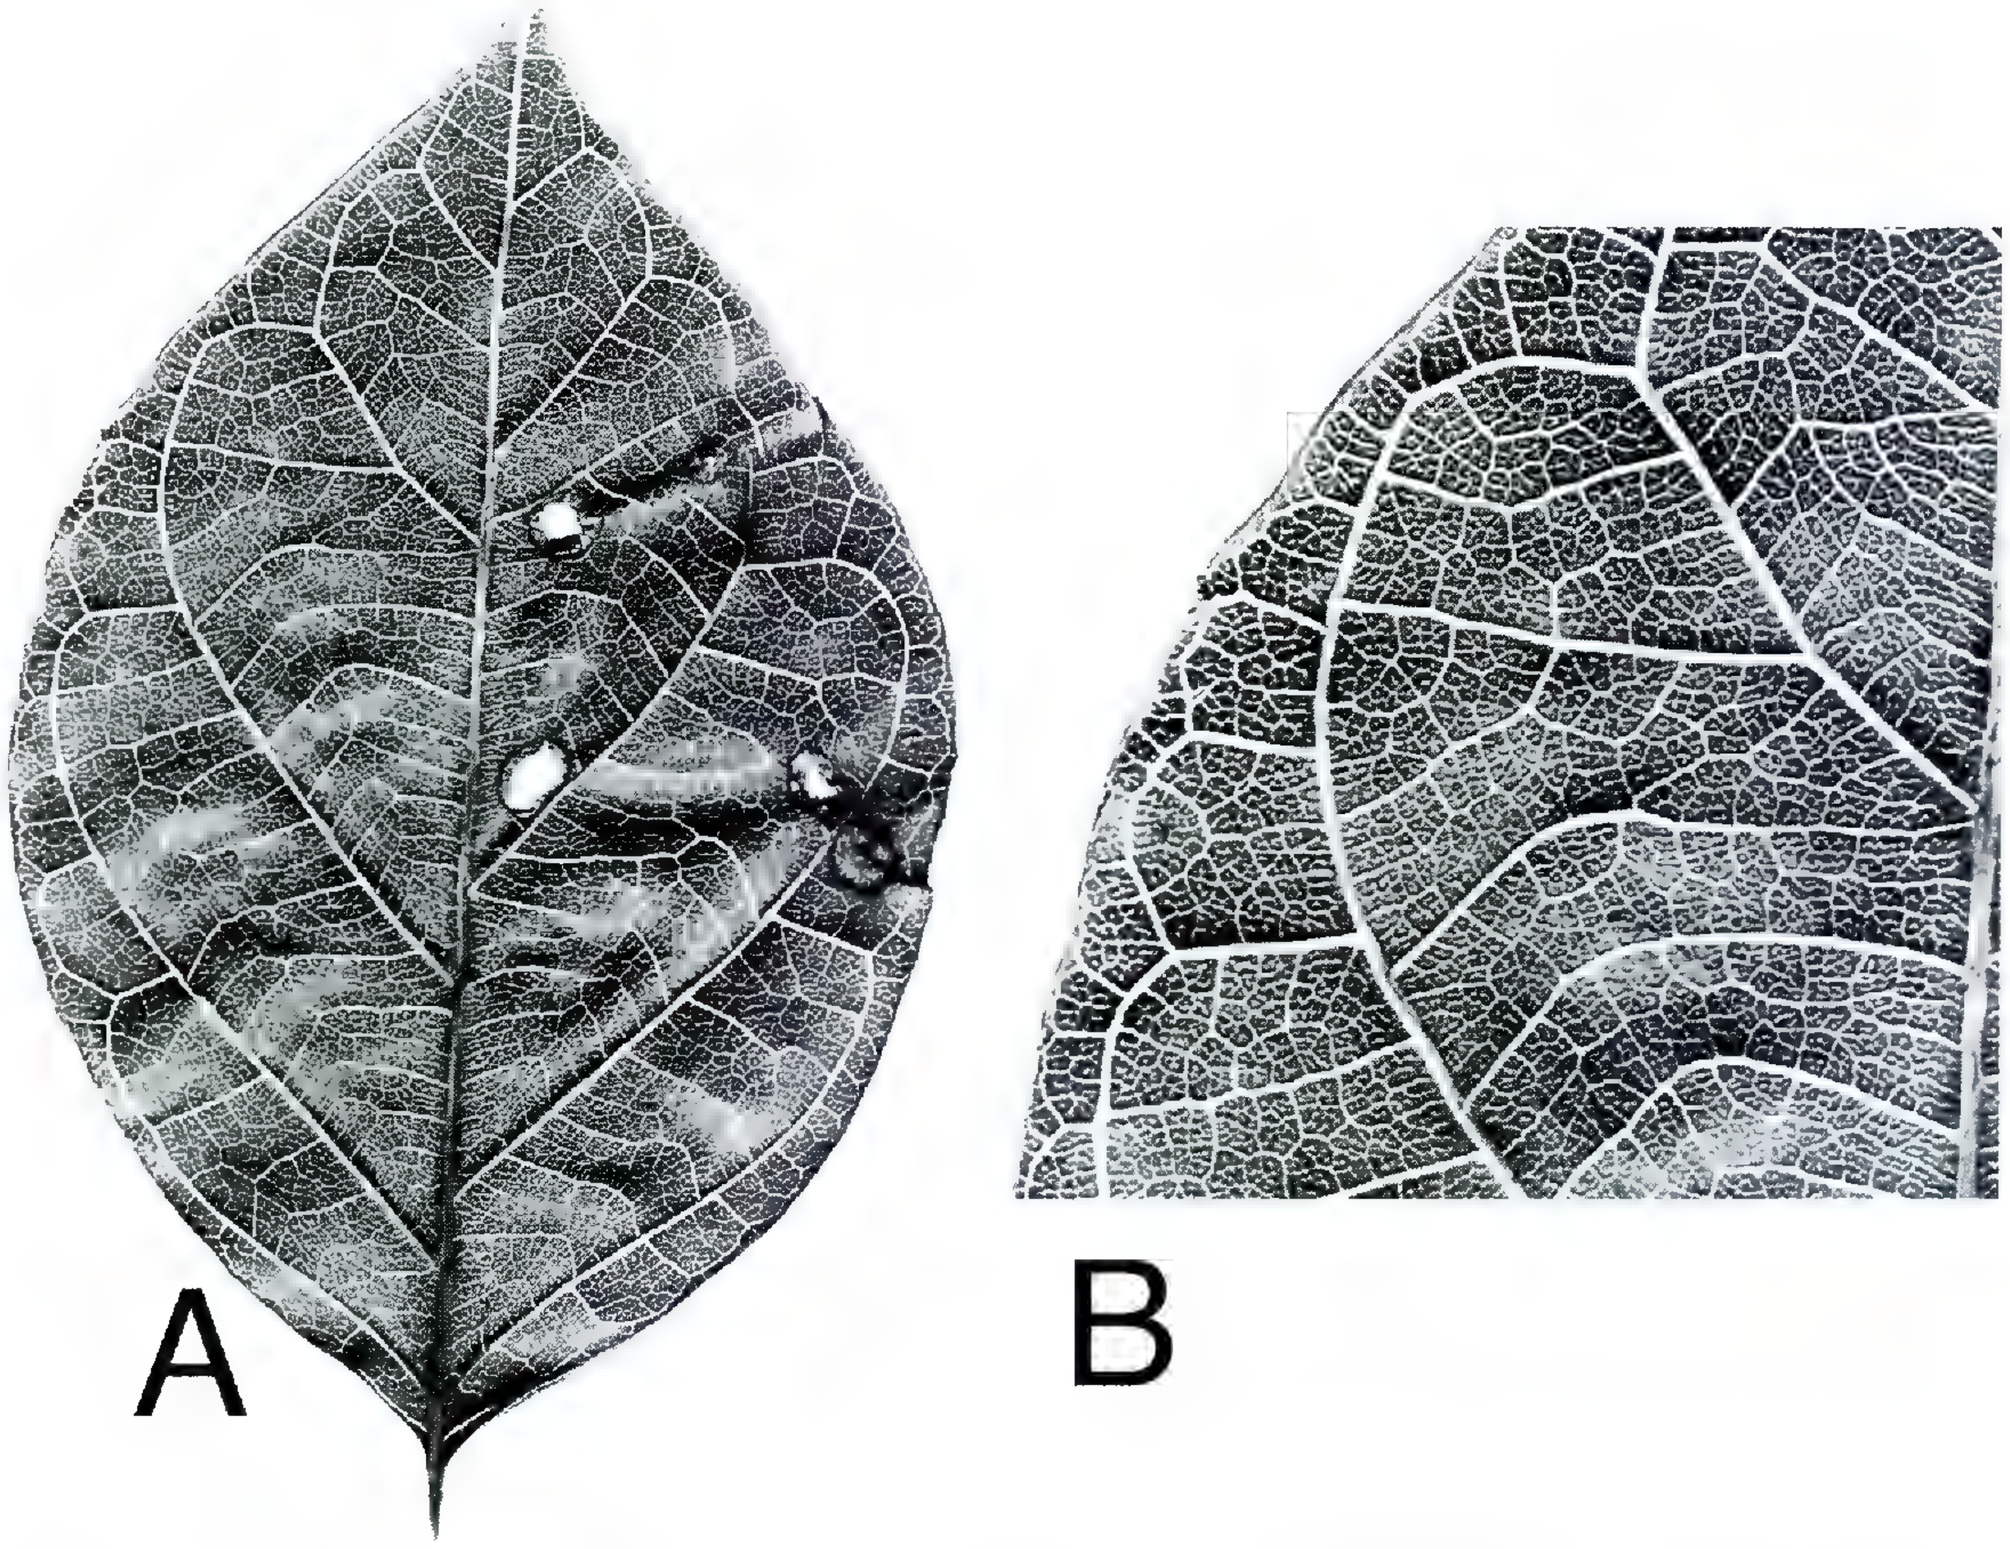

FIG. 2. A, typical leaf of *Campomanesia guabiroba* showing its venation pattern (blade 9 cm long). B, magnified view of portion of same leaf showing detail of venation (*Landrum 2490*, ASU).

or oblanceolate, 4–12(–15) cm long, 2–4(–7.5) cm wide, 1.7–4 times as long as wide; peduncles 0.3–2.6 cm long, uniflorous; bracteoles 1–4 mm long; calyx-lobes hemiorbicular to oblong-truncate, 2–4.3 mm long; hypanthium obconic to campanulate, 1.5–2.5 mm long; stamens 80–90, 4–7 mm long; anthers 0.5–0.8 mm long; ovary 4–6-locular; ovules 4–7 per locule; fruits ca. 1 cm long, black.

Specimens examined. **Mun. Salgado:** Capoeira de mata subperenifólia, 18 Dec 1981, *G.N. Silva 39* (ASE). **Mun. Lagarto:** Caatinga hipoxerófila, 7 May 1982, E. *Carneiro 374* (ASE). **Mun. Itabajana:** Capoeira de caatinga hipoxerófila, 20 Jul 1988, *M. Fonseca 857* (ASE). **Mun. Sta. Luzia do Itanhy:** Mata Atlântica, Mata do Crasto, 3 May 1995, *M. Landim 354* (ASE, ASU, UB).

Although species of *Campomanesia* are usually known locally as "gabiroba" or variations of this name, a specimen collected in the caatinga region was called "cadeia brava."

In his revision of this genus, Landrum (1986) cited only a few collections of *C. aromatica* in the Northeast, namely in the states of Maranhão, Ceará, Rio Grande do Norte, Paraíba and Bahia. The species also occurs in Bolivia (Landrum 1986), an interesting disjunction of over 2000 km. In the present study, it has

been found in areas of coastal forest (Mata Atlantica) as well as caatinga, a shrubby vegetation of dry areas. A greater sampling effort is needed to better understand the distribution of this species.

Campomanesia dichotoma (O. Berg) J.R. Mattos

Shrub or tree up to 10 m high; leaves mature at anthesis, elliptic, elliptic-oblong, ovate or suborbicular, 3–9.5 cm long, 1.5–6 cm wide, 1–2.3 times as long as wide; peduncles 2–6 cm long, bearing 3–15 flowered dichasia; bracteoles ca. 2 mm long; calyx nearly closed in the bud, the calyx-lobes 1–2 mm long, the calyx tearing between the lobes at anthesis; hypanthium (including closed calyx) 5–8 mm long; stamens 200–350, 3–10 mm long; anthers 0.8–1 mm long; ovary 6–10-locular; ovules 7–18 per locule; fruits ca. 1 cm long.

Specimens examined: **Mun. Santa Luzia do Itanhy:** Mata Atlântica, Mata do Crasto, 19 Apr 1995, *M. Landim 333* (ASE, UB), 3 May 1995, *M. Landim 356* (ASE, ASU, UB), 12 Jun 1995, *M. Landim 406* (ASE, ASU, UB), 24 May 1996, *M. Landim and V.M. Schettino 920* (ASE, ASU)

The common name "bacalhau" is used for this species as well as the more common generic designation of "gobiraba."

Campomanesia dichotoma is known from the coastal region of the Northeast of Brazil and the state of Rio de Janeiro (Landrum 1986). So far in Sergipe, examples have been found in only one fragment of Atlantic coastal forest.

Campomanesia guaviroba (A.P. de Candolle) Kiaerskou

Tree up to ca. 12 m high; leaves mature at anthesis, mainly elliptic, less often ovate, lanceolate, suborbicular, or ovate, 4–13 cm long, 1.7–8 cm wide, 1.4–3 times as long as wide; peduncle 0.3–2.5 cm long, uniflorous; bracteoles ca. 4 mm long; calyx-lobes broadly triangular or rounded, 1.5–3 mm long; hypanthium obconic to campanulate, 4–6 mm long; stamens 250–500, 3–9 mm long; anthers 0.5–1 mm long; ovary 7–14-locular; ovules 13–20 per locule; fruit 1–3.5 cm long, yellow or orangish. (Fig. 1 B).

Specimens examined. **Mun. Santa Luzia do Itanhy:** Mata Atlântica, Mata do Crasto, 3 May 1995, *M. Landim 346* (ASE, UB), 25 Apr 1996, *M. Landim 906* (ASE, ASU).

Until recently *Campomanesia guaviroba* was known only from Brazil's Atlantic forest from Espirito Santo to Rio Grande do Sul and adjacent Argentina and Paraguay (Landrum 1986). The collections cited above extend the range far to the north (ca. 1200 km) and are the only ones known to us from the Northeast of Brazil. Recently a collection has extended the known range to Bolivia [Santa Cruz, Velasco Province, Parque Nacional Noel Kempff Mercado, 5 km S del campamento Las Gamas (14° 48'14"S, 60° 23'59"W), 850 m, *A Rodriguez & J. Surubi' 558* (ASU)]. It thus has a disjunct distribution similar to that of *C. aromatica*.

In one area of São Paulo (Mantovani 1993) this species was represented by only two individuals, having an I.V.I of 0.58. Apparently rare, it was not found in the forest gap areas in the same study, although other Myrtaceae were, e.g.,

Eugenia, *Marlieria*, *Calyptranthes*, *Myrcia* and *Gomidesia*. This may mean that it is less tolerant of disturbance (anthropogenic or not) and thus is at a higher risk of going extinct through habitat disturbance and fragmentation.

Campomanesia viatoris Landrum

Shrub or tree to ca. 12 m high; leaves mature at anthesis, elliptic to ovate, 3–13 cm long, 2–6.5 cm wide, 1.5–2 times as long as wide; peduncle 0.5–2 cm long, uniflorous or bearing a 3-flowered dichasium; bracteoles ca. 3 mm long; calyx-lobes truncate-auriculate, 1–3 mm long; hypanthium 8–10 mm long, attenuate at base, constricted near summit of ovary; stamens ca. 300, 4–8 mm long; anthers ca. 1–2 mm long; ovary 7–8-locular; ovules 11–16 per locule; fruit globose except for an attenuate base, up to ca. 2.5 cm in diameter. (Fig. 1 A).

Specimens examined. **Mun. Sto Amaro das Brotas:** restinga, 10 Dec 1981, *G. Viana 294* (ASE). **Mun. São Cristóvão:** restinga, 21 Mar 1985, *G. Viana 1112* (ASE). **Mun. Pirambu:** Reserva Biológica Santa Isabel, dunas no km 11 de praia na direção de Ponta dos Mangues, 28 Jan 1992, *C. Farney et al. 2944* (ASU). **Mun. Santa Luzia do Itanhy:** cerca de 2.5 km do Distrito de Crasto, na estrada para Sta. Luzia do Itanhy, 27 Nov 1993, *A.M.A. Amorim et al. 1500* (ASU); Mata Atlântica, 7 Apr 1995, *M. Landim 282* (ASE, ASU, UB), 3 May 1995, *M. Landim 355* (ASE, ASU, UB), 5 Jul 1995, *M. Landim 456* (ASE, ASU, UB); Mata Atlântica, Mata do Crasto, 7 Apr 1995, *M. Landim 285* (ASE, ASU, UB), 16 Dec 1996, *M. Landim 1108* (ASE, ASU). **Mun. São Cristóvão:** restinga, 9 Apr 1996, *M. Landim 904* (ASE, ASU). **Mun. Areia Branca:** Mata, Serra de Itabaiana, 28 Mar 1997, *A. Vicente 7* (ASE).

The common names for this species are "guabiraba," "gabiroba," "gabirobinha," "gobirabinha," and "gobiraba."

Until recently only two collections for this species were known, the type and one other, both from Alagoas (Landrum 1986). The type was collected by Gardner over 150 years ago and the additional specimen has no date. Since the species was thought to be extinct or near extinction, Landrum (1986) urged botanists in Alagoas to search for this rare species. The collections cited above from Sergipe indicate that *Campomanesia viatoris* is at least locally common in the state and additional specimens have also been found in Bahia. [e.g., Mun. Apora, 31 km S of Olindina along highway BR-116, 310 m, 1 Apr 1976, *G. Davidse et al. 11758* (ASU)].

The anthers of *Campomanesia viatoris* anthers are unusually elongate and similar to those of *C. laurifolia*. This unusual shared anther morphology may indicate an interesting pollination mechanism deserving more careful study.

DISCUSSION

Phytogeographic analysis of species of Myrtaceae is greatly hampered by the difficulty in identifying material, due to the fact that American species of Myrtaceae often are very similar in the majority of their characters (McVaugh 1968), and because of the cryptic nature of the characters used to identify the genera (Landrum and Kawasaki 1997). Some floristic and/or phytosociological studies list great numbers of species or individuals of Myrtaceae, but authors often are unable to identify them to species or genus (e.g., Guedes 1992). In

a study of the flora of Atlantic rainforest, Myrtaceae are cited as the family with the greatest number of unknown specimens (Siqueira 1994).

Ecological studies of the Northeast of Brazil will require many more specialists to identify the great number of collections unknown to species, genus, or even family (Siqueira, 1994). Three conditions need to be improved: **1)** there needs to be more collecting in general as this paper demonstrates; **2)** monographers must study the flora of the Northeast and include specimens from the regional herbaria; and **3)** there should be a greater investment in training more specialists.

The absence of reports of *Campomanesia* in Sergipe in Landrum's 1986 revision of the genus reflects the low sampling effort in the state until recently. It is still difficult to describe the distribution of the species in the state because they are known from so few collections. The present study indicates the existence of a flora that is still relatively unknown in the fragments of Atlantic rainforest in Sergipe and indicates the importance of the exploration and conservation of these areas.

The sympatric occurrence of these four *Campomanesia* species in one fragment, the Mata do Crasto, in Santa Luzia do Itanhy, a coastal region in the south of the Sergipe, provides opportunities for more studies. These might involve the identification of possible differences between these four species in flowering and fruiting phenology, pollinators and fruit predators, and reproductive isolating mechanisms that may have led to speciation.

Finally, it is worth noting that even in regions with forest coverings insufficient to be registered in some national surveys, such as Sergipe, the forest remnants that do exist are the last representatives of an entire ecosystem, including plants, animals, fungi, and micro-organisms. These fragments, mostly of medium to small size, are the best possible estimation of the original ecosystem that will ever be available. Studies on the composition of these fragments can contribute to the preservation of that ecosystem at the regional level and will be useful for future reforestation programs. In order to avoid the drastic loss of large portions of biodiversity, the establishment of reserves is necessary, at least for some of these fragments, and conservation management that includes corridors between fragments as well as the involvement of neighboring human communities in this process is desirable

BIOLOGICAL STATUS OF *HEDYOTIS NIGRICANS* VAR. *GYPSOPHILA* (RUBIACEAE) IN TEXAS

B.L. Turner

Plant Resources Center
University of Texas
Austin, TX, 78713, U.S.A.

Terrell (2001) presented a taxonomic study of the genus *Stenaria* (= *Hedyotis nigricans* and closely related cohorts, sensu Turner 1995). In this he recognized *H. nigricans* var. *gypsophila* as occurring in Trans-Pecos, Texas, citing among his "selected representative specimens" four sheets (cf. Fig. 1), two from Culberson Co., a north-south ridge of limestone outcrops extending for ca. 50 miles from near Van Horn, Texas to near the New Mexico border, and one from the same mountain range in closely adjacent Hudspeth Co.; the fourth collection (*Webster 4501*, MICH) was said to be from the "Madera Canyon" in igneous soils of Jeff Davis County.

Terrell distinguished *H. nigricans* var. *gypsophila* (Fig. 3) from the rest of his concept of the wide-ranging, highly variable *H. nigricans* by the following couplet:

1. Leaves more or less elliptical, 2.5–3.5(–4) times longer than wide; Mexico and south west Texas _____ var. **gypsophila**
1. Leaves usually filiform, linear, narrowly lanceolate, or oblanceolate, more than 4 times longer than wide; corollas 2–8 mm long _____ [var. **nigricans** and closely related cohorts]

Careful scrutiny of the above key will show that the only meaningful character used by Terrell to define his "var. *gypsophila*" is leaf shape. Indeed, Terrell, himself (2001), states that "the most conspicuous character [distinguishing between these elements] is the elliptical leaves on rather small plants...[and] I cannot find any other characters significantly different from var. *nigricans*..."

Regardless, I would like to place on record here that I take many, if not most, of the specimens cited by Terrell (2001) as occurring outside of the regional distributions of *H. n.* var. *gypsophila* (Turner 1995) to be misidentifications of *H. n.* var. *nigricans*, these but leaf and/or habital forms occurring among otherwise typical populations of var. *nigricans*.

This can be readily attested to by reference to the single sheet (*Webster 4501*) of *H. nigricans* var. *gypsophila* cited in the above introduction. A duplicate of this collection at SRSC (Fig. 2) is clearly linear-leaved and could not be identified as var. *gypsophila* by Terrell's key to varieties. Additionally, its habit and floral features do not conform to those of var. *gypsophila* as described by Turner (1995). Indeed, I have reexamined 200 or more specimens of *H. n.* var. *nigricans*

SIDA 20(1): 215 – 220. 2002

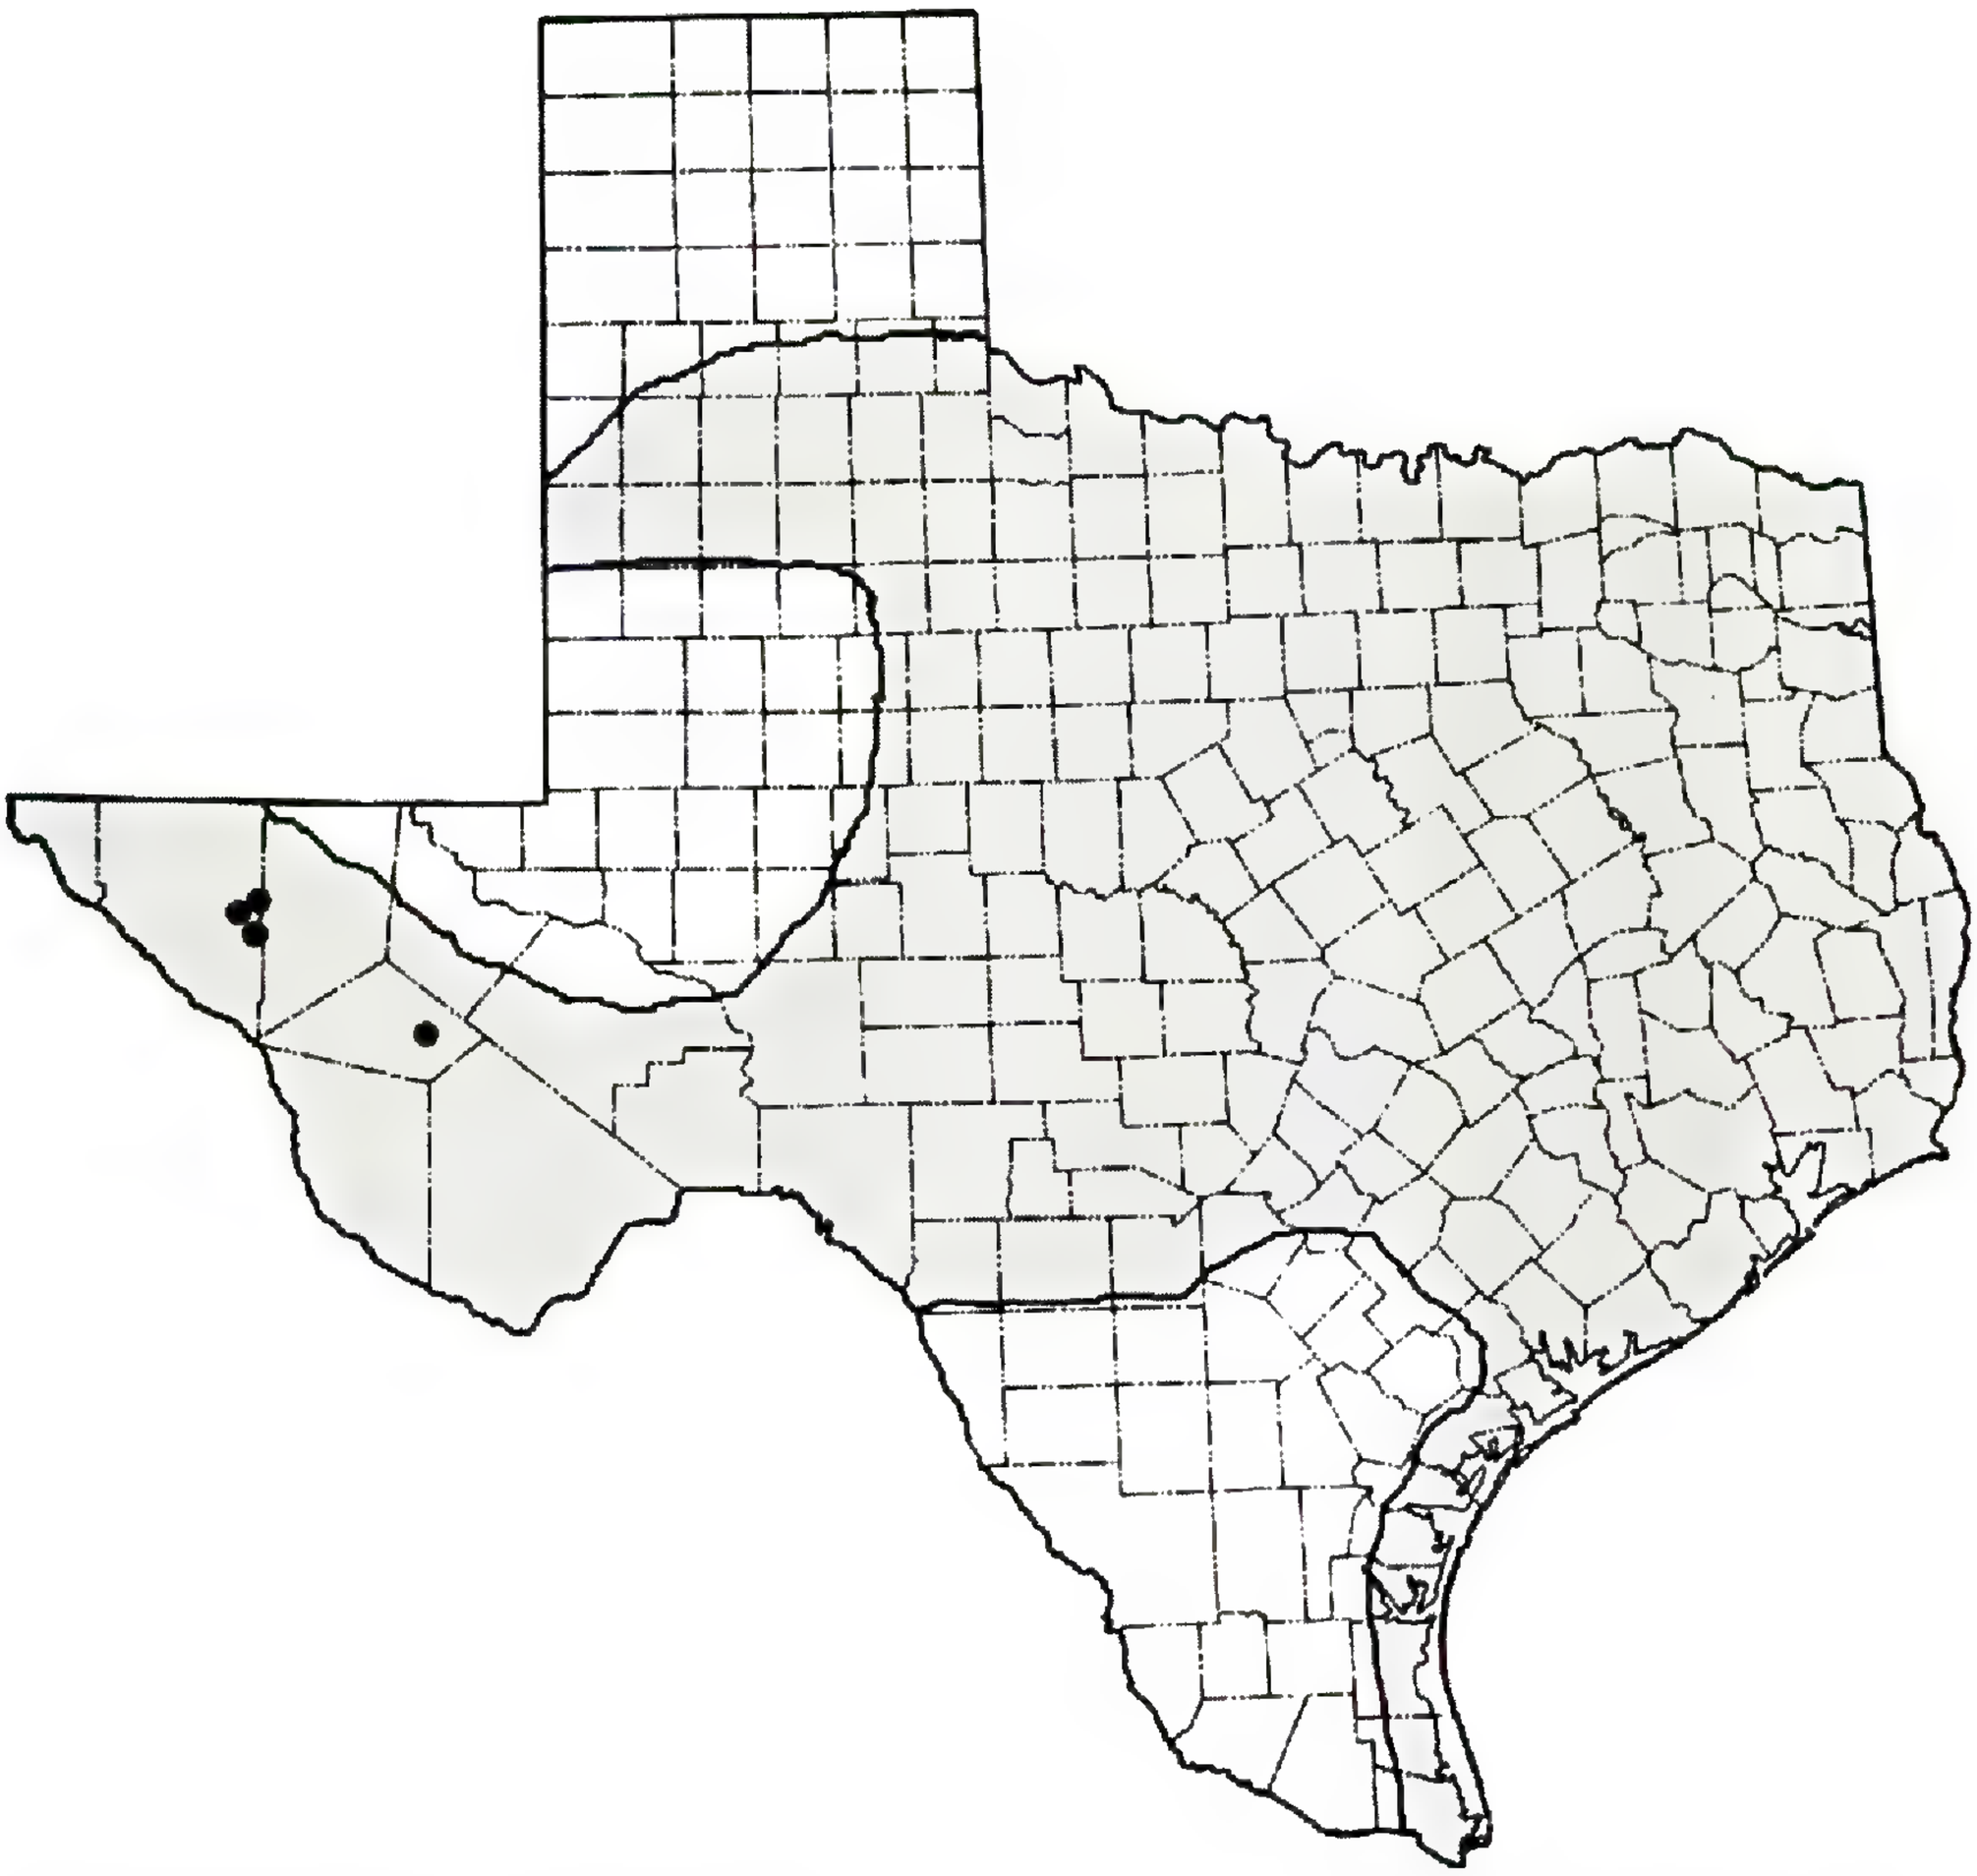

FIG. 1. Generalized distribution of *Hedyotis nigricans* var. *nigricans* in Texas (sensu Turner 1995); dots represent specimens of *H. nigricans* var. *gypsophila* cited by Terrell (2001); I take these to be atypical or misidentified specimens of *H. nigricans* var. *nigricans*.

from Trans-Pecos, Texas (LL, SRSC, TEX) and find not a single plant referable to *H. n.* var. *gypsophila*, including most of the specimens so cited by Terrell (2001).

He further ventures that "I [Terrell] consider the taxon as misnamed, as I recorded only one collection out of 49 Mexican collections from 19 herbaria that mentioned a gypsum substrate. It may be noted that the type specimen came from a gypsum habitat."

However, had Terrell examined the 49 sheets of this taxon on file at LL,TEX he would have found 12 sheets with labels noting their occurrence on gypsum substrates, and most of the rest from areas known to possess such soils. The truth is that most early collectors did not know the difference between gypsum substrates (CaSO4) and limestone substrates (CaCO4), or else they ignored such distinctions. The highly endemic flora occurring on gypsum substrates need

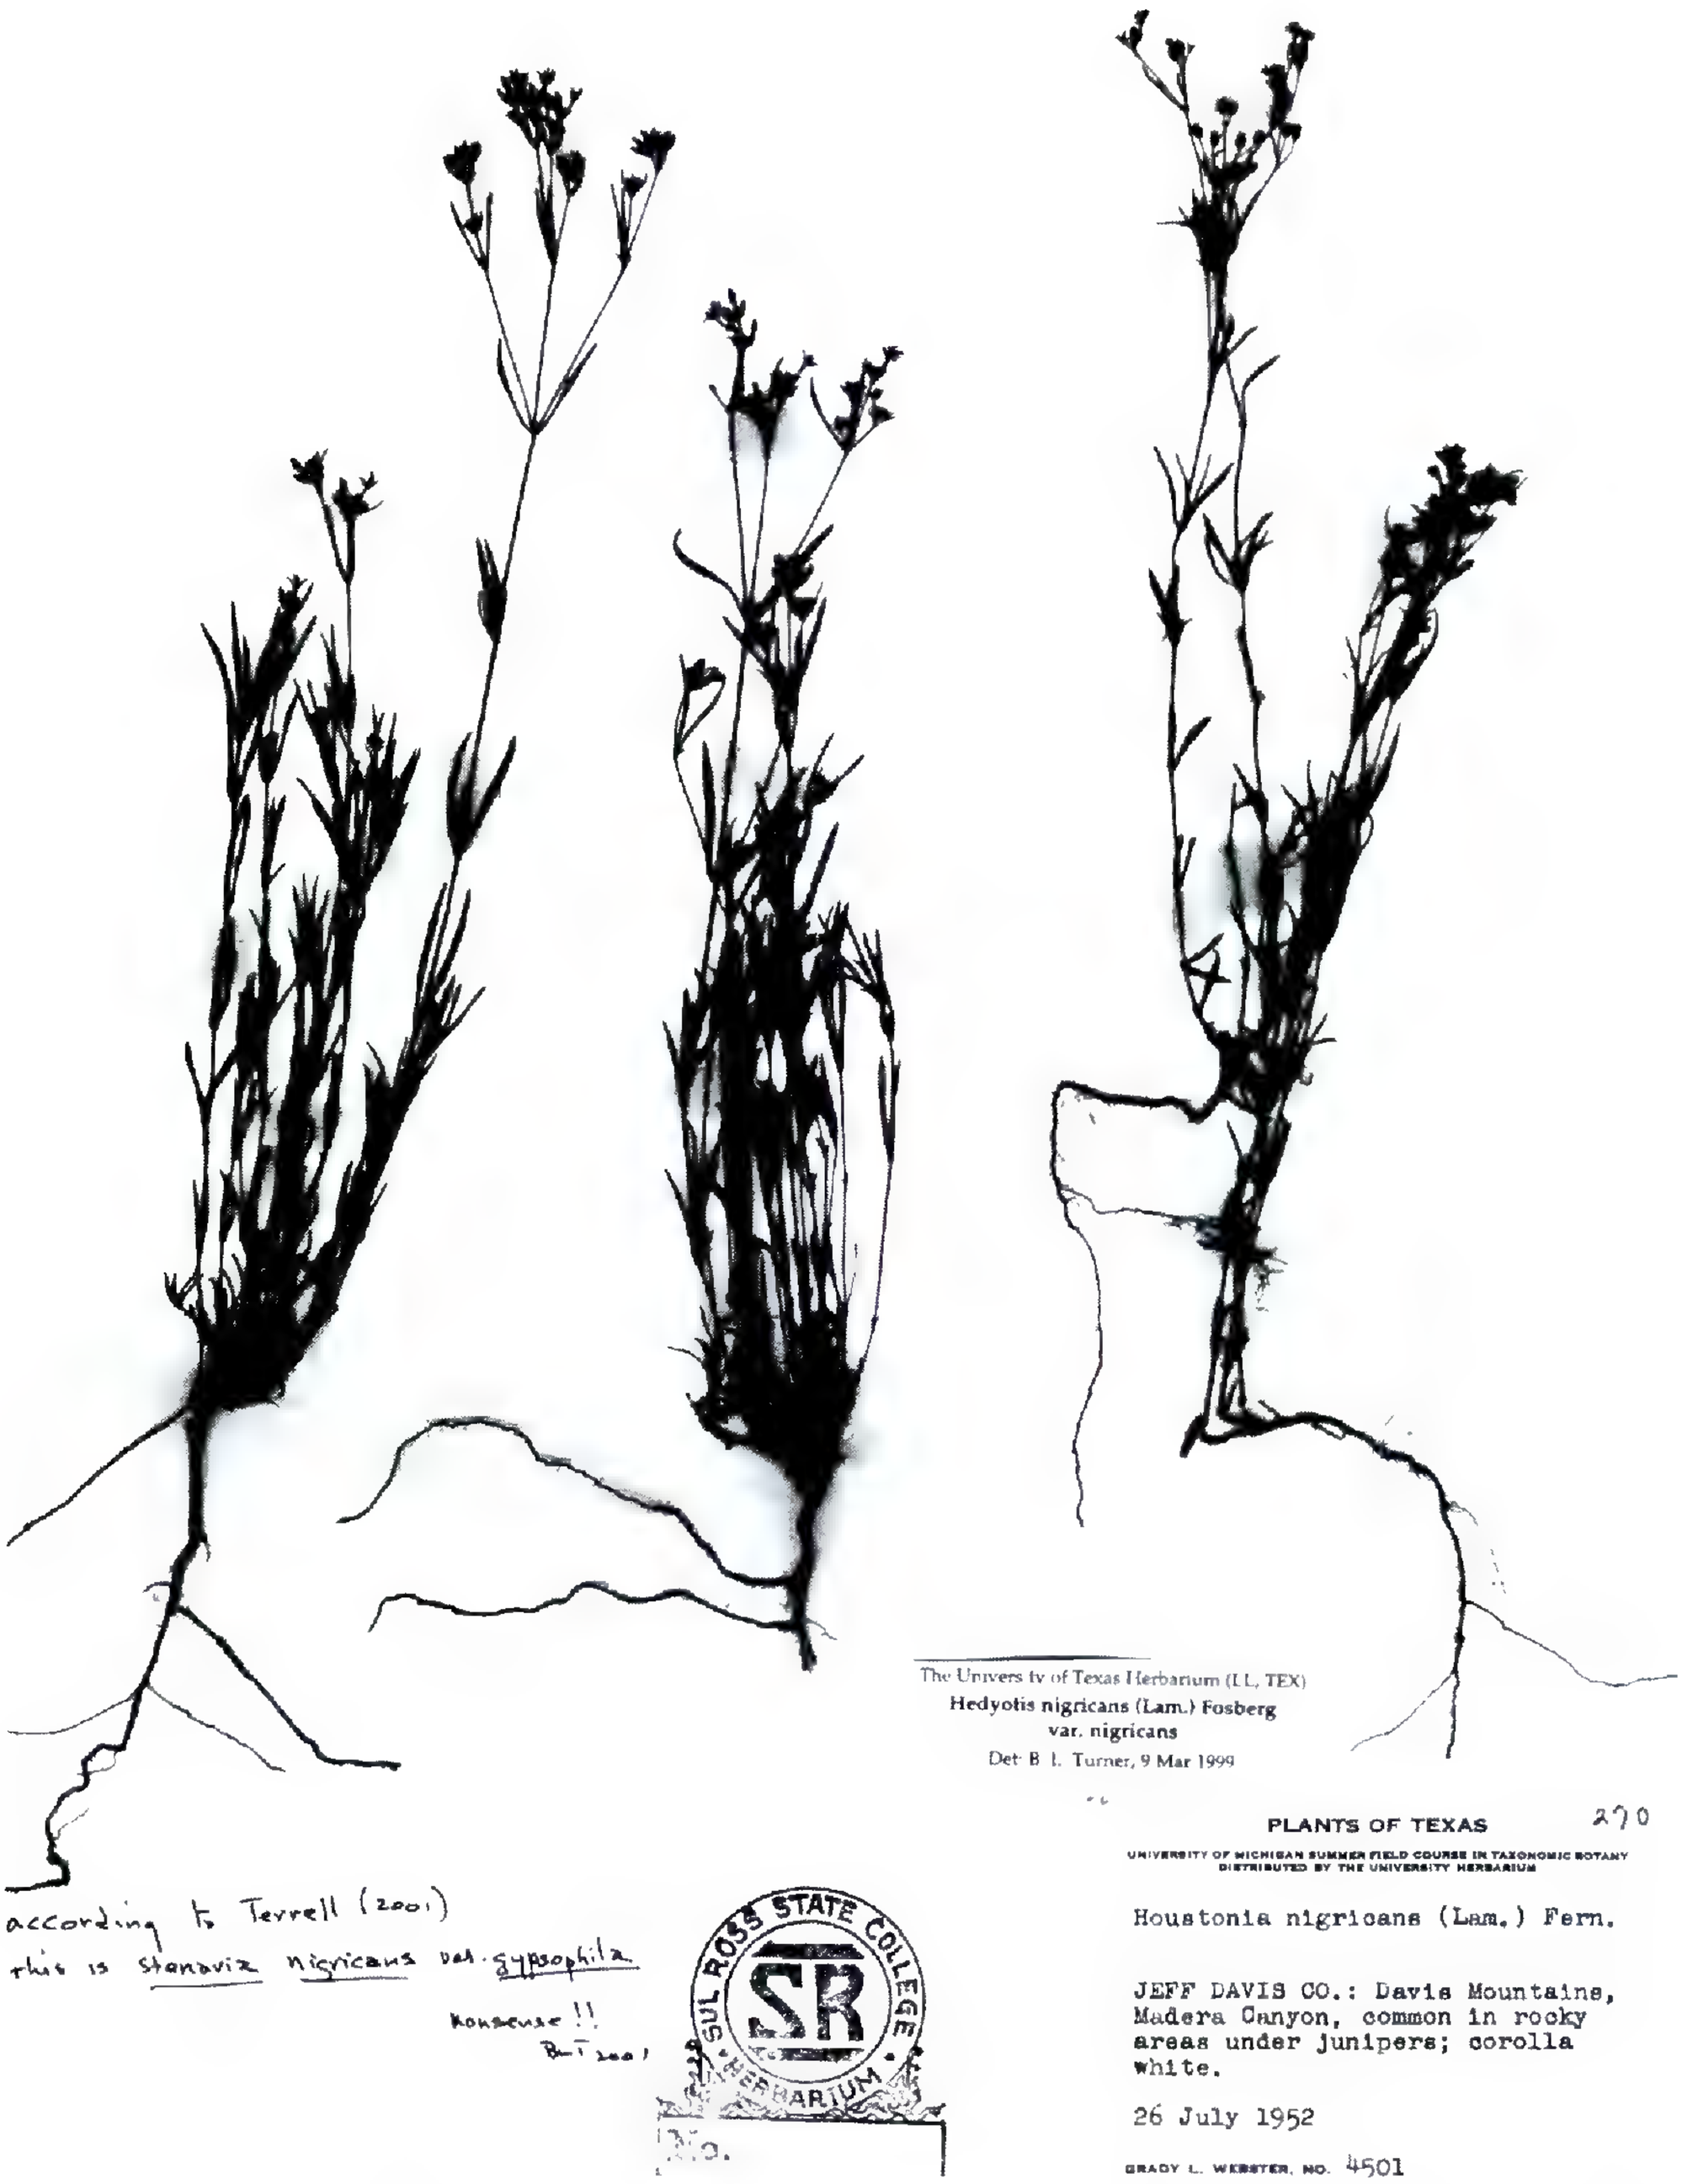

Fig. 2. ***Hedyotis nigricans*** **var.** ***nigricans*** **(sensu Turner 1995); duplicate of** ***Webster 4501*** **(SRSC); which Terrell recognized as** ***H. nigricans*** **var.** ***gypsophila*****. Holotype of the latter is pictured in Fig. 3.**

not be reiterated, this phenomenon being well documented by Powell and Turner (1977) and Turner and Powell (1979).

It should be noted that Terrell seemingly ignored my published comment (Turner 1993) that "This taxon [var. *gypsophila*] is represented by 45 or more

FIG. 3. Holotype of *Hedyotis nigricans* var. *gypsophila* (TEX); according to Turner (1995) populational units of this taxon are confined to mostly gypsum outcrops of southernmost Coahuila, Nuevo Leon, San Luis Potosi and closely adjacent southernmost Tamaulipas, Mexico.

collections at LL, TEX, mostly obtained from gypseous soils in the state of Nuevo Leon." This is not to say that occasional plants of var. *gypsophila* in north central Mexico might not approach var. *nigricans* in this or that character, but such "intermediates" do not occur in Texas. Indeed, var. *nigricans* can be found in relatively close proximity to var. *gypsophila* in Nuevo Leon without clear intermediates, the former occurring on calcareous soils (e.g., *Hinton* et al. *24351, 24575, 25940*, etc., all TEX), the latter on gypseous soils (e.g., *Hinton et al. 24373, 27183*, etc., TEX). In fact, my initial taxonomic sense was to recognize var. *gypsophila* as specifically distinct, but such treatment would deny the occasional intermediates, these mostly occurring in regions of near geographical contact.

It should be emphasized that var. *gypsophila* is distinguished from var. *nigricans* by more than habit, leaf shape and calyx vestiture. The upper leaf surfaces of the former are more nearly papillose; those of the latter having surface-sculpturing more like that of the epidermis of a peanut. In short, there are a syndrome of characters which provide for the recognition of both taxa, although the occasional plant from this or that population might lack one or another of the characters concerned.

Such identification problems are touched upon by numerous workers, including my own (Turner et al. 1988). Leaf shape and habit vary considerably among populations of var. *nigricans* in Texas. Thus, heavily browsed plants will appear much branched from the base, and newly produced basal shoots will possess somewhat broader leaves. No doubt such plants occasioned the attribution of var. *gypsophila* to Texas, and probably those Mexican collections cited by Terrell as occurring outside the distribution of var. *gypsophila* sensu the present author.

Finally, I can't help but note that I currently live among populations of *H. nigricans* var. *nigricans* in Trans-Pecos, Texas, and have examined numerous populations from throughout this region and nearly all consist of plants identifiable as var. *nigricans* as defined by both Terrell and myself, except as how one might let the occasional over-browsed plant cloud one's identification.

ACKNOWLEDGMENTS

It is a pleasure to acknowledge the input of two reviewers, Guy Nesom and Piero Delprete, whose comments greatly improved the present contribution.

ABSTRACT

Mitotic chromosome counts for *Stenanthium densum* and *S. leimanthoides* ($2n = 20$), reported here for the first time, match the number previously documented for *S. gramineum*, the only other species in this genus as recently recircumscribed based on molecular data. The significance of chromosome numbers in the Melanthiaceae, particularly as generic synapomorphies in tribe Melanthieae, is discussed.

RESUMEN

El recuento de cromosomas mitóticos de *Stenanthium densum* y *S. leimanthoides* ($2n = 20$), reportados por primera vez aquí, concuerdan con el número previamente documentado para *S. gramineum*, la única otra especie de este género recircumscrito recientemente basándose en datos moleculares. Se discute aquí el significado del número de cromosomas en Melanthiaceae, particularmente como sinapomorfías genéricas en la tribu Melanthieae.

The Melanthiaceae sensu the Angiosperm Phylogeny Group (APG 1998) comprise five tribes (11–16 genera; ca. 154–201+ spp.) of predominately woodland and/or alpine perennial herbs occurring mainly in the temperate to Arctic zones of the Northern Hemisphere (with one species of *Schoenocaulon* extending into South America; Zomlefer et al. 2001). Of concern here are two genera of the tribe Melanthieae, *Stenanthium* s.l. and *Zigadenus* s.l. As traditionally and broadly circumscribed, both genera form poorly defined complexes (summary in Zomlefer 1997). *Stenanthium* s.l. has sometimes been divided into two genera: a monotypic *Stenanthium* (*S. gramineum*) and *Stenanthella* (2–4 spp.); *Zigadenus* has a more complex taxonomic history involving several proposed segregates, although contemporary botanists have typically accepted only the monotypic segregate *Amianthium* with the remaining ca. 19 species maintained in *Zigadenus* s.l.

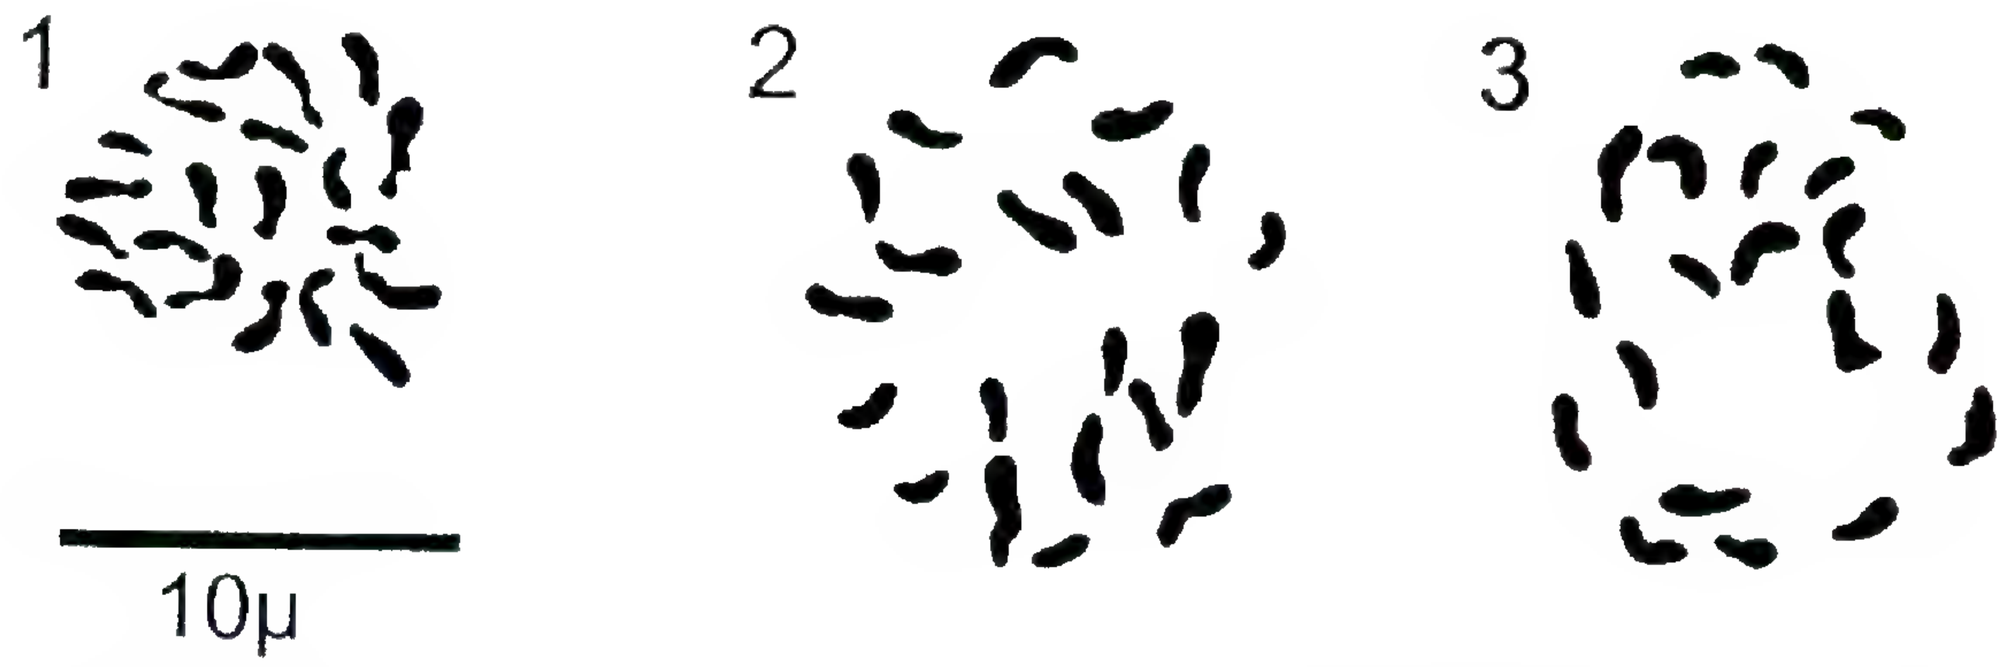
The circumscription and relationships of genera within the tribe Melanthieae were recently evaluated using parsimony analyses of ITS (nuclear ribosomal) and *trnL-F* (plastid) DNA sequence data (Zomlefer et al. 2001). Based on the cladograms generated in this study, *Zigadenus* s.l. is polyphyletic and

SIDA 20(1): 221 – 226. 2002

Stenanthium s.l. is biphyletic, with *Stenanthium* s.s. and *Stenanthella* embedded within two different "*Zigadenus*" clades. In overview, the species of *Stenanthium* and *Zigadenus*, as traditionally circumscribed, form five strongly supported clades that correlate with distinctive geographical distribution, chromosome number, and certain morphological characters. The *Stenanthium* clade, comprising *Stenanthium gramineum* (*Stenanthium* s.s.), *Zigadenus densus*, and *Z. leimanthoides*, is defined by the morphological synapomorphies of a slender (cylindrical) bulb and one obscure (or lacking) gland per tepal. However, the chromosome number for this group, $2n = 20$, has been documented only for *Stenanthium gramineum* (Miller 1930; Satô 1942; as *S. robustum*, see Fernald 1946). Since chromosome number is a significant feature for genera of tribe Melanthieae, 20 was predicted as the likely mitotic count for the other two species now transferred to the recircumscribed *Stenanthium*, *Stenanthium densum* and *S. leimanthoides* (Zomlefer et al. 2001; Zomlefer & Judd 2002).

MATERIALS AND METHODS

Several plants of *Stenanthium densum* and *S. leimanthoides* were collected during April to June 2001 (see Table 1) and transplanted to pots maintained at the Plant Biology Dept. Greenhouse Facility at the University of Georgia and the Biology Dept. Greenhouse at High Point University. Dividing root tip cells were prepared for examination according to general protocols outlined by Flory and Smith (1980), Jones and Luchsinger (1986), and Smith (1984). Once the plants were well-established, actively growing root tips were harvested at noon and treated with 0.2 % colchicine for 4 hours, rinsed in distilled water, and then fixed in Carnoy's solution (3 ethanol: 1 acetic acid) overnight or longer. Following this fixation, the roots were rinsed in distilled water, hydrolyzed in 1.0 N HCl at 43° C for 25 minutes, macerated with a dissecting spatula on a glass microscope slide, and stained with 1% aceto-orcein. After application of a cover slip, the slide was gently heated with an alcohol lamp, placed between blotters, and subjected to additional pressure. Slides were mounted in euparal for future reference. Well-spread metaphase chromosomes were traced under a Leica DMLB Research Microscope with a camera lucida attachment. Herbarium specimen vouchers (Table 1) are deposited at GA.



RESULTS AND DISCUSSION

The mitotic chromosome number of $2n = 20$ for *Stenanthium*, as circumscribed by Zomlefer and Judd (2002), is verified for all species (Table 1, Figs. 1–3). Chromosome number is a useful taxonomic character for genera within tribe Melanthieae (see Fig. 4), especially the synapomorphic $2n$ numbers of 20 for *Stenanthium* and 22 for *Toxicoscordion*. A probable base chromosome number of $x = 8$ is often cited for the tribe Melanthieae (Sen 1975; Tamura 1995; Lowry et al.

TABLE 1. Distinguishing features of *Stenanthium densum* and *S. leimanthoides* (from Zomlefer 1997), and voucher specimens for the chromosome numbers reported in this study. Based on reports of morphologically intergrading populations in Mississippi (McDearman 1984), some authors (e.g., Sorrie & Weakley 2001) regard these taxa as conspecific. Despite some overlap in habitat, morphology, and phenology, Small (1903) considered these taxa as two separate monotypic genera (*Tracyanthus* and *Oceanoros*).

Taxon	Distribution, habitat, distinguishing characters, & phenology	Locality & collection number (voucher location)	Mitotic chromosome number (*2n*)
Stenanthium densum (Desr.) Zomlefer & Judd	se VA to e LA Flatwoods, bogs Plants delicate, racemes simple, flowers perfect Apr -May	FLORIDA. Franklin Co.: E side of FL 65, 1.1 mi N of Ft. Gadsden Creek, 4 Apr 2001 *Zomlefer 782* (GA)	20

1987; Zomlefer 1997), and multiples of this number (or perhaps of 4) are prevalent in the group (Fig. 4): *Anticlea* (which includes *Stenanthella*), *Schoenocaulon*, and sister groups *Amianthium* and *Veratrum* (including *Melanthium*). Unfortunately, due to the small chromosome size of members of the tribe (ca. 2.0–4.0 µm in length), the few karyotype studies (e.g., Lee 1985) are not detailed enough to infer a possible mechanism of chromosomal evolution, although the chromosome numbers (Fig. 4) indicate the prevalence of polyploidy and/or aneuploid variation. The functional outgroup for Melanthieae (see Zomlefer et al. 2001), *Z. glaberrimus* (*Zigadenus* s.s.), has an unpublished count of $2n = 52$, tentatively reported by Preece (1956). Probable base numbers for the other immediate outgroup taxa of the tribe Melanthieae (the remaining four tribes of the Melanthiaceae) are five and 15, respectively, for sister taxa Parideae

FIGS. 1–3. Mitotic chromosomes of the three species of *Stenanthium*, all *2n* = 20. 1. *S. gramineum* [modified from Satô (1942), Fig. 58]. 2. *S. densum* (*Zomlefer 782*). 3. *S. leimanthoides* (*Zomlefer 792*).

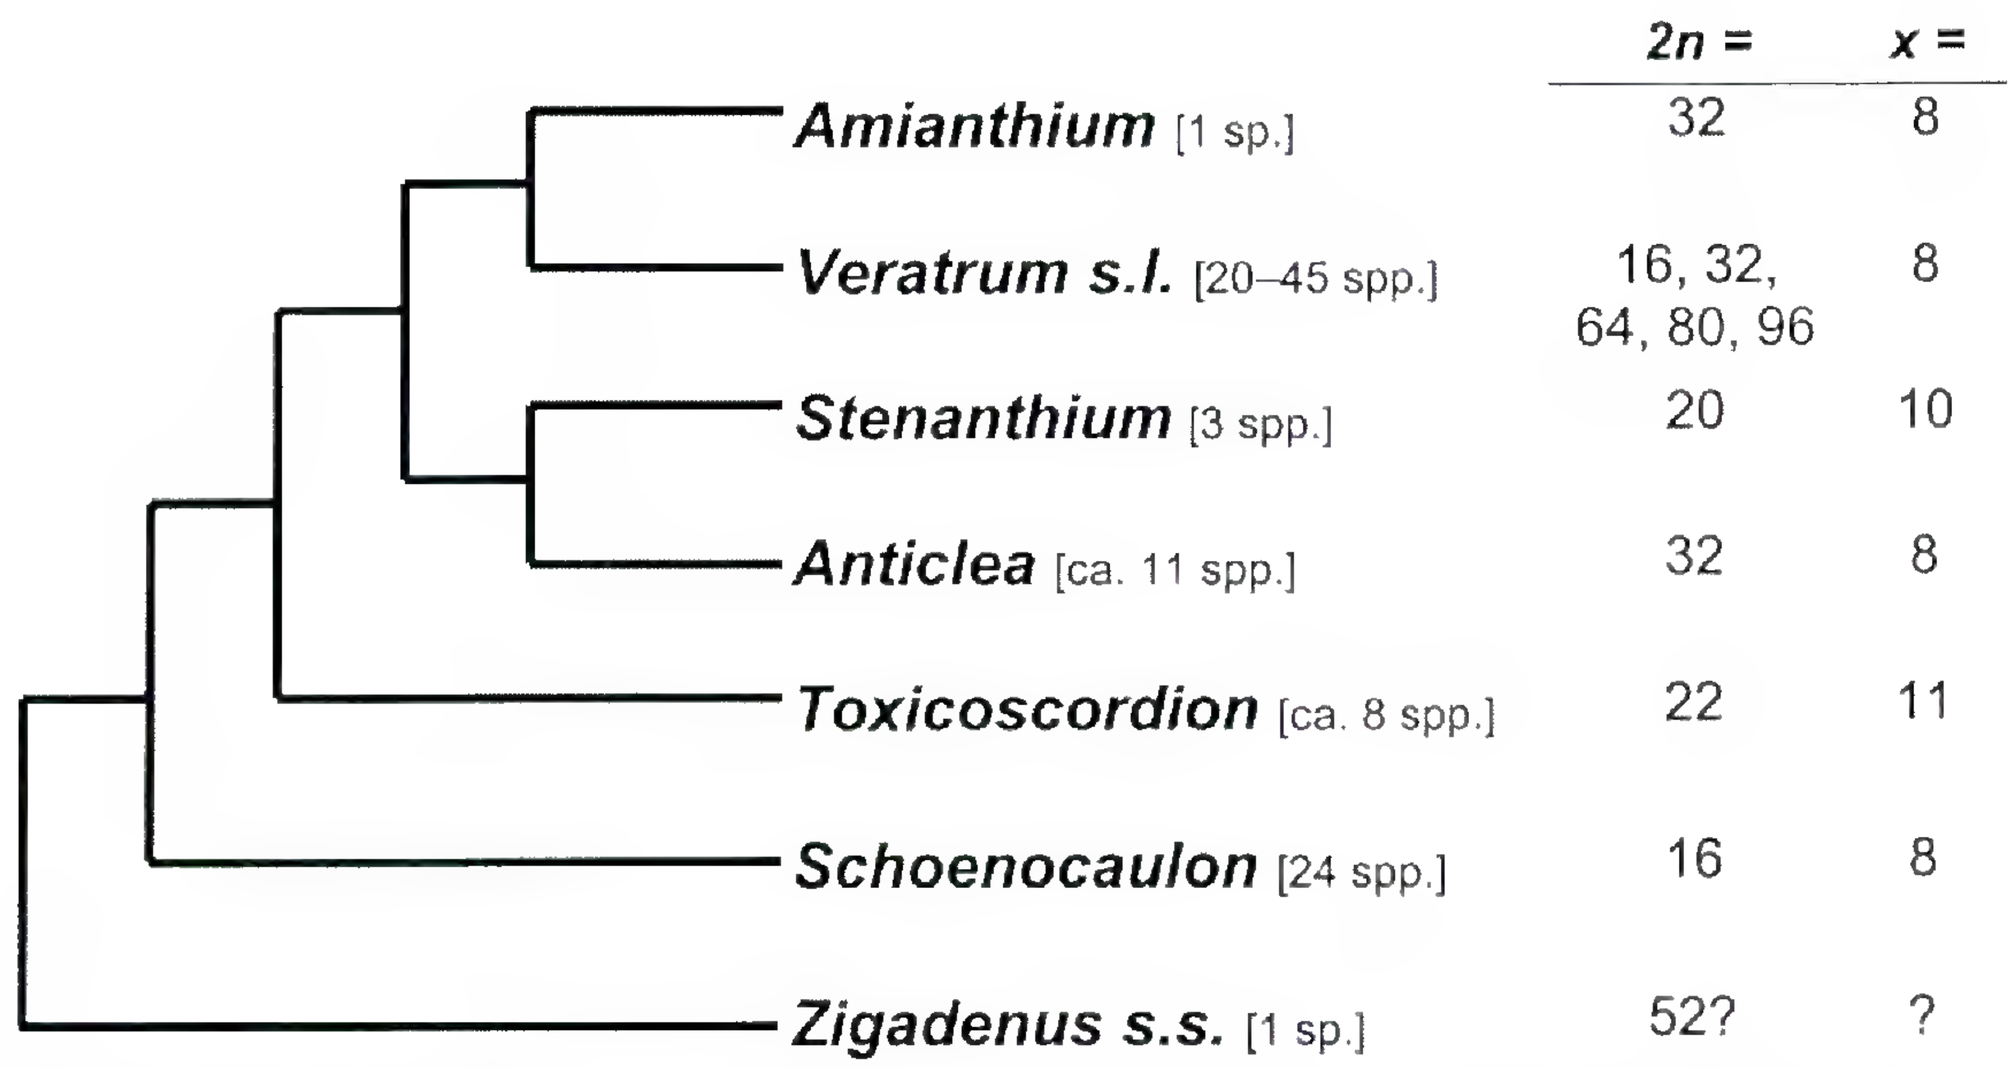

FIG. 4. Phylogenetic relationships and reported chromosome numbers for the genera of tribe Melanthieae. The cladogram, modified from Zomlefer et al. (2001), is based on ITS and *trnL-F* sequence data; chromosome numbers are from references summarized in Zomlefer (1997). As circumscribed here, *Amianthium*, *Stenanthium*, *Anticlea*, *Toxicoscordion*, and *Zigadenus* s.s. all contain species of the polyphyletic *Zigadenus* s.l. (Zomlefer & Judd 2002).

(Trilliaceae) and Xerophylleae, and 17 and possibly six, respectively, for sister taxa Heloniadeae and Chionographideae (Lowry et al. 1987; Zomlefer 1996, 1997).

Confirmation of the chromosome number for *Z. glaberrimus* (a possible polyploid) and the reassessment of the base number for the tribe merit further investigation (Zomlefer in prep.), especially in relation to the probable base numbers of the other tribes. Available data, however, already demonstrate that chromosome number strengthens support for the monophyly of *Toxicoscordion* and *Stenanthium*, as recircumscribed. Chromosome counts for the superficially similar plants in the Melanthieae validate chromosome number as a signifi-

cant character, useful for elucidating and predicting groupings and relationships. Variation in chromosome number has also proven phylogenetically significant in other monocot clades, such as *Polygonatum*/Polygonateae (Tamura 1993; Tamura et al. 1997a, b).

ACKNOWLEDGMENTS

Stephanie Bergamo, Richard Carter, Angus Gholson, Jr., David E. Giannasi, Mary Jo Godt, and Elissa Totin enthusiastically assisted WBZ in the field; S. Bergamo also shared her time and expertise with the laboratory work. We are grateful to Andrew W. Tull (Plant Biology Dept. Greenhouse Facility, University of Georgia) for maintaining plants collected in the field; Walter S. Judd and Douglas E. Soltis for helpful comments on the manuscript; and William Carromero for the Spanish translation of the abstract. Funds provided by the University of Georgia Department of Plant Biology financed the collecting trips associated with this project.

DOCUMENTED CHROMOSOME NUMBERS 2002: 2. CHROMOSOME NUMBERS IN NORTH AMERICAN SPECIES OF *CERASTIUM* (CARYOPHYLLACEAE)

J.K. Morton

Department of Biology
University of Waterloo
Waterloo, Ontario, Canada N2L 3G1

ABSTRACT

Chromosome numbers are reported for 85 collections of *Cerastium* (Caryophyllaceae) from continental North America belonging to 22 taxa. First published reports include those for *C. nutans* var. *objectum* Kearney & Peebles ($2n = 34$) and *C. texanum* Britton ($2n = 36$). First reports for material of North American origin include *C. bialynickii* Tolm. ($2n = 108$), *C. brachypodum* (Eng. ex Gray) B.L. Robinson ($2n = 34$), *C. dichotomum* L. ($2n = 38$), *C. diffusum* Pers. ($2n = 72$), *C. fischerianum* Ser. ($2n = 66$ & 72), *C. glomeratum* Thuill. ($2n = 72$) and *C. semidecandrum* L. ($2n = 36$).

RESUMEN

Se citan los números cromosomáticos de colecciones de *Cerastium* (Caryophyllaceae) de Norte América continental pertenecientes a 22 taxa. Entre ellos se encuentran los primeros recuentos de *C. nutans* var. *objectum* Kearney & Peebles ($2n = 34$) y *C. texanum* Britton ($2n = 36$). Primeros recuentos en materiales de origen norteamericano de *C. bialynickii* Tolm. ($2n = 108$), *C. brachypodum* (Eng. ex Gray) B.L. Robinson ($2n = 34$), *C. dichotomum* L. ($2n = 38$), *C. diffusum* Pers. ($2n = 72$), *C. fischerianum* Ser. ($2n = 66$ & 72), *C. glomeratum* Thuill. ($2n = 72$) y *C. semidecandrum* L. ($2n = 36$).

INTRODUCTION

The purpose of this paper is to put on record previously unpublished data on chromosome numbers in the species of *Cerastium*, both native and introduced, occurring in continental North America.

METHODS AND MATERIALS

Mitotic chromosomes were studied in root-tip preparations. Plants were raised in the greenhouse, either from seed or from material transplanted from the wild. Root-tips were taken from actively growing plants, prefixed for about one hour in a saturated aqueous solution of paradichlorobenzene and fixed in 1:3 glacial acetic acid and ethanol (absolute). They were hydrolyzed in N hydrochloric acid at 60°C for 10—15 minutes and squashed in aceto-carmine. In a few cases flower buds were used for counts of meiotic chromosomes. The buds were fixed in Carnoy's Fluid (acetic acid 1:chloroform 1:ethanol 3). Developing anthers were teased out and squashed in aceto-carmine or aceto-orcein. The cultivated plants were grown to maturity and voucher specimens taken for comparison with those collected in the wild. Voucher specimens are retained in the author's re-

SIDA 20(1): 227 – 231. 2002

TAB. 1. Chromosome numbers in *Cerastium*. Collection numbers prefixed with NA are J.K. Morton or J.K. Morton and Joan M. Venn collections.

search collections and partial sets of duplicates have been distributed to WAT, MICH, DAO and VDB. Collection numbers prefixed with NA are J.K. Morton or J.K. Morton and Joan M. Venn collections (Table 1).

DISCUSSION

Many of these chromosome counts confirm those from previous workers. However, the following appear to be the first published counts for their respective taxa: *Cerastium nutans* var. *objectum* - $2n = 34$ and *C. texanum* - $2n = 36$. That for *C. terrae-novae* - $2n = 108$, is the first definitive count for that species though Böcher (1977) reported a chromosome number of "lower than 72 (perhaps 68)."

The following chromosome counts appear to be the first published counts for North American material of these alien species: *C. dichotomum* - $2n = 38$, *C. diffusum* - $2n = 72$, *C. glomeratum* - $2n = 72$ and *C. semidecandrum* - $2n = 36$.

Amongst native species that also occur in other regions, that for *C. bialynickii* - $2n = 108$, is new. *Cerastium bialynickii* has not previously been reported from North America, having been originally described from Siberia, where it is reported to have a chromosome number of $2n = 72$. It is a very compact and hispid relative of *C. beeringianum* with obtuse sepals.

Also our count for *C. fischerianum* is the first from this continent. The presence of two different chromosome numbers in adjacent populations of this species is unusual. The differences appear to be genuine, for the preparations were carefully checked. The explanation may be that the population at sea level, with $2n = 66$, was growing in a weedy situation on mine tailings. As *C. fischerianum* frequently intergrades with *C. beeringianum* it is possible that these plants were of hybrid origin.

The count for *C. brachypodum* ($2n = 34$) is the first for North America, but Beaman et al. (1962) reported the same chromosome number in material from Central America.

ACKNOWLEDGMENTS

I am indebted to the following persons for their assistance in supplying seeds used in this research: L.C. Bliss, K.L. Chambers, W.J. Cody, R. Old, M.J. Oldham, D.J. Pinkava, S.S. Talbot, E.K. Winterhalder and the late G.L. Stebbins.

BOOK REVIEW

SALLY WASOWSKI. 2002. **Gardening with Prairie Plants: How to Create Beautiful Native Landscapes. Photography by Andy Wasowski.** (ISBN 0-8166-3087-9, pbk.) University of Minnesota Press. 111 Third Avenue South, Suite 290, Minneapolis, MN 55401-2520. (Orders: www.upress.umn.edu, 612-627-1932, 612-627-1980 fax). $29.95, 304 pp, 241 color photos, 335 figures, 8 1/2" × 11".

Most gardening books could be classified informative, educational and instructive. But rarely could a book on gardening be regarded as a page-turner. *Gardening with Prairie Plants* was such a pleasure to read that I had a hard time putting down. Wasowski begins her book by elaborating the on merits of gardening with native prairie plants and remarks "a prairie landscape can also be eye-poppingly gorgeous!" I would characterize this book in a similar light.

Gardening with Prairie Plants is generally divided into three main parts: I. Prairies and Prairie Gardens, II. Design, Installation, and Maintenance, and III. Plant Profiles. The first part defines a prairie, where prairies are located in North America and how prairies vary based on geography. The author follows with many examples of home prairie gardens, which perhaps are described better as testimonials to the advantages of native plant landscapes. Each one of these testimonials more or less describes how the homeowner installed and maintained their gardens, with a color photo and a figure of the landscape design to accompany the text. The next chapter, "Using Preserved and Replicated Prairies as Models", encourages the reader to determine the soil type for their proposed prairie plot and locate a nearby prairie example to model their garden by. Lowland, mesic, upland and sand prairies and savannas are all considered here.

Putting your newfound knowledge of prairies is put to work in Part II. The chapter entitled, "Designing Prairie Gardens", gives advice on planning your garden for your lifestyle and yard. This information is followed by clear and candid advice on garden installation, including preparing a seedbed, tilling and enriching the soil, collecting native seed and planting transplants. As well, readers will know exactly how to maintain their gardens with the author's advice on weed control, irrigation, prescribed burning and mowing. Conducting a safe controlled burn is considered in some detail, with an outline on the proper procedure.

The author's labor shines through in Part III, with the wealth of knowledge provided for each species included in the plant profiles. This part is divided into four chapters, which deal first with grasses, sedges and rushes, followed by warm season forbs, then cool season forbs and finally trees and shrubs. At the end of each chapter, a table is provided of all included species, which serves the reader in quickly identifying species that would grow best in their garden habitat. For each plant listed, information on common and scientific name, some diagnostic characters and habitat preferences are provided. Each species also has a map of its geographic distribution and many species have a lovely photo to accompany the description

To say that the illustrations and photographs in this book are lovely would be a mild understatement. Exquisite and inspiring are two terms that might do them justice. Hats off to Michael Parkey and Andy Wasowski for their illustrations and photographs, respectively. Their work is the eye candy of this treatise. A short glossary of prairie terms, a list of gardening resources listed by state and an index with common and scientific names concludes this book

In sum, this book would be of interest to anyone interested in native landscape gardening—homeowners, landscape architects, Master Gardeners and prairie plant enthusiasts. Those particularly interested in prairie restoration should not be without a copy of this book. It is pure pleasure to read.—*Amy Trauth Nare, Botanical Research Institute of Texas, Fort Worth, TX, 76102-4060, U.S.A., amy_trauth@yahoo.com*

USOS DE MELASTOMATACEAE EN EL ECUADOR

RESUMEN

Melastomataceae es una familia con aproximadamente 4500 especies distribuidas en los trópicos y subtrópicos, principalmente en América del Sur. En Ecuador se han registrado 43 géneros y 553 especies, de éstos, 24 géneros y 124 reportan alguna utilidad para el ser humano.

Según los registros de los herbarios QCNE y QCA y la literatura, las especies ecuatorianas de Melastomataceae son utilizadas principalmente para tratar heridas, picaduras de culebras y para construcciones. De las 124 especies útiles, 27 (21,8%) son alimenticias, especialmente debido a los frutos dulces y a los tallos agrios usados para calmar la sed; 32 (25,8 %) son utilizadas para tablas y construcción; 59 (47,6%) son medicinales; 8 (6,4%) son usados por los shamanes para aliviar algunas enfermedades físicas y espirituales; solamente 4 (3,2%) son ornamentales y 50 (40,3%) tienen otros usos, tales como cabos de herramientas, escobas, encofrados, forraje para animales, leña, tinciones, y como cercas vivas.

ABSTRACT

Melastomataceae is a family with about 4500 species distributed mainly in the tropics, especially in South America. There are 43 genera and 553 species registered for Ecuador. Based on the revision of herbarium specimens housed at QCNE, QCA and the literature, 24 genera and 124 species are registered as useful for humans. Of these, 27 (21.8%) are used as food due to the sweetish fruits and acidic stems, used against thirst; 32 (25.8 %) are used for construction; 59 (47.6%) are medicinal; 8 (6.4%) are used by Shamans for treating fisical and spiritual ailments; only 4 (3.2%) are ornamentals; and 50 (40.3%) have various uses, such us for tools handles, brooms, fuelwood, charcoal, dyes, and for living fences.

INTRODUCTION

El Ecuador incluye 553 especies (Renner et al. 1999) de las 4500 existentes en el mundo (Mabberley 1997). Registros de usos de Melastomataceae, junto con otras familias de plantas se han concentrado principalmente a áreas o a grupos étnicos determinados del país. Así, Cerón (1996) registra los usos de plantas del Parque

Nacional Machalilla (prov. de Manabí), Kvist y Holm-Nielsen (1987), basados en sus estudios en la comunidad indígena Cayapa (prov. de Esmeraldas) y en la literatura, describen rituales curativos y usos de plantas por comunidades indígenas de las tierras bajas. Para la región Andina, Kothari (1993) lista las plantas usadas por pobladores de La Esperanza, comunidad indígena Zuleta (prov. de Imbabura), Cerón (1996) reporta los usos de plantas de la Reserva Geobotánica Pululahua (prov. de Pichincha), Ríos (1993) lista las plantas de una comunidad mestiza del noroccidente de Pichincha, Elleman (1991) publica los usos maderables realizados por la comunidad Saraguro (prov. de Loja), y Cueva (1997) y Van den Eynden (1997) listan las plantas alimenticias de la provincia de Loja. Muchos otros trabajos etnobotánicos han sido realizados en comunidades indígenas de la Amazonía ecuatoriana, entre ellos podemos citar a Alarcón (1988), Cerón (1996), Cerón y Montalvo (1998), Lescure et al. (1987) y Vickers y Plowman (1984). A una mayor escala geográfica, Schultes y Raffauf (1990) presentan usos etnobotánicos de Melastomataceae y demás familias de angiospermas presentes en la Región Amazónica Nororiental.

La ausencia de publicaciones sobre los usos de la familia a nivel del Ecuador nos motivó a la recopilación de información sobre nombres vernaculares, usos actuales y potenciales de especies de Melastomataceae a partir de las etiquetas de especímenes depositados en los dos herbarios con mayor número de colecciones del país (QCNE y QCA).

METODOLOGIA

La información sobre usos de plantas se la obtuvo a partir de los especímenes con información etnobotánica depositados en el Herbario Nacional del Ecuador (QCNE) y herbario de la Pontificia Universidad Católica del Ecuador (QCA), ambos en Quito. De cada especimen se recopiló el nombre de la especie, el colector y número, el nombre vernacular e idioma (si presentes), y los usos. La determinación de los especímenes botánicos depositados en ambos herbarios fue realizada principalmente por Elvira Cotton (actualmente en el Herbario AAU, Aarhus, Dinamarca), especialista en Melastomataceae ecuatorianas quien residió en Ecuador por varios años. Información publicada en la literatura, y aquella producto de nuestra experiencia de campo también fueron incluídos en el presente trabajo. Datos sobre el número total de especies por género fueron tomados de Renner (1993) y Mabberley (1997), e información sobre el número de especies por género y su distribución en el Ecuador se obtuvo de Wurdack (1980), Renner et al. (1999) y Freire-Fierro (en prensa). El material examinado está listado en el Anexo, en el cual se incluyen a los autores de los nombres científicos.

Aciotis D. Don

Este género herbáceo incluye 13 especies, y en Ecuador se registran cuatro especies que se distribuyen principalmente en las faldas occidentales de la Cor-

dillera Occidental y en las faldas orientales de la Cordillera Oriental. *Aciotis rubricaulis*, una especie distribuída a ambos lados de la cordillera es utilizada para curar picaduras de culebras. Similar uso se registra para *Aciotis ornata*, especie que en Ecuador se distribuye únicamente en las tierras bajas al noroccidente. Cerón (1994) registra el uso de *Aciotis leoyara* (probablemente refiriéndose a *A. levyana* Cong., un sinónimo de *A. rubricaulis* [Freire-Fierro (en prensa)]) como antiofídica.

Arthrostemma Pavón ex D. Don

Este género arbustivo presenta siete especies, y solamente *Arthrostemma ciliatum* está registrada en el Ecuador, en donde se distribuye en la región costera, andina y amazónica. Esta especie es utilizada para curar la diarrea en niños y para curar dolores de garganta. Los tallos suculentos son un tanto acídicos y son generalmente utilizados para calmar la sed. Esta especie también podría ser utilizada como ornamental debido a su hábito trepador y flores de un vistoso color rosado.

Axinaea Ruiz y Pavón

Este género arbóreo o arbustivo consta de 30 especies, 10 de las cuales ocurren en los Andes del Ecuador. De éstas, *Axinaea affinis*, *A. macrophylla*, *A. quitensis*, y *A. sclerophylla* son utilizadas principalmente para la construcción y como combustible en calidad de leña y carbón. Un potencial uso del género sería como ornamental ya que las flores son bastante vistosas.

Dos especies de *Axinaea* son consideradas maderables, *A. macrophylla* por Cerón (1994) y *A. sclerophylla* (como *A. schlerophylla)* por Elleman (1991).

Bellucia Neck. ex Raf.

Este género arbóreo consta de siete especies, y solamente *Bellucia pentamera* está registrada en el Ecuador, en donde se distribuye en la Costa, Andes y Amazonía. La madera de esta especie es utilizada para la construcción. Los frutos, que nacen directamente de los troncos, pueden alcanzar hasta 10 cm de diámetro, son comestibles y de sabor ligeramente dulce.

El fruto maduro de *Bellucia pentamera* (como *B. weberbaueri* Cogn.) es comestible para los Kichwas (como Quichuas) de la Amazonía Ecuatoriana (Alarcón 1988, Lescure et al. 1987) y por colonos mestizos de la comunidad Ahuano (provincia del Napo) (Ríos y Caballero 1997). El nombre *Bellucia axinthera* (probablemente refiriéndose a *B. axinanthera* Triana, un sinónimo de *B. pentamera)* es listado como alimenticio por Cerón (1994).

Blakea P. Browne

Este género arbustivo incluye 100 especies, 31 de las cuales ocurren en el Ecuador, en donde se distribuyen en la Costa, Región Andina y Amazonía. *Blakea bracteata*, *B. glandulosa*, *B. involvens*, *B. punctulata*, *B. rosea*, y *B. subconnata* son utilizadas para tratar heridas, picaduras de culebras, y prevenir ampollas. También son utilizadas para curar el "enduendado" [hechizo] y para la construcción de casas.

Especies de este género también tienen gran potencial ornamental, especialmente para reforestar parques y avenidas debido a que sus flores son bastante llamativas, puesto que existe un contraste entre los pétalos, generalmente rosados, con los estambres y estaminoides que son de un amarillo dorado.

El espécimen *Vickers* y *Plowman* 255 (QCA) listado como "*Blakea* aff. *ciliata* Mgf. or *B. rosea*" por Vickers y Plowman (1984), y como *B. rosea* por Lescure et al. (1987), es conocido por los Siona-Secoyas como "Yayurua" y es utilizado para tratar quemaduras. *B. sawadae* es utilizada por los Cofanes como medicinal (Cerón 1994). *B. portentosa* Wurdack es conocida por los Huaoranis como "Namuntaqui" y tiene frutos que son consumidos por aves pequeñas (Cerón y Montalvo 1998).

Brachyotum (A. DC.) Triana

Brachyotum es un género arbustivo de 58 especies, 21 de las cuales ocurren en el Ecuador, en donde se distribuyen únicamente en los Andes. Cinco especies, *Brachyotum alpinum*, *B. azuayense*, *B. ledifolium*, *B. rostratum* y *B. trichocalyx* son utilizadas para curar el catarro en los pollos, teñir, construír, así como para leña y escobas. Este género puede ser también utilizado como cercas vivas. Algunas especies de *Brachyotum* tienen potencial como ornamental ya que sus flores presentan generalmente cálices de un color rojo vivo y corolas morado oscuras (e.g. *Brachyotum andreanum* Cogn.) o amarillas (e.g. *B. ledifolium*); sin embargo, las plantas tendrían que ser sembradas especialmente en lugares fríos ya que el género es típicamente de páramo.

Brachyotum ledifolium es utilizada medicinalmente por los Kichwas andinos (Cerón 1994) y como combustible y para escobas en la zona del Pululahua (Cerón 1996).

Clidemia D. Don

Este género arbustivo incluye 120 species, 38 de las cuales ocurren en el Ecuador, en donde se distribuyen tanto en la Costa, Región Andina como Amazonía. Las siguientes 14 especies son utilizadas: *Clidemia acostae*, *C. allardii*, *C. capitellata*, *C. crenulata*, *C. dentata*, *C. dimorphica*, *C. epiphytica*, *C. heterophylla*, *C. hirta*, *C. ostrina*, *C. purpurea*, *C. septuplinervia*, *C. sprucei* y *C. variifolia*. Estas especies son utilizadas para tratar heridas, úlceras, diarrea con sangre, así como para cicatrizar, calmar el mareo, y bajar la fiebre. Además, una de estas especies es utilizada por los shamanes para "asustar a los espíritus", especialmente los "malos" espíritus [entidades sobrenaturales que pueden hacer daño]. Debido a que las bayas son agri-dulces, éstas son utilizadas para calmar la sed. Muchas especies de *Clidemia* presentan formicarios en la base de las hojas o en los tallos y tienen asociación con hormigas, las cuales utililizan estas estructuras como sus nidos. Los formicarios tienen un sabor ácido debido a esta situación y son consumidos como alimento por algunos grupos étnicos de la Amazonía.

Clidemia dentata, conocida como "Paitzi", es utilizada por los Kichwas de

la Amazonía ecuatoriana para bajar la fiebre (como *Clidemia* sp., Alarcón 1988, Lescure et al. 1987). Los frutos de *C. dimorphica* y *C. sprucei* son comestibles para los indígenas Huaoranis (Lescure et al. 1987), y es también conocida como medicinal por los Cofanes (Cerón 1994). Los indígenas Kichwas y mestizos de la comunidad Ahuano (provincia del Napo), también consumen los frutos de una especie de *Clidemia* no determinada (Ríos y Caballero 1997). *Clidemia heterophylla* es listada como medicinal por Cerón (1994).

Conostegia D. Don

Conostegia es un género arbustivo de 43 especies, 16 de las cuales ocurren en Ecuador, en donde se distribuyen principalmente en la Costa, aunque también se han registrado especies para la Región Andina y la Amazonía. *Conostegia attenuata*, *C. centronioides* y *C. dentata* son utilizadas para curar enfermedades [no especificadas en las etiquetas].

Diplarpea Triana

Este género herbáceo o arbustivo tiene solamente una especie, la cual está presente en el Ecuador. *Diplarpea paleacea* ocurre en los flancos de la cordillera norte andina y es utilizada para tratar dolores de estómago.

Graffenrieda DC.

Este género arbustivo o arbóreo consta de 44 species, 11 de las cuales existen en Ecuador, y están distribuídas principalmente en la región andina. Dos especies del género, *G.* aff. *intermedia* y *Grafferieda* sp. son utilizadas en la construcción y como leña por los Huaoranis de Quehueiri-Ono (provincia del Napo) (Cerón y Montalvo 1998).

Henriettella Naudin

Este género arbustivo o arbóreo incluye 51 species, siete de las cuales se encuentran en Ecuador, tanto en las tierras bajas como en los flancos occidental y oriental de los Andes. De acuerdo a Ríos y Caballero (1997), el fruto de una especie no identificada es conocida como comestible por los pobladores Kichwas y mestizos de la comunidad de Ahuano (provincia del Napo).

Leandra Raddi

Este género arbustivo incluye 175 especies, 19 de las cuales ocurren en el Ecuador, en donde se distribuyen principalmente en la Amazonía, aunque también hay registros de la Región Andina y de la Costa. *Leandra caquetana*, *L. caquetensis*, *L. granatensis*, *L. secunda* y *L. subseriata*, son utilizadas como comestibles por sus frutos, y para curar ulceraciones de la piel. Los pequeños frutos carnosos son comidos por las aves.

Loreya DC.

Loreya es un género arbustivo que comprende 14 especies. De las cuatro especies ecuatorianas, una se distribuye en la Costa y las tres restantes en la Amazonía. De acuerdo a Lescure et al. (1987), los frutos de *Loreya spruceana* (bajo *L. collatata*

Wurdack) son comestibles. Estos frutos también son comidos por tapires y puercos salvajes (-bajo *L. collatata* -Schultes y Raffauf 1990).

Maieta Aubl.

Este género arbustivo incluye únicamente dos especies, y ambas se distribuyen en la Amazonía ecuatoriana. De éstas, *Maieta guianensis* es utilizada para tratar dolores estomacales, y de cabeza, mareos, y para cicatrizar heridas. Esta especie también tiene frutos carnosos que son comidos por las aves.

Meriania Sw.

Este género arbustivo y arbóreo consta de 74 especies, 27 de las cuales ocurren en el Ecuador. Una sola especie está registrada para la Costa y las restantes se distribuyen en los Andes. Los troncos de *Meriania tomentosa* son utilizados para la elaboración de carbón (Cerón 1996). Este género también tendría gran potencial para forestación de parques y avenidas por las vistosas flores. Aunque este último uso no se da en el Ecuador, en Colombia especies del género son utilizadas como árboles ornamentales de avenidas (D. Neill, com. pers. 2001).

La madera del "Quihle o Quishle blanco," una especie indeterminada de *Meriania*, es utilizada en la construcción por los Saraguros (Elleman 1991).

Miconia Ruiz y Pav.

Miconia es el género más grande de la familia, incluye aproximadamente 1000 especies, 240 de las cuales están registradas para el Ecuador. La mayoría de especies son andinas, aunque también ocurren en la Costa y en la Amazonía. La alta diversidad de especies es acompañada por la diversidad de usos de especies de *Miconia* en el Ecuador. En los herbarios revisados se tienen registradas como medicinales a las siguientes especies: *Miconia affinis, M. barbinervis, M. bracteolata, M. bubalina, M. crocea, M. erioclada, M. goniostigma, M. gracilis, M. lugonis, M. nervosa, M. paleacea, M. papillosa, M. procumbens, M. theaezans, M. trinervia, M. triplinervis, M. venulosa*, y *M. zubenetana*, las que son utilizadas como vermífugo, para estimular las dilataciones durante el parto, curar dolores de garganta y del cuello, tratar la tuberculosis, dolores de muelas, infecciones bucales, micosis, sarnas y para curar diarrea de niños recién nacidos, e inclusive pueden ser utilizadas como antídoto de picaduras de la hormiga "Conga" (*Paraponera* spp.) (ver Cerón 1994, 1996, Cerón y Montalvo 1998; Schultes y Raffauf 1990). *Miconia bubalina* (como *Miconia* sp.) es utilizada por los Kichwas de la amazonía para tratar pequeños abcesos (Alarcón 1988; Lescure et al. 1987).

La madera de *Miconia aeruginosa, M. astroplacama, M. aureoides, M. brachycalyx, M. bracteolata, M. bubalina, M. caelata, M. corymbiformis, M. crocea, M. decurrens, M. floribunda, M. lutescens, M. matthaei, M. napoana, M. obscura, M. ochracea, M. paleacea, M. papillosa, M. pustulata, M. salicifolia, M. splendens, M. subspicata*, M. *theaezans*, y *M. tinifolia*, es utilizada principalmente para construcción, para fabricación de herramientas, producción de carbón y como

combustible (Ver Cerón 1994, 1996; Cerón y Montalvo 1998; Cueva 1997; Elleman 1991; Van den Eynden 1997; Lescure et al. 1987; Schultes y Raffauf 1990; Vickers y Plowman 1984). De acuerdo a Cerón y Montalvo (1998), otra especie utilizada en la construcción y leña es *Miconia ternifolia* Triana, sin embargo, este nombre no está registrado en el Catálogo de Plantas Vasculares del Ecuador (Renner et al. 1999) ni en la base de datos TROPICOS (Missouri Botanical Garden 2002).

Si bien los frutos bacáceos de *Miconia* alcanzan hasta 1 cm de diámetro, algunos son dulces y comestibles, tal es el caso por ejemplo de *Miconia asclepiadea*, *M. aspergillaris*, *M. crocea*, *M. latifolia*, *M. ledifolia*, *M. lutescens*, *M.* cf. *splendens* y *M. theaezans* (Ver Cerón 1994, 1996; Cerón y Montalvo 1998; Cueva 1997; Van den Eynden 1997).

Los frutos de *Miconia bubalina*, *M. calvescens*, *M. cazaletii*, *M. centrodesma*, *M. cercophora*, *M. decurrens*, *M. nervosa* y *M. oraria* son comidos por aves (Ver Cerón y Montalvo 1998).

Algunas especies tendrían también potencial ornamental, por ejemplo, *Miconia crocea* tiene panículas de cerca de 20 cm de longitud con abundantes flores con pétalos blancos y estambres amarillos. Otra especie con potencial ornamental podría ser *Miconia salicifolia*, la cual se distribuye en la Región Andina y presenta arbustos con apariencia de candelabros debido a la densa y erecta disposición de los tallos y a la posición adpresa de las hojas, las cuales muestran la densa pubescencia ferruginosa-amarilla de su envés.

Los indígenas Kichwas de la Amazonía ecuatoriana utilizan una especie no determinada de *Miconia* conocida como "Chiquitapayansu" para tratar granos infectados (Alarcón 1988). La madera de *M. astroplacama* es utilizada por los Siona-Secoyas para pilares en construcción de casas (Lescure et al. 1987; Vickers y Plowman 1984). Los frutos de otra especie no identificada de *Miconia*, y conocida por los Kichwas como "Payanzo", son comestibles (Lescure et al. 1987). Los frutos de *M. ledifolia*, *M. lutescens* y dos especies no determinadas son comestibles en la provincia de Loja (Cueva 1997; Van den Eynden 1997). Cerón (1994) registra el uso de *Miconia crocea* en la medicina y *M. palacea*, *M. pustulata* y *M. theaezans* en la construcción. Elleman (1991) lista como maderables para los Saraguros a *M. caelata*, *M. corymbiformis*, *M. obscura*, *M.* cf. *tinifolia* y dos especies no identificadas.

Monochaetum (DC.) Naudin

Este género arbustivo incluye 45 especies, y solamente tres están registradas para el Ecuador, en donde se distribuyen en la región andina. *Monochaetum hartwegianum* es utilizado como ornamental y *M. lineatum* para leña. Esta última especie es conocida como maderable por los Saraguros (Elleman (1991).

Monolena Triana

Monolena es un género herbáceo de 10 especies, y únicamente *M. primulaeflora*

está registrada tanto en la Costa y Región Andina como en la Amazonía ecuatoriana. Esta especie es utilizada para tratar la gripe, dolores de estómago, parásitos intestinales, conjuntivitis, siendo además usada como antiofídica. Debido al sabor ácido de los pecíolos suculentos, esta especie también es utilizada para calmar la sed. *Monolena primulaeflora* podría ser explotada como planta de interior debido a que las hojas acaulescentes tienen pecíolos rojizos y suculentos, láminas variegadas y flores bastante llamativas.

Kvist y Holm-Nielsen (1987) mencionan que esta especie es usada por los Coaiqueres como vermífuga y que es fuertemente hemética, y Cerón (1994) la lista como laxante. Schultes y Raffauf (1990) registran el uso de la misma especie para tratamientos de mordeduras de serpientes en la provincia de Pastaza.

Mouriri Aubl.

Este género arbóreo consta de 81 especies, 10 de las cuales se han registrado para el Ecuador, en donde ocurren principalmente en la Amazonía. De las tres especies registradas como útiles, *M. oligantha* es utilizada como anticonceptivo y esterilizante; y los frutos de *Mouriri grandiflora* y *M. nigra* son comestibles. Su uso como comestible está registrado también por Cerón (1994).

Ossaea A.P. DC.

Ossaea es un género arbustivo con 91 especies, 20 de las cuales ocurren tanto en la Costa y Amazonía ecuatoriana como en los Andes. El Ecuador tiene cinco especies útiles: *Ossaea bracteata*, *O. laxivenula*, *O. micrantha*, *O. quadrisulca*, y *O. robusta*. Los herbarios estudiados registran que estas especies han sido utilizadas para bajar la fiebre y tratar la epilepsia. Los frutos están registrados como comestibles.

Una especie identificada como *Ossaea* sp. [muestra *Alarcón 34*] y conocida por los Kichwas de la Amazonía ecuatoriana como "Hagapania/Payanzo" es utilizada para tratar granos infectados y sarna (Alarcón 1988; Lescure et al. 1987). En realidad, este espécimen fue más tarde identificado como *Miconia affinis*.

Tessmanianthus Markgr.

Este género arbóreo neotropical incluye siete especies, de las cuales dos están registradas para la Amazonía ecuatoriana. Aunque no se estudió material de herbario de este género, Cerón y Montalvo (1998) indican que el fuste de *T. heterostemon* Markgr. es utilizado por los Huaoranis de Quehueri-Ono para la construcción y para leña.

Tibouchina Aubl.

Este género arbustivo incluye 240 especies. Solamente 14 especies están registradas para el Ecuador, las cuales se distribuyen principalmente en los Andes, aunque también existen especies en la Costa y Amazonía. Siete especies, *Tibouchina gleasoniana*, *T. grossa*, *T. laxa*, *T. lepidota*, *T. longifolia*, *T. mollis*, y *T. oroensis* son utilizadas para tratar cataratas, extraer sarcoma de los ojos, tratar dolor de muelas, para forraje de los animales, leña o uso ornamental.

Tibouchina lepidota es muy común en la región andina nor-oriental, y podría ser utilizada no solo como combustible, sino también como ornamental. Las inflorescencias están compuestas de grandes flores con colores blancos, rosados y fucsias y con estambres amarillos vistosos. Con la excepción de *Tibouchina oroensis*, las otras especies de *Tibouchina* ornamentales observadas en el Ecuador son importadas del Brasil (D. Neill, com. pers. 2001).

El uso como combustible de *Tibouchina mollis* está registrado en Cerón (1994).

Tococa Aubl.

Tococa comprende cerca de 50 especies de plantas arbustivas usualmente mirmecófilas. Ecuador posee 12 especies distribuidas principalmente en las tierras bajas de la Amazonía, existiendo menos en la Región Andina y la Costa. *Tococa guianensis* es utilizada para tratar los granos infectados de la piel. Los especímenes examinados también registran que los frutos de *T. spadiciflora* y de *T. symphandra* son comidos por las aves. Aunque las etiquetas de los especímenes herborizados no lo registren, es posible que las pequeñas y vistosas bayas de otras especies de *Tococa* sean también comidas por aves.

Tococa guianensis (-erróneamente escrita "*Cococa*") es utilizada por los Kichwas de la Amazonía ecuatoriana para curar granos infectados y es conocida como "Payanshu" (Alarcón 1988), o como "Jatunpayanshu" (Lescure et al. 1987). Los frutos maduros de esta misma especie, bajo el sinónimo *Tococa chuivensis* Wurdack var. *ecuadorensis* Wurdack, son comidos por personas y por aves (Cerón y Montalvo 1998).

Triolena Naudin

Triolena es un género herbáceo de 22 especies, 11 de las cuales se encuentran en Ecuador, especialmente en las tierras bajas tanto de la Costa como de la Amazonía. *Triolena hirsuta*, *T. obliqua*, *T. pluvialis*, *T. pedemontana*, y *T. pustulata* son utilizadas en Ecuador como medicinales. Estas especies son utilizadas principalmente para tratar picaduras de culebras, reducir las subsiguientes hinchazones, y para tratar tuberculosis y tos.

Los Cayapas y Coaiqueres utilizan *Triolena* para tratar mordeduras de culebras, y los Siona-Secoyas usan *T. pluvialis* para tratar dolores de muelas (Kvist y Holm-Nielsen 1987; Vickers y Plowman 1984). Similar uso es dado para esta especie por los Kichwas de la Amazonía ecuatoriana (Alarcón 1988; Lescure et al. 1987) y por los Cofanes (Schultes y Raffauf 1990). Cerón (1994) también registra el uso medicinal de esta especie.

CONCLUSIONES Y DISCUSION

El presente trabajo se basó primordialmente en la compilación de la información de las etiquetas de dos herbarios ecuatorianos. Contrariamente a la opinión generalizada de que Melastomataceae no es una familia etnobotánicamente

TABLA 1. Porcentajes de especies por tipos de usos de las 124 especies de Melastomataceae utilizadas en Ecuador. Nota: El número total de especies (177) aparece mayor que el real (124) debido a que 46 especies tienen al menos dos usos.

Usos	Número spp. útiles	Porcentaje
Medicina	59	47,6
Otros	50	40,3
Construcción	32	25,8
Alimenticio	27	21,8
Mágico Religioso	8	6,4
Ornamental	4	3,2

importante (e.g. Schultes y Raffauf 1990), al menos una de cada cinco especies que ocurre en Ecuador tiene alguna utilidad.

Más de la mitad de los géneros registrados para el Ecuador son útiles, sin embargo, a pesar de que algunos géneros están presentes en el país y de ser citados en la literatura como útiles (e.g. *Adelobotrys* DC. y *Centronia* D. Don [Schultes y Raffauf 1990]), no registran uso alguno en Ecuador.

La mayoría de especies de Melastomataceae (Tabla 1) es utilizada medicinalmente, en segundo lugar está el uso para leña, carbón, alimentos de animales, tinciones, etc. [Otros]; una de cada cuatro especies útiles de la familia es usada en la construcción, menos del 22% de especies es utilizado en la alimentación, muy pocas especies son utilizadas en rituales mágico religiosos y solamente cuatro de las 124 especies es utilizada como ornamental. Según Schultes y Raffauf (1990), sin embargo, la única importancia económica que la familia tiene es por las especies ornamentales. Probablemente esta discrepancia se deba a que si bien en Ecuador Melastomataceae no es muy utilizada a nivel ornamental, este uso es común en otros países.

Debido a la diversidad de especies, *Miconia* es el género que mayor número de especies útiles presenta, principalmente en la construcción, medicina y usos varios. *Clidemia* es el segundo género más importante (14 especies útiles) y la mayoría de sus especies es utilizada en la medicina, aunque *C. crenulata* es también utilizada en ritos mágico religiosos. En tercer lugar están *Blakea* y *Tibouchina*, géneros con 7 especies útiles cada uno. Los otros géneros tienen de una a cinco especies útiles. A nivel de especies, *Miconia theaezans*, *Blakea subconnata*, *Miconia bracteolata*, *Miconia bubalina*, *Miconia crocea*, y *Ossaea micrantha* registraron el mayor número de usos, tanto en la alimentación, como en medicina y construcción.

A nivel de uso, *Arthrostema* y *Monolena* son los más utilizados para calmar la sed debido a sus hábitos suculentos y de sabor ácido; y *Bellucia*, *Henriettella*, *Mouriri*, y *Ossaea* son predominantemente usados como alimenticios debido a que sus frutos son relativamente grandes y bastante dulces. Las especies de

Axinaea, *Bellucia*, *Graffenrieda*, y *Tessmanianthus* son las más utilizadas en la construcción, especialmente debido al hábito arbóreo de las mismas. Más del 60% de las especies de *Aciotis*, *Arthrostema*, *Blakea*, *Clidemia*, *Conostegia*, *Diplarpea*, *Maieta*, *Monolena*, *Ossaea*, y *Triolena*, son utilizadas medicinalmente. A nivel mágico religioso, *Aciotis* es el más utilizado y menos del 50% de las especies de *Blakea*, *Clidemia*, *Conostegia*, *Miconia*, y *Ossaea* es también usado para este fin; ninguno de los otros géneros registrados para Ecuador es utilizado para el mismo propósito. De los 24 géneros usados en Ecuador, únicamente *Monochaetum* (*M. hartwegianum*) y *Tibouchina* (*T. gleasoniana* y *T. grossa*) son en la actualidad utilizados como ornamentales. Más del 55% de las especies de los géneros arbóreos y arbustivos *Axinaea*, *Brachyotum*, *Graffenrieda*, *Loreya*, *Meriania*, y *Tibouchina* es utilizado primordialmente para carbón, leña o por la fauna local como alimento.

De las 124 especies útiles, 13 de ellas (cerca del 10%) fueron citadas en la literatura pero no estaban representadas en los dos herbarios (Cerón 1994, 1996, Cerón y Montalvo 1998; Elleman 1991; Ríos y Caballero 1997), y de las 111 especies restantes, solamente 36 (32%) fueron citadas en estudios etnobotánicos anteriores (Alarcón 1988; Cerón 1994, 1996; Cerón y Montalvo 1998; Cueva 1997; Elleman 1991; Freire-Fierro en prensa; Kvist y Holm-Nielsen 1987; Lescure et al. 1987; Ríos y Caballero 1997; Schultes y Raffauf 1990; Van den Eynden 1997; Vickers y Plowman 1984). Esta compilación da una pauta sobre la necesidad de publicar información que de otra manera permanece restringida únicamente a los investigadores locales, quienes podrían darla a conocer a la comunidad internacional por medio de publicaciones similares en otras familias de plantas.

La información sistemática sobre usos de Melastomaceae podría servir de base por ejemplo, para la búsqueda de principios activos en las especies listadas como medicinales; o para la selección de especies para la construcción y ornato que mejor podrían crecer en determinada región geográfica; o para estudios ecológicos de las especies útiles endémicas, especialmente de aquellas amenazadas de extinción (Cotton 2000); para futuros planes de manejo sustentable y conservación. Adicionalmente, estudios etnobotánicos y de campo, enfatizados en la familia, podrían verificar los usos de Melastomataceae registrados aquí y en la literatura.

ANEXO

Material de Melastomataceae examinado en los herbarios QCA y QCNE. Usos: A = Alimenticio; C = Construccción; M = Medicinal; MR = Mágico-Religioso, O = ornamental; R = Otros. AGRADECIMIENTOS

Agradecemos a todas aquellas comunidades que desinteresadamente compartieron sus conocimientos con los colectores; a todos los colectores listados en el apéndice quienes registraron los usos de las plantas en sus etiquetas, especialmente a A. Barfod, C.E. Cerón, L. Ellemann, J. Jaramillo, L.P. Kvist y M. Ríos; al personal de los herbarios QCNE y QCA, quienes nos permitieron revisar las colecciones de Melastomataceae, especialmente a Mercedes Asanza, David Neill, Katya Romoleroux y Renato Valencia. David Neill y Rosa Ortiz-Gentry (Missouri Botanical Garden), Kevin Janni y un revisor anónimo, contribuyeron mucho para el mejoramiento del artículo gracias a sus comentarios en versiones anteriores. La primera autora agradece al Plutarco Naranjo de la Universidad Andina Simón Bolívar, por la oportunidad de presentar este trabajo en las II Jornadas Ecuatorianas de Etnomedicina realizadas en 1999, a FUNDACYT y al Missouri Botanical Garden por todo el apoyo logístico, y a Joseph C. Welling por toda su ayuda durante la recopilación de la información.

ABSTRACT

Gyrinops ledermannii (Thymelaeaceae) is identified as the tree involved in the eaglewood trade. Several taxa are currently being confused with *G. ledermannii* but the true eaglewood is readily distinguished by its floral characters.

INTRODUCTION

In recent years, a lucrative trade has emerged in the Hunstein subdistrict of East Sepik Province, involving a natural product commonly known as 'eaglewood' (Fig. 1). The newly established market is based on an arborescent species which accumulates aromatic oils in older wood. Demand for the fragrant wood can be likened to that for sandalwood, *Santalum* spp. (Santalaceae). However unlike sandalwood, the eaglewood essence appears to be a contingent response to injury or trauma, rather than a normal outcome of maturation. In its most desirable form, eaglewood becomes blackened by concentrated deposits of aromatic compounds, attracting prices of K800–1,000 per kg for the highest grades. Following separation of the oils, the fragrant extracts are currently used in the production of expensive incense and perfumes, for eventual purchase by Asian consumers.

Due to its recent appearance in commerce and unusually high value, eaglewood has become the focus of intense interest. Although the product is known primarily from lowland and low montane forest, there has been considerable uncertainty over the identity and number of species involved in the current trade. In an attempt to resolve the taxonomic issues, the eaglewood source areas near Ambunti township were visited by the authors in August 2001,

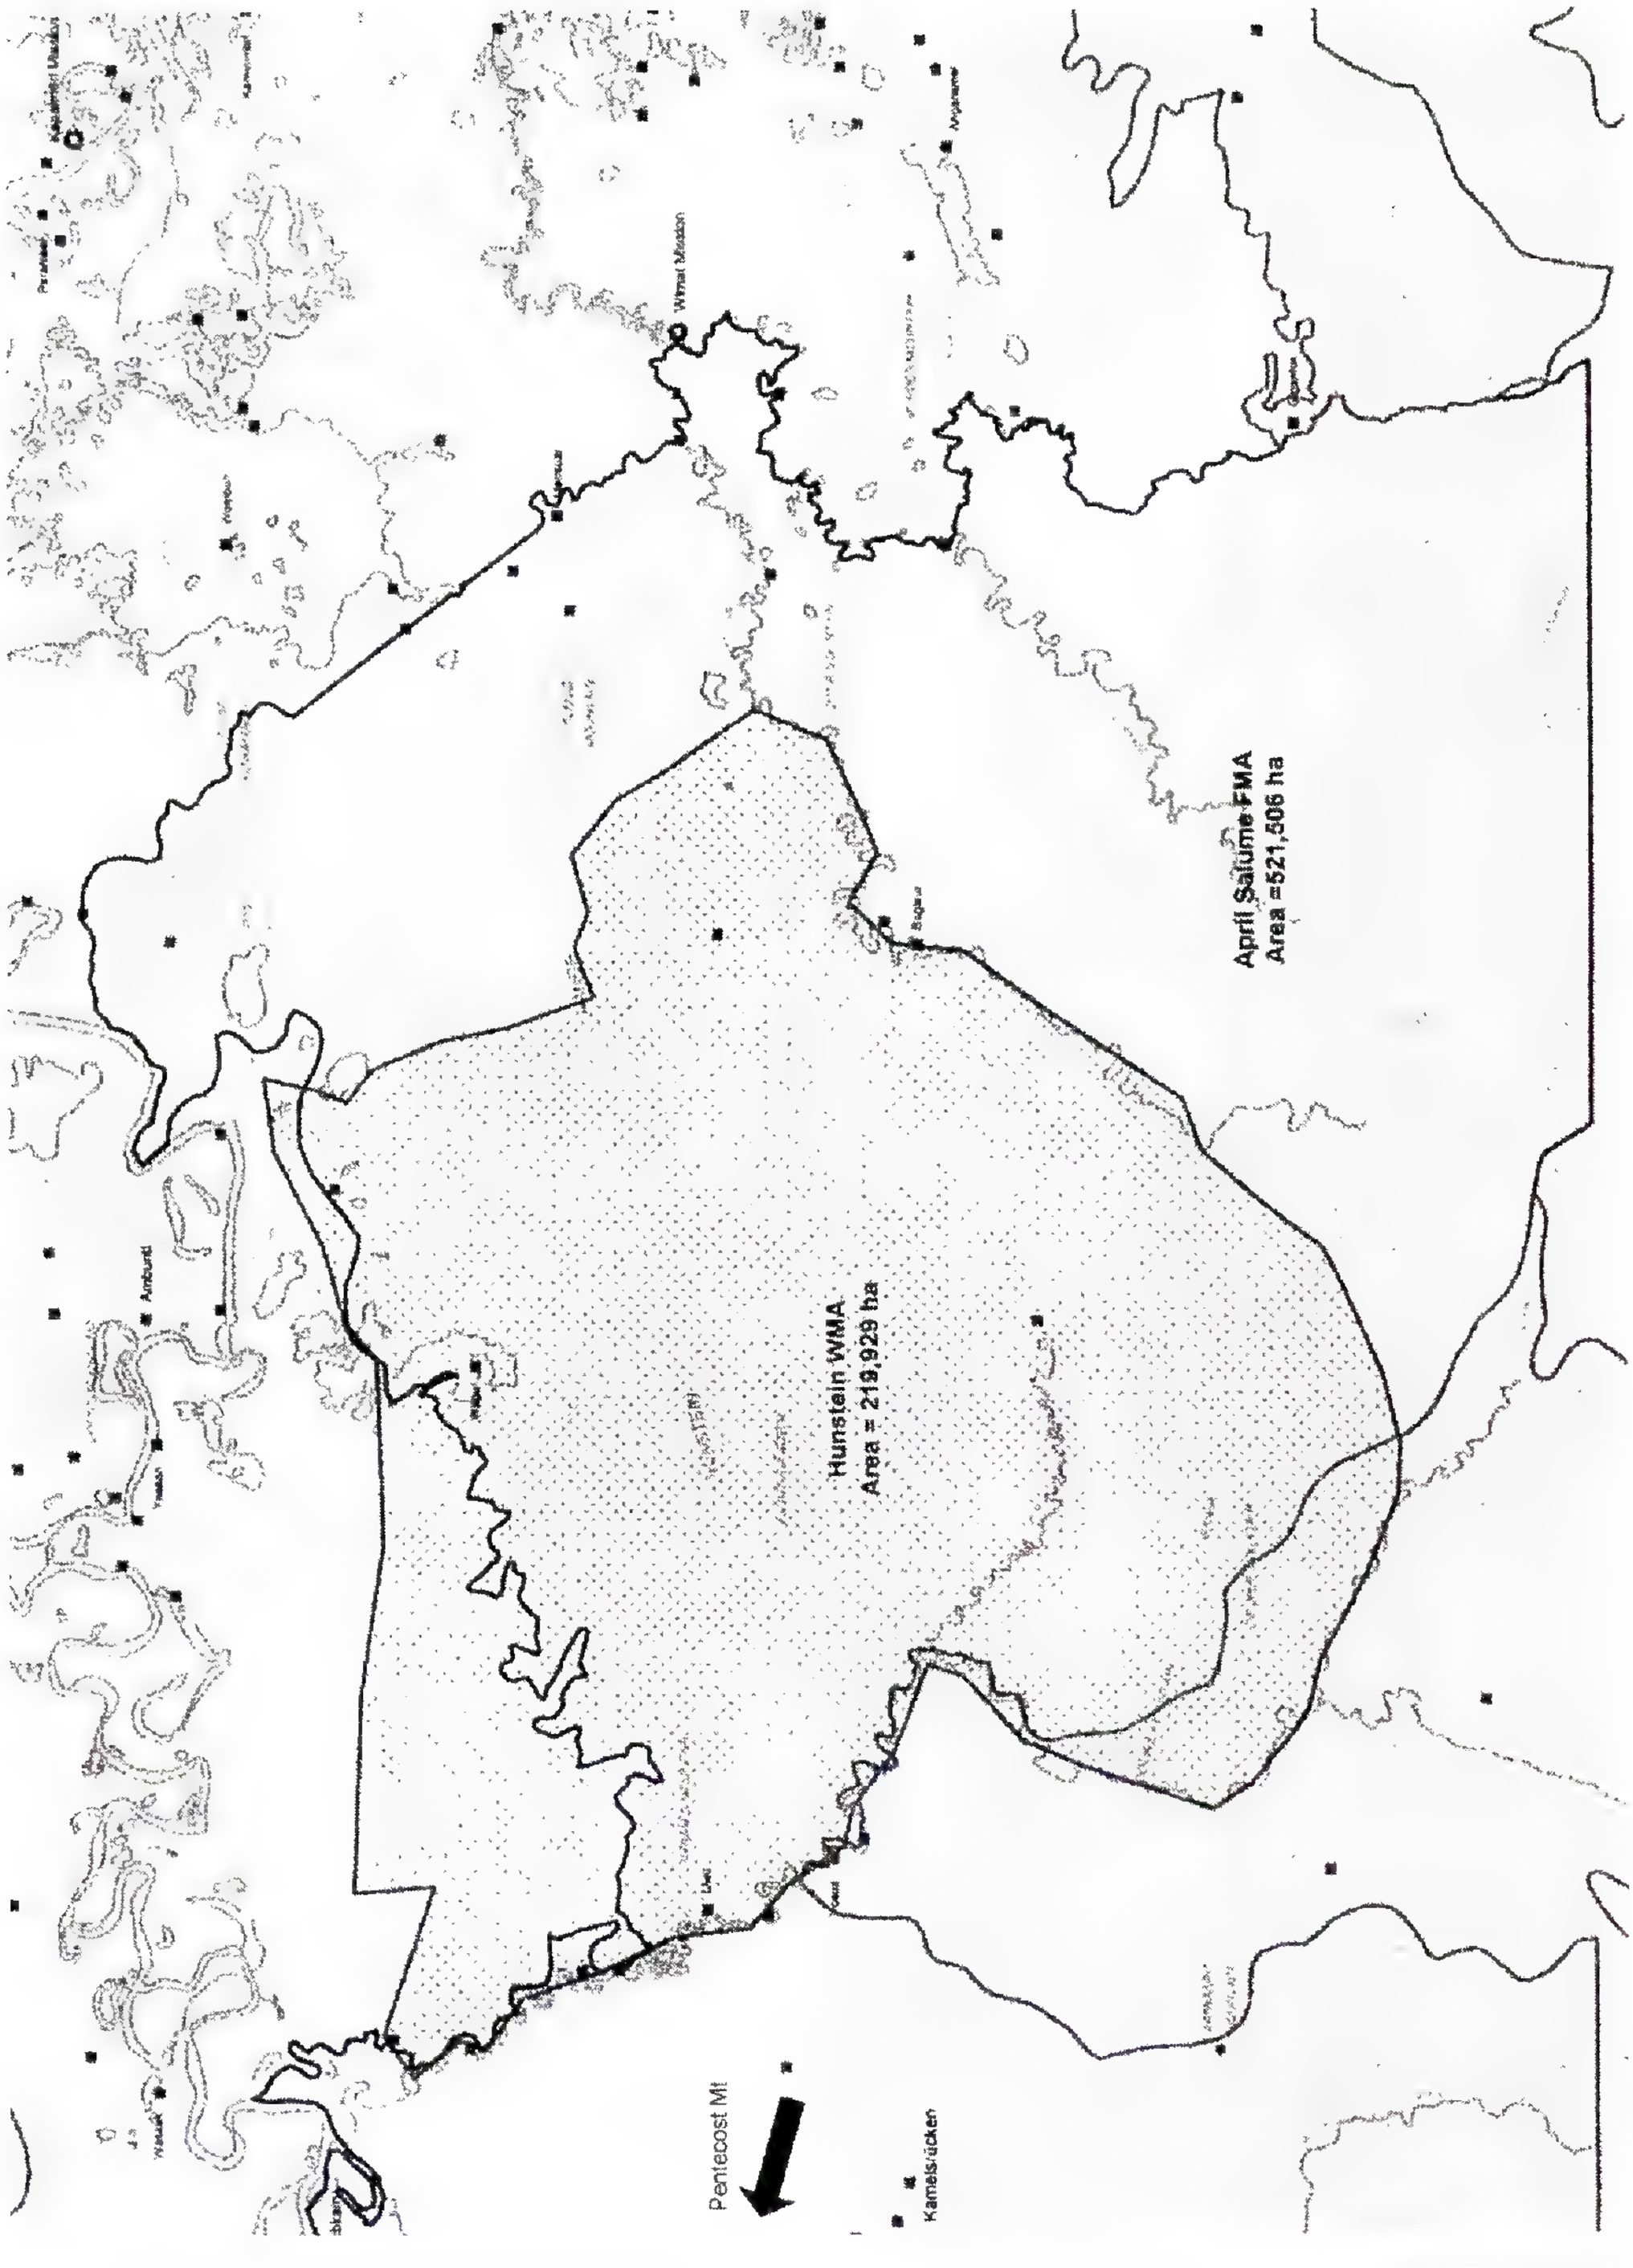

FIG. 1. Hunstein subdistrict, the principal geographic source for eaglewood. Most of the known populations are in the Hunstein WMA (dot stipling), but the distributional center for *Gyrinops ledermannii* probably lies further west. Gray shading indicates areas of closed canopy forest.

as part of a general floristic study of the upper Sepik. The following account presents the results of these investigations.[1]

TAXONOMY OF EAGLEWOOD

During the 1989 National Geographic Society expedition to Mt. Hunstein (cf. Bakker 1994; Sohmer et al. 1991), over 1,200 botanical specimens were obtained from areas where eaglewood is now harvested. Among the survey vouchers was *Takeuchi 4848* (A!, LAE!), collected from a tree described by village guides as having a fragrant black wood which could burn even when wet. This specimen was identified as *Gyrinops ledermannii* Domke on the original distribution (also confirmed in 1995, cf. annotation on the A duplicate), a species considered endemic to the upper Sepik and previously known with certainty only from the type gathering (*Ledermann 7401*; Pentecost Mt along the May River). The identification of the 1989 collection was facilitated by comparisons against two additional specimens obtained within the last 50 years, but the other reference materials have since disappeared from the Lae National Herbarium.

The Ledermann locality lies ca. 100 km WNW of the April River site designated as 'Kamelsrücken' (Samsai Mt) by early German explorers. Samsai villagers report that eaglewood is very common on the west-facing slopes of Kamelsrücken, in the direction of Pentecost Mt. Because the original specimen was taken from the May River, the local testimony implies that the distributional center for the species lies further to the west of existing production areas. The Hunstein populations are possibly only secondary occurrences.

Although Ledermann's type was lost in the 1943 destruction of Berlin Herbarium, the National Geographic survey voucher was unambiguously keyed to the given species using Ding Hou (1960). After eaglewood became a resource deserving of scrutiny, suspicion was thus directed to *Gyrinops* as the likely source for the new product.[2] However, in the absence of herbarium material specifically identified as eaglewood by local producers, it was difficult to be sure of the presumed correspondence. Especially as eaglewood was recently discovered in Jayapura (West Papua or Papua Barat, the former Irian Jaya), where it is there identified as *Aquilaria filaria* (Oken) Merr. (Thymelaeaceae), considerable confusion existed over the plant's identity.

A fertile collection taken during our Ambunti reconnaissance (*Towati & Golman 159*) was pointed out by village suppliers as an example of the tree harvested for the eaglewood trade. The Ambunti voucher includes both flowers and fruits, and its completeness leaves no room for doubt that *Gyrinops ledermannii* is the Hunstein eaglewood. In the Ambunti specimen, the pen-

---

[1]The original submission of this manuscript was made to another journal in 2001, but subsequently withdrawn.

[2]A similar conclusion and an extensive discussion of eaglewood has been independently reported by Zich and Compton (2001) wnile this paper was in submission.

tamerous flowers have the same number of stamens as calyx lobes, each stamen also alternating with a fimbriate petaloid appendage. This clearly eliminates *Aquilaria* from consideration, because in that genus the number of stamens is twice that of the calyx lobes (Ding Hou 1960). *Aquilaria filaria* is otherwise very similar to *Gyrinops ledermannii*, particularly in their shared characteristic of loculicidal capsules that develop by rupturing through one side of the corolla tube. It is easy to get the two species confused unless the flowers are carefully examined. Reports of eaglewood being present in West Papua, and its identification as *Aquilaria filaria*, need to be reevaluated. *Aquilaria* has thus far been recorded in New Guinea only from the Vogelkop region, so its alleged presence at other West Papuan localities such as Jayapura is not unreasonable. Due to the similarities between the respective taxa, it is entirely plausible that *Aquilaria* represents another source for eaglewood. However photographs of the Jayapura provenance taken by M. Golman are more suggestive of *Gyrinops ledermannii* than of *Aquilaria filaria* (Figs. 2, 3).

Uncertainty over the identification of eaglewood is also evident among local villagers searching for the plant. Thymelaeaceae is a prominent family in the Hunstein flora, with very close similarities among its representatives. Within the existing source areas, *Phaleria coccinea* (Gaud.) F.v.M. (Thymelaeaceae) is the species most often mistaken for eaglewood. In superficial aspect its inflorescence is comparable to *Gyrinops*, and the leaves are also of similar appearance, particularly with respect to venation. As with other members of the family, *Phaleria coccinea* has an extremely strong inner bark which is often used in the construction of white bilums (i.e., local netbags used as carry-alls) noted for their soft texture.

Due to the black color of the branchlets, *Diospyros papuana* Val. (Ebenaceae) is also mistaken by villagers for eaglewood, even though the differences in morphological aspect are rather obvious. For example, unlike eaglewood the leaf venation in *D. papuana* is bifacially prominulous, and the fruits are indehiscent and large. The flowers are also unisexual and dioecious, rather than bisexual. Table 1 summarizes some of the salient distinctions between *Gyrinops ledermannii* and the plants with which it is presently confused.

In addition to the problems caused by similarities with other taxa, *G. ledermannii* is highly variable and can exhibit considerable difference in leaf size between individuals. The collection from the 1989 survey has lanceolate blades averaging 5.0 × 2.5 cm but the more recent material has elliptic leaves ca. 19.5 × 6.5 cm. Presumably these distinctions are at least partly under environmental control, especially in view of the wide range of substrates comprising eaglewood habitat (cf. Takeuchi & Golman 2002:63–64; this issue). The nondescript nature of the vegetative characters also discourages effective identification of sterile plants, thus adding to the confusion.

FIG. 3. Flowering branchlet from the Jayapura population. The internal structure of the flower is critical to the proper identification of eaglewood. Photo by M. Golman, August, 2001.

TABLE 1. Comparative list of reproductive characters for *Gyrinops ledermannii* and the taxa with which it is confused in the field. Tokples names are provided with the village locality where the name originates. Voucher source: H&C = R. Hoogland and L. Craven, CSIRO survey from 1966; T – W. Takeuchi, Hunstein surveys from 1989, 1995.

Scientific name/Tokples name	Flower	Fruit
Gyrinops ledermannii Domke (Thymelaeaceae), may-hasei (Bugabugi, *T 15531*)	bisexual stamens same no. as calyx lobes; stamens included	small loculicidal capsule
Aquilaria filaria (Oken) Merr. (Thymelaeaceae), sp. not recorded from PNG	bisexual stamens 2 × no. of calyx lobes; stamens included	small loculicidal capsule
Phaleria coccinea (Gaud.) F.v.M. (Thymelaeaceae), wanyip or yaru (Wagu; *H&C 10371*); wonyip (Wagu; *H&C 10543*); winyap (Waskuk; *T 10193*)	bisexual stamens 2 × no. of calyx lobes; stamens exserted from floral tube	small drupe
Diospyros papuana Val. (Ebenaceae) manukway (Ambunti; *H&C 10214*); mankall (Waskuk; *T 10227*)	unisexual, dioecious stamens 3 4 × no. of calyx lobes; stamens included	large berry

DISCUSSION

Although the economic value of eaglewood affords the promise of substantial returns for stakeholders, high market prices clearly create incentives for overexploitation and eradication of natural populations. In order to ensure long-term viability of existing stocks, appropriate measures in resource management will eventually require enactment. However the present dearth of information on *Gyrinops ledermannii* will undoubtedly constrain its sustainable development. Even 90 years after its initial discovery, the plant remains poorly understood by botanical and forestry science. The demography, distribution, and ecology of *G. ledermannii* are unknown. This situation will require correction before eaglewood can be properly developed as an economic asset. There is also an obvious need for natural products research into the chemical principles which are responsible for eaglewood's desirable qualities. Depending on the nature of the resource, the species could conceivably serve as a valuable subject for silvicultural and natural products development.

ACKNOWLEDGMENTS

The authors express their appreciation to parataxonomist Ali Towati of Waskuk, for his assistance on the Ambunti reconnaissance. We also thank the Kokomo clan of Bugabugi for their goodwill and hospitality during our visits to the April River. Reviewers John Pipoly III (Fairchild Tropical Garden) and Kevin Janni (University of Hawaii) provided helpful comments on the manuscript.

BOOK REVIEW

T.M. Antonio and S. Masi. 2001. **The Sunflower Family in the Upper Midwest: a Photographic Guide to the Asteraceae in Illinois, Indiana, Iowa, Michigan, Minnesota, and Wisconsin.** (ISBN 1-883362-11-3, hbk.). Indiana Academy of Science, Indianapolis, in collaboration with Chicago Botanic Garden, Glencoe, IL, U.S.A. $50.00, 419 pp, numerous color photos, maps, 7" × 10".

I love this book for the superlative photos and the detailed distribution maps—others may be more interested for the wealth of liberally referenced, genera- and species-specific information included in the species discussions. 150 species are treated, approximately one half of the family in the Upper Midwest (the region including, by definition, Illinois, Indiana, Iowa, Michigan, Minnesota, and Wisconsin). A full-page color photo for each species shows habit and habitat and smaller photos on the facing page provide details. A distribution map for each species gives county-level distribution for the entire region (Appendix VI give references from which the map data are derived). All Asteraceae species of the region are included in a key at the back of the book ("adapted largely from Swink and Wilhelm 1994"—Appendix II), but here is an example of photos good enough to serve for effective species-level identification, relegating the key to adjunct value (for example, compare among species of *Aster*, *Erigeron*, *Eupatorium*, *Lactuca*, and *Liatris*). The Introduction includes background information on recognition of the family, general principles of nomenclature and classification, and habitat and conservation, as well as "Comments on Distribution Maps" and "Comments on Photography" (technical and otherwise: "Waiting for the wind to die down in a midwestern prairie can seem to take an eternity").

In the context of general enthusiasm for this book, my 'technical' side can at least provide a wish-list of features toward a second edition:

(1) Overview. Synoptic list of all species of the area and distribution maps for all species – these could be added without accompanying photos and discussions.

(2) Nomenclature. How did the authors decide what generic name to use? Readers are referred to other floristic publications "for varying nomenclatural interpretations," but some generic concepts used in the book have been modified within the last decade or longer with varying degrees of acceptance: *Aster* (= *Doellingeria*, *Eurybia*, *Ionactis*, *Symphyotrichum*), *Cacalia* (= *Arnoglossum*), *Chrysopsis* (= *Heterotheca*), *Eupatorium* (– *Ageratina* and *Eupatorium* sensu stricto), *Gnaphalium* (= *Pseudognaphalium*), *Senecio* (– *Packera*) – not even synonyms are provided in the book. For other genera, listed synonyms give notice of potential taxonomic variance: *Chrysanthemum* (AKA *Leucanthemum*), *Kuhnia* (AKA *Brickellia*), *Hymenoxys* (AKA *Actinea*, but not *Tetraneuris* not listed), *Microseris* (AKA *Nothocalais*).

(3) Arrangement of species. The species are first arranged within four color classes—White or Green, White with Yellow Centers, Yellow or Yellow with Brown Centers, and Blue, Violet, Rose or Pink—then alphabetically by genus and species. I believe folks interested in Asteraceae, at almost all levels of botanical sophistication, could appreciate the value of placing all species of one genus together and arranging the genera by relationship rather than alphabetically.—*Guy L. Nesom, Botanical Research Institute of Texas, Fort Worth, TX, 76102-4060, U.S.A.*

VASCULAR PLANTS OF KONZA PRAIRIE BIOLOGICAL STATION: AN ANNOTATED CHECKLIST OF SPECIES IN A KANSAS TALLGRASS PRAIRIE

E. Gene Towne

Division of Biology
Kansas State University
Manhattan, KS 66506-4901, U.S.A.
egtowne@ksu.edu

ABSTRACT

The native and naturalized vascular plants of Konza Prairie Biological Station, a 3487-ha tallgrass prairie research site located in the Flint Hills of northeastern Kansas, are listed along with their primary habitat, relative abundance, flowering period, and life span. After more than 25 years of collections, the known vascular flora of Konza Prairie consists of 576 species, representing 336 genera and 96 families. Families with the most species are Poaceae (84), Asteraceae (79), Fabaceae (49), and Cyperaceae (33). Non-native species (n = 96) comprise 16.7% of the total flora. When categorized by life span, 64.6% of all species are perennials, 31.3% are annuals, and 4.2% are biennials. Species that are characteristically associated with a prairie habitat comprise 40.6% of the flora, followed by species in disturbed (22.4%), woodland (22.2%), and wetland (14.8%) habitats. In the prairie habitat, 16.2% of the species are grasses and 76.9% are herbaceous forbs. The C_4 photosynthetic pathway occurs in 59.5% of all grass species and in 70.8% of the annual grasses. The diversified habitats created by management and research activities on Konza Prairie provide a flora richness that is likely greater than that of any other area of comparable size in the Great Plains region.

KEY WORDS: Prairie Flora, Vascular Plant Survey, Biodiversity, Species Richness

RESUMEN

Las plantas vasculares indígenas y aclimatadas de la Estación Biológica de la Pradera Konza, un sitio de investigación en una pradera de pasto alto de 3487 hectáreas en el noreste de Kansas, se listan indicando su hábitat principal, abundancia relativa, periodo de floración y su longevidad. Tras más de 25 años de colectar, se han identificado 576 especies de flora vascular de la Pradera Konza, que representan 336 géneros y 96 familias. Las familias con mayor cantidad de especies son Poaceae (84), Asteraceae (79), Fabaceae (49) y Cyperaceae (33). Las especies no indígenas (n = 96) componen el 16.7% de la flora total. Cuando son clasificadas por su longevidad, 64.6% del total de especies son perennes, 31.3% anuales y 4.2% bienales. Las especies características de un hábitat de praderas componen el 40.6% de la flora total, seguidas por las de hábitat perturbado (22.4%), forestal (22.2%) y pantano (14.8%). La ruta fotosintética C_4 aparece en el 59.5% de las especies de pastos y en el 70.8% de los pastos anuales. Los hábitats diversificados que se han producido a través de actividades de administración e investigación en la Pradera Konza ofrecen una abundancia de flora que posiblemente sobrepasa cualquier otra área de tamaño comparable en esta región.

SITE OVERVIEW

Konza Prairie Biological Station is a 3487-ha tallgrass prairie located in the Flint Hills of northeastern Kansas (39° 05' N, 96° 35' W; Fig. 1). The Nature Conser-

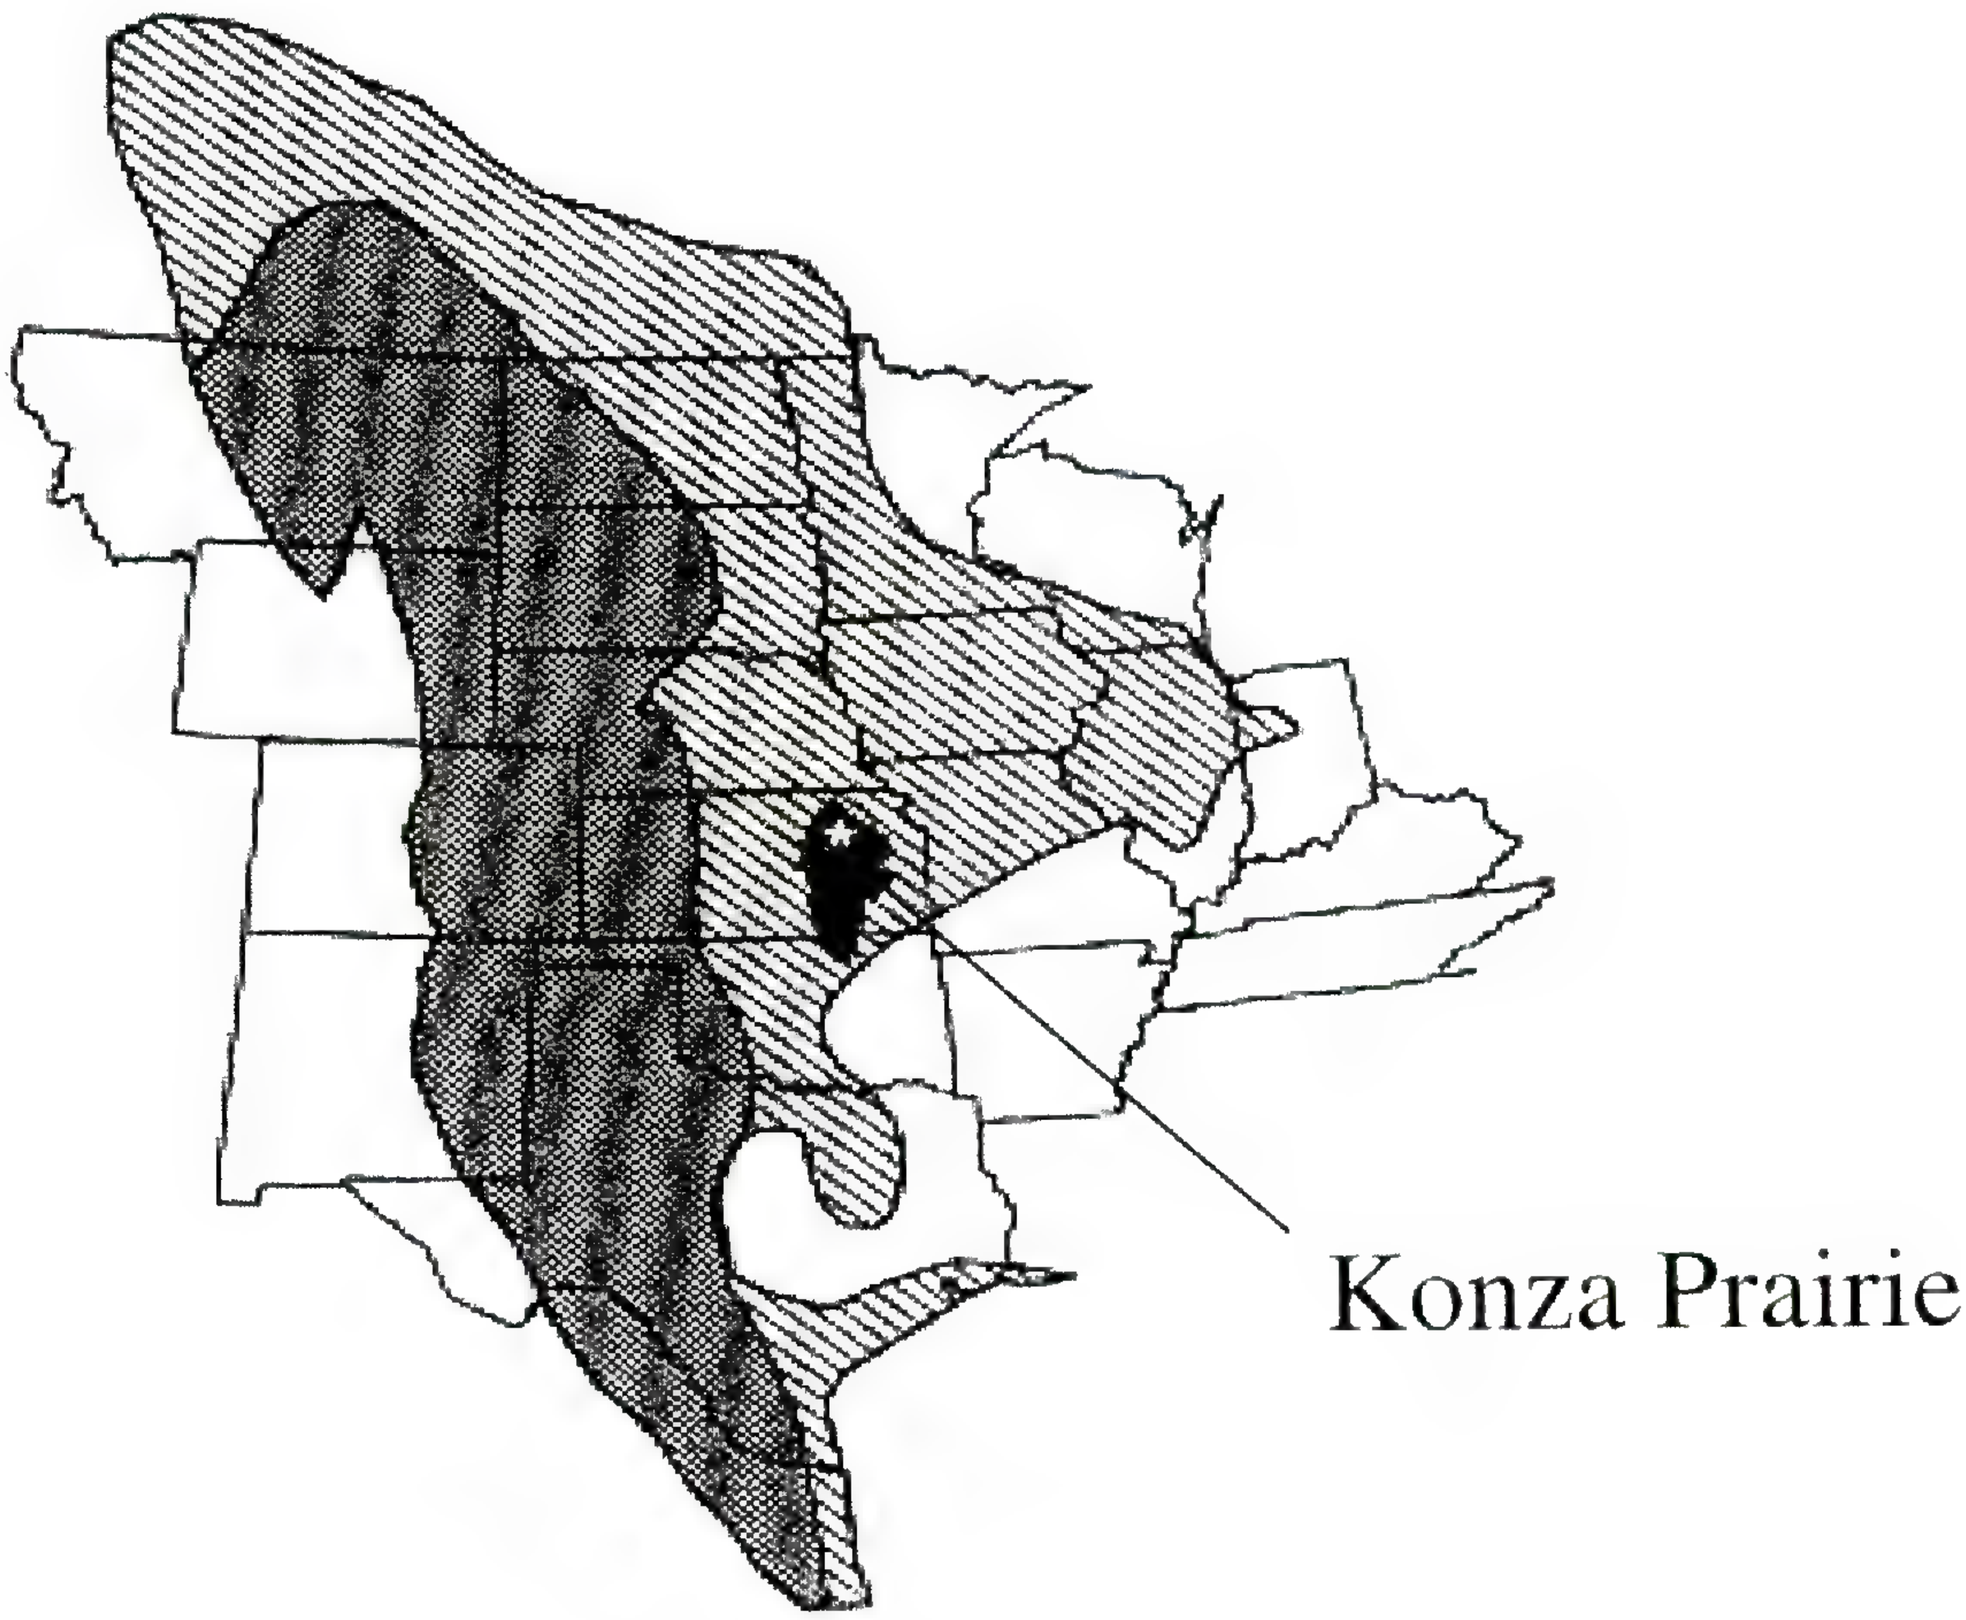

Fig. 1. Location of Konza Prairie in the flint hills of Kansas.

vancy initially purchased 371 ha of the site in 1971, followed by the remaining procurement in 1977. The preserve is managed for ecological research by the Division of Biology at Kansas State University. To study how fire and grazing affect the ecosystem, Konza Prairie is parceled into 52 watershed units that are burned at different frequencies and in different seasons, and are either ungrazed or grazed by large herbivores. Mowed fireguards or gravel roads separate the watersheds. Approximately 200 ha of agricultural land and abandoned brome fields are scattered throughout the site. The headquarters area consists of old homesteads with renovated buildings, a corral, and cultivated fields.

Topographically, the prairie landscape comprises upland plateaus, limestone hillsides, and fertile lowlands. The upland soils are relatively shallow, silty clay loams overlying limestone and shale layers (Udic Argiustolls and Lithic Haplustolls), whereas the lowland soils are deeper colluvial and alluvial deposits (Pachic Argiustolls). Two major creeks meander through the lowlands, but water flow is intermittent and dependent upon precipitation patterns. Permanent pools in the lower creek channels, localized springs, seeps, and several

small stock ponds constitute the wetland habitat. Gallery forests (bands of deciduous trees bordering the creeks and ravines) cover about 8.5% of the site.

Prairie vegetation is dominated by warm-season perennial grasses, with numerous interstitial forb species. Although the grassland flora consists primarily of tallgrass prairie plants, species that are characteristic of midgrass prairies thrive on the uplands and hillsides, and many shortgrass prairie species occur on the shallow, droughty sites.

For nearly 100 years, the site was a cattle ranch with both year-long and season-long grazing operations. After acquisition by The Nature Conservancy, Konza Prairie was not grazed by large herbivores until 1987, when a bison (*Bos bison*) herd was established in a 992-ha internal enclosure. Seasonal grazing by domestic cattle (*Bos taurus*) resumed in 1992 in 6 adjacent pastures (510 ha), although not all are grazed every year. The remainder of Konza Prairie is ungrazed by ungulates, except for a prolific white-tailed deer (*Odocoileus virginianus*) population.

Konza Prairie has a temperate continental climate, characterized by hot summers, cold winters, and moderately strong surface winds. Average annual precipitation is 835 mm, with 75% of this occurring in the April through September growing season. The average frost-free season lasts 180 days. Mean annual temperature is 13° C, with average minimum and maximum temperatures ranging from -3° C in January to 27° C in July. Elevations on Konza Prairie range from 320 to 444 m.

FLORISTIC EFFORTS

After a decade of collecting, 436 species of vascular plants (plus 5 varieties) were initially reported to occur on Konza Prairie (Freeman & Hulbert 1985), with another 27 species subsequently added (Freeman & Gibson 1987). Six years later, Kazmaier (unpublished pamphlet) listed 524 vascular plant species for Konza Prairie. Because of Konza Prairie's role as a benchmark tallgrass prairie, it is essential that the flora inventory and pertinent ecological synopsis of the species be current and readily accessible. With more than 70 new species discovered since Kazmaier's unpublished checklist, questionable validity of some previously listed species, and extensive nomenclatural revisions, an updated inventory of the Konza Prairie vegetation is necessary. Format for this flora follows standards proposed by Palmer et al. (1995). Voucher specimens are stored in the Kansas State University Herbarium (KSC).

ORGANIZATION OF THE CHECKLIST

The vascular plants known to occur spontaneously on Konza Prairie are arranged alphabetically by family, genus, and species within four groups: Pteridophyta (ferns and fern allies), Pinophyta (gymnosperms), Magnoliopsida

(dicots), and Liliopsida (monocots). Each entry includes scientific name, common name, relative abundance, primary habitat, flowering period, and life span (Appendix I). In addition, non-native species and the photosynthetic pathway of grass species are listed.

Nomenclature follows Kartesz (1999), although authority abbreviations conform to Brummitt and Powell (1992). A synonym is enclosed in brackets for those species that have been annotated recently or if the scientific name changed from that listed by Freeman and Hulbert (1985). Infraspecific taxa (subspecies and varieties) are not delineated, although naturally occurring hybrids are included.

The common name for each species was selected from regional sources (Anderson 1961; Bare 1979; Great Plains Flora Association 1986) to reflect customary usage for this area. Most species are identified with a single colloquial name, but alternatives are presented in a few instances. Structure and format of common names generally follow guidelines recommended by Kartesz and Thieret (1991).

The listed habitat indicates where each species is most likely found on Konza Prairie; however, it does not imply that the plant is restricted to that site. Many species occur at different densities in heterogeneous locations. Designated habitat categories for the Konza Prairie flora are:

Prairie—Open grassland that is subdivided by topographic position: uplands (clayey, cherty, or shallow soils on top of the hills), lowlands (deep bottom land soils), and slopes (rocky hillsides). Additionally, some species are listed as occurring predominantly in grazed or infrequently burned sites.

Woodland—Gallery forest and sites that are shaded by trees.

Wetland—Wet sites that include ponds, creeks, seeps, stock tanks, and mesic lowlands.

Disturbed—Sites where the soil has been disrupted, include trails, wallows, ditches, roadsides, homesteads, lawns, and cultivated fields.

Richness among the different plant habitats was estimated by assigning each species to one habitat. Because many species occur in a variety of habitats, assignment to a specific category may be debatable. However, the criterion for assigning species was based on which habitat the species is most characteristically associated with on Konza Prairie. Species that are found predominantly in disturbed sites were not considered prairie plants even if they appear sporadically in grazed or unburned prairie. Likewise, woodland species that migrate into unburned grassland were not grouped in the prairie habitat.

Relative abundance is an evaluation of how common and widespread a species is for the particular habitat, and is based on extensive field experience of the author. However, abundance of most annuals and some perennial species may fluctuate yearly in response to precipitation patterns and grazing or burning treatments. Descriptions of the five abundance classes are:

Abundant—Species is dominant or co-dominant in the habitat.
Common—Species is found easily in the particular habitat.
Occasional—Species occurs sporadically but is not difficult to find.
Infrequent—Species is relatively scarce and not easily found.
Rare—Species is seldom encountered or found only in specific locations.

The flowering period is when peak blooming normally occurs on Konza Prairie and often indicates when the species is most likely found. For vascular cryptogams, the dates represent spore formation. Flowering periods are based on field observations, herbarium specimens, and phenology records for this area.

Each species is classified by life span as either annual, biennial, or perennial. Non-herbaceous perennial plants were additionally subdivided into tree, shrub, and woody vine categories. Although some biennials and short-lived perennials may persist for only one year, designations were based on the expected longevity of the species for this area.

Grasses (Poaceae) are designated as either C_3 or C_4 species (Waller & Lewis 1979). The C_3 grasses are cool-season plants that initially produce a 3-carbon compound during photosynthesis and characteristically flower in May and June. The C_4 grasses are warm-season plants that initially produce a 4-carbon compound in the photosynthetic pathway and characteristically flower in July and August.

Species that were not present in this region before European settlement are considered introduced (Brooks 1986). Cultivated crops from the agricultural fields (e.g., wheat, oats, sorghum, corn, and soybean), and other non-naturalized annual species are not included in this checklist. However, exotic horticultural and ornamental species that were planted decades ago near the headquarters area and have subsequently persisted, are listed in Appendix II.

RESULTS AND DISCUSSION

The known vascular flora on Konza Prairie consists of 576 species, representing 336 genera and 96 families (Table 1; Appendix I). Families with the most species are Poaceae (84), Asteraceae (79), Fabaceae (49), and Cyperaceae (33). Forty families are represented by a single species. The most species-rich genera are *Carex* (17 species), *Polygonum* (12 species), *Symphyotrichum* (9 species), and *Asclepias* (9 species).

Twenty-three species from the last inventory (Kazmaier, unpublished pamphlet) are deleted from the present list because the specimens were misidentified (n = 8), had been reduced to synonymy (n = 4), or because there are no vouchers and no bona fide evidence of their presence on Konza Prairie. Most of the unsubstantiated species appeared in preliminary inventories (see Freeman & Hulbert 1985), and their unverified presence was subsequently perpetuated. Taxonomic revisions of Kazmaier's unpublished checklist also transferred 55 species into different genera and changed the specific epithet of 19 species.

TABLE 1. Summary of vascular plant families, genera, and species on Konza Prairie.

Taxonomic group	Families	Genera	Species		
			Native	Introduced	Total
Pteridophyta	4	6	6	0	6
Pinophyta	1	1	1	0	1
Magnoliophyta:					
Magnoliopsida	76	254	349	73	422
Liliopsida	15	75	124	23	147
Total	96	336	480	96	576

When species are categorized to one predominant habitat, 40.6% of Konza Prairie plants are characteristically associated with prairie grassland, followed by disturbed (22.4%), woodland (22.2%), and wetland (14.8%) habitats (Table 2). In the prairie habitat, 16.2% of the species are grasses and 76.9% are herbaceous forbs. Only seven woody species are characteristically associated with the prairie habitat; but without frequent fire, many woodland species invade and proliferate. Species richness is lowest in wetland sites, but these areas are the smallest and most fragmented habitats on Konza Prairie.

When partitioned into life span categories, 316 species (54.9%) are herbaceous perennials, 56 species (9.7%) are woody perennials, 180 species (31.3%) are annuals, and 24 species (4.2%) are biennials. Within the prairie habitat, 76.1% of the species are perennials, 20.9% are annuals, and 3.0% are biennials. In comparison, 23.3% of the species in disturbed sites are perennials, 69.0% are annuals, and 7.8% are biennials.

Non-native species (n = 96) account for 16.7% of the total flora. Families with the most introduced species are Poaceae (21), Brassicaceae (13), Fabaceae (9), and Asteraceae (8). Annuals and biennials comprise 59.4% of all introduced species, compared to 30.8% of the native flora (Table 3). The highest density of exotics is in the headquarters area where many species were planted intentionally or are cosmopolitan weeds. Most introduced species are either restricted to disturbed soils or are weak competitors in native prairie. However, some invasive species are capable of displacing native vegetation. Because the aggressiveness of four exotic species (*Bothriochloa bladhii*, *Bothriochloa ischaemum*, *Carduus nutans*, and *Lespedeza cuneata*) potentially threatens the integrity of tallgrass prairie, they have been specifically targeted for eradication.

The C_4 photosynthetic pathway occurs in 59.5% for all grass species and in 65.1% of the native grasses. Of the 24 annual grasses that occur on Konza Prairie, 17 species (70.8%) use the C_4 photosynthetic pathway. Most dicotyledons use the C_3 photosynthetic pathway, but 14 species representing five genera (*Amaranthus*, *Bassia*, *Chamaesyce*, *Portulaca*, and *Tribulus*) have C_4 photosyn-

TABLE 2. The number of vascular plant species within taxonomic groups that are characteristically associated with different habitats on Konza Prairie.

Taxonomic group	Prairie	Disturbance	Woodland	Wetland
Pteridophyta	0	0	5	1
Pinophyta	0	0	1	0
Magnoliophyta:				
Magnoliopsida	178	98	102	45
Liliopsida	56	31	20	39
Total numbers	234	129	128	85
Percent	40.6%	22.4%	22.2%	14.8%

TABLE 3. The number and percent of native and introduced species within different life form categories on Konza Prairie.

	Native Species		Introduced Species	
Life form	Number	%	Number	%
Total annuals	134	27.9	47	49.0
Annual grasses	16	3.3	8	8.3
Annual dicot forbs	111	23.1	39	40.6

Totals	480		96	

thesis (Downton 1975). All of the Konza Prairie forb species that utilize the C_4 photosynthetic pathway are annuals.

Although field collections of Konza Prairie flora have been ongoing for more than 25 years, the compilation of vascular plants will continue to be dynamic. New immigrants, ephemeral annuals that fluctuate with precipitation patterns, and superficially similar species will undoubtedly be found in subsequent years. Species also will disappear. Some species have not been observed on Konza Prairie for more than 10 years and may be extirpated. Other species occur in a single locale or consist of only a few plants. Few areas of tallgrass prairie have been surveyed as intensively as Konza Prairie, and the diversified habitats created by management and research activities provide a flora richness that is likely greater than any other area of comparable size in the Great Plains region.

APPENDIX 1
Annotated Checklist of Species for Konza Prairie

PTERIDOPHYTA – Vascular Cryptogams

DRYOPTERIDACEAE – Wood fern family

Woodsia obtusa (Spreng.) Torr.; blunt-lobed cliff fern; rare on shaded limestone outcrops; Jul; perennial.

EQUISETACEAE – Horsetail family

Equisetum laevigatum Braun; smooth scouring rush; infrequent in wet sites; May–Jun; perennial.

OPHIOGLOSSACEAE – Adder's-tongue family

Botrychium virginianum (L.) Sw.; rattlesnake fern; occasional in woodlands; May–Jun; perennial.

Ophioglossum engelmannii Prantl; adder's tongue; rare in woody lowlands; Apr–Jun; perennial.

PTERIDACEAE – Maidenhair fern family

Argyrochosma dealbata (Pursh) Windham; [*Notholaena dealbata*]; false cloak fern; rare on shaded limestone outcrops; Jun; perennial.

Pellaea glabella Mett. ex Kuhn; smooth cliff brake; rare on shaded limestone outcrops; May Jun; perennial.

DIVISION PINOPHYTA – Gymnosperms

CUPRESSACEAE – Cypress family

Juniperus virginiana L.; red-cedar; occasional in woodlands and unburned prairie; Mar–Apr; evergreen tree.

DIVISION MAGNOLIOPHYTA – Angiosperms
Class Magnoliopsida – Dicots

ACANTHACEAE – Acanthus family

Ruellia humilis Nutt.; fringe-leaf ruellia; common on all prairie sites; Jun Aug; perennial.

Ruellia strepens L.; limestone ruellia; occasional in woodlands; May -Sep; perennial.

ACERACEAE – Maple family

Acer negundo L.; boxelder; occasional in woodlands; Apr; tree.

AMARANTHACEAE – Pigweed family

Amaranthus blitoides Watson; [*Amaranthus graecizans*]; prostrate pigweed; common in disturbed sites and along roads; Jun–Sep; annual.

Amaranthus palmeri Watson; Palmer's pigweed; infrequent in disturbed sites; Jul -Oct; annual.

Amaranthus retroflexus L.; rough pigweed; infrequent in cultivated fields and disturbed lowlands; Jul Oct; introduced annual.

Amaranthus rudis Sauer; water-hemp; rare in wet sites; Jul–Oct; annual.

ANACARDIACEAE – Cashew family

Rhus aromatica Aiton; aromatic sumac; infrequent on uplands and lowlands; Apr–May; shrub.

Rhus glabra L.; smooth sumac; common on shallow uplands and slopes; May–Jun; shrub.

Toxicodendron radicans (L.) Kuntze; poison-ivy; common in woodlands; May–Jun; woody vine.

ANNONACEAE – Custard-apple family

Asimina triloba (L.) Dunal; pawpaw; rare in woodlands and along creeks; Apr–May; tree.

APIACEAE – Parsley family

Chaerophyllum procumbens (L.) Crantz; spreading chervil; infrequent at woodland edges and in unburned prairie; May Jun; annual.

Chaerophyllum tainturieri Hook.; erect chervil; infrequent at woodland edges; May–Jun; annual.

Conium maculatum L.; poison-hemlock; infrequent at woodland edges and in disturbed sites; May -Jun; introduced biennial

Lomatium foeniculaceum (Nutt.) Coult. & Rose; carrot-leaf lomatium; common on shallow uplands and slopes; Apr–May; perennial.

Osmorhiza longistylis (Torr.) DC.; long style sweet cicely rare in woodlands; May; perennia

Sanicula canadensis L.; Canadian sanicle; occasional in woodlands; Jul–Sep; biennial.

Spermolepis inermis (Nutt. ex DC.) Mathias & Constance; scaleseed; occasional on uplands and slopes; Jun; annual.

Torilis arvensis (Huds.) Link; hedge-parsley; infrequent at woodland edges and in unburned prairie; Jun–Jul; introduced annual.

Zizia aurea (L.) Koch; golden alexanders; occasiona in woodlands; May Jun; perennial.

APOCYNACEAE – Dogbane family

Apocynum cannabinum L.; hemp dogbane; occasional on lowlands; Jun–Jul; perennial.

ASCLEPIADACEAE – Milkweed family

Asclepias lanuginosa Nutt.; woolly milkweed; rare on grazed uplands; May; perennial.

Asclepias speciosa Torr.; showy milkweed; rare on uplands and lowlands; Jun; perennial.

Asclepias stenophylla A. Gray; narrow-leaf milkweed; occasional on uplands and lowlands; Jun–Jul; perennial.

Asclepias sullivantii Engelm. ex A. Gray; smooth milkweed; occasional on lowlands; Jun; perennial.

Asclepias syriaca L.; common milkweed; occasional on lowlands; Jun; perennial.

Asclepias tuberosa L.; butterfly milkweed; occasional on uplands and lowlands; Jun–Jul; perennial.

Asclepias verticillata L.; whorled milkweed; common on all prairie sites; Jun–Sep; perennial.

Asclepias viridiflora Raf.; green milkweed; occasional on uplands and slopes; Jun–Jul; perennial.

Asclepias viridis Walter; spider milkweed; common on all prairie sites; May–Jun; perennial.

Cynanchum laeve (Michx.) Pers.; climbing milkweed; infrequent at woodland edges and in disturbed lowlands; Jul–Sep; perennial.

ASTERACEAE – Sunflower family

Achillea millefolium L.; western yarrow; common on all prairie sites; May–Jun; perennial.

Ageratina altissima (L.) King & Rob.; [*Eupatorium rugosum*]; white snakeroot; common in woodlands; Aug–Oct; perennial.

Ambrosia artemisiifolia L.; annual ragweed; occasional in disturbed sites; Jul–Oct; annual.

Ambrosia psilostachya DC.; western ragweed; abundant on all prairie sites; Jul–Oct; perennial.

Ambrosia trifida L.; giant ragweed; occasional in disturbed sites and at woodland edges; Jul–Oct; annual.

Amphiachyris dracunculoides (DC.) Nutt.; [*Gutierrezia dracunculoides*]; annual broomweed; infrequent in disturbed sites; Aug–Oct; annual.

Antennaria neglecta Greene; field pussytoes; common on uplands; Apr–May; perennial.

Arctium minus Bernh.; burdock; infrequent in woodlands and shaded disturbed sites; Jul–Sep; introduced biennial.

Arnoglossum plantagineum Raf.; [*Cacalia plantaginea*]; tuberous indian-plantain; occasional on uplands and lowlands; Jun–Jul; perennial.

Artemisia ludoviciana Nutt.; Louisiana sagewort; common on all prairie sites; Aug–Sep; perennial.

Bidens aristosa (Michx.) Britton; [*Bidens polylepis*]; coreopsis beggar-ticks; infrequent in wet sites; Sep–Oct; annual.

Bidens bipinnata L.; Spanish needles; rare in wet sites; Sep–Oct; annual.

Bidens cernua L.; nodding beggar-ticks; infrequent in wet sites; Sep–Oct; annual.

Bidens frondosa L.; devil's beggar-ticks; occasional in wet sites; Sep–Oct; annual.

Brickellia eupatorioides (L.) Shinners; [*Kuhnia eupatorioides*]; false-boneset; common on uplands and slopes; Aug–Sep; perennial.

Carduus nutans L.; musk thistle; infrequent on lowlands and in disturbed sites; May–Jun; introduced biennial.

Cirsium altissimum (L.) Spreng.; tall thistle; common in unburned lowlands; Aug–Sep; biennial.

Cirsium undulatum (Nutt.) Spreng.; wavy-leaf thistle; common on uplands and slopes; Jun–Jul; perennial.

Cirsium vulgare (Savi) Ten.; bull thistle; rare in disturbed sites; Jun–Sep; introduced biennial.

Conyza canadensis (L.) Cronquist; Canadian horseweed; common in disturbed sites; Jul–Sep; annual.

Conyza ramosissima Cronquist; spreading horseweed; rare in disturbed sites; Jul–Sep; annual.

Dyssodia papposa (Vent.) Hitchc.; fetid-marigold, prairie dogweed; occasional along roads; Jul–Oct; annual.

Echinacea angustifolia DC.; black-sampson echinacea; common on slopes and rocky prairie; Jun; perennial.

Eclipta prostrata (L.) L.; yerba-de-tajo; rare along creeks; Jul–Sep; annual.

Erechtites hieraciifolia (L.) Raf. ex DC.; American burnweed; infrequent at woodland edges and along creeks; Aug–Sep; annual.

Erigeron annuus (L.) Pers.; annual fleabane; occasional in disturbed lowlands; May–Jun; annual.

Erigeron philadelphicus L.; Philadelphia fleabane; infrequent in mesic lowlands; Apr–Jun; biennial.

Erigeron strigosus Muhl. ex Willd.; daisy fleabane; common on uplands and in disturbed sites; May–Jun; annual.

Eupatorium altissimum L.; tall joe-pye weed; occasional on lowlands; Aug–Sep; perennial.

Euthamia gymnospermoides Greene; sticky euthamia; infrequent on lowlands; Sep–Oct; perennial.

Grindelia squarrosa (Pursh) Dunal; curly-cup gumweed; common in disturbed sites and along roads; Aug–Oct; biennial.

Helianthus annuus L.; common sunflower; common in ditches and disturbed sites; Jul–Oct; annual.

Helianthus hirsutus Raf.; hairy sunflower; common at woodland edges; Jul–Oct; perennial.

Helianthus maximilianii Schrad.; Maximilian's sunflower; occasional on uplands and slopes; Aug–Oct; perennial.

Helianthus pauciflorus Nutt.; [*Helianthus rigidus*]; stiff sunflower; occasional on uplands; Jul–Sep; perennial.

Helianthus petiolaris Nutt.; plains sunflower; rare in disturbed sites; Jul–Sep; annual.

Helianthus tuberosus L.; Jerusalem artichoke; common at woodland edges; Aug–Oct; perennial.

Heliopsis helianthoides (L.) Sweet; rough heliopsis; infrequent on lowlands; Jul–Sep; perennial.

Heterotheca canescens (DC.) Shinners; [*Chrysopsis canescens*]; golden aster; rare on uplands; Aug–Sep; perennial.

Hieracium longipilum Torr.; long-beard hawkweed; occasional on uplands; Jul; perennial.

Hymenopappus scabiosaeus L'Her.; white-bract hymenopappus, old plainsman; occasional on shallow uplands and slopes; May–Jun; biennial.

Iva annua L.; annual sumpweed; rare in ditches and mesic disturbed sites; Aug–Oct; annual.

Krigia cespitosa (Raf.) Chambers; dwarf-dandelion; infrequent in mesic uplands and lowlands; May–Jun; annual.

Lactuca canadensis L.; Canadian lettuce; infrequent at woodland edges; Jul–Sep; biennial.

Lactuca ludoviciana (Nutt.) Riddell; Louisiana lettuce; occasional in unburned prairie; Jul–Sep; biennial.

Lactuca saligna L.; willow leaf lettuce; infrequent at woodland edges and in disturbed sites; Jul–Sep; introduced annual.

Lactuca serriola L.; prickly lettuce; occasional in unburned prairie and disturbed sites; Jul–Sep; introduced annual.

Liatris aspera Michx.; button gayfeather; infrequent on uplands and rocky prairie; Aug–Sep; perennial.

Liatris mucronata DC.; eastern dotted gayfeather; infrequent on uplands; Aug–Sep; perennial.

Liatris punctata Hook.; western dotted gayfeather; common on shallow uplands and rocky prairie; Aug–Sep; perennial.

Nothocalais cuspidata (Pursh) Greene; [*Microseris cuspidata*]; wavy leaf false dandelion; infrequent on uplands and slopes; Apr–May; perennial.

Oligoneuron rigidum (L.) Small; [*Solidago rigida*]; stiff goldenrod; occasional on lowlands; Aug–Oct; perennial.

Packera plattensis (Nutt.) Weber & Löve; [*Senecio plattensis*]; prairie groundsel; common on uplands; Apr–May; biennial.

Pseudognaphalium obtusifolium (L.) Hilliard & Burtt; [*Gnaphalium obtusifolium*]; fragrant cudweed; infrequent on uplands and lowlands; Sep–Oct; annual.

Ratibida columnifera (Nutt.) Wooton & Standl.; upright prairie-coneflower; common on uplands and along roads; Jun–Jul; perennial.

Rudbeckia hirta L.; black-eyed susan; infrequent on owlands; Jun–Jul; biennial.

Silphium integrifolium Michx.; whole-leaf rosinweed; infrequent on lowlands; Jul–Aug; perennial.

Silphium laciniatum L.; compassplant; occasional on lowlands; Jul–Aug; perennial.

Solidago canadensis L.; tall goldenrod, Canadian goldenrod; common on lowlands; Aug–Oct; perennial.

Solidago gigantea Aiton; late goldenrod; infrequent in mesic lowlands; Sep–Oct; perennial.

Solidago missouriensis Nutt.; Missouri goldenrod; common on all prairie sites; Aug–Oct; perennial.

Solidago mollis Bartl.; ashy goldenrod; rare on uplands; Aug–Sep; perennial.
Solidago petiolaris Aiton; downy goldenrod; infrequent on rocky prairie; Sep–Oct; perennial.
Solidago speciosa Nutt.; showy-wand goldenrod; infrequent on uplands; Sep–Oct; perennial.
Sonchus asper (L.) Hill; prickly sow-thistle; infrequent in disturbed sites; Jun–Oct; introduced annual.
Symphyotrichum drummondii (Lindl.) Nesom; [*Aster drummondii*]; Drummond's aster; common in woodlands; Sep–Oct; perennial.
Symphyotrichum ericoides (L.) Nesom; [*Aster ericoides*]; heath aster; abundant on all prairie sites; Sep–Oct; perennial.
Symphyotrichum laeve (L.) Löve; [*Aster laevis*]; smooth aster; occasional on uplands and slopes; Sep–Oct; perennial.
Symphyotrichum lanceolatum (Willd.) Nesom; [*Aster simplex*]; panicled aster; occasional on lowlands; Sep–Oct; perennial.
Symphyotrichum oblongifolium (Nutt.) Nesom; [*Aster oblongifolius*]; aromatic aster; common on uplands; Sep–Oct; perennial.
Symphyotrichum oolentangiense (Riddell) Nesom [*Aster oolentangiensis*]; azure aster; rare on lowlands; Sep–Oct; perennial.
Symphyotrichum pilosum (Willd.) Nesom; [*Aster pilosus*]; hairy aster; infrequent on lowlands and in abandoned brome fields; Sep–Oct; perennial.
Symphyotrichum sericeum (Vent.) Nesom; [*Aster sericeus*]; silky aster; occasional on uplands and slopes; Aug–Oct; perennial.
Symphyotrichum subulatum (Michx.) Nesom; [*Aster subulatus*]; saltmarsh aster; infrequent in ditches and wet sites; Sep–Oct; annual.
Taraxacum officinale Weber ex Wigg.; dandelion; occasional around headquarters; Mar–Oct; introduced perennial.
Tragopogon dubius Scop.; western salsify, goat's-beard; infrequent in ditches and disturbed sites; May–Jun; introduced biennial.
Verbesina alternifolia (L.) Britton ex Kearney; wing-stem; common in woodlands; Aug–Oct; perennial.
Vernonia baldwinii Torr.; western ironweed; common on all prairie sites; Jul–Sep; perennial.
Xanthium strumarium L.; cocklebur; infrequent in ditches and disturbed sites; Jul–Oct; annual.

BETULACEAE – Birch family

Ostrya virginiana (Mill.) Koch; hop-hornbeam; rare on wooded slopes; Apr; tree.

BIGNONIACEAE – Bignonia family

Campsis radicans (L.) Seem. ex Bureau; trumpet creeper; infrequent in woodlands; Jun–Aug; woody vine.

BORAGINACEAE – Borage family

Buglossoides arvensis (L.) Johnst.; [*Lithospermum arvense*]; corn gromwell; infrequent in ditches and disturbed sites; Apr–May; introduced annual.
Cynoglossum officinale L.; hound's-tongue; rare in woodlands; Jun–Jul; introduced biennial.
Hackelia virginiana (L.) Johnst.; Virginia stickseed; occasional in woodlands; Jul–Aug; biennial.
Lithospermum canescens (Michx.) Lehm.; hoary gromwell; rare on uplands and slopes; May; perennial.
Lithospermum incisum Lehm.; narrow-leaf gromwell, fringed puccoon; occasional on uplands and slopes; Apr–May; perennial.
Myosotis verna Nutt.; Virginia forget-me-not; infrequent on uplands; May; annual.
Onosmodium molle Michx.; western marbleseed; infrequent on uplands and slopes; Jun–Jul; perennial.

BRASSICACEAE – Mustard family

Alliaria petiolata (Bieb.) Cavara & Grande; garlic-mustard; common in woodlands; Apr–May; introduced biennial.
Arabis hirsuta (L.) Scop.; hairy rockcress; rare in abandoned brome fields and disturbed sites; May–Jun; biennial.
Barbarea vulgaris Br.; wintercress; rare in ditches and disturbed sites; Apr–May; introduced perennial.
Camelina microcarpa DC.; little-pod false-flax; infrequent along roads and in disturbed sites; Apr -May; introduced annual.
Capsella bursa-pastoris (L.) Medik.; shepherd's-purse; occasional in disturbed sites; Apr–May; introduced annual.
Cardamine concatenata (Michx.) Schwarz; [*Dentaria laciniata*]; cut-leaf toothwort; rare in woodlands; Apr–May; perennial.
Cardaria draba (L.) Desv.; hoary cress; rare in disturbed sites; May; introduced perennial.
Chorispora tenella (Pallas) DC.; blue-mustard;

infrequent in disturbed sites; Apr–May; introduced annual.

Descurainia pinnata (Walter) Britton; pinnate tansy-mustard; occasional in disturbed sites; May–Jun; annual.

Descurainia sophia (L.) Webb ex Prantl; flixweed tansy-mustard; rare in disturbed sites; May–Jun; introduced annual.

Draba cuneifolia Nutt. ex Torr. & A. Gray; wedge leaf draba; occasional on shallow and rocky sites; Apr May; annual.

Draba reptans (Lam.) Fernald; white whitlow wort; occasional on shallow uplands and slopes; Apr–May; annual.

Erysimum repandum L.; bushy wallflower; infrequent in ditches and disturbed sites; Apr - May; introduced annual.

Hesperis matronalis L.; dame's rocket; rare around headquarters; Apr May; introduced perennial.

Lepidium densiflorum Schrad.; common pepperweed; common on uplands and in disturbed sites; Apr Jun; introduced annual.

Lepidium oblongum Small; branched pepperweed; occasional in disturbed sites and along roads; Apr Jun; annual.

Lepidium virginicum L.; Virginia pepperweed; common in disturbed sites and along roads; Apr–Jun; annual.

Microthlaspi perfoliatum (L.) Mey.; [*Thlaspi perfoliatum*]; perfoliate pennycress; rare around headquarters; Apr; introduced annual.

Rorippa nasturtium aquaticum (L.) Hayek; [*Nasturtium officinale*]; watercress; occasional in wet sites; May–Jul; introduced perennial.

Rorippa palustris (L.) Besser; bog yellowcress; rare in wet sites; May–Jul; annual.

Rorippa sessiliflora (Nutt.) Hitchc.; stalkless yellow cress; rare in wet sites; May–Jul; annual.

Rorippa sinuata (Nutt.) Hitchc.; spreading yellow cress; infrequent along creeks; May Jun; perennial.

Thlaspi arvense L.; field pennycress; occasional in disturbed sites; Apr May; introduced annual.

CACTACEAE – Cactus family

Escobaria missouriensis (Sweet) Hunt.; [*Coryphantha missouriensis*]; nipple cactus; infrequent on shallow uplands; Apr–May; perennial.

Opuntia macrorhiza Engelm.; plains pricklypear; infrequent on shallow uplands; May–Jun; perennial.

CAMPANULACEAE – Bell-flower family

Campanulastrum americanum (L.) Small; [*Campanula americana*]; American bellflower; infrequent in wet sites; Jul–Sep; annual.

Lobelia cardinalis L.; red cardinal flower; rare in wet sites; Aug–Oct; perennial.

Lobelia siphilitica L.; blue cardinal-flower; infrequent in wet sites; Aug–Oct; perennial.

Triodanis leptocarpa (Nutt.) Nieuwl.; slimpod Venus' looking-glass; infrequent on uplands and lowlands; May–Jun; annual.

Triodanis perfoliata (L.) Nieuwl.; clasping Venus'-looking-glass; occasional on uplands and lowlands; May–Jun; annual.

CANNABACEAE – Hemp family

Cannabis sativa L.; marijuana, hemp; occasional in ditches, at woodland edges, and around headquarters; Jul–Sep; introduced annual.

CAPPARACEAE – Caper family

Polanisia dodecandra (L.) DC.; clammyweed; infrequent in disturbed sites and on slopes; Jul–Sep; annual.

CAPRIFOLIACEAE – Honeysuckle family

Lonicera maackii (Rupr.) Maxim.; Amur honeysuckle; rare in shaded sites near headquarters; May; introduced shrub.

Sambucus nigra L.; [*Sambucus canadensis*]; American elderberry; infrequent in woodlands; Jun–Jul; shrub.

Symphoricarpos orbiculatus Moench; buckbrush; common in woodlands and unburned lowlands; Jul; shrub.

Triosteum perfoliatum L.; horse-gentian; infrequent at woodland edges; May–Jun; perennial.

CARYOPHYLLACEAE – Pink family

Arenaria serpyllifolia L.; thyme-leaf sandwort; infrequent in disturbed sites; May–Jun; introduced annual.

Cerastium brachypodum (Engelm. ex A. Gray) Rob.; mouse ear chickweed; rare in disturbed sites and along roads; Apr; annual.

Dianthus armeria L.; deptford pink; rare in disturbed sites and along roads; Jun–Jul; introduced annual.

Holosteum umbellatum L.; jagged chickweed; occasional in disturbed sites; Apr–May; introduced annual.

Saponaria officinalis L.; soapwort; rare around headquarters; Jun–Aug; introduced perennial.

Silene antirrhina L.; sleepy catchfly; occasional on uplands; May–Jun; annual.

Silene stellata (L.) Aiton; starry silene; occasional in woodlands; Jun–Jul; perennial.

Stellaria pallida (Dumort.) Crep.; lesser chickweed; occasional around headquarters; Mar–Jun; introduced annual.

CELASTRACEAE – Staff-tree family

Celastrus scandens L.; American bittersweet; infrequent in woodlands and on creek banks; May; woody vine.

Euonymus atropurpurea Jacq.; eastern wahoo; rare in woodlands and on creek banks; May–Jun; shrub.

CHENOPODIACEAE – Goosefoot family

Bassia scoparia (L.) Scott; [*Kochia scoparia*]; kochia, fireweed; infrequent in disturbed sites; Jul–Sep; introduced annual.

Chenopodium album L.; lamb's-quarters; rare in disturbed sites; Jun–Sep; introduced annual.

Chenopodium berlandieri Moq.; pit-seed goosefoot; occasional in disturbed sites; Jun–Oct; annual.

Chenopodium pallescens Standl.; pale goosefoot; rare on rocky prairie; Jul–Sep; annual.

Chenopodium simplex (Torr.) Raf.; [*Chenopodium gigantospermum*]; maple-leaf goosefoot; occasional at woodland edges and in disturbed lowlands; Jul–Sep; annual.

Chenopodium standleyanum Aellen; Standley's goosefoot; occasional in woodlands; Jul–Oct; annual.

Monolepis nuttalliana (Schult.) Greene; povertyweed; infrequent in ditches and disturbed sites; Apr–May; annual.

CLUSIACEAE – St. John's-wort family

Hypericum perforatum L.; common St. John's-wort; infrequent on uplands and lowlands; Jun–Jul; introduced perennial.

CONVOLVULACEAE – Morning-glory family

Calystegia macounii (Greene) Brummitt; hedge bindweed; infrequent in disturbed lowlands; May–Sep; perennial.

Convolvulus arvensis L.; field bindweed; infrequent in disturbed sites; May–Sep; introduced perennial.

Evolvulus nuttallianus Schult.; Nuttall's evolvulus; infrequent on shallow and rocky uplands; May–Jun; perennial.

Ipomoea hederacea Jacq.; ivy-leaf morning-glory; infrequent in ditches and disturbed lowlands; Jun–Sep; introduced annual.

Ipomoea lacunosa L.; white morning-glory; infrequent in disturbed lowlands; Aug–Sep; annual.

Ipomoea pandurata (L.) Mey.; big-root morning glory; infrequent in disturbed lowlands; Jun–Sep; perennial.

CORNACEAE – Dogwood family

Cornus amomum Mill.; pale dogwood; rare in ravines and on wooded slopes; May–Jun; shrub.

Cornus drummondii Mey.; rough-leaf dogwood; common in unburned prairie and woodlands; May–Jun; shrub.

CRASSULACEAE – Stonecrop family

Penthorum sedoides L.; ditch stonecrop; infrequent along creeks; Jul–Sep; perennial.

CUCURBITACEAE – Cucumber family

Cucurbita foetidissima Kunth; buffalo gourd; infrequent in ditches and along fence lines; Jun–Aug; perennial.

Sicyos angulatus L.; bur-cucumber; infrequent in woodlands; Aug -Sep; annual.

CUSCUTACEAE – Dodder family

Cuscuta glomerata Choisy; cluster dodder; infrequent on lowlands; Jul–Sep; annual forb parasitic on various Asteraceae species.

Cuscuta indecora Choisy; showy dodder; infrequent on lowlands; Aug–Sep; annual forb parasitic on numerous dicot species.

ELAEAGNACEAE – Oleaster family

Elaeagnus angustifolia L. Russian-olive; rare along creeks; May–Jun; introduced tree.

EUPHORBIACEAE – Spurge family

Acalypha ostryifolia Riddell; hop-hornbeam copperleaf; occasional in shaded lowlands and disturbed sites; Jul–Oct; annual.

Acalypha rhomboidea Raf.; rhombic copperleaf; infrequent in shaded lowlands and disturbed sites; Jul–Oct; annual.

Acalypha virginica L.; Virginia copperleaf; occasional in shaded lowlands and disturbed sites; Jul Oct; annual.

Chamaesyce glyptosperma (Engelm.) Small; [*Euphorbia glyptosperma*]; ridge-seed mat-spurge; infrequent on shallow uplands and in disturbed sites; Jul–Sep; annual.

Chamaesyce maculata (L.) Small; [*Euphorbia maculata*]; spotted mat spurge; occasional on grazed uplands and in disturbed sites; Jul–Oct; annual.

Chamaesyce missurica (Raf.) Shinners; [*Euphorbia missurica*]; Missouri mat-spurge; infrequent on rocky uplands; Jul Sep; annual.

Chamaesyce nutans (Lag.) Small; [*Euphorbia nutans*]; eyebane; occasional in unburned uplands and lowlands; Jul–Oct; annual.

Chamaesyce prostrata (Aiton) Small; [*Euphorbia prostrata*]; prostrate mat-spurge; occasional along roads and in disturbed sites; Jul–Sep; introduced annual.

Chamaesyce serpens (Kunth) Small; [*Euphorbia serpens*]; serpent mat-spurge; infrequent on grazed uplands and in disturbed sites; Jul–Oct; annual

Chamaesyce stictospora (Engelm.) Small; [*Euphorbia stictospora*]; slim-seed mat spurge; infrequent in disturbed sites; Jul–Oct; annual.

Croton capitatus Michx.; woolly croton; rare on rocky uplands; Jul–Sep; annual.

Croton monanthogynus Michx.; one-seed croton; occasional on shallow uplands and slopes; Jun–Sep; annual.

Euphorbia corollata L.; flowering spurge; infrequent on uplands and lowlands; Jul–Sep; perennial.

Euphorbia cyathophora Murray; painted spurge; infrequent in disturbed sites; Jul Sep; annual.

Euphorbia davidii Subils; western toothed spurge; infrequent in disturbed and unburned sites; Jul–Sep; annua..

Euphorbia dentata Michx.; eastern toothed spurge; infrequent in disturbed and unburned sites; Jul Sep; annual.

Euphorbia hexagona Nutt. ex Spreng.; six-angle spurge; rare in disturbed sites, Aug–Sep; annual.

Euphorbia marginata Pursh; snow on the mountain; occasional on uplands and in disturbed sites; Jul Sep; annual.

Euphorbia spathulata Lam.; warty spurge; occasional on uplands and rocky sites; May–Jun; annual.

Tragia betonicifolia Nutt.; nettle-leaf noseburn; occasional on shallow uplands and rocky sites; Jun–Aug; perennial.

Tragia ramosa Torr.; catnip noseburn; occasional on shallow uplands and rocky sites; Jun–Aug; perennial.

FABACEAE – Bean family

Amorpha canescens Pursh; leadplant; common on all prairie sites; Jun–Jul; shrub.

Amorpha fruticosa L.; indigobush amorpha; occasional in wet sites and along creeks; Jun–Jul; shrub.

Amphicarpaea bracteata (L.) Fernald; hog-peanut; occasional on shaded creek banks; Aug–Sep; perennial.

Astragalus canadensis L.; Canadian milk-vetch; rare on shaded slopes; Jul; perennial.

Astragalus crassicarpus Nutt.; ground plum milk-vetch; occasional on uplands; Apr–May; perennial.

Astragalus lotiflorus Hook.; lotus milk-vetch; infrequent on shallow uplands and slopes; Apr May; perennial.

Astragalus missouriensis Nutt.; Missouri milk vetch; infrequent on shallow uplands and slopes; May–Jun; perennial.

Astragalus plattensis Nutt.; Platte River milk-vetch; rare on rocky uplands; May–Jun; perennial.

Baptisia australis (L.) Br. ex Aiton; blue wild-indigo; common on uplands; May–Jun; perennial.

Baptisia × *bicolor* Greenm. & Larisey; [*B. australis* × *B. bracteata*]; bicolor wild-indigo; rare on uplands; May; perennial.

Baptisia bracteata Muhl. ex Elliott; plains wild-indigo; common on all prairie sites; Apr–May; perennial.

Cercis canadensis L.; eastern redbud; occasional in woodlands; Apr; tree.

Chamaecrista fasciculata (Michx.) Greene; [*Cassia chamaecrista*]; showy partridgepea; infrequent on lowlands and in ditches; Jul–Sep; annual.

Coronilla varia L.; crown-vetch; occasional on prairie adjacent to highway embankments; Jun–Sep; introduced perennial.

Crotalaria sagittalis L.; rattlebox; rare on shaded slopes; Jul–Sep; annual.

Dalea aurea Nutt. ex Pursh; silk top prairie clover; rare on shallow uplands; Jul–Aug; perennial.
Dalea candida Michx. ex Willd.; white prairie-clover; common on all prairie sites; Jun Jul; perennial.
Dalea leporina (Aiton) Bullock; fox-tail prairie-clover; rare in mesic lowlands; Aug–Sep; annual.
Dalea multiflora (Nutt.) Shinners; round-head prairie-clover; occasional on uplands and slopes; Jul; perennial.
Dalea purpurea Vent.; purple prairie-clover; common on uplands and slopes; Jun–Jul; perennial.
Desmanthus illinoensis (Michx.) MacMill. ex Rob. & Fernald; Illinois bundle-flower; infrequent on uplands and lowlands; Jul; perennial.
Desmodium canescens (L.) DC.; hoary tick-clover; infrequent on lowlands; Aug–Sep; perennial.
Desmodium glutinosum (Muhl. ex Willd.) Wood; large-flower tick-clover; occasional in wood lands; Jul–Aug; perennial.
Desmodium illinoense A. Gray; Illinois tick clover; occasional on uplands and lowlands; Jul; perennial.
Desmodium paniculatum (L.) DC.; panicled tick-clover; occasional at woodland edges; Aug–Sep; perennial.
Desmodium sessilifolium (Torr.) Torr. & A. Gray; sessile tick-clover; infrequent on lowlands and slopes; Aug–Sep; perennial.
Gleditsia triacanthos L.; honey-locust; occasional in woodlands and unburned lowlands; May; tree.
Glycyrrhiza lepidota Pursh; American licorice; in frequent on uplands and lowlands; Jun Jul; perennial.
Gymnocladus dioicus (L.) Koch; Kentucky coffee tree; infrequent in woodlands; May; tree.
Kummerowia stipulacea (Maxim.) Makino; [*Lespedeza stipulacea*]; Korean lespedeza; occasional in disturbed sites and along roads; Aug–Oct; introduced annual.
Lespedeza capitata Michx.; round-head lespedeza; common on lowlands; Aug–Sep; perennial.
Lespedeza cuneata (Dum. Cours.) Don; sericea lespedeza; rare on uplands and lowlands; Aug–Oct; introduced perennial.
Lespedeza stuevei Nutt. tall bush-clover; rare on lowlands; Aug–Sep; perennial.
Lespedeza violacea (L.) Pers.; prairie lespedeza; occasional on lowlands and slopes; Aug–Sep; perennial.
Medicago lupulina L.; black medic; occasional in disturbed sites; May–Sep; introduced annual.
Medicago sativa L.; alfalfa; rare in abandoned brome fields and ditches; Jun–Sep; introduced perennial.
Melilotus officinalis (L.) Lam.; yellow sweet-clover, white sweet-clover; occasional in ditches and disturbed sites; May–Jul; introduced biennial.
Mimosa nuttallii (DC.) Turner; [*Schrankia nuttallii*]; cat-claw sensitive-brier; occasional on uplands and slopes; Jun–Jul; perennial.
Pediomelum argophyllum (Pursh) Grimes; [*Psoralea argophylla*]; silver-leaf scurfpea; occasional on lowlands; Jun–Jul; perennial.
Pediomelum esculentum (Pursh) Rydb.; [*Psoralea esculenta*]; breadroot scurfpea; occasional on uplands and slopes; May; perennial.
Psoralidium tenuiflorum (Pursh) Rydb.; [*Psoralea tenuiflora*]; many-flower scurfpea; common on all prairie sites; Jun; perennial.
Robinia pseudoacacia L.; black locust; rare in woodlands; May; tree.
Senna marilandica (L.) Link; [*Cassia marilandica*]; wild senna; infrequent at woodland edges and on lowlands; Jul–Aug; perennial.
Strophostyles helvula (L.) Elliott; trailing wildbean; rare on shaded creek banks; Aug–Oct; annual.
Strophostyles leiosperma (Torr. & A. Gray) Piper; smooth-seed wildbean; infrequent on lowlands; Aug–Sep; annual.
Trifolium pratense L.; red clover; infrequent around headquarters; May–Sep; introduced perennial.
Trifolium repens L.; white clover; infrequent around headquarters; May Sep; introduced perennial.
Vicia americana Muhl. ex Willd.; American vetch; infrequent on lowlands and slopes; May–Jun; perennial.
Vicia villosa Roth; hairy vetch; infrequent in ditches and disturbed sites; May–Jun; introduced annual.

FAGACEAE – Oak family

Quercus macrocarpa Michx.; bur oak; common in woodlands; Apr–May; tree.

Quercus muehlenbergii Engelm.; chinquapin oak; common in woodlands; May; tree.

FUMARIACEAE – Fumitory family

Corydalis micrantha (Engelm. ex A. Gray) A. Gray; slender fumewort; infrequent on disturbed sites; Apr–May; annual.

Dicentra cucullaria (L.) Bernh.; Dutchman's-breeches; rare in woodlands; Apr–May; perennial.

GENTIANACEAE – Gentian family

Gentiana puberulenta Pringle; downy gentian; rare on lowlands; Sep–Oct; perennial.

GERANIACEAE – Geranium family

Geranium carolinianum L.; Carolina crane's-bill; infrequent in disturbed sites and along roads; May–Jun; annual.

GROSSULARIACEAE – Currant family

Ribes missouriense Nutt.; Missouri gooseberry; occasional in woodlands; Apr–May; shrub.

HIPPOCASTANACEAE – Buckeye family

Aesculus glabra Willd.; Ohio buckeye; infrequent in woodlands and along creeks; Apr–May; shrub.

HYDROPHYLLACEAE – Waterleaf family

Ellisia nyctelea (L.) L.; waterpod; occasional in woodlands and along creeks; May–Jun; annual.

JUGLANDACEAE – Walnut family

Carya cordiformis (Wangenh.) Koch; bitter-nut hickory; infrequent in woodlands; May; tree.

Juglans nigra L.; black walnut; occasional in woodlands; May; tree.

LAMIACEAE – Mint family

Agastache nepetoides (L.) Kuntze; catnip giant-hyssop; infrequent in woodlands; Aug–Oct; perennial.

Hedeoma hispida Pursh; rough false-penny-royal; occasional on grazed uplands and shallow sites; May–Jun; annual.

Isanthus brachiatus (L.) Britton et al.; [*Trichostema brachiatum*]; fluxweed; rare on slopes and rocky uplands; Jul–Sep; annual.

Lamium amplexicaule L.; hen-bit; common around headquarters; Mar–May; introduced annual.

Lycopus americanus Muhl. ex Barton; American bugleweed; infrequent in wet sites; Jul–Sep; perennial.

Marrubium vulgare L.; common horehound; infrequent in shaded and disturbed sites; Jun–Oct; introduced perennial.

Mentha arvensis L.; field mint; infrequent along creeks; Jul–Sep; perennial.

Monarda fistulosa L.; mint-leaf bee-balm, wild bergamot; occasional on lowlands and slopes; Jun–Jul; perennial

Nepeta cataria L.; catnip; occasional in shaded disturbed sites; Jun–Sep; introduced perennial.

Prunella vulgaris L.; selfheal; infrequent in woodlands and along creeks; Jun–Sep; perennial.

Salvia azurea Michx. ex Lam.; [*Salvia pitcheri*]; Pitcher's sage, blue sage; common on uplands; Jul–Sep; perennial.

Salvia reflexa Hornem.; lance leaf sage; occasional in disturbed sites and along roads; Jun–Sep; annual.

Scutellaria parvula Michx.; small skullcap; infrequent on uplands and rocky sites; May–Jun; perennial.

Teucrium canadense L.; American germander; common on lowlands; Jun–Jul; perennial.

LINACEAE – Flax family

Linum sulcatum Riddell; grooved flax; common on uplands; Jun–Jul; annual.

LOASACEAE – Stick-leaf family

Mentzelia oligosperma Nutt. ex Sims; stick-leaf; infrequent on slopes and rocky uplands; Jun–Sep; perennial.

LYTHRACEAE – Loosestrife family

Ammannia coccinea Rottb.; purple toothcup; infrequent in wet sites; Jul–Sep; annual.

Lythrum alatum Pursh; winged loosestrife; occasional in wet sites; Jun–Aug; perennial.

MALVACEAE – Mallow family

Abutilon theophrasti Medik.; velvetleaf; occasional in disturbed lowlands and cultivated fields; Jun–Oct; introduced annual.

Callirhoe alcaeoides (Michx.) A. Gray; pale poppy mallow; occasional on uplands and lowlands; May–Jun; perennial.

Callirhoe involucrata (Torr. & A. Gray) A. Gray; purple poppy-mallow; occasional on uplands and lowlands; May–Jul; perennial.

Hibiscus trionum L.; flower-of-an-hour; infrequent in disturbed lowlands and cultivated fields; Jun–Sep; introduced annual.

Malva neglecta Wallr.; common mallow; infrequent in disturbed lowlands; Jun Oct; introduced annual.

Malvastrum hispidum (Pursh) Hocnr.; rough false-mallow; infrequent in disturbed and unburned sites; Jun -Oct; annual.

Sida spinosa L.; prickly sida; infrequent in disturbed lowlands and cultivated fields; Jul–Oct; introduced annual.

MENISPERMACEAE – Moonseed family

Menispermum canadense L.; moonseed; common in woodlands; May–Jun; woody vine.

MOLLUGINACEAE – Carpetweed family

Mollugo verticillata L.; carpetweed; infrequent in disturbed sites; Jul–Sep; introduced annual.

MORACEAE – Mulberry family

Maclura pomifera (Raf.) Schneid.; osage-orange, hedge-apple; infrequent in unburned sites and woodlands; May; introduced tree.

Morus alba L.; white mulberry; occasional in woodlands; May; introduced tree.

NYCTAGINACEAE – Four-o'clock family

Mirabilis albida (Walt.) Heimerl; white four o'clock; infrequent on uplands and lowlands; Jun - Sep; perennial.

Mirabilis linearis (Pursh) Heimerl; narrow-leaf four-o'clock; infrequent on uplands; Jun–Sep; perennial.

Mirabilis nyctaginea (Michx.) MacMill.; wild four-o'clock; occasional at woodland edges and in disturbed sites; May–Sep; perennial.

OLEACEAE – Olive family

Fraxinus pennsylvanica Marshall; green ash; common in woodlands; Apr; tree.

ONAGRACEAE – Evening-primrose family

Calylophus serrulatus (Nutt.) Raven; serrate-leaf evening-primrose; infrequent on uplands and slopes; May–Jul; perennial.

Gaura mollis James; [*Gaura parviflora*]; small flower gaura, velvet gaura; infrequent in ditches and disturbed sites; Jul–Sep; annual.

Oenothera biennis L.; common evening-primrose; infrequent in disturbed sites; Jul–Sep; biennial.

Oenothera laciniata Hill; cut-leaf evening-primrose; rare in disturbed sites; May–Jul; annual.

Oenothera macrocarpa Nutt.; Missouri evening-primrose; occasional on shallow uplands and slopes; May–Jun; perennial.

Oenothera speciosa Nutt.; showy evening-primrose; occasional in mesic lowlands and ditches; Jun–Jul; perennial.

Stenosiphon linifolius (Nutt. ex James) Heynh.; flax-leaf stenosiphon; occasional on uplands and slopes; Aug–Sep; biennial.

OROBANCHACEAE – Broomrape family

Orobanche uniflora L.; one-flower broomrape; rare on lowlands; May; annual forb parasitic on roots of various dicots.

OXALIDACEAE – Wood-sorrel family

Oxalis dillenii Jacq.; gray-green wood sorrel; infrequent on uplands and in woodlands; Apr–Jun; perennial.

Oxalis stricta L.; yellow wood-sorrel; occasional on uplands and in woodlands; Apr–Jun; perennial.

Oxalis violacea L.; violet wood sorrel; occasional on lowlands; Apr–May; perennial.

PAPAVERACEAE – Poppy family

Argemone polyanthemos (Fedde) Ownbey; white prickly-poppy; infrequent on slopes and shallow uplands; Jun–Sep; annual.

PHYTOLACCACEAE – Pokeweed family

Phytolacca americana L.; pokeweed; occasional in woodlands and disturbed lowlands; Jun–Sep; perennial.

PLANTAGINACEAE – Plantain family

Plantago aristata Michx.; bottle-brush plantain; occasional on uplands and in disturbed sites; Jun–Jul; annual.

Plantago lanceolata L.; buck-horn plantain; rare in disturbed sites; Jun–Aug; introduced perennial.

Plantago patagonica Jacq.; woolly plantain; occasional on uplands and slopes; Jun–Jul; annual.

Plantago rhodosperma Decne.; red-seed plantain; common on uplands and in disturbed sites; May–Jun; annual.

Plantago rugelii Decne.; black-seed plantain; common in woodlands and shaded disturbed sites; Jun–Sep; perennial.

Plantago virginica L.; pale-seed plantain; occasional on uplands and in disturbed sites; May–Jun; annual.

PLATANACEAE – Sycamore family

Platanus occidentalis L.; sycamore; infrequent in woodlands; Apr–May; tree.

POLEMONIACEAE – Polemonium family

Phlox divaricata L.; blue phlox; occasional in woodlands; Apr–May; perennial.

POLYGALACEAE – Milkwort family

Polygala verticillata L.; whorled milkwort; infrequent on uplands and rocky sites; Jun–Sep; annual.

POLYGONACEAE – Buckwheat family

Polygonum amphibium L.; water smartweed; rare in ditches and wet sites; Jul–Sep; perennial.

Polygonum aviculare L.; prostrate knotweed; common on trails and in heavily disturbed sites; May–Oct; introduced annual.

Polygonum hydropiper L.; swamp water-pepper; rare in wet sites; Jul–Oct; annual.

Polygonum hydropiperoides Michx.; mild water pepper; rare in wet sites; Jul–Oct; perennial.

Polygonum lapathifolium L.; pale smartweed; infrequent in wet sites; Jul–Oct; annual.

Polygonum pensylvanicum L.; Pennsylvania smartweed; infrequent in wet sites; Jul–Oct; annual

Polygonum persicaria L.; lady's-thumb smartweed; infrequent in wet sites; Jul–Sep; introduced annual.

Polygonum punctatum Elliott; dotted smartweed; infrequent in wet sites; Jun–Oct; perennial.

Polygonum ramosissimum Michx.; bushy knotweed; infrequent in disturbed sites and along roads; Aug–Oct; annual.

Polygonum scandens L.; false buckwheat; infrequent at woodland edges and in disturbed sites; Aug–Sep; perennial.

Polygonum tenue Michx.; slim knotweed; infrequent on uplands; Jul–Oct; annual.

Polygonum virginianum L.; Virginia smartweed; occasional in woodlands; Jul–Sep; perennial

Rumex altissimus Wood; pale dock; infrequent in ditches and disturbed lowlands; Apr–Jun; perennial.

Rumex crispus L.; curly dock; infrequent in ditches and disturbed sites; May–Sep; introduced perennial.

PORTULACACEAE – Purslane family

Portulaca oleracea L.; common purslane; rare in disturbed sites; Jul–Sep; introduced annual.

PRIMULACEAE – Primrose family

Androsace occidentalis Pursh; western rock-jasmine; infrequent on shallow uplands and rocky sites; Apr–May; annual.

Lysimachia ciliata L.; fringed loosestrife; rare in wet sites and along creeks; Jun–Jul; perennial.

RANUNCULACEAE – Buttercup family

Anemone caroliniana Walter; Carolina anemone; infrequent on uplands; Apr–May; perennial.

Anemone virginiana L.; tall anemone; rare in woodlands; Jun–Jul; perennial.

Clematis pitcheri Torr. & A. Gray; Pitcher's clematis; rare in woodlands; Jun–Jul; perennial.

Delphinium carolinianum Walter; [*Delphinium virescens*]; plains larkspur; infrequent on uplands; May–Jun; perennial.

Myosurus minimus L.; tiny mousetail; rare in wet sites; Apr–May; annual.

Ranunculus abortivus L.; little-leaf buttercup; rare in wet sites; Apr–May; biennial.

Thalictrum dasycarpum Fisch. & Ave-Lall.; purple meadow-rue; rare in woodlands; May–Jun; perennial.

RHAMNACEAE – Buckthorn family

Ceanothus herbaceus Raf.; New Jersey tea, inland ceanothus; common in unburned uplands and slopes; Apr–May; shrub.

ROSACEAE – Rose family

Agrimonia pubescens Wallr.; downy agrimony; rare at woodland edges; Jul–Aug; perennial.

Crategus mollis Scheele; downy hawthorn, summer haw; rare on wooded slopes and along creeks; Apr–May; shrub.

Geum canadense Jacq.; white avens; common in woodlands and unburned lowlands; Jun–Jul; perennial.

Potentilla arguta Pursh; tall cinquefoil; infrequent on lowlands; Jun–Jul; perennial.

Potentilla recta L.; sulphur cinquefoil; rare in disturbed sites; May–Jun; introduced perennial.

Prunus americana Marshall; wild plum; occasional along creeks and in unburned sites; Mar–Apr; shrub.

Prunus angustifolia Marshall; chickasaw plum; infrequent along creeks and in unburned sites; Apr; shrub.

Prunus virginiana L.; choke cherry; infrequent along creeks and in unburned sites; Apr–May; shrub.

Rosa arkansana Porter; Arkansas rose; common in unburned prairie; May–Jun; shrub.
Rosa multiflora Thunb.; multiflora rose; rare in woodlands and unburned lowlands; May–Jul; introduced shrub.
Rubus occidentalis L.; black raspberry; occasional in woodlands and unburned lowlands; May–Jun; shrub.
Rubus ostryifolius Rydb.; high-bush blackberry; common in woodlands and unburned lowlands; May–Jun; shrub.

RUBIACEAE – Madder family

Galium aparine L.; catch-weed bedstraw; occasional in woodlands and unburned lowlands; May–Jun; annual.
Galium circaezans Michx.; woods bedstraw; occasional in woodlands; May–Jun; perennial.
Galium triflorum Michx.; sweet-scented bedstraw; occasional in woodlands; May–Jun; perennial.
Hedyotis nigricans (Lam.) Fosberg; narrow-leaf bluets; occasional on uplands and slopes; Jun–Jul; perennial.
Houstonia pusilla Schoepf; [*Hedyotis crassifolia*]; small bluets; rare on shallow uplands; Apr May; annual.

RUTACEAE – Citrus family

Zanthoxylum americanum Mill.; prickly ash; infre quent in woodlands and unburned low lands; Apr; shrub.

SALICACEAE – Willow family

Populus deltoides Bartram ex Marshall; cotton wood; occasional in wet sites; Apr; tree.
Salix amygdaloides Andersson; peach leaf wil low; infrequent in wet sites; May; tree.
Salix caroliniana Michx.; Carolina willow; infre quent in wet sites; Apr; tree.
Salix exigua Nutt.; sandbar willow; occasional in wet sites; Apr; shrub.
Salix nigra Marshall; black willow; infrequent in wet sites; Apr; tree.

SANTALACEAE – Sandalwood family

Comandra umbellata (L.) Nutt.; bastard toad-flax; common on shallow uplands and slopes; Apr–Jun; perennial.

SCROPHULARIACEAE – Figwort family

Agalinis aspera (Dougl. ex Benth.) Britton; rough agalinis; infrequent on uplands and slopes; Aug–Sep; annual.
Agalinis densiflora (Benth.) Blake; [*Tomanthera densiflora*]; fine leaf hairy-foxglove; rare on rocky uplands and slopes; Aug–Sep; annual.
Bacopa rotundifolia (Michx.) Wettst.; water-hys sop; rare in shallow water and mud; Jul–Aug; perennial.
Leucospora multifida (Michx.) Nutt.; paleseed; infrequent in wet sites; Jul–Sep; annual.
Mimulus glabratus Kunth; yellow monkey-flower; infrequent in wet sites; May–Aug; perennial.
Penstemon cobaea Nutt.; cobaea beardtongue; occasional on uplands and slopes; May–Jun; perennial.
Penstemon grandiflorus Nutt.; shell-leaf beard tongue, large beardtongue; infrequent on uplands and slopes; May–Jun; perennial.
Penstemon tubiflorus Nutt.; tube beardtongue; rare on uplands and slopes; May–Jun; perennial.
Scrophularia marilandica L.; Maryland figwort; occasional in woodlands; Jul–Sep; perennial.
Verbascum blattaria L.; moth mullein; occasional in ditches and disturbed sites; May–Sep; in troduced biennial.
Verbascum thapsus L.; flannel mullein; infrequent in ditches and disturbed sites; Jun–Sep; in troduced biennial.
Veronica agrestis L.; field speedwell; occasional in disturbed sites and around headquarters; Apr–Jun; introduced annual.
Veronica anagallis-aquatica L.; water speedwell; occasional in wet sites; May–Sep; perennial.
Veronica arvensis L.; corn speedwell; infrequent in disturbed lowlands; Apr–May; introduced annual.
Veronica peregrina L.; purslane speedwell; occa sional in wet sites; Apr–May; annual.

SOLANACEAE – Nightshade family

Datura stramonium L.; jimsonweed; rare in dis turbed sites; Jul–Oct; introduced annual.
Physalis hederifolia A. Gray; heart-leaf ground cherry; rare in disturbed sites; Jul–Aug; perennial.
Physalis heterophylla Nees; clammy ground cherry; infrequent on lowlands; Jun–Aug; perennial.
Physalis pubescens L.; downy ground-cherry; rare in woodlands and along creeks; Jun–Jul; annual.
Physalis pumila Nutt.; prairie ground-cherry; com mon on all prairie sites; Jun–Sep; perennial.
Physalis virginiana Mill.; Virginia ground-cherry;

occasional on lowlands and in disturbed sites; Jun–Sep; perennial.

Solanum carolinense L.; Carolina horse-nettle; occasional on lowlands and in disturbed sites; Jun–Sep; perennial.

Solanum ptychanthum Dunal; black nightshade; rare in wet sites and ditches; Jun Oct; annual.

Solanum rostratum Dunal; buffalo-bur nightsnade; occasional in disturbed sites; Jun -Sep; annual.

TILIACEAE – Linden family

Tilia americana L.; basswood; rare in woodlands; Jun; tree.

ULMACEAE – Elm family

Celtis occidentalis L.; hackberry; common in woodlands; Apr May; tree.

Ulmus americana L.; American elm; common in woodlands; Mar; tree.

Ulmus pumila L.; Siberian elm; occasional in woodlands; Mar–Apr; introduced tree.

Ulmus rubra Muhl.; red elm, slippery elm; infrequent in woodlands and along creeks; Mar–Apr; tree.

URTICACEAE – Nettle family

Laportea canadensis (L.) Wedd.; Canadian wood nettle; infrequent in woodlands; Jul–Sep; perennial.

Parietaria pensylvanica Muhl. ex Willd.; Pennsylvania pellitory; infrequent in woodlands and unburned lowlands; Jun Sep; annual.

Pilea pumila (L.) A. Gray; clearweed; occasional in wet sites; Aug Oct; annual.

Urtica dioica L.; stinging nettle; common in woodlands; Jul -Sep; perennial.

VERBENACEAE – Verbena family

Glandularia bipinnatifida (Nutt.) Nutt.; [*Verbena bipinnatifida*]; Dakota verbena; occasional on slopes and rocky sites; May–Jul; perennial.

Glandularia canadensis (L.) Nutt.; [*Verbena canadensis*]; rose verbena; infrequent on slopes; Apr–Jun; perennial.

Phryma leptostachya L.; lopseed; occasional in woodlands; Jul–Aug; perennia .

Phyla lanceolata (Michx.) Greene; [*Lippia lanceolata*]; northern fogfruit; occasional in wet sites; Jul–Sep; perennial.

Verbena bracteata Lag.& Rodr.; prostrate verbena, bigbract verbena; occasional in disturbed sites and along roads; Jun–Aug; perennial.

Verbena hastata L.; blue verbena; infrequent in mesic lowlands and along creeks; Jul Sep; perennial.

Verbena simplex Lehm.; narrow-leaf verbena; rare on slopes and rocky sites; Jun Aug; perennial.

Verbena stricta Vent.; woolly verbena; occasional on uplands and along roads; Jun–Sep; perennial.

Verbena urticifolia L.; white verbena, nettle-leaf verbena; occasional in woodlands and along creeks; Jul–Aug; perennial.

VIOLACEAE – Violet family

Hybanthus verticillatus (Ortega) Baill.; nodding green-violet; infrequent on uplands and slopes; May; perennial.

Viola bicolor Pursh; [*Viola rafinesquii*]; johnny-jump-up, field pansy; occasional on uplands and in disturbed sites; Apr–May; annual.

Viola pedatifida Don; prairie violet; occasional on all prairie sites; Apr–May; perennial.

Viola nephrophylla Greene; [*Viola pratincola*]; common violet; common in woodlands; Apr–Jun; perennial.

Viola sororia Willd.; downy blue violet; infrequent in woodlands; Apr–Jun; perennial.

VITACEAE – Grape family

Parthenocissus quinquefolia (L.) Planch.; Virginia creeper; common in woodlands; Jun–Jul; woody vine.

Vitis riparia Michx.; riverbank grape; occasional in woodlands; May; woody vine.

ZYGOPHYLLACEAE – Caltrop family

Tribulus terrestris L.; puncturevine; infrequent in disturbed sites and along trails; Jul–Sep; introduced annual.

Class LILIOPSIDA – Monocots

AGAVACEAE – Agave family

Yucca glauca Nutt.; small soapweed, yucca; infrequent on uplands and slopes; May–Jun; perennial.

ALISMATACEAE – Water-plantain family

Alisma subcordatum Raf.; subcordate water-plantain; infrequent in wet sites; Jul–Sep; perennial.

Echinodorus berteroi (Spreng.) Fassett; [*Echinodorus rostratus*]; burhead; infrequent in wet sites; Jun–Aug; annual.

Sagittaria latifolia Willd.; common arrowhead; infrequent in wet sites; Jul–Aug; perennial.

ARACEAE – Arum family

Arisaema dracontium (L.) Schott; dragonroot; rare in woodlands; May; perennial.

COMMELINACEAE – Spiderwort family

Commelina erecta L.; erect dayflower; infrequent at woodland edges; Jun–Oct; perennial.

Tradescantia bracteata Small ex Britton; bracted spiderwort; occasional in mesic lowlands; Apr–Jun; perennial.

Tradescantia ohiensis Raf.; Ohio spiderwort; rare in mesic lowlands; May Jun; perennial.

CYPERACEAE – Sedge family

Bolboschoenus fluviatilis (Torr.) Soják; [*Scirpus fluviatilis*]; river bulrush; rare around ponds; Jun–Jul; perennial.

Carex albicans Willd. ex Spreng.; [*Carex artitecta*]; white-tinge sedge; infrequent in woodlands; May–Jun; perennial.

Carex austrina Mack.; southern sedge; infrequent on uplands and lowlands; Apr Jun; perennial.

Carex blanda Dewey; woodland sedge; occasional in woodlands and along creeks; Apr Jun; perennial.

Carex brachyglossa Mack.; [*Carex annectens*]; yellow-fruit sedge; occasional in wet sites; May–June; perennial.

Carex brevior (Dewey) Mack. ex Lunell; straw sedge; common on uplands and lowlands; May–Jun; perennial.

Carex davisii Schwein. & Torr.; Davis' sedge; rare in woodlands; May–Jun; perennial.

Carex emoryi Dewey; Emory's sedge; rare in wet sites; May–Jun; perennial.

Carex frankii Kunth; Frank's sedge; infrequent in wet sites; May–Jun; perennial.

Carex gravida Bailey; heavy sedge; common on lowlands and in woodlands; Apr–Jun; perennial.

Carex grisea Wahlenb.; [*Carex amphibola*]; narrow-leaf sedge; common in woodlands and wet sites; Apr Jun; perennial.

Carex hyalinolepis Steud.; shoreline sedge; rare in wet sites; May–Jun; perennial.

Carex hystericina Muhl. ex Willd.; bottle brush sedge; common in wet sites; May–Jun; perennial.

Carex inops Bailey; [*Carex heliophila*]; prairie sedge; abundant on uplands; Apr–May; perennial.

Carex meadii Dewey; Mead's sedge; abundant on all prairie sites; Apr–May; perennial.

Carex molesta Mack. ex Bright; pest sedge; occasional on lowlands and in wet sites; May–June; perennial.

Carex pellita Muhl. ex Willd.; [*Carex lanuginosa*]; woolly sedge; occasional in wet sites; May–Jun; perennial.

Carex vulpinoidea Michx.; fox sedge; occasional in wet sites; May–Jun; perennial.

Cyperus acuminatus Torr. & Hook. ex Torr.; tapeleaf flat-sedge; occasional in wet sites; Jul–Sep; annual.

Cyperus bipartitus Torr.; [*Cyperus rivularis*]; brook flat-sedge; infrequent in wet sites; Jul–Sep; annual.

Cyperus esculentus L.; yellow nut-sedge; rare in mesic lowlands and ditches; Aug–Oct; perennial.

Cyperus lupulinus (Spreng.) Marcks; plains flat sedge; common on uplands; Jun–Jul; perennial.

Cyperus × *mesochorus* Geise; [*C. lupulinus* × *C. schweinitzii*]; intermediate flat-sedge; infrequent on uplands; Jun–Jul; perennial.

Cyperus odoratus L.; rusty flat-sedge; occasional in wet sites; Jul Sep; annual.

Cyperus squarrosus L.; [*Cyperus aristatus*]; awned flat-sedge; rare in wet sites; Jul Aug; annual.

Cyperus strigosus L.; straw flat-sedge; infrequent in wet sites; Aug–Sep; perennial.

Eleocharis compressa Sull.; flat-stem spike-rush; common in wet sites; Apr–Jun; perennial.

Eleocharis erythropoda Steud.; red-foot spike rush; common in wet sites; May–Jun; perennial.

Eleocharis macrostachya Britton; long stem spike-rush; common in wet sites; Apr–Jun; perennial.

Fuirena simplex Vahl; umbrella-sedge; infrequent in wet sites; Jul–Sep; annual.

Schoenoplectus tabernaemontani (Gmel.) Palla; [*Scirpus validus*]; soft stem bulrush; occasional in wet sites; Jun–Aug; perennial.

Scirpus atrovirens Willd.; green bulrush; common in wet sites; Jun–Jul; perennial.

Scirpus pendulus Muhl.; drooping bulrush; common in wet sites; May–Jul; perennial.

IRIDACEAE – Iris family

Sisyrinchium campestre Bicknell; prairie blue-eyed-grass; common on uplands; Apr–May; perennial.

JUNCACEAE – Rush family

Juncus dudleyi Wiegard; Dudley's rush; occasional in wet sites; Jun–Aug; perennial.

Juncus interior Wiegard; inland rush; common in mesic uplands and lowlands; May–Aug; perennial.

Juncus torreyi Coville; Torrey's rush; common in wet sites; Jun Aug; perennial.

LEMNACEAE – Duckweed family

Lemna minor L.; lesser duckweed; rare in shallow water; Jul–Sep; perennial.

LILIACEAE – Lily family

Allium canadense L.; wild onion; occasional on uplands; Apr Jun; perennial.

Allium stellatum Nutt. ex Ker Gawl.; pink onion; infrequent on uplands; Aug -Sep; perennial.

Asparagus officinalis L.; asparagus; rare at woodland edges; May–Jun; introduced perennial.

Erythronium albidum Nutt.; white fawn-lily; infrequent in woodlands; Apr; perennial.

Ornithogalum umbellatum L.; star-of-Bethlehem; rare around headquarters; Apr–May; introduced perennial.

Polygonatum biflorum (Walter) E liott; Solomon's seal; rare in woodlands; Jun; perennial.

Zigadenus nuttallii (A. Gray) Watson; Nuttall's death camas; occasional on uplands and lowlands; May–Jun; perennial.

NAJADACEAE – Naiad family

Najas guadalupensis (Spreng.) Magnus; common naiad; occasional in ponds; Aug Sep; annual.

ORCHIDACEAE – Orchid family

Spiranthes cernua (L.) Rich.; nodding ladies' tresses; rare on lowlands; Sep Oct; perennial.

Spiranthes vernalis Engelm. & A. Gray; spring ladies'-tresses; rare on lowlands; Jul–Aug; perennial.

POACEAE – Grass family

Aegilops cylindrica Host; jointed goat grass; rare in disturbed sites; May–Jun; introduced annual C_3.

Agrostis hyemalis (Walter) Britton et al.; tickle grass, winter bent grass; occasional on uplands; May–Jun; perennial C_3.

Agrostis stolonifera L.; redtop; infrequent along creeks; Jun–Jul; introduced perennial C_3.

Alopecurus carolinianus Walter; Carolina foxtail; infrequent in wallows and mesic uplands; Apr -Jun; annual C_3.

Andropogon gerardii Vitman; big bluestem; abundant on all prairie sites; Jul–Oct; perennial C_4.

Aristida oligantha Michx.; prairie threeawn; infrequent on disturbed sites; Aug–Sep; annual C_4.

Aristida purpurea Nutt.; purple threeawn; infrequent on uplands and rocky sites; Jun–Aug; perennial C_4.

Bothriochloa bladhii (Retz.) Blake; [*Andropogon bladhii*]; Caucasian bluestem; common on uplands and lowlands around headquarters; Jul Oct; introduced perennial C_4.

Bothriochloa ischaemum (L.) Keng; [*Andropogon ischaemum*]; Turkestan bluestem; common on uplands and lowlands around headquarters; Jul–Oct; introduced perennial C_4.

Bothriochloa laguroides (DC.) Herter; [*Andropogon saccharoides*]; silver bluestem; rare in ditches and disturbed sites; Jul–Sep; perennial C_4.

Bouteloua curtipendula (Michx.) Torr.; side-oats grama; abundant on uplands and slopes; Jul–Sep; perennial C_4.

Bouteloua gracilis (Willd. ex Kunth) Lag. ex Griffiths; blue grama; occasional on uplands and slopes; Jul–Aug; perennial C_4.

Bouteloua hirsuta Lag.; hairy grama; infrequent on shallow uplands and slopes; Jul–Sep; perennial C_4.

Bromus inermis Leyss.; smooth brome; common in fields near headquarters, ditches, and at woodland edges; May–Jun; introduced perennial C_3.

Bromus japonicus Thunb.; Japanese brome; common in disturbed sites and unburned prairie; Apr -Jun; introduced annual C_3.

Bromus pubescens Muhl. ex Willd.; woodland brome; common in woodlands; May Jun; perennial C_3.

Bromus tectorum L.; downy brome; infrequent in disturbed sites and unburned prairie; May–Jun; introduced annual C_3.

Buchloe dactyloides (Nutt.) Engelm.; buffalo grass; common on clay uplands and shallow sites; May–Aug; perennial C_4.

Cenchrus longispinus (Hack.) Fernald; sandbur; infrequent in disturbed sites and along trails; Jul Sep; annual C_4.

Chloris verticillata Nutt.; windmill grass; infrequent on shallow uplands; Jun–Sep; perennial C_4.

Cynodon dactylon (L.) Pers.; Bermuda grass; occasional around headquarters; Jun–Sep; introduced perennial C_4.

Dactylis glomerata L.; orchard grass; infrequent around headquarters; May–Jun; introduced perennial C_3.

Diarrhena obovata (Gleason) Brandenburg; [*Diarrhena americana* var. *obovata*]; American beakgrain; occasional in woodlands; Jul–Aug; perennial C_3.

Dichanthelium acuminatum (Sw.) Gould & Clark; woolly dichanthelium; occasional on all prairie sites; May–Jun; perennial C_3.

Dichanthelium oligosanthes (Nash) Gould; Scribner's dichanthelium; abundant on all prairie sites; May–Jun; perennial C_3.

Digitaria cognata (Schult.) Pilg.; [*Leptoloma cognatum*]; fall witch grass; infrequent on uplands and slopes; Jul–Sep; perennial C_4.

Digitaria sanguinalis (L.) Scop.; hairy crab grass; common around headquarters; Jul–Oct; introduced annual C_4.

Echinochloa muricata (Beauv.) Fernald; barnyard grass; occasional in ditches and disturbed sites; Jun–Sep; annual C_4.

Eleusine indica (L.) Gaertn.; goose grass; occasional in disturbed sites and along roads; Jul–Oct; introduced annual C_4.

Elymus canadensis L.; Canadian wild-rye; occasional on all prairie sites; Jun–Jul; perennial C_3.

Elymus villosus Muhl. ex Willd.; hairy wild-rye; occasional in woodlands; Jun–Jul; perennial C_3.

Elymus virginicus L.; Virginia wild-rye; occasional in woodlands; Jun–Jul; perennial C_3.

Eragrostis capillaris (L.) Nees; lace grass; rare on slopes; Jul–Sep; annual C_4.

Eragrostis cilianensis (All.) Vignolo ex Janch.; stink grass; occasional in disturbed sites and along roads; Jun–Oct; introduced annual C_4.

Eragrostis pectinacea (Michx.) Nees ex Steud.; Carolina love grass; occasional in disturbed sites and along roads; Jul–Oct; annual C_4.

Eragrostis spectabilis (Pursh) Steud.; purple love grass; occasional on all prairie sites; Aug–Sep; perennial C_4.

Eriochloa contracta Hitchc.; prairie cup grass; occasional in disturbed sites and along roads; Jul–Sep; annual C_4.

Festuca subverticillata (Pers.) Alexeev; [*Festuca obtusa*]; nodding fescue; infrequent in woodlands; May–Jun; perennial C_3.

Glyceria striata (Lam.) Hitchc.; fowl manna grass; occasional in wet sites and along creeks; May–Jun; perennial C_3.

Hesperostipa spartea (Trin.) Barkworth; [*Stipa spartea*]; porcupine grass; infrequent on uplands; May–Jun; perennial C_3.

Hordeum jubatum L.; fox-tail barley; infrequent in ditches and mesic lowlands; Jun; perennial C_3.

Hordeum pusillum Nutt.; little barley; occasional in disturbed sites and along roads; May; annual C_3.

Koeleria macrantha (Ledeb.) Schult.; [*Koeleria pyramidata*]; prairie June grass; common on uplands; May–Jun; perennial C_3.

Leersia oryzoides (L.) Sw.; rice cut grass; infrequent in wet sites and along creeks; Aug–Sep; perennial C_3.

Leersia virginica Willd.; white grass; occasional in wet sites and along creeks; Jul–Sep; perennial C_3.

Leptochloa fusca (L.) Kunth; [*Leptochloa fascicularis*]; bearded sprangletop; infrequent in disturbed sites; Jul–Sep; annual C_4.

Leptochloa panicea (Retz.) Ohwi; [*Leptochloa filiformis*]; red sprangletop; rare in disturbed sites; Jul–Sep; annual C_4.

Lolium arundinaceum (Schreb.) Darbyshire; [*Festuca arundinacea*]; tall fescue; occasional around headquarters; May–Jun; introduced perennial C_3.

Lolium perenne L.; rye grass; infrequent in disturbed sites and ditches; May–Jun; introduced perennial C_3.

Lolium pratense (Huds.) Darbyshire; [*Festuca pratensis*]; meadow fescue; infrequent around headquarters; May–Jun; introduced perennia C_3.

Muhlenbergia bushii Pohl; nodding muhly; occasional in woodlands; Aug–Sep; perennial C_4.

Muhlenbergia cuspidata (Torr. ex Hook.) Rydb.; plains muhly; occasional on uplands and slopes; Aug–Sep; perennial C_4.

Muhlenbergia frondosa (Poir.) Fernald; wire-stem muhly; occasional in woodlands and along creeks; Aug–Oct; perennial C_4.

Muhlenbergia mexicana (L.) Trin.; leafy muhly; infrequent in woodlands and along creeks; Sep–Oct; perennial C_4.

Muhlenbergia racemosa (Michx.) Britton et al.; marsh muhly, green muhly; occasional at

woodland edges and in mesic lowlands; Aug–Oct; perennial C_4.

Muhlenbergia schreberi Gmel.; nimblewill; occasional in woodlands; Aug–Oct; perennial C_4.

Panicum capillare L.; common witch grass; occasional in disturbed sites and along roads; Jul Oct; annual C_4.

Panicum dichotomiflorum Michx.; fall panicum; occasional in disturbed sites and along roads; Aug–Oct; annual C_4.

Panicum obtusum Kunth; vine mesquite; rare on lowlands and in mesic uplands; Jul Sep; perennial C_4.

Panicum virgatum L.; switch grass; common on all prairie sites; Jul–Oct; perennial C_4.

Pascopyrum smithii (Rydb.) Löve; [*Agropyron smithii*]; western wheat grass; occasional on clay uplands and in ditches; Jun; perennial C_3.

Paspalum pubiflorum Rupr. ex Fourn.; hairy-seed paspalum; rare along roads; Jul–Oct; perennial C_4.

Paspalum setaceum Michx.; sand paspalum; rare on clay uplands and shallow sites; Jul–Aug; perennial C_4.

Phleum pratense L.; timothy; rare in mesic lowlands and ditches; Jun; introduced perennial C_3.

Poa arida Vasey; plains blue grass; infrequent on mesic lowlands; May Jun; perennial C_3.

Poa chapmaniana Scribn.; Chapman's blue grass; rare in disturbed sites; May–Jun; annual C_3.

Poa compressa L.; Canadian blue grass; infrequent in unburned uplands and disturbed sites; May–Jun; introduced perennial C_3.

Poa pratensis L.; Kentucky blue grass; abundant in unburned prairie and woodlands; Apr Jun; introduced perennial C_3.

Schedonnardus paniculatus (Nutt.) Trel.; tumble grass; occasional on uplands and shallow soils; Jun–Aug; perennial C_4.

Schizachyrium scoparium (Michx.) Nasn; [*Andropogon scoparius*]; little bluestem; abundant on all prairie sites; Aug Sep; perennial C_4.

Setaria pumila (Poir.) Roem. & Schult.; [*Setaria glauca*]; yellow bristle grass; occasional in disturbed sites and along roads; Jul -Sep; introduced annual C_4.

Setaria viridis (L.) Beauv.; green bristle grass; infrequent in disturbed sites and along roads; Jun–Sep; introduced annual C_4.

Sorghastrum nutans (L.) Nash; Indian grass; abundant on all prairie sites; Aug–Oct; perennial C_4.

Sorghum halepense (L.) Pers.; Johnson grass; rare near cultivated fields; Jul–Oct; introduced perennial C_4.

Spartina pectinata Bosc ex Link; prairie cord grass; common in mesic lowlands and ditches; Jul–Sep; perennial C_4.

Sphenopholis obtusata (Michx.) Scribn.; prairie wedgescale; occasional on uplands and lowlands; May–Jun; perennial C_3.

Sporobolus compositus (Poir.) Merr.; [*Sporobolus asper*]; tall dropseed; abundant on all prairie sites and in abandoned brome fields; Aug–Oct; perennial C_4.

Sporobolus cryptandrus (Torr.) A. Gray; sand dropseed; infrequent on clay uplands and shallow soils; Jul -Aug; perennial C_4.

Sporobolus heterolepis (A. Gray) A. Gray; prairie dropseed; occasional on all prairie sites; Aug–Sep; perennial C_4.

Sporobolus neglectus Nash; puff-sheath dropseed; occasional along roads; Aug–Sep; annual C_4.

Sporobolus vaginiflorus (Torr. ex A. Gray) Wood; poverty dropseed; infrequent along roads; Aug–Sep; annual C_4.

Tridens flavus (L.) Hitchc.; purpletop; occasional on lowlands and in ditches; Jul–Sep; perennial C_4.

Tripsacum dactyloides (L.) L.; eastern gamma grass; occasional on lowlands around headquarters; Jun–Jul; perennial C_4.

Vulpia octoflora (Walter) Rydb.; [*Festuca octoflora*]; six-weeks fescue; occasional on grazed uplands and disturbed sites; Apr–May; annual C_3.

POTAMOGETONACEAE – Pondweed family

Potamogeton foliosus Raf.; leafy pondweed; rare in ponds; Jun–Aug; perennial.

Potamogeton nodosus Poir.; long-leaf pondweed; occasional in ponds; Jun Aug; perennial.

Potamogeton pusillus L.; baby pondweed; rare in ponds; Jun -Aug; perennial.

SMILACACEAE – Catbrier family

Smilax herbacea L.; carrion flower greenbrier; rare in woodlands; May Jun; perennial.

Smilax tamnoides L.; [*Smilax hispida*]; bristly greenbrier; common in woodlands; May Jun; woody vine

TYPHACEAE – Cat-tail family

Typha angustifolia L.; narrow-leaf cat-tail; rare in wet sites; Jun–Jul; perennial.

Typha latifolia L.; broad-leaf cat-tail; occasional in wet sites; Jun–Jul; perennial.

APPENDIX II

Non-naturalized ornamental and horticultural species growing around the headquarters area on Konza Prairie.

Family	Species	Common name
Araliaceae	*Hedra helix*	English ivy
Bignoniaceae	*Catalpa speciosa*	Northern catalpa
Caprifoliaceae	*Lonicera tatarica*	Tatarian honeysuckle
Cupressaceae	*Juniperus horizontalis*	Creeping juniper
Iridaceae	*Iris germanica*	Iris
Liliaceae	*Amaryllis bella-donna*	Naked ladies
Liliaceae	*Narcissus poeticus*	Poet's narcissus
Liliaceae	*Narcissus pseudonarcissus*	Daffodil
Oleaceae	*Syringa vulgaris*	Lilac
Paeoniaceae	*Paeonia lactiflora*	Peony
Pinaceae	*Pinus nigra*	Austrian pine
Rosaceae	*Malus sylvestris*	Apple
Rosaceae	*Pyrus communis*	Pear
Sapindaceae	*Koelreuteria paniculata*	Golden rain-tree

ACKNOWLEDGMENTS

Numerous individuals have contributed to compiling the Konza Prairie flora, but the most prominent predecessors were Craig Freeman, Richard Kazmaier, Lloyd Hulbert, and Linda Marple. Ted Barkley and Iralee Barnard were instrumental in persuading me to collect formally and update the Konza Prairie flora. Earlier drafts of this manuscript were improved by comments from Carolyn Ferguson, Mark Mayfield, and Iralee Barnard. I also appreciate the meticulous review and insightful comments from Robert B. Kaul and Craig C. Freeman. The National Science Foundation Long-Term Ecological Research Program, Konza Prairie Biological Station, Kansas State University Herbarium, and the Kansas Agricultural Experiment Station provided support for this project. This report is contribution no. 02-122-J of the Kansas Agricultural Experiment Station.

ABSTRACT

The cerrado, a savanna-like ecosystem, is the second largest vegetation type in Brazil, originally covering about two million km^2 (or 23%) of the Brazilian territory. The Emas National Park (ENP), comprising about 133,000 ha, is one of the most important reserves within the cerrado. From November 1998 to October 1999, we carried out a floristic survey of all the cerrado physiognomies of the ENP and found 601 species, belonging to 303 genera and 80 families. Among the collected species, 12 were weeds and seven were new to science. The herbaceous to woody species ratio was 3.03:1. The richest families were Asteraceae (88 species), Fabaceae (87), Poaceae (51), Myrtaceae (39), and Lamiaceae (24); these five families comprised 48% of the total number of species. The results obtained show the importance of the ENP to cerrado conservation, since from 8 to 20% of the species recorded for this vegetation type occur within the reserve. We emphasize the need for more floristic surveys in which the frequently overlooked herbaceous component should also be sampled.

Key words: cerrado, savanna, floristics, Emas National Park, central Brazil

RESUMEN

El cerrado, un tipo de sabana, es el segundo mayor tipo de vegetación de Brasil. Una de las reservas más importantes destinada a proteger el cerrado es el "Parque Nacional das Emas" (PNE), con un área aproximada de 133.000 ha. En el periodo de noviembre de 1998 a octubre de 1999, fue realizado un levantamiento florístico en las fisionomías de cerrado del PNE, encontrándose 601 especies pertenecientes a 303 géneros y 80 familias. De entre las especies colectadas, fueron encontradas 12 invasoras y siete nuevas para la ciencia. La proporción entre especies herbáceo-subarbustivas y arbustivo-arbóreas fue de 3,03:1. Las familias más ricas en especies fueron: Asteraceae (88 especies), Fabaceae (87), Poaceae (51), Myrtaceae (39) e Lamiaceae (24), compreendiendo 48% del total de especies. Los resultados mostraron la importancia del PNE para la conservación del cerrado, ya que en esta reserva aparecen de 8 a 20 % de las especies listadas para dicha formación vegetal. Resaltamos aquí la necesidad de realizar levantamientos florísticos contemplando también el componente herbáceo-subarbustivo, frecuentemente olvidado.

INTRODUCTION

The Cerrado Domain, the second largest Brazilian phytogeographic province, once covered about 2 million km^2, or 23% of the Brazilian territory, with its core area in central Brazil (Ratter et al. 1997). As its name implies, cerrado vegetation prevails in the Cerrado Domain. The cerrado vegetation is not uniform in physiognomy (Coutinho 1990), ranging from grassland to tall woodland, but most of its physiognomies within the range defined as tropical savanna

(Sarmiento 1983). In the Cerrado Domain, interspersed with the prevailing cerrado vegetation, there are other vegetation types, such as seasonal forest, riparian forest, rocky *campo*, and wet *campo*.

Although frequently neglected in the past, the cerrado vegetation stands out in its high floristic richness (Ratter et al. 1997). After comparing a large number of floristic and phytosociological surveys carried out in cerrado sites from all over Brazil, Castro et al. (1999) estimated that 3,000 to 7,000 vascular plant species occur in this vegetation type. In addition to its high floristic richness, the cerrado presents a high degree of endemism. Lenthall et al. (1999), for instance, listed 234 woody species occurring in 10 cerrado sites and verified that 80% of them were restricted to this vegetation type. Owing to its high richness, high degree of endemism, and present conservation status, Fonseca et al. (2000) included the cerrado among the biodiversity hotspots for highest priority conservation in the world.

According to Rizzini (1963), the cerrado flora consists of an herbaceous and a woody component, which compete because both are heliophilous, i.e., there is no shade-adapted ground layer. Following Coutinho's (1990) concept of cerrado, the importance of the herbaceous component decreases from open to closed physiognomies, whereas the importance of the woody component increases. In most forms of cerrado, the herbaceous component is much richer in species, as demonstrated by Mantovani and Martins (1993), who found a ratio between herbaceous and woody species ranging from 2:1 to 3:1 in the comparison of some southern cerrado sites. However, despite its richness, Castro et al. (1999) pointed out the almost complete absence of existing surveys on the herbaceous component of the cerrado. These authors also highlighted the uneven distribution of surveys, which tend to be concentrated on few well studied areas (Castro et al. 1999).

The Emas National Park (ENP) is the largest and one of the most important reserves among those in the Cerrado Domain (Conservation International 1999). Although some papers about its fauna and wildfires exist (e.g., Ramos-Neto & Pivello 2000; Rodrigues & Monteiro 2000), the ENP's vegetation remains poorly studied. The present work was designed as an intense and systematic floristic survey to provide a better knowledge of the ENP's flora in particular and of the cerrado flora in general, especially concentrating on the still poorly known herbaceous component. Furthermore, this survey is intended to provide a basis for other studies to be carried out in the ENP and for phytogeographical studies on the cerrado flora.

To achieve these aims, we have tried to answer the following questions: What is the floristic composition of the cerrado physiognomies in ENP? Which families are the richest ones in its flora? Does the herbaceous to woody species ratio lie within the range described by Mantovani and Martins (1993), that is, be-

tween 2:1 and 3:1? Are there woody species that should be included in the checklist elaborated by Castro et al. (1999)?

SITE SUMMARY

Created in 1961, the ENP is located in the Brazilian Central Plateau, southwestern Goiás State (17°49'-18°28'S, 52°39'-53°10'W), in the cerrado core region, and comprises 132,941 ha. Regional climate is humid tropical with wet summer and dry winter, classified as Aw following Köppen's (1948) system. Annual rainfall varies from 1,200 to 2,000 mm, concentrated from October to March, and mean annual temperature lies around 24,6°C (Ramos-Neto & Pivello 2000). Three quarters of the ENP consist of flat tableland, 820–888 m high, and the remaining area consists of hilly terrain, 720–820 m high (Ramos-Neto & Pivello 2000). Recently, ENP was included by UNESCO (2001) in the World Natural Heritage List as one of the sites containing flora, fauna, and key habitats that characterize the cerrado.

The cerrado in ENP exhibits almost all physiognomies found in this vegetation type. Following Coutinho's (1990) classification and Sarmiento's (1984) translation, the cerrado in ENP ranges from *campo limpo* (a grassland) to *cerrado sensu stricto* (a woodland). In the reserve, open cerrado physiognomies—*campo limpo, campo sujo* (a shrub savanna), and *campo cerrado* (a savanna woodland)—prevail, covering 68.1% of the total area, especially on the flat tableland (Ramos-Neto & Pivello 2000). The more closed *cerrado sensu stricto* covers 25.1% of the reserve, mainly on the hilly terrain. Other vegetation types, such as wet campo (4.9% of the total area) and riparian and seasonal semideciduous forests (1.2%), also exist within the park.

METHODS

We surveyed all cerrado physiognomies occurring within the reserve from November 1998 to October 1999, in monthly field trips, each one with a 50–60 hr. sampling effort in the field. We established routes through the firebreaks that cross the reserve (Fig. 1) and covered one of them each day by driving a vehicle and stopping whenever vegetation of interest was seen. The routes comprised the following reference points (with approximate distances): i) U2, U1, Q, R, S, T, U2 (51.5 km); ii) U2, V, P1, O, U1 (52.5 km); iii) O, M, N, P1 (45 km); iv) V, P2, W, Y, V (47.5 km); v) X, Z1, Z2, Z3, Z2, Z1, Y, W, X (47.5 km); vi) A, B, J, G, D, C, K2, K1, A (48 km).

We collected fertile botanical material along the pre-established routes. During the last two field trips, we also collected sterile material from species previously not found in reproductive stages. The collected material was identified to species level by comparing it with lodged vouchers and consulting taxonomic references. The specimens were then sent to taxonomists for confirma-

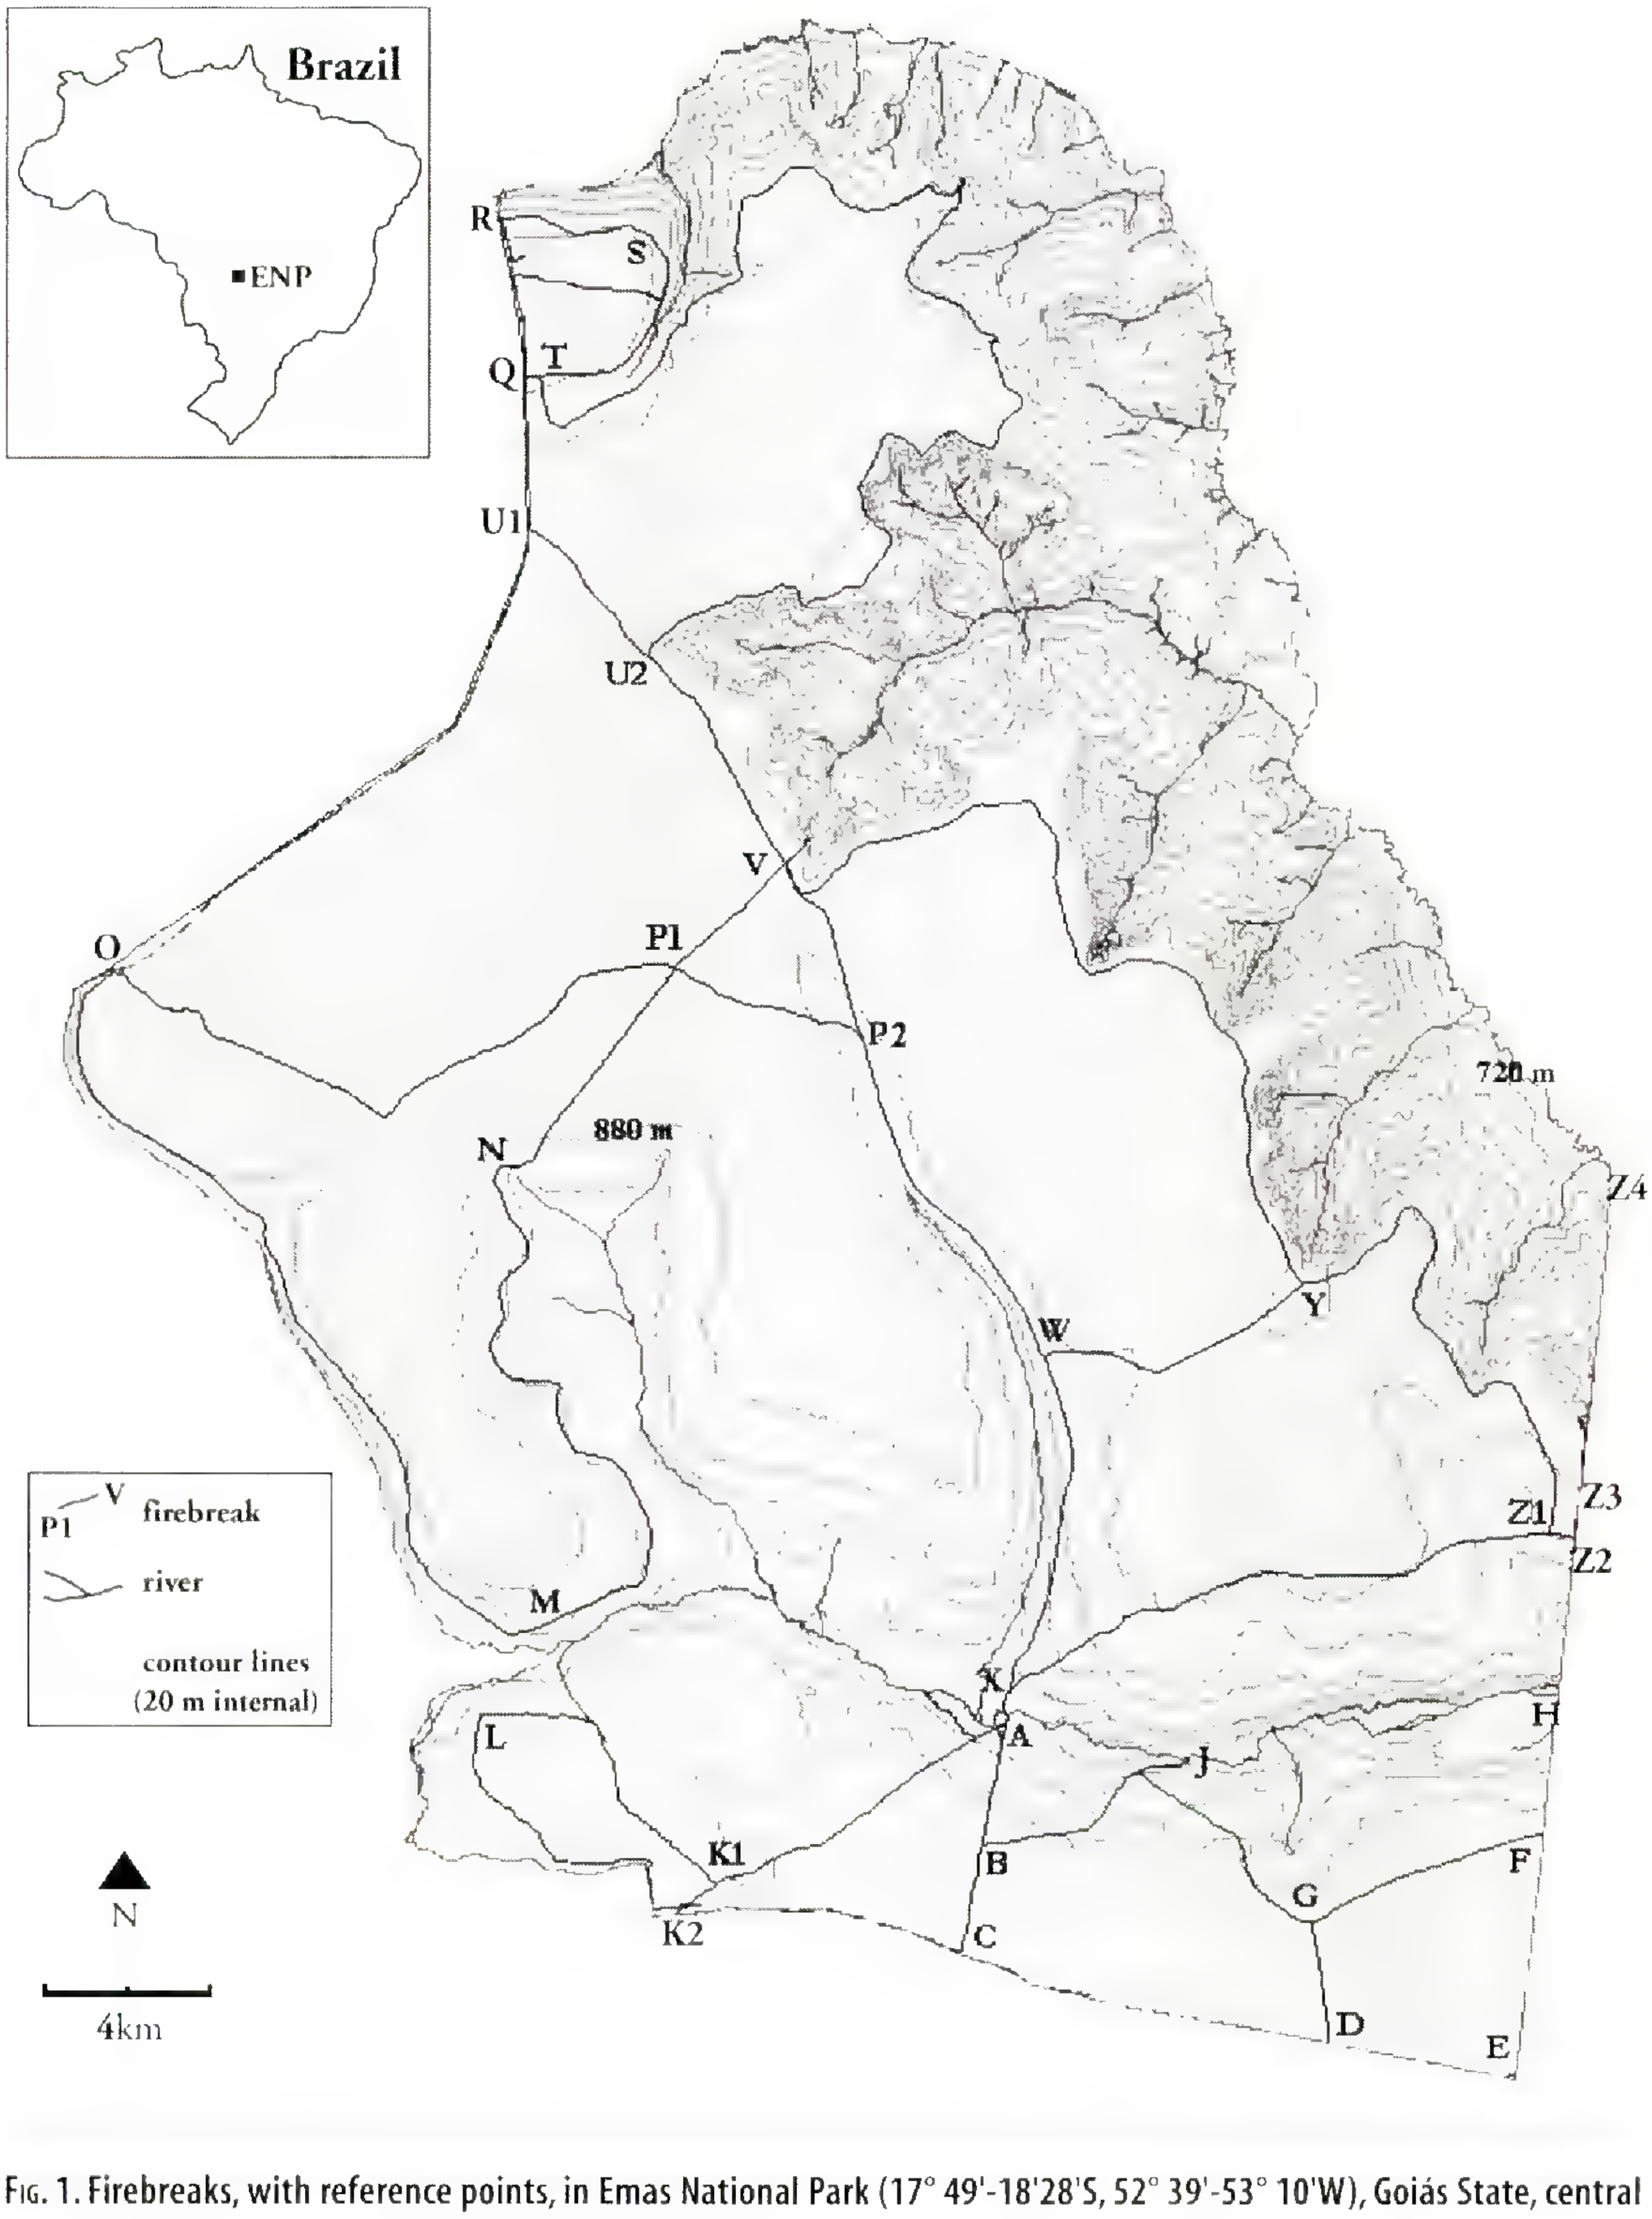

Fig. 1. Firebreaks, with reference points, in Emas National Park (17° 49'-18'28'S, 52° 39'-53° 10'W), Goiás State, central Brazil.

tion. The voucher material was stored in the herbaria of the São Paulo Botanical Institute (SP) and State University of Campinas (UEC).

We classified the species in families according to the system proposed by Judd et al. (1999) and in life forms following Raunkiaer's (1934) system adapted by Mueller-Dombois and Ellenberg (1974). We considered the chamaephytes,

epiphytes, hemicryptophytes, geophytes, lianas, vascular parasites, and therophytes as belonging to the herbaceous component and the phanerophytes as belonging to the woody component. We applied the chi-square test (Zar 1999) to verify whether the herbaceous to woody species ratio was significantly different from the expected by Mantovani and Martins (1993). The results found were also compared to the patterns obtained by Castro et al. (1999).

RESULTS

We collected 2,123 voucher specimens, representing 601 species, 303 genera, and 80 families (Appendix I). Out of these 601 species, 571 were identified to species level, including one new to science, *Piriqueta emasensis* Arbo (Turneraceae). Six out of the remaining 30 species were also new to science and are currently being described by taxonomists: *Annona* sp. nov. (Annonaceae), *Gyrostelma* sp. nov. (Apocynaceae), *Dimmerostema* sp. nov. (Asteraceae), *Ipomoea* sp. nov. (Convolvulaceae), *Hybanthus* sp. nov. (Violaceae), and another Convolvulaceae that belongs to a new genus. There were 22 species identified to genus level, one identified to family level (Fabaceae sp.), and one that we could not identify even to family level.

Twelve species (2.0% of the total number of species) were considered by Mendonça et al. (1998) as weeds that do not occur spontaneously in the cerrado. Of the 601 species, 149 were phanerophytes and thus included in the woody component, while 452 belonged to other life forms and were included in the herbaceous component. The herbaceous to woody species ratio was 3.03:1, a value not significantly different ($\chi^2 = 0.014$, $P = 0.906$) from the highest ratio (3:1) set by Mantovani and Martins (1993).

The richest families were Asteraceae (88 species), Fabaceae (87), Poaceae (51), Myrtaceae (39), Lamiaceae (24), Malpighiaceae (23), Euphorbiaceae (20), Apocynaceae (19), Malvaceae (16), Rubiaceae (16), and Convolvulaceae (15), which together summed up 66.2% of the total number of species. In the herbaceous component, the richest families were Asteraceae (85 species), Fabaceae (59), Poaceae (48), Lamiaceae (23), Euphorbiaceae (19), Malpighiaceae (16), Myrtaceae (16), Convolvulaceae (15), and Apocynaceae (14), which comprised 65.27% of the herbaceous species. In the woody component, the richest families were Fabaceae (28), Myrtaceae (23), Malpighiaceae (7), Melastomataceae (7), Annonaceae (6), Apocynaceae (5), Vochysiaceae (5), Bignoniaceae (4), Nyctaginaceae (4), and Rubiaceae (4), which together accounted for 62.42% of the woody species.

Seventeen out of the 149 woody species (11.4%) did not appear on the checklist of the cerrado woody flora established by Castro et al. (1999): *Annona* sp. nov., *Aiouea trinervis* Meisn., *Apoclada arenicola* McClure, *Banisteriopsis acerosa* (Nied.) B. Gates, *Calliandra macrocalyx* Harms, *Dalbergia cuiabensis* Benth., *Mimosa amnis-atri* Barneby, *M. gemmulata* Barneby, *M. hebecarpa* Benth.,

Myrcia bracteata O. Berg, *M. camapuanensis* N.F.E. Silveira, *M. crassifolia* (O. Berg) Kiaersk., *M. fallax* (Rich.) A. DC., *M. linguaeformis* Kiaersk., *M. rhodeosepala* Kiaersk., *Olyra taquara* Sw., and *Psidium laruotteanum* Cambess.

DISCUSSION

If we assume that the number of species in the cerrado ranges from 3,000 to 7,000 (Castro et al. 1999), then the ENP contains approximately 8.5 to 20.0% of the cerrado flora. These figures show the importance of this reserve for the conservation of the cerrado vegetation. The number of species in ENP might be increased by species not found in our survey. Floristic surveys certainly miss a number of species in a given area, especially those that are not at reproductive stage at the time of the visit, flower sporadicaly, are ephemeral, or are inconspicuous, problems that particularly affect the herbaceous component of the vegetation (Mantovani & Martins 1993; Castro et al. 1999).

Among the 601 species found in the ENP, seven are new to science. Although the cerrado is one of the most studied vegetation types in Brazil (Castro et al. 1999), the fact that undescribed species keep on appearing in floristic surveys—for example, also in Brasília, Federal District (Pereira et al. 1993)—shows that the cerrado has not yet been satisfactorily sampled. The affirmation that the tropical flora remains undercollected (Prance et al. 2000) seems to apply also to the cerrado vegetation. Some of the species not identified to species level in our inventory may be new to science as well.

Although the proportion of weedy species in the ENP's cerrado flora was lower than the ca. 5% found by Mendonça et al. (1998) for the whole Cerrado Domain, the invasion of ruderal plants in ENP is alarming, notably the African grasses *Brachiaria decumbens* Stapf and *Melinis minutiflora* P. Beauv. Plant invasion has become a great problem in virtually all cerrado fragments (Pivello et al. 1999) and will grow into a serious problem in the ENP if precautions are not taken.

The richest families in the ENP were also the richest ones in other cerrado sites (Mantovani & Martins 1993; Batalha et al. 1997; Batalha & Mantovani 2000). Exceptions were Convolvulaceae and Lamiaceae, well represented only in the ENP. The herbaceous to woody species ratio, although not significantly different from the maximum set by Mantovani and Martins (1993), was higher than the ratios found in other surveys (Mantovani & Martins 1993; Batalha et al. 1997; Batalha & Mantovani 2000). This probably was a consequence of the prevalence of open physiognomies (*campo limpo* and *campo sujo*) in ENP.

According to Castro et al. (1999), surveys in poorly sampled regions should augment the cerrado woody species checklist. Indeed, the 17 species found in our survey that should be included in their list represent a high percentage of the species collected in ENP and indicate that even the woody component of the cerrado vegetation remains undercollected. As for the herbaceous compo-

nent, this undercollection might be even greater. In the visits we paid to herbaria and in our search for references, the absence of surveys in this component became evident.

Species inventories, even at the most basic level, are available for only about 1% of the tropical regions (Hammond 1992). Our floristic survey of the dominant cerrado vegetation in the ENP represents a first step, and it will be necessary to survey the other vegetation types existing within the reserve, such as seasonal semideciduous forest, riparian forest, wet *campo*, and the aquatic vegetation of streams, rivers, and lakes.

APPENDIX I

Species collected in the floristic survey of the cerrado vegetation in Emas National Park (17°49'-18°28'S, 52°39'-53°10'W), Goiás State, central Brazil. Taxa were listed alphabetically by family, genus, and species. The format used was species name, authority, collection number, and life form. Authorities were abbreviated according to Brummit and Powell (1992). Species designated by an asterisk (*) were considered non-native weeds by Mendonça et al. (1998). All specimens were collected by M.A. Batalha (B). Life form was assigned according to Raunkiaer's (1934) system adapted by Muller-Dombois and Ellenberg (1974). Life form classes were abbreviated as: Ch = chamaephyte, Ep = epiphyte, Geo = geophyte, H = hemicryptophyte, Li = Liana, Ph = phanerophyte, Th = therophyte, and Vp = vascular parasite.

APPENDIX I

The vascular flora of the cerrado in Emas National Park (central Brazil).

ACANTHACEAE
Hygrophila brasiliensis (Spreng.) Lindau, B 2306, H
Ruellia geminiflora Kunth, B 2169, H
Ruellia incompta (Nees) Lindau, B 3592, Ch

ALSTROEMERIACEAE
Alstroemeria gardneri Baker, B 2715, H

AMARANTHACEAE
Froelichia procera (Seub.) Pedersen, B 2123, H
Gomphrena arborescens L. f., B 2395, H
Gomphrena macrocephala A. St-Hil., B 2214, H
Gomphrena pohlii Moq., B 2091, H
Pfaffia helichrysoides (Moq.) Kuntze, B 2152, H
Pfaffia jubata Mart., B 2283, H

ANACARDIACEAE
Anacardium humile A. St-Hil., B 2050, Ch
Tapirira guianensis Aubl., B 3804, Ph

ANNONACEAE
Annona coriacea Mart., B 695, Ph
Annona crassiflora Mart., B 2403, Ph
Annona monticola Mart., B 3620, H
Annona tomentosa R.E. Fries, B 2347, Ch
Annona warmingiana Mello-Silva & Pirani, B 3763, H
Annona sp. nov., B 2621, Pn
Bocageopsis mattogrossensis (R.E. Fries) R.E. Fries, B 3506, Ph
Duguetia furfuracea (A. St-Hil.) Benth. & Hook. f., B 2180, Ph
Duguetia glabriuscula (R.E. Fries) R.E. Fries, B 1955, Ch
Xylopia aromatica (Lam.) Mart., B 2515, Ph

APIACEAE
Didymopanax macrocarpum (Cham. & Schltdl.) Seem., B 2107, Ph
Didymopanax malmei Harms, B 2733, Ph
Eryngium ciliatum Cham. & Schltdl., B 3890, H
Eryngium junceum Cham. & Schltdl., B 2566, H

APOCYNACEAE
Asclepias mellodora A. St-Hil., B 2967, H

Aspidosperma macrocarpon Mart., B 2232, Ph
Aspidosperma nobile Müll. Arg., B 3661, Ph
Aspidosperma tomentosum Mart., B 4028, Ph
Barjonia cymosa Fourn., B 2897, H
Barjonia erecta (Vell.) K. Schum., B 2182, H
Blepharodon bicuspidatum Fourn., B 2451, Li
Gyrostelma sp. nov., B 2081, H
Hancornia speciosa Gomez, B 2106, Ph
Hemipogon acerosus Decne., B 2083, H
Himatanthus obovatus (Müll. Arg.) Woods., B 2380, Ph
Macrosiphonia longiflora Müll. Arg., B 2218, H
Macrosiphonia velame (A. St-Hil.) K. Schum., B 2610, H
Mandevilla coccinea (Hook. & Arn.) Woods., B 2577, H
Mandevilla pohliana (Standelm.) A. Gentry, B 2099, H
Odontadenia lutea (Vell.) Markgr., B 2645, Li
Oxypetalum aequaliflorum Fourn., B 2241, H
Rauvolfia weddelliana Müll. Arg., B 1962, H
Rhodocalyx rotundifolius Müll. Arg., B 2281, H

ARACEAE

Scaphispatha gracilis Brongn. ex Schott, B 2075, H

ARECACEAE

Acrocomia aculeata (Jacq.) Lodd. ex Mart., B 2498, Ph
Acrocomia hassleri (Barb. Rodr.) Hahn, B 3828, Geo
Allagoptera campestris (Mart.) Kuntze, B 2006, Geo
Allagoptera leucocalyx (Mart.) Kuntze, B 2215, Geo
Attalea geraensis Barb. Rodr., B 2509, Geo
Syagrus flexuosa (Mart.) Becc., B 2249, Geo

ARISTOLOCHIACEAE

Aristolochia gibertii Hook., B 2852, Li
Aristolochia gracilis Duch., B 4029, Li

ASTERACEAE

Acanthospermum australe (Loefl.) Kuntze, B 2527, Th
Achyrocline satureoides (Lam.) A. DC., B 3400, Th
Apopyros warmingii (Baker) Nesom, B 2176, H
Aspilia foliacea (Spreng.) Baker, B 3377, H
Aspilia laevissima Baker, B 2704, H
Aspilia leucoglossa Malme, B 2122, H
Aspilia platyphylla (Baker) Blake, B 2848, H
Ayapana amygdalina (Lam.) King & H. Rob., B 3458, H
Baccharis camporum A. DC., B 3313, Ch
Baccharis humilis Sch. Bip., B 2172, H
Bidens gardneri Baker, B 3031, Th
Calea clausseniana Baker, B 3771, H
Calea cuneifolia A. DC., B 4011, H
Calea hymenolepis Baker, B 2886, H
Calea platylepis Sch. Bip. ex Baker, B 3204, H
Campuloclinium chlorolepis Baker, B 3120, H
Campuloclinium megacephalum (Mart.) King & H. Rob., B 2605, H
Chaptalia integerrima (Vell.) Burkart, B 2089, Th
Chromolaena chaeseae H. Rob., B 3314, Ch
Chromolaena leucocephala Gardner, B 3409, Ch
Chromolaena squalida (A. DC.) King & H. Rob., B 2328, Ch
Chromolaena stachyophylla (Spr.) King & H. Rob., B 3416, H
Conyza bonariensis (L.) Cronq., B 2497, Th
Dasyphyllum sprengelianum (Gardner) Cabrera, B 3042, Ch
Dimmerostema asperatum Blake, B 2592, H
Dimmerostema brasilianum Cass., B 3161, H
Dimmerostema retifolium (Sch. Bip.) Blake, B 2246, H
Dimmerostema sp. nov., B 2010, H
Elephantopus biflorus Less., B 3159, H
Elephantopus mollis L., B 3128, H
Elephantopus racemosus Gardner, B 3412, H
Emilia coccinea (Sims.) Sweet *, B 2364, Th
Erechtites hieracifolia (L.) Raf. *, B 2368, Th
Eremanthus erythropappus Sch. Bip., B 2213, Ph
Eremanthus glomerulatus Less., B 3333, Ph
Eremanthus sphaerocephalus Baker, B 2273, H
Eupatorium betonicaeforme Baker, B 3402, H
Eupatorium campestre A. DC., B 1996, H
Eupatorium lanigerum Hook. & Arn., B 3946, H
Eupatorium myriocephalum Gardner, B 3406, Ch
Eupatorium purpurascens Sch. Bip., B 3093, H
Eupatorium urticifolium L. f., B 1973, H
Eupatorium sp., B 3309, H
Gochnatia barrosoae Cabrera, B 3484, Ch
Gochnatia pulchra Cabrera, B 3014, Ch
Hoehnephyton trixoides (Gardner) Cabrera, B 3596, H
Ichthyothere sp. 1, B 2121, H
Ichthyothere sp. 2, B 3792, H
Ichthyothere sp. 3, B 3563, H
Isostigma megapotamicum Scherff, B 2149, H
Isostigma sp., B 3819, H
Mikania cordifolia (L.) Willd., B 3156, Li

Orthopappus angustifolius (Sw.) Gleason *, B 2402, H
Piptocarpha rotundifolia (Less.) Baker, B 1957, Ph
Porophyllum angustissimum Gardner, B 2513, Th
Pseudobrickellia pinifolia (Spr.) King & H. Rob., B 3491, H
Pterocaulon virgatum (L.) A. DC., B 3155, H
Riencourtia oblongifolia Gardner, B 2331, H
Riencourtia tenuifolia Gardner, B 2256, H
Spilanthes nervosa Chod., B 1900, H
Stilpnopappus glomerulatus Gardner, B 2877, H
Stilpnopappus speciosus Baker, B 2504, H
Stomatanthes dictyophyllum (A. DC.) King & H. Rob., B 2555, H
Vernonia argentea Less., B 2388, H
Vernonia bardanoides Less., B 2514, H
Vernonia brevipetiolata Sch. Bip., B 3189, H
Vernonia buddleiifolia Sch. Bip. ex Baker, B 2338, H
Vernonia compactiflora Mart. ex Baker, B 2867, H
Vernonia desertorum Mart. ex A. DC., B 3567, H
Vernonia erythrophylla Mart., B 2094, H
Vernonia ferruginea Less., B 3510, H
Vernonia grandiflora Less., B 2487, H
Vernonia herbacea (Vell.) Rusby, B 1992, H
Vernonia ignobilis Less., B 2168, H
Vernonia polyanthes (Spreng.) Less., B 2336, Ch
Vernonia psilophylla A. DC., B 2832, H
Vernonia rubricaulis Humb. & Bonpl., B 2375, H
Vernonia rubriramea Mart., B 3191, Ch
Vernonia simplex Less., B 4014, H
Vernonia tomentella Mart. ex A. DC., B 2063, H
Vernonia tragiaefolia A. DC., B 2172, H
Vernonia varroniifolia A. DC., B 3304, H
Vernonia venosissima Sch. Bip. ex Baker, B 2001, H
Vernonia virgulata Mart., B 2033, H
Viguiera bakeriana Blake, B 2414, H
Viguiera sp. 1, B 2084, H
Viguiera sp. 2, B 1960, H
Wedelia macedoi H. Rob., B 3920, H

BALANOPHORACEAE

Langsdorffia hypogea Mart., B 4030, VP

BIGNONIACEAE

Anemopaegma arvense (Vell.) Stellfeld ex de Souza, B 2883, H
Anemopaegma glaucum Mart. ex A. DC., B 3035, H
Anemopaegma scabriusculum Mart. ex A. DC., B 1938, H
Arrabidaea brachypoda (A. DC.) Bur., B 2272, Ch
Arrabidaea pulchra (Cham.) Sandw., B 2460, Li
Cybistax antisyphilitica Mart., B 3246, Ph
Jacaranda caroba (Vell.) A. DC., B 2279, Ch
Jacaranda decurrens Cham., B 3799, Ch
Jacaranda rufa Silva Manso, B 2267, Ch
Memora pedunculata (Vell.) Miers, B 2063, Ch
Tabebuia aurea (Silva Manso) S. Moore, B 3557, Ph
Tabebuia ochracea (Cham.) Standl., B 3659, Ph
Zeyheria montana Mart., B 2661, Ph

BORAGINACEAE

Cordia villicaulis Fresen., B 3811, H

BROMELIACEAE

Aechmea bromeliifolia (Rudge) Baker, B 2474, Ep
Ananas ananassoides L.B. Sm., B 2878, H
Bilbergia magnifica Mez, B 3755, Ep
Bromelia balansae Mez, B 2013, H
Dickia tuberosa (Vell.) Beer, B 2839, H

BURSERACEAE

Protium ovatum Engl., B 1930, Ph

CACTACEAE

Epiphyllum phyllanthus (L.) Haw., B 3878, Ep

CARYOCARACEAE

Caryocar brasiliense Cambess., B 1989, Pn

CARYOPHYLLACEAE

Polycarpaea corymbosa (L.) Lam., B 3359, Th

CELASTRACEAE

Plenckia populnea Reissek, B 2277, Ph
Tontelea micrantha (Mart.) A.C. Sm., B 1934, Ph

CHRYSOBALANACEAE

Couepia grandiflora (Mart. & Zucc.) Benth. ex Hook. f., B 3717, Ph
Licania humilis Cham. & Schltdl., B 3034, Ph
Parinari excelsa Sabine, B 1978, Ch

CLUSIACEAE

Kielmeyera abdita Saddi, B 2095, Ch
Kielmeyera coriacea Mart., B 2119, Ph
Kielmeyera grandiflora (Wawra) Saddi, B 2061, Ph
Kielmeyera rubriflora Cambess., B 3022, Ph
Kielmeyera trichophora Mart., B 2035, Ch
Kielmeyera variabilis Mart., B 1915, Ch

COCHLOSPERMACEAE

Cochlospermum regium (Mart.) Pilg., B 2428, H

COMBRETACEAE

Buchenavia tomentosa Eichl., B 4031, Ph
Combretum hilarianum D. Dietr., B 2133, Cn

COMMELINACEAE
Commelina obliqua Vahl, B 2060, Th

CONNARACEAE
Connarus suberosus Planch., B 2374, Ph
Rourea induta Planch., B 1931, Ph

CONVOLVULACEAE
Evolvulus cressoides Mart., B 2917, H
Evolvulus fuscus Meisn., B 3974, H
Evolvulus macroblepharis Mart., B 3252, H
Ipomoea argentea Meisn., B 2651, H
Ipomoea campestris Meisn., B 3524, H
Ipomoea procumbens Mart. ex Choisy, B 2613, H
Ipomoea procurrens Meisn., B 2295, Li
Ipomoea sp. nov., B 2357, H
Ipomoea virgata Meisn., B 3415, H
Jacquemontia guaranitica Hassl., B 2636, H
Jacquemontia sphaerocephala Meisn., B 2363, H
Merremia contorquens (Choisy) Hall. f., B 2600, Li
Merremia digitata Meisn., B 2140, Li
Turbina abutiloides (Kunth) O'Donnell, B 2512, H
Convolvulaceae sp. 1, gen. et sp. nov., B 1967, H

CUCURBITACEAE
Cayaponia espelina Cogn., B 2118, Li
Ceratosanthes hilariana Cogn., B 3645, Li
Melancium campestre Naud., B 2608, H

CYPERACEAE
Bulbostylis junciformis (Kunth) C.B.Clarke, B 2300, H
Bulbostylis paradoxa (Spreng.) Lindm., B 3565, H
Bulbostylis sphaerocephala (Nees) C.B. Clarke, B 2046, H
Bulbostylis truncata (Nees) M.T. Strong, B 3971, H
Cyperus aggregatus (Willd.) Endl., B 2023, H
Cyperus meyenianus Kunth, B 2707, H
Kyllinga odorata Vahl, B 2931, H
Rhynchosphora diamantina (C.B.Clarke) Kükenth, B 2316, H
Rhynchosphora emaciata Boeck., B 3087, H
Rhynchosphora exaltata Kunth, B 2466, H
Rhynchosphora rugosa (Vahl) Gale, B 3534, H
Scleria scabra Willd., B 2310, H

DILLENIACEAE
Davilla elliptica A. St-Hil., B 2080, Ph
Davilla nitida (Vahl) Kubitzki, B 3988, Li

DIOSCOREACEAE
Dioscorea amaranthoides Presl, B 3124, Li
Dioscorea claussenii Uline, B 3044, Li

EBENACEAE
Diospyros hispida A. DC., B 2031, Ph

ERYTHROXYLACEAE
Erythroxylum campestre A. St-Hil., B 2228, Ph
Erythroxylum deciduum A. St-Hil., B 3716, Ph
Erythroxylum suberosum A. St Hil., B 1965, Ph

EUPHORBIACEAE
Chamaesyce caecorum (Mart. ex Boiss.) Croizat, B 2137, H
Cnidosculus quercifolius Pohl, B 1946, H
Croton aberrans Müll. Arg., B 2036, H
Croton antisyphiliticus Mart., B 2017, H
Croton cinctus Müll. Arg., B 3109, H
Croton glandulosus Müll. Arg., B 2389, H
Croton goyazensis Müll. Arg., B 2222, H
Croton lundianus Müll. Arg., B 2205, H
Croton pohlianus Müll. Arg., B 2196, H
Croton sclerocalyx Müll. Arg., B 2885, H
Croton sp., B 1964, H
Dalechampia humilis Müll. Arg., B 1981, H
Dalechampia linearis Baill., B 2076, H
Julocroton humilis Didr., B 2207, H
Manihot caerulescens Pohl, B 2459, H
Manihot tripartita (Spreng.) Müll. Arg., B 1908, H
Maprounea guianensis Aubl., B 3930, Ph
Phyllanthus orbiculatus Müll. Arg., B 2445, Th
Sapium glandulatum (Vell.) Pax, B 2301, Ch
Sebastiania bidentata (Mart.) Pax, B 2430, H

FABACEAE
Acosmium subelegans (Mohl.) Yakovlev, B 3815, Ph
Aeschynomene marginata Benth., B 2716, Th
Aeschynomene oroboides Benth., B 2055, H
Anadenanthera falcata (Benth.) Speg., B 2650, Ph
Andira cuiabensis Benth., B 2045, Ph
Andira laurifolia Benth., B 2342, Ch
Andira vermifuga (Mart.) Benth., B 3718, Ph
Arachis tuberosa Bong. ex Benth., B 2275, H
Bauhinia rufa Steud., B 1907, Ph
Bowdichia virgilioides Kunth, B 3350, Ph
Calliandra dysantha Benth., B 1979, Ch
Calliandra macrocalyx Harms, B 2230, Ph
Calopogonium sericeum (Benth.) Chodat ex Hassl., B 2569, Li
Camptosema ellipticum (Desv.) Burkart, B 3232, Li
Centrosema venosum Mart. ex Benth., B 1924, Li
Chamaecrista basifolia (Vogel) Irwin & Barneby, B 2710, Ch

Chamaecrista campestris Irwin & Barneby, B 2723, Ch
Chamaecrista cotonifolia (G. Don) Killip, B 4001, Ch
Chamaecrista desvauxii (Collad.) Killip, 2457, Ch
Chamaecrista filicifolia (Benth.) Irwin & Barneby, B 2325, Ch
Chamaecrista flexuosa (L.) Greene, B 2290, Ch
Chamaecrista lundii (Benth.) Irwin & Barneby, B 3435, H
Chamaecrista nictitans (L.) Moench., B 2726, Ch
Chamaecrista planaltoana (Harms) Irwin & Barneby, B 2208, H
Chamaecrista rotundifolia (Pers.) Greene, B 1974, H
Chamaecrista setosa (Vogel) Irwin & Barneby, B 2725, Ch
Clitoria densifolia (Presl) Benth., B 2433, H
Copaifera langsdorffii Desf., B 2127, Ph
Crotalaria maypurensis Kunth, B 2597, Th
Crotalaria nitens Benth., B 2724, H
Crotalaria velutina Benth., B 2881, H
Dalbergia cuiabensis Benth., B 3214, Ph
Dalbergia miscolobium Benth., B 3504, Ph
Desmodium barbatum (L.) Benth., B 3024, H
Desmodium incanum (Sw.) A. DC., B 2523, Th
Desmodium platycarpum Benth., B 3944, H
Dimorphandra mollis Benth., B 2047, Ph
Dioclea bicolor Benth., B 2042, Li
Diptychandra aurantiaca Tul., B 3056, Ph
Eriosema crinitum (Kunth) Gardner, B 2483, H
Eriosema cupreum Harms, B 2120, H
Eriosema glabrum Mart. ex Benth., B 2251, H
Eriosema heterophyllum Benth., B 3992, H
Eriosema longifolium Benth., B 2194, H
Eriosema rufum Kunth, B 2444, H
Galactia decumbens (Benth.) Chodat & Hassl., B 2371, H
Galactia dimorpha Burk., B 2130, H
Galactia martii A. DC., B 3512, H
Harpalyce brasiliana Benth., B 2548, Ph
Hymenaea stigonocarpa Mart., B 2326, Pn
Indigofera gracilis Bong., B 2057, H
Lupinus subsessilis Benth., B 2320, H
Machaerium acutifolium Vogel, B 2115, Ph
Mimosa amnis-atri Barneby, B 3589, Ph
Mimosa distans Benth., B 2070, Ch
Mimosa foliolosa Benth., B 2367, Ph
Mimosa gemmulata Barneby, B 2012, Ph
Mimosa gracilis Benth., B 2395, Ch
Mimosa hebecarpa Benth., B 1911, Ph
Mimosa nuda Humb. & Bonpl., B 2074, H
Mimosa polycephala Benth., B 2391, Ch
Mimosa radula Benth., B 2452, Ch
Mimosa xanthocentra Mart., B 2114, Ch
Periandra mediterranea (Vell.) Taub., B 2671, Ch
Phaseolus firmulus Mart., B 3488, H
Plathymenia reticulata Benth., B 3977, Ph
Poiretia angustifolia Vogel, B 2386, H
Poiretia latifolia Vogel, B 3007, H
Poiretia longipes Harms, B 2599, H
Pterodon pubescens Benth., B 3833, Ph
Rhynchosia platyphylla Benth., B 2653, H
Senna rugosa (G. Don.) Irwin & Barneby, B 2329, Ph
Senna silvestris (Vell.) Irwin & Barneby, B 2314, Ph
Senna velutina (Vogel) Irwin & Barneby, B 3032, Ph
Stryphnodendron adstringens (Mart.) Coville, B 1985, Ph
Stryphnodendron obovatum Benth., B 2087, Ph
Stylosanthes bracteata Vogel, B 2155, H
Stylosanthes gracilis Kunth, B 2562, Th
Stylosanthes guianensis Sw., B 2423, Th
Stylosanthes scabra Vogel, B 3323, H
Tephrosia adunca Benth., B 2258, H
Vatairea macrocarpa (Bentn.) Ducke, B 4032, Ph
Vigna linearis Kunth, B 2838, Li
Zornia latifolia Sm., B 2676, H
Zornia reticulata Sm., B 2481, H
Zornia virgata Moric., B 3142, H
Fabaceae sp. 1, B 2796, Ph

FLACOURTIACEAE

Casearia grandiflora Cambess., B 2078, Ph
Casearia sylvestris Sw., B 2473, Ph
Casearia sp., B 2034, H

GENTIANACEAE

Deianira nervosa Cham. & Schltdl., B 3457, H
Irlbachia alata (Aubl.) Maas, B 2879, H
Irlbachia speciosa (Cham. & Schltdl.) Maas, B 3438, H

GESNERIACEAE

Sinningia elatior (Kunth) Chautems, B 3989, H

HYPOXIDACEAE

Curculigo sp., B 4019, Geo

ICACINACEAE

Emmotum nitens (Benth.) Miers, B 3244, Ph

IRIDACEAE

Sisyrinchium vaginatum Spreng. B 2253, Geo
Trimezia juncifolia (Kl.) Kunth, B 2062, Geo

LAMIACEAE

Eriope crassipes Benth., B 2054, H
Hypenia macrantha (A. St-Hi.. ex Benth.) Harley, B 3704, H
Hyptidodendron canum (Pohl ex Benth.) Harley, B 3493, Ph
Hyptis adpressa A. St-Hil. ex Benth., B 4013, H
Hyptis capriariifolia Pohl ex Benth., B 3006, H
Hyptis caudata Epling & Sativa, B 3643, H
Hyptis crinita Benth., B 3334, H
Hyptis desertorum Pohl ex Benth., B 4015, H
Hyptis eriophylla Pohl, B 2849, H
Hyptis ferruginosa Pohl ex Benth., B 3979, H
Hyptis interrupta Pohl ex Benth., B 3076, H
Hyptis lythroides Pohl ex Benth., B 3708, H
Hyptis multiflora Pohl ex Benth., B 2670, H
Hyptis recurvata Poit. B 3535, H
Hyptis saxatilis A. St-Hil. ex Benth., B 3111, Ch
Hyptis villosa Poh. ex Benth., B 2255, H
Hyptis virgata Benth., B 1925, H
Hyptis sp., B 3544, H
Marsypianthes chamaedrys (Vahl) Kuntze, B 2531, H
Marsypianthes montana Benth., B 3108, H
Ocimum sp., B 2151, H
Peltodon pusillus Pohl, B 3271, H
Peltodon tomentosus Pohl, B 3065, H
Salvia sp., B 2100, H

LAURACEAE

Aiouea trinervis Meisn., B 3931, Ph
Cassytha filiformis L., B 2422, VP

LECYTHIDACEAE

Eschweilera nana (O. Berg) Miers, B 2825, Ph

LOGANIACEAE

Strychnos pseudoquina A. St Hil., B 3943, Ph

LYTHRACEAE

Cuphea carthagenensis (Jacq.) Macbr., B 2179, H
Cuphea linarioides Koenne, B 2136, H
Lafoensia pacari A. St Hil., B 3782, Ph

MALPIGHIACEAE

Banisteriopsis acerosa (Nied.) B. Gates, B 2809, Ph
Banisteriopsis amplectens B. Gates, B 2429, Li
Banisteriopsis campestris (A. Juss.) Little, B 2346, Li
Banisteriopsis gardneriana (A. Juss.) W. Anderson & Sattl., B 3756, Li
Banisteriopsis laevifolia (A. Juss.) B. Gates, B 2558, Li
Banisteriopsis schizoptera (A. Juss.) B. Gates, B 3049, Li
Banisteriopsis stellaris (Griseb.) B. Gates, B 2479, L
Banisteriopsis variabilis B. Gates, B 2304, Li
Byrsonima basiloba A. Juss., B 2133, Ph
Byrsonima coccolobifolia A. Juss., B 2233, Ph
Byrsonima crassa Nied., B 1898, Ph
Byrsonima gaultherioides Griseb., B 2898, Ch
Byrsonima guilleminiana A. Juss., B 2044, Ch
Byrsonima intermedia A. Juss., B 2467, Ph
Byrsonima rigida A. Juss., B 2135, Ch
Byrsonima verbascifolia (Griseb.) B. Gates, B 2643, Ph
Camarea affinis A. St-Hil., B 2417, H
Heteropterys anoptera A. Juss., B 3149, Li
Heteropterys byrsonimifolia A. Juss., B 2476, Ph
Heteropterys campestris A. Juss., B 2172, Li
Heteropterys coriacea A. Juss., B 3089, Li
Peixotoa reticulata Griseb., B 2079, Li
Tetrapteris ambigua (A. Juss.) Nied., B 3279, Li

MALVACEAE

Byttneria oblongata Pohl, B 2129, H

BOOK REVIEW

IRWIN M. BRODO, SYLVIA DURAN SHARNOFF, and STEPHEN SHARNOFF. 2001. **Lichens of North America.** (ISBN 0-300-08249-5, hbk.). Yale University Press, 302 Temple Street, P.O. Box 209040, New Haven, CT 06520-9040, U.S.A. (Orders: 203-432-0960, 203-432-0948 fax). $69.95, 795 pp, 924 color photos, distribution maps, 9 1/2" × 11".

This recently published magnum opus *Lichens of North America* is a beautiful volume that treats an often overlooked group of organisms. And this book has everything! The book is divided into two parts. The first part begins with introductory material including a wonderful description of the symbiotic relationships that lichens form and moves on to discuss lichen morphology, anatomy, reproduction, physiology, chemistry, ecology and biogeography. Two chapters describe how humans have found uses for lichens and how we may use them as environmental indicators. There are also two chapters offering very practical information on how to describe and classify lichens and how to collect and preserve them for future study. The final chapter in the first part of the book provides useful information about how to use the maps, keys and descriptions in the second half of the book

The second part of this volume provides easy to follow keys, well crafted descriptions, beautiful photographs, and very useful range maps for 805 species of lichens. The photographs and range maps should make this volume extremely useful for anyone interested in lichens whether they be professionals or avocational enthusiasts. A comprehensive glossary in the back of the book provides a most welcome guide to the terminology associated with a group of organisms about which many people know very little.

The introductory text in this book is extremely well written and immensely readable. And the photographs are simply works of art. This captivating and thoroughly engrossing book should be on the shelf of everyone who loves nature, and can appreciate the wonderful diversity to be found even in one of the least well-known and overlooked groups of organisms. It will surely inspire many of us to take a closer look the next time we see a lichen.—*Debra Trock, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102-4060, U.S.A.*

ABSTRACT

This paper presents the results of a study of rust fungi (Uredinales) on wild and cultivated plants in the provinces of Catamarca, Jujuy, Salta and Tucumán that belong to the region known as Northwest Argentina. The rust fungi are represented by 635 collections on 257 host plant species belonging to 51 vascular plant families. These rusts constitute 182 species in 30 genera of which 61 are new records for Argentina and 10 are new species of rusts. Eighty-four of the collections represent new host records for Argentina, and 50 of these are new host records for rusts. Specimens have been deposited in either Fundación Miguel Lillo (LIL) or the U.S. National Fungus Collection (BPI).

RESUMEN

En el presente trabajo se presentan los resultados de la prospección de royas (Uredinales) realizada sobre la flora silvestre y cultivada de las Provincias de Catamarca, Jujuy, Salta, y Tucumán, pertenecientes a la región conocida como Noroeste Argentino. Como resultado de este trabajo se elaboraron 635 colecciones correspondientes a 51 familias de hospedantes (257 especies). Ochenta y cuatro de estas colecciones son nuevos hospedantes para Argentina, de las cuales 50 son nuevas citas como hospedantes para royas. Se identificaron 30 géneros y 182 especies de royas, de las cuales 61 son nuevos registros para el país y 10 nuevas especies. Las colecciones fueron depositadas en Fundación Miguel Lillo (LIL) y U.S. National Fungus Collection (BPI).

The fungi of Argentina have been studied by a number of mycologists, most notably Carlos Luigi Spegazzini (1858–1926) whose taxa were compiled into a comprehensive account by Farr (1973). Spegazzini's collections of rust fungi (Uredinales) as well as collections made by later mycologists were organized and studied by Lindquist (1982). Lindquist's studies resulted in numerous publications on rust fungi, culminating in his "Royas de la República Argentina y Zonas Limítrofes" (Lindquist 1982). Although the fungi of Argentina are relatively well known, the rust fungi of Northwest Argentina are less well studied because few mycologists collected rusts in that region.

In this paper we present a study of rust fungi collected on wild and cultivated plants in the provinces of Catamarca, Jujuy, Salta and Tucumán in Northwest Argentina. This subtropical region is characterized by climatic and biological diversity and consists of a plain in the east and the Cordillera de los Andes in the west where valleys closely alternate with mountains. The gradations in latitude and altitude in Northwest Argentina result in a mosaic of bioecosystems with vegetation types varying from desert to rain forest. The diversity of flora is reflected in the range of phytogeographical regions described

SIDA 20(1): 313 – 338. 2002

for this area by Cabrera (1994). For these reasons, Northwest Argentina is an interesting and rich area for collecting rust fungi.

Lindquist (1982) documented 450 species representing 28 genera of rust fungi from throughout Argentina of which 124 species were reported from Northwest Argentina. Between 1993 and 1999 the authors collected and identified or re-examined 635 specimens of rust fungi representing 182 species in 30 genera. These rust specimens were collected on 257 host plant species from 51 plant families. Eighty-four of these host plants are new host records for Argentina, and 50 of these are new host records for rusts worldwide. Sixty-one rust species are reported for the first time from Argentina and 10 of these are new species. One of those, *Baeodromus ranunculi* J.R. Hern. & J.F. Hennen, has been described (Hernández 2000) and the remainder will be described elsewhere.

RESULTS

The rust species reported here are presented according to host family. This is the most useful form of organization because of the high level of host specificity of the rust fungi. Collections for each rust species are then listed alphabetically by host species followed by the province, details of locality, date, collector(s) and collector's number, herbarium number and rust stage present. For the rust stages symbols are used as follows: 0 = spermogonial stage, I = aecial stage, II = uredinial stage, and III = telial stage. The abbreviation "An" refers to the presence of an anamorph stage for which we are uncertain whether it is functionally an aecial or uredinial stage. Symbols representing spore types are X = amphispores, M = mesospores, and IV = basidiospores.

New rust records are indicated in superscript following the species name as follows: new rust species (N), new rust record for Argentina (A), Catamarca (C), Jujuy (J), Salta (S), and Tucumán (T). Superscript notations following host names indicate: new host plant genus for this rust worldwide (G), new host plant species for this rust worldwide (S), new host plant species for any rust in Argentina (A), and new host plant species for which another rust was previously known from Argentina (AR).

Abbreviations of authorities for plant host and fungal names follow Brummit and Powell (1992) and Kirk and Ansell (1992) respectively. Plant host names were verified using W3TROPICOS at the Missouri Botanical Garden.

ACANTHACEAE

Aecidium sp.[N]

on *Dyschoriste* sp.[G]; **Salta:** Quebrada de San Lorenzo, 6 Dec 1997, *J.R.Hernández 97-162* (BPI 841258) [I]. **Tucumán:** 22 km W of San Miguel de Tucumán, mtn, 27 Mar 1993, *J.F.Hennen, L.D.Ploper & J.R.Hernández 93-019* (LIL 54702, BPI 840996) [I].

Puccinia justiciae Puttemans

on *Chaetothylax umbrosus* Nees[G]; **Tucumán:** San Pedro de Colalao, 2 Apr 1994, *J.F.Hennen & M.M.Hennen 94-069* (LIL 54706, BPI 841031) [II].

Puccinia lateripes Berk. & Ravenel[A]

on *Ruellia ciliatiflora* Hook.[S]; **Tucumán:** Dept. Trancas, Vipos, 30 Mar 1995, *J.R.Hernández 95-043* (BPI 841086) [II-

III]; Las Salas, 5 May 1995, *J.R.Hernández 95-015* (BPI 841079) [I-II-III]; San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R.Hernández 94-150* (LIL 54704, BPI) [II-III]; San Pedro de Colalao, 2 Apr 1994, *J.F.Hennen & M.M.Hennen 94-071* (LIL 54703, BPI) [0].

Puccinia sp.

on *Ruellia erythropus* (Nees) Lindau[A]; **Catamarca:** E of La Viña, 24 Sep 1997, *J.F.Hennen & J.R.Hernández 97-061* (BPI 841197) [II].

Puccinia thunbergiae Cooke[A]

on *Justicia* sp.; **Tucumán:** San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R.Hernández 94-144* (LIL 54705, BPI 841067) [II-III].

Uromyces sp.[A]

on *undtn.*; **Jujuy:** Palma Sola, 12 Apr 1994, *J.F.Hennen & L.D.Ploper 94-127* (LIL 54707, BPI 841056) [III].

AMARANTHACEAE

Uromyces bonaerensis Speg.

on *Gomphrena elegans* Mart.; **Tucumán:** Cruz Alta, 28 Jul 1913, leg. ? [II].

Uromyces celosiae Dietel & Holw.[A]

on *Chamissoa altissima* (Jacq.) Kunth[A]; **Tucumán:** San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R.Hernández 94-165* (LIL 54708, BPI 841074) [II].

Uromyces iresines Lagerh. ex Syd. & P. Syd.[A]

on *Iresine diffusa* Humb. & Bonpl. ex Willd. var. *diffusa*[A]; **Tucumán:** San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R.Hernández 94-140* (LIL 54709, BPI 841064) [III].

ANNONACEAE

Phakopsora neocherimoliae (Cummins) Buriticá & J.F. Hennen[A]

on *Annona cherimolia* Mill.; **Tucumán:** Dept. Capital, 15 Sep 1995, *J.R.Hernández 95-088* (BPI 841111) [II]; Dept. Famailla, Sauce Huascho, 23 Apr 1993, *N.E.V.de Ramallo s.n.* (BPI) [II].

APIACEAE

Puccinia hydrocotyles Cooke[C,S]

on *Hydrocotyle bonariensis* Comm. ex Lam.[A]; **Buenos Aires:** La Plata, 29 Sep 1997, *J.F.Hennen & J.R.Hernández 97-072* (BPI) [II]. **Catamarca:** N of Catamarca, Hwy. 38, 24 Sep 1997, *J.F.Hennen & J.R.Hernández 97-054* (BPI) [II]; road to El Rodeo, camping area, 29 Nov 1997, *J.R.Hernández 97 117* (BPI) [II]; W of Catamarca, 23 Sep 1997, *J.F.Hennen & J.R.Hernández 97-043* (BPI) [II]; W side of Catamarca, 23 Sep 1997, *J.F.Hennen & J.R.Hernández 97-035* (BPI 841184) [II]. **Salta:** Dept. Santa Victoria, La Misión, 30 Jun 1996, *J.R.Hernández 96-059* (BPI) [II]. **Tucumán:** Lules, Aug 1994, *J.R.Hernández 94-149* (LIL 54943, BPI) [II].

on *Hydrocotyle* sp.; **Catamarca:** El Rodeo, 29 Nov 1997, *J.R.Hernández 97-121* (BPI) [II]. **Tucumán:** Amberes, 5 May 1989, *L.D.Ploper & G.Würschmidt s.n.* (BPI) [II]; Dept. Trancas, Rt. 9, km 1364, 26 Oct 1995, *J.R.Hernández 95-052* (BPI) [II]; San Javier, Parque Sierras de San Javier, La Cascada., 29 Mar 1996, *J.R.Hernández 96-014* (BPI 841122) [II-III].

ASCLEPIADACEAE

Puccinia sp.

on *Morrenia variegata* (Griseb.) T. Mey.; **Tucumán:** Alta Gracia, 19 Nov 1997, *J.R.Hernández 97-092* (BPI 841213) [0].

ASTERACEAE

Aecidium ampliatum H.S. Jacks. & Holw.

on *Eupatorium lasiophthalmum* Griseb.; **Catamarca:** near Balcozna, 28 Nov 1997, *J.R.Hernández 97-113* (BPI 841226) [0-I]. **Tucumán:** J.B. Alberdi, road to Escaba, bank of creek, 28 Nov 1997, *J.R.Hernández 97-103* (BPI 841221) [0-I].

Aecidium niederleinii Henn.[C,I,S,T]

on *Conyza* sp.; **Catamarca:** Dept. Ambatos, El Rodeo, 14 Nov 1999, *J.R.Hernández 99-007* (BPI 841276) [0-I]. **Salta:** Dept. Güemes, La Calderilla, 7 Dec 1997, *J.R.Hernández 97-167* (BPI) [I]. **Tucumán:** Alta Gracia, 19 Nov 1997, *J.R.Hernández 97-0932* (BPI 841215) [0-I]; Alta Gracia, 19 Nov 1997, *J.R.Hernández 97-087* (BPI) [0-I]; El Siambón, river next to monastery, 3 Nov 1997, *J.R.Hernández 97-145* (BPI 841243) [0-I].

Aecidium sp.

on *Senecio cremeiflorus* Mattf.; **Catamarca:** Rio Las Juntas, 23 Sep 1997, *J.F.Hennen & J.R.Hernández 97-051* (BPI 841192) [I].

Cionothrix praelonga (G. Winter) Arthur[A]
on *Eupatorium* sp.[AR]; **Salta:** Dept. Santa Victoria, Los Toldos, El Nogalal, 29 Jun 1996, *J.R.Hernández 96-040* (BPI 841135) [III] **Tucumán:** San Javier, Parque Sierras de San Javier, 27 Mar 1993, *J.F.Hennen, L.D.Ploper & J.R.Hernández 93-033* (LIL 54734, BPI) [III]; San Javier, Parque Sierras de San Javier, 27 Mar 1993, *J.F.Hennen, L.D.Ploper & J.R.Hernández 93-035* (LIL 54735, BPI) [III].

Coleosporium tussilaginis (Pers.) Lév.
on *Senecio bravensis* Cabrera[S]; **Buenos Aires:** Partido de Gral. Pueyrredon, 2 Nov 1944, *A.L. Cabrera s.n.* [II].
on *Senecio cremeiflorus* Mattf.[S]; **Catamarca:** Dept. Ambatos, El Rodeo, 14 Nov 1999, *J.R.Hernández 99-004* (BPI 841273) [II]; N of Catamarca, Hwy. 38, 24 Sep 1997, *J.F.Hennen & J.R.Hernández 97-055* (BPI 841194) [II].
on *Senecio deferens* Griseb.; **Tucumán:** Sierras de San Javier, 17 Nov 1949, *Singer & Digilio s.n.* [II].
on *Senecio otopterus* Griseb.[S]; **Catamarca:** El Rodeo, 29 Nov 1997, *J.R.Hernández 97-126* (BPI 841231) [II].
on *Senecio rudbeckiifolius* Meyen & Walp.; **Tucumán:** Tafí del Valle, 6 Apr 1995, *J.R.Hernández 95-077* (BPI) [II]; Tafí del Valle, 6 Apr 1993, *J.F.Hennen & J.R.Hernández 93-120* (LIL 54736, BPI) [II].
on *Senecio* sp.; **Salta:** road to Parque del Rey, 6 Dec 1997, *J.R.Hernández 97-158* (BPI 841254) [II].

Coleosporium vernoniae Berk. & M.A. Curtis[A]
on *Elephantopus mollis* Kunth[AR]; **Tucumán:** San Javier, Parque Sierras de San Javier, 27 Mar 1993, *J.F.Hennen, L.D.Ploper & J.R Hernández 93-029* (LIL 54737, BPI) [II]. San Miguel de Tucumán, 20 Jun 1994, *J.R.Hernández 94-168* (BPI 841075) [II].

Puccinia baccharidis Dietel & Holw.[C,S]
on *Baccharis lilloi* Heering[AR]; **Salta:** Cafayate, 9 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-111* (LIL 54754, BPI 841046) [I II III].
on *Baccharis salicifolia* (Ruiz & Pav.) Pers.; **Catamarca:** Balcozna, 22 Sep 1997, *J.F.Hennen & J.R.Hernández 97-023* (BPI) [I III]; N of Catamarca, 22 Sep 1997, *J.F.Hennen & J.R.Hernández 97-019* (BPI 841173) [II]; road to El Rodeo, camping area, 29 Nov 1997, *J.R.Hernández 97-120* (BPI 841228) [II-III]; W side of Catamarca, 23 Sep 1997, *J.F.Hennen & J.R.Hernández 97-028* (BPI 841178) [I II].

Puccinia calcitrapae DC. var. **centaureae** (DC.) Cummins[A]
on *Carthamus tinctorius* L.[A]; **Salta:** Dept. Tartagal, General Ballivián, 25 Sep 1997, *A.C.Ramallo s.n.* (BPI 841201) [II-III].

Puccinia cnici-oleracei Pers.[A]
on *Vernonia remotiflora* Rich.[S]; **Tucumán:** Dept. Trancas, Rio de la Cuesta, elev. 1700 m, 19 Apr 1926, *S.Venturi 4138* [III].
on *Vernonia saltensis* Hieron.[S]; **Salta:** Metán, 1 Jun 1933, *A.L.Cabrera 3024* [III].

Puccinia colossea Speg.[T]
on *Baccharis latifolia* Lem.[S]; **Tucumán:** Tafí del Valle, 6 May 1995, *J.R.Hernández 95-078* (BPI 841106) [III]; Tafí del Valle, 6 Apr 1993, *J.F.Hennen & J.R.Hernández 93-123* (LIL 54738, BPI 841019) [III].

Puccinia conoclinii Seym. in Burrill[S]
on *Eupatorium macrocephalum* Less.[AR]; **Tucumán:** 9 km NW of Concepción de la Sierra, 11 Mar 1969, *A. Krapovickas et al. s.n.* [II]; Dept. Burruyacú, Cerro del Campo, elev. 1500 m, 29 Mar 1930, *S.Venturi s.n.* [II].
on *Eupatorium* sp.; **Salta:** Dept. Rosario de la Frontera, Horcones, 6 Dec 1997, *J.R.Hernández 97-154* (BPI 841251) [II]. **Tucumán:** Cevil Pozo, 12-15 km E of San Miguel de Tucumán, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-055* (LIL 54761, BPI 841003) [II].

Puccinia enceliae Dietel & Holw. var. **aemulans** (Syd. & P. Syd.) Parmelee[S]
on *Simsia dombeyana* DC[S]; **Salta:** Cafayate, 9 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-112* (LIL 54740, BPI 841047) [II-III].

Puccinia eupatorii Dietel[S,T]
on *Eupatorium* sp.; **Salta:** Cafayate, 8 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R. Hernández 94-101* (LIL 54742, BPI 841042) [II-III]. **Tucumán:** Dept. Trancas, Vipos, 30 Mar 1995, *J.R.Hernández 95-048*

(BPI 841089) [II-III]; San Pedro de Colalao, 1 Apr 1994, *J.F.Hennen & M.M.Hennen 94-053* (LIL 54741, BPI) [III].

Puccinia exornata Arthur[A]

on *Baccharis* sp. (A)[AR]; **Salta:** Quebrada de San Lorenzo, 6 Dec 1997, *J.R.Hernández 97-163* (BPI 841259) [I-II-III].

on *Baccharis* sp. (B)[AR]; **Catamarca:** naer Balcozna, 28 Nov 1997, *J.R.Hernández 97-112* (BPI 841225) [II].

Puccinia helianthi Schwein.[T]

on *Helianthus annuus* L.; **Tucumán:** Dept. Capital, 17 Dec 1995, *J.R.Hernández 95-095* (BPI) [II]; Horco Molle, Parque Sierras de San Javier, 29 Mar 1996, *J.R.Hernández 96-024* (BPI 841129) [II-III]; Monte Redondo, 24 Apr 1996, *J.R.Hernández 96-081* (BPI 841152) [II-III].

Puccinia hieracii (Röhl.) H. Mart.

on *Taraxacum officinale* Weber; **Catamarca:** Dept. Ambatos, El Rodeo, 14 Nov 1999, *J.R.Hernández 99-003* (BPI 841272) [II].

Puccinia investita Schwein.[S]

on *Achyrocline* sp.; **Salta:** Dept. Santa Victoria, La Misión, 30 Jun 1996, *J.R.Hernández 96-052* (BPI 841140) [II].

Puccinia lilloana J.C. Lindq.[T]

on *Baccharis lilloi* Heering; **Tucumán:** Tafí, 16 Apr 1904, leg. ? [III].

Puccinia lorentzii Henn.[J,T]

on *Vernonia scorpioides* (Lam.) Pers.; **Jujuy:** Quinta prop. Laguna de la Brea, 31 May 1901, *R.E.Frias s.n.* [II]. **Tucumán:** Horco Molle, 17 Sep 1997, *J.R.Hernández 97-075* (BPI 841205) [II].

Puccinia noccae Arthur[T]

on *Lagascea mollis* Cav.; **Tucumán:** Cruz Alta, San Agustín, 29 Mar 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-039* (BPI) [II-III]; Dept. Cruz Alta, San Agustín, Monte Redondo, 29 Mar 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-025* (LIL 54743, BPI) [II-III]; San Pedro de Colalao, 2 Apr 1994, *J.F.Hennen & M.M.Hennen 94-070* (LIL 54744, BPI 841032) [II-III].

Puccinia ocellifera Cummins[A]

on *Pluchea* sp.[AR]; **Tucumán:** J.B. Alberdi, road to Escaba, 28 Nov 1997, *J.R.Hernández 97-097* (BPI 841218) [II].

Puccinia petrakii J.C. Lindq.[S]

on *Baccharis tucumanensis* Hook. & Arn.; **Salta:** Dept. Santa Victoria, Los Toldos, El Nogalal, 29 Jun 1996, *J.R.Hernández 96-048* (BPI 841137) [I-III].

Puccinia proluviosa H.S. Jacks. & Holw.[A]

on *Senecio peregrinus* Griseb.[S]; **Catamarca:** E of La Viña, 24 Sep 1997, *J.F.Hennen & J.R.Hernández 97-057* (BPI 841196) [II]; W of Catamarca, 23 Sep 1997, *J.F.Hennen & J.R.Hernández 97-045* (BPI 841189) [II]. **Tucumán:** 15 Sep 1949, *R.Singer & Digilio s.n.* [II-III]; Dept. Trancas, 27 Oct 1995, *J.R.Hernández 95-059* (BPI 841094) [II]; J.B. Alberdi, S of Escaba Dike, 22 Sep 1997, *J.F.Hennen & J.R.Hernández 97-010* (BPI 841168) [II]; San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R.Hernández 94-162* (LIL 54746, BPI) [II]; San Javier, Parque Sierras de San Javier, 27 Mar 1993, *J.F.Hennen, L.D.Ploper & J.R.Hernández 93-028* (LIL 54745, BPI) [II-III].

Puccinia rata H.S. Jacks. & Holw.[A]

on *Vernonia saltensis* Hieron.[S]; **Salta:** Capital, Cerro San Bernardo, 27 May 1933, *A.L.Cabrera 3021* [II-III]. **Tucumán:** Dept. Trancas, Vipos, elev. 780 m, 19 Mar 1928, *Screiter 47843* [I-II-III]; San Pedro de Colalao, 1 Apr 1994, *J.F.Hennen & M.M.Hennen 94-058* (LIL 54747, BPI 841028) [II-III].

Puccinia schileana Speg. var. **partheniicola** (H.S. Jacks. & Holw.) J.C. Lindq.

on *Parthenium hysterophorus* L.; **Tucumán:** Cruz Alta, San Agustín, 30 Mar 1994, *J.F. Hennen, M.M.Hennen & J.R. Hernández 94-031* (LIL 54748, BPI 841022) [II-III]; Dept. Trancas, Vipos, 28 Mar 1996, *J.R.Hernández 96-012* (BPI 841121) [II]; San Pedro de Colalao, 2 Apr 1994, *J.F.Hennen & M.M.Hennen 94-066* (LIL 54749, BPI) [II].

Puccinia schileana Speg. var. **schileana**

on *Verbesina lilloi* S.F. Blake; **Jujuy:** Dept. Tumbaya, volcano, on slope to abra de Tiraxi, 31 Dec 1952, *H. Sleumer s.n.* [0-I-II].

Puccinia singeri J.C. Lindq.

on *Verbesina* sp.; **Tucumán:** Sierras de San Javier, 15 Nov 1950, *R.Singer s.n.* [II-III].

on *Verbesina suncho* (Griseb.) S.F. Blake; **Tucumán:** J.B. Alberdi, S of Escaba Dike, 22 Sep 1997, *J.F.Hennen & J.R.Hernández 97-011* (BPI 841169) [II].

Puccinia sp.

on *Baccharis* sp.; **Salta:** Dept. Santa Victoria, La Misión, 30 Jun 1996, *J.R.Hernández 96-062B* (BPI) [I-III]. **Tucumán:** Tafí del Valle, 6 Apr 1993, *J.F.Hennen & J.R.Hernández 93-122* (LIL 54757, BPI 841018) [I-II-III].

Puccinia sp. A[N]

on *Vernonia fulta* Griseb.[N]; **Tucumán:** Dept. Trancas, Rt. 9, km 1364, 26 Oct 1995, *J.R.Hernández 95-055* (BPI 841093) [III]; San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R.Hernández 94-141* (LIL 54758, BPI 841065) [III].

on *Vernonia* sp.; **Tucumán:** Horco Molle, Parque Sierras de San Javier, 6 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R. Hernández 94-091A* (BPI) [I-III].

Puccinia sp. B[N]

on *Vernonia squamosa* Gardner; **Catamarca:** Balcozna, 22 Sep 1997, *J.F.Hennen & J.R.Hernández 97-022* (BPI 841175) [II-III]. **Salta:** Orán, Jul-Aug 1873, *P.G.Lorentz & G.Hieronymus s.n.* [II-III]. **Tucumán:** Dept. Capital, elev. 480 m, 15 Aug 1909, *Lillo 3792* [II-III].

Puccinia sp. C[N]

on *Vernonia* sp.; **Salta:** road to Parque del Rey, 6 Dec 1997, *J.R.Hernández 97-161* (BPI 841257) [II-III]. **Tucumán:** El Siambón, river next to monastery, 3 Nov 1997, *J.R.Hernández 97-147* (BPI 841245) [II]; J.B. Alberdi, Escaba Dike, 28 Nov 1997, *J.R.Hernández 97-106* (BPI 841223) [III]; Yerba Buena, 29 Mar 1993, *J.R.Hernández 93-047* (LIL 54755, BPI) [II].

Puccinia sp.(A)

on *undtn.*, **Salta:** Dept. Santa Victoria, La Misión, 30 Jun 1996, *J.R.Hernández 96-056* (BPI 841142) [III].

Puccinia sp.(B)

on *undtn.*; **Tucumán:** NW of San Miguel de Tucumán, 31 Mar 1993, *J.F.Hennen & J.R.Hernández 93-088* (LIL 54759, BPI 841009) [II-III].

Puccinia spegazzinii De Toni[N]

on *Mikania micrantha* Kunth[N]; **Tucumán:** Horco Molle, 15 May 1995, *J.R.Hernández 95-079* (BPI) [III]; Horco Molle, Parque Sierras de San Javier, 6 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-088* (LIL 54752, BPI) [III]; San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R.Hernández 94-160* (LIL 54753, BPI) [III]

on *Mikania periplocifolia* Hook. & Arn.; **Salta:** Los Vaqueros, 7 Dec 1997, *J.R.Hernández 97-165* (BPI 841261) [III]; Metán, 2 Apr 1993, *J.F.Hennen & L.D.Ploper 93-113* (LIL 54751, BPI) [III]. **Tucumán:** 19.5 km W of San Miguel de Tucumán, mtn, 27 Mar 1993, *J.F.Hennen, L.D.Ploper & J.R.Hernández 93-010* (LIL 54750, BPI) [III]; Dept. Trancas, Vipos, 28 Mar 1996, *J.R.Hernández 96-009* (BPI) [III]; J.B. Alberdi, road to Escaba, 28 Nov 1997, *J.R.Hernández 97-098* (BPI) [III].

on *Mikania* sp.; **Tucumán:** 15 Jan 1895, *C. Spegazzini s.n.* [III]; Dept. Capital, 15 Jun 1992, *J.R.Hernández 92-005* (BPI) [III].

Puccinia tanaceti DC. var **tanaceti**[A]

on *Chrysanthemum* sp.[AR]; **Tucumán:** San Miguel de Tucumán, 15 Dec 1994, *J.R.Hernández 94-170* (BPI 841076) [II].

Puccinia unicolor Arthur[A]

on *Baccharis* sp.[AR]; **Tucumán:** Alta Gracia, 19 Nov 1997, *J.R.Hernández 97-0931* (BPI 841214) [II].

Uredo sp

on *Baccharis* sp.; **Tucumán:** Tafí del Valle, 6 Apr 1993, *J.F.Hennen & J.R.Hernández 93-118* (LIL 54756, BPI 841017) [II].

on *Eupatorium* sp.; **Tucumán:** Valle de Las Salas, bank of Río Las Salas, 3 Nov 1997, *J.R.Hernández 97-151* (BPI 841248) [II].

Uromyces aspiliae H.S. Jacks. & Holw.[A]

on *Aspilia* sp.[AR]; **Tucumán:** Horco Molle, 14 Nov 1997, *J.R.Hernández 97-130* (BPI 841234) [0-I-II-III].

on *Wedelia saltensis* Cabrera[N]; **Tucumán:** Horco Molle, 21 Dec 1992, *J.R.Hernández 92 004* (BPI 840991) [II-III].

Uromyces bidenticola Arthur

on *Bidens pilosa* L.; **Tucumán:** Horco Molle, 17 Sep 1997, *J.R.Hernández 97-078* (BPI 841207) [II]; Horco Molle, Parque Sierras de San Javier, 29 Mar 1996, *J.R.Hernández 96-022* (BPI 841128) [II]; Horco Molle,

Parque Sierras de San Javier, 6 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-087* (LIL 54762, BPI) [II-III]; San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R.Hernández 94-151* (LIL 54763, BPI) [II].

on *Bidens* sp.; **Tucumán:** 19.5 km W of San Miguel de Tucumán, mtn, 27 Mar 1993, *J.F.Hennen, L.D.Ploper & J.R.Hernández 93-014* (LIL 54764, BPI) [II-III]; J.B. Alberdi, road to Escaba, 28 Nov 1997, *J.R. Hernández 97-096* (BPI 841217) [II].

Uromyces megalospermus Speg.

on *Tessaria absinthioides* (Hook. & Arn.) DC.; **Catamarca:** N of Catamarca, 22 Sep 1997, *J.F.Hennen & J.R.Hernández 97-017* (BPI 841171) [II-III]; N of Catamarca, 22 Sep 1997, *J.F.Hennen & J.R.Hernández 97-018* (BPI 841172) [II-III]; road to El Rodeo, camping area, 29 Nov 1997, *J.R. Hernández 97-115* (BPI 841227) [II]; W side of Catamarca, 23 Sep 1997, *J.F.Hennen & J.R.Hernández 97-024* (BPI 841176) [II]; W side of Catamarca, 23 Sep 1997, *J.F.Hennen & J.R.Hernández 97-027* (BPI) [II].

Uromyces polymniae Dietel & Holw.

on *Polymnia connata* (Spreng.) S.F. Blake; **Tucumán:** NW of San Miguel de Tucumán, 31 Mar 1993, *J.F.Hennen & J.R.Hernández 93-090* (LIL 54765, BPI 841010) [II-III].

BERBERIDACEAE

Edythea quitensis (Lagerh.) H.S. Jacks. & Holw.[A]

on *Berberis* sp.; **Tucumán:** Tafí del Valle, 6 Apr 1993, *J.F.Hennen & J.R.Hernández 93-116* (LIL 54711, BPI 841016) [II-III].

BETULACEAE

Melampsoridium hiratsukanum S. Ito ex Hirats. f.[A]

on *Alnus acuminata* Kunth[A]; **Salta:** Dept. Santa Victoria, La Misión, 30 Jun 1996, *J.R.Hernández 96-058* (BPI 841143) [II]; Dept. I]; Dept. Monteros, 29 Oct 1996, *J.R.Hernández 96-077* (BPI) [0-I]; El Corte, 15 Feb 1995, *J.R.Hernández 95-067* (BPI 841099) [0-I]; El Manantial, 27 Sep 1997, *J.F.Hennen & J.R.Hernández 97-064* (BPI 841198) [0]; Horco Molle, Parque Sierras de San Javier, 6 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-092* (LIL 54719, BPI) [II-III]; San Javier, 21 Mar 1995, *J.R.Hernández 95-072* (BPI 841103) [II-III]; Yerba Buena, 5 Oct 1997, *J.R.Hernández 97-074* (BPI) [0].

Prospodium pithecoctenii (Pazschke) Cummins[A]
on *Pithecoctenium* sp.; **Salta:** Las Lajitas, 12 Apr 1994, *J.F.Hennen & L.D.Ploper 94 130* (LIL 54722, BPI 841057) [II-III]. **Tucumán:** Las Cejas, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-061* (LIL 54721, BPI) [II-III]; San Pedro de Colalao, 1 Apr 1994, *J.F.Hennen & M.M.Hennen 94-055* (LIL 54720, BPI 841026) [II-III].

Prospodium singeri Petr.[A]
on *Clytostoma callistegioides* (Cham.) Bureau ex Griseb.[AR]; **Tucumán:** San Miguel, Jardín Botánico Inst. Miguel Lillo, 30 Aug 1951, *R.Singer* s.n. [II-III].

Uropyxis rickiana Magnus[A]
on *Macfadyena unguis-cati* (L.) A.H. Gentry; **Salta:** Dept. Rosario de la Frontera, Horcones, 6 Dec 1997, *J.R.Hernández 97-153* (BPI 841250) [II-III]; Posta de Yatasto, 6 Dec 1997, *J.R.Hernández 97-155* (BPI) [II]. **Tucumán:** 19.5 km W of San Miguel de Tucumán, mtn, 27 Mar 1993, *J.F.Hennen, L.D.Ploper & J.R.Hernández 93-013* (LIL 54723, BPI) [II-III]; Horco Molle, 15 Mar 1992, *J.R.Hernández 92-002* (BPI) [II-III].

BORAGINACEAE

Aecidium tournefortiae Henn.[A]
on *Tournefortia paniculata* Cham.[A]; **Tucumán:** Raco, 3 Nov 1997, *J.R.Hernández 97-141* (BPI 841240) [0-I].

Puccinia cordiae Arthur[A]
on *Cordia* sp.; **Jujuy:** Parque Nacional Calilegua, 8 Dec 1997, *J.R.Hernández 97-178* (BPI 841266) [I]. **Salta:** Dept. Güemes, 7 Dec 1997, *J.R.Hernández 97-171* (BPI) [III].

Uromyces dolichosporus Dietel & Holw.[A]
on *Tournefortia rubicunda* DC.[A]; **Tucumán:** San Pedro de Colalao, 2 Apr 1994, *J.F.Hennen & M.M.Hennen 94-072* (LIL 54724, BPI 841033) [II-III].

CACTACEAE

Uromyces pereskiae Dietel[I]
on *Pereskia aculeata* Mill.; **Jujuy:** Santa Clara, 12 Apr 1994, *J.F.Hennen & L.D.Ploper 94-125* (LIL 54725, BPI 841055) [III].

CANNACEAE

Puccinia thaliae Dietel[I]
on *Canna compacta* Roscoe[A]; **Tucumán:** Yerba Bueba, 15 Nov 1995, *J.R.Hernández 95-089* (BPI 841112) [II-III].
on *Canna* sp.; **Tucumán:** Dept. Capital, 12 Aug 1994, *J.R.Hernández 94-153* (LIL 54726, BPI 841070) [II-III].

CARYOPHYLLACEAE

Uromyces dianthi (Pers.) Niessl
on *Dianthus* sp.; **Tucumán:** Lules, 17 Aug 1995, *J.R.Hernández 95-086* (BPI) [II].

CHENOPODIACEAE

Puccinia subnitens Dietel[A]
on *Suaeda divaricata* Moq.; **Salta:** Cafayate, 9 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-110* (LIL 54727, BPI 841045) [I]

COMMELINACEAE

Phakopsora tecta H.S. Jacks. & Holw.
on *Commelina* sp.; **Tucumán:** Dept. Trancas, Vipos, 28 Mar 1996, *J.R.Hernández 96-006* (BPI 841118) [II]; Horco Molle, Parque Sierras de San Javier, 6 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-095* (LIL 54728, BPI) [II]; San Javier, 23 Jun 1995, *J.R.Hernández 95-084* (BPI 841109) [II].

Puccinia commelinae Holw.[A]
on *Tradescantia* sp.[AR]; **Tucumán:** Horco Molle, 11 Nov 1990, *J.R.Hernández 90-001* (BPI) [II].
on *Tripogandra elongata* (G. Mey.) Woodson[A]; **Salta:** Dept. Santa Victoria, Los Toldos, 28 Jun 1996, *J.R.Hernández 96-032* (BPI) [II]. **Tucumán:** Horco Molle, Parque Sierras de San Javier, 6 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-082* (LIL 54729, BPI) [II].
on *Tripogandra* sp.[A]; **Tucumán:** 19.5 km W of San Miguel de Tucumán, mtn, 27 Mar 1993, *J.F.Hennen, L.D.Ploper & J.R. Hernández 93-009* (LIL 54730, BPI) [II];

Horco Molle, 17 Sep 1997, *J.R.Hernández 97-079* (BPI) [II]; Horco Molle, 14 Nov 1997, *J.R.Hernández 97-134* (BPI 841237) [II]; Yerba Buena, 29 Mar 1993, *J.R.Hernández 93-046* (LIL 54731, BPI 841000) [II-III].

Uromyces commelinae Cooke

on *Commelina* sp.; **Tucumán:** Dept. Capital, 17 Dec 1995, *J.R.Hernández 95-093* (BPI 841114) [II]; San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R.Hernández 94-155* (LIL 54732, BPI 841071) [II-III].

CONVOLVULACEAE

Puccinia crassipes Berk. & Curt. var. **crassipes**[I]

on *Ipomoea cairica* (L.) Sweet; **Tucumán:** Dept. Capital, 27 Mar 1993, *J.F.Hennen, L.D.Ploper & J.R.Hernández 93-042* (LIL 54767, BPI) [II]; J.B. Alberdi, 22 Sep 1997, *J.F.Hennen & J.R.Hernández 97-001* (BPI 841160) [II]; J.B. Alberdi, road to Escaba, 28 Nov 1997, *J.R.Hernández 97-095* (BPI) [II]; San Miguel de Tucumán, 10 Jun 1992, *J.R.Hernández 92-001* (BPI) [II-III].

on *Ipomoea hieronymi* (Kuntze) O'Donell; **Jujuy:** Santa Clara, 12 Apr 1994, *J.F. Hennen & L.D.Ploper s.n.* (LIL 54768, BPI 841058) [II-III].

on *Ipomoea* sp.; **Jujuy:** Pampa Blanca, 1 Apr 1993, *J.F.Hennen & L.D.Ploper 93-099* (LIL 54769, BPI 841013) [II]. **Tucumán:** Amberes, 5 May 1989, *L.D.Ploper & G.Würschmidt s.n.* (BPI) [II-III].

Puccinia dichondrae Mont.

on *Dichondra sericea* Sw.[A]; **Buenos Aires:** La Plata, 29 Sep 1997, *J.F.Hennen & J.R. Hernández 97-071* (BPI 841203) [III]. **Catamarca:** Dept. Ambatos, El Rodeo, 14 Nov 1999, *J.R.Hernández 99-005* (BPI 841274) [III]. **Tucumán:** El Siambón, river next to monastery, 3 Nov 1997, *J.R. Hernández 97-149* (BPI 841246) [III].

on *Dichondra* sp.; **Tucumán:** San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R. Hernández 94-158* (LIL 54766, BPI) [III].

CUCURBITACEAE

Uromyces novissimus Speg.

on *Cayaponia citrullifolia* (Griseb.) Cogn.; **Tucumán:** Dept. Capital, 12 Aug 1994, *J.R.Hernández 94-139* (LIL 54770, BPI) [III]; Las Salas, 5 May 1995, *J.R.Hernández 95-021* (BPI 841080) [III].

on *Cucurbitella cucumifolia* (Griseb.) Cogn.[A]; **Tucumán:** San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R. Hernández 94-148* (LIL 54771, BPI 841069) [III].

on *undtn.*; **Tucumán:** Horco Molle, Parque Sierras de San Javier, 6 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-094* (LIL 54772, BPI 841037) [II-III].

CYPERACEAE

Puccinia cyperi Arthur

on *Cyperus* sp.; **Tucumán:** San Pedro de Colalao, 2 Apr 1994, *J.F.Hennen & M.M.Hennen 94-075* (LIL 54773, BPI 841035) [II-III].

DRYOPTERIDACEAE

Desmella anemiae Syd. & P. Syd.[A]

on *Athyrium lilloi* (Hicken) Alston[S]; **Tucumán:** Las Lenguas, 22 Oct 1950, *R.Singer s.n.* [II]; Las Lenguas, 22 Oct 1950, *R.Singer s.n.* [II].

ERYTHROXYLACEAE

Phakopsora coca Buriticá & J.F. Hennen

on *Erythroxylum coca* Lam.; **Jujuy:** 2 Apr 1993, *J.F.Hennen & L.D.Ploper 93-115* (LIL 54774, BPI) [II]. **Salta:** Cafayate, 10 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R. Hernández 94-135A* (LIL 54775, BPI 841061) [II].

EUPHORBIACEAE

Uromyces cisneroanus Speg.[C I]

on *Sapium haematospermum* Mül.Arg.; **Catamarca:** W side of Catamarca, 23 Sep 1997, *J.F.Hennen & J.R.Hernández 97-033* (BPI 841182) [II-III]. **Tucumán:** Dept. Capital, 14 May 1995, *J.R.Hernández 95-051* (BPI 841092) [II-III]; El Manantial, 5 Mar 1996, *J.R.Hernández 96-076* (BPI 841149) [II-III]; Los Gutierrez, 15 Aug 1994, *J.R.Hernández 94-171* (BPI) [III]; San Pedro de Colalao, 1 Apr 1994, *J.F.Hennen & M.M.Hennen 94-062* (LIL 54779, BPI) [II-III]; San Pedro de Colalao, 31 Mar 1994, *J.F.Hennen & M.M.Hennen 94-047* (LIL 54778, BPI) [III].

Uromyces euphorbiae Cooke & Peck

on *Euphorbia hirta* L.; **Tucumán:** Dept. Cruz Alta, San Agustín, Monte Redondo, 29

Mar 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-028* (LIL 54776, BPI) [II-III]; San Pedro de Colalao, 31 Mar 1994, *J.F.Hennen & M.M.Hennen 94-046* (LIL 54777, BPI 841024) [III].

FABACEAE

Phakopsora meibomiae (Arthur) Arthur[A]

on *Cologania ovalifolia* Kunth[S]; **Tucumán:** 22 km W of San Miguel de Tucumán, mtn, 27 Mar 1993, *J.F.Hennen, L.D.Ploper & J.R. Hernández 93-018* (LIL 54819, BPI 840995) [II].

Phragmopyxis deglubens (Berk. & M.A. Curtis) Dietel in Engl. & Prantl[A]

on *Coursetia brachyrhachis* Harms[S]; **Jujuy:** Pampa Blanca, 1 Apr 1993, *J.F. Hennen & L.D.Ploper 93-097* (LIL 54820, BPI 841012) [II-III]

Puccinia bergii Speg.[A]

on *Poiretia tetraphylla* (Prior.) Burkart[A]; **Corrientes:** Dept. Concepción, Rincón de Luna, Estancia Santillana, 26 Feb1957, *T.M.Pedersen 4483* [II].

Ravenelia argentinensis Speg.[C,S]

on *Acacia aroma* Gillies in Hook. & Arn.; **Catamarca:** N of Catamarca, Hwy. 38, 24 Sep 1997, *J.F.Hennen & J.R.Hernández 97-052* (BPI 841193) [I]. **Jujuy:** Parque Nacional Calilegua, 8 Dec1997, *J.R.Hernández 97-179* (BPI 841267) [I]. **Salta:** Metán, 2 Apr 1993, *J.F.Hennen & L.D.Ploper 93-103* (LIL 54823, BPI 841014) [I-II III]; road to Parque del Rey, 6 Dec 1997, *J.R.Hernández 97-160* (BPI 841256) [I]. **Tucumán:** Cevil Pozo, 30 Mar 1993, *J.F.Hennen & J.R Hernández 93-051* (LIL 54824, BPI) [II]; Cruz Alta, San Agustín, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93 059* (LIL 54825, BPI) [II-III]; Cruz Alta, San Agustín, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93 060A* (LIL54845, BPI) [III]; Las Cejas, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-076* (LIL 54821, BPI) [I-II]; Las Cejas, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-072* (LIL 54848, BPI) [I-II]; Las Cejas, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-078* (LIL 54822, BPI) [I-II-III]; Las Cejas, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-065* (LIL 54826, BPI) [II-III]; Las Cejas, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-069* (LIL 54847, BPI) [I-II-III]; Las Cejas, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-074* (LIL 54827, BPI) [II-III]; Raco, 3 Nov 1997, *J.R.Hernández 97-143* (BPI) [II]; Raco, 3 Nov 1997, *J.R.Hernández 97-142* (BPI 841241) [I]; San Javier, Parque Sierras de San Javier, 27 Mar 1993, *J.F.Hennen, L.D.Ploper & J.R.Hernández 93-032* (LIL 54844, BPI) [I-II-III]

Ravenelia cebil Speg.

on *Anadenanthera* sp.[S]; **Jujuy:** Caimancito, 2 Apr 1993, *J.F.Hennen & L.D.Ploper 93-111* (LIL 54831, BPI) [II III]; Pampa Blanca, 1 Apr 1993, *J.F.Hennen & L.D.Ploper 93-100* (LIL 54829, BPI) [II III]; San Pedro, 2 Apr 1993, *J.F.Hennen & L.D.Ploper 93 107* (LIL 54830, BPI) [II-III]. **Tucumán:** San Pedro de Colalao, 1 Apr 1994, *J.F.Hennen & M.M.Hennen 94-059* (LIL 54828, BPI 841029) [II-III].

Ravenelia cohniana Henn.[A]

on *Legum. undetn.*; **Jujuy:** Chalicán, 2 Apr 1993, *J.F.Hennen & L.D.Ploper 93-105* (LIL 54832, BPI 841015) [II-III].

Ravenelia echinata Lagerh. & Dietel var. **ectypa** (Arthur & Holw.) Cummins[A]

on *Calliandra formosa* (Kunth) Benth.[S]; **Salta:** Pichanal, 2 Apr 1993, *J.F.Hennen & L.D.Ploper 93-102* (LIL 54835, BPI) [II-III]. **Tucumán:** San Pedro de Colalao, 1 Apr 1994, *J.F.Hennen & M.M.Hennen 94-054* (LIL 54836, BPI) [II-III]; San Pedro de Colalao, 2 Apr 1994, *J.F.Hennen & M.M. POACEAE

Physopella compressa (Mains) Cummins & Ramachar[A]

on *Paspalum* sp.[AR]; **Tucumán:** Yerba Buena, 24 Mar 1993, *J.R.Hernández 93-043* (LIL 54783, BPI 840999) [II].

Puccinia abnormis Henn.

on *Echinochloa cruspavonis* (Kunth) Schult.[S]; **Salta:** Cafayate, 9 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-117* (LIL 54784, BPI 841049) [II-III].

on *Echinochloa* sp.; **Tucumán:** Amberes, 5 May 1989, *L.D.Ploper & G.Würschmidt s.n.* (BPI) [II-III-IV].

Puccinia aristidae Tracy var. **chaetaria** Cumm. & Husain[A]

on *Aristida* sp.[AR]; **Catamarca:** bank of Rio Las Juntas, 23 Sep 1997, *J.F.Hennen & J.R. Hernández 97-040* (BPI 841186) [II-III].

Puccinia brachypodii G.H. Otth var. **poae-nemoralis** (G.H. Otth) Cummins & H.C. Greene

on *Poa* sp.; **Tierra del Fuego:** Est. Fique, 16 Feb 1953, *Ruiz Leal & Roig s.n.* (LPS 22392)[II].

on *Poa stuckertii* (Hack.) Parodi; **Buenos Aires:** Santa Catalina, Oct 1941, *J.C.Lindquist s.n.* (LPS 4895)[II-III].

Puccinia cacabata Arthur & Holw.[I]

on *Chloris gayana* Kunth[AR]; **Salta:** Las Lajitas,

12 Apr 1994, *J.F.Hennen & L.D.Ploper 94-128* (LIL 54785, BPI) [II-III].

on *Chloris polydactyla* (L.) Sw.; **Tucumán:** Dept. Trancas, Vipos, 30 Mar 1995, *J.R. Hernández 95-042* (BPI 841085) [II-III].

Puccinia chaetochloae Arthur[A]

on *Setaria lachnea* (Nees) Kunth[A]; **Salta:** Las Lajitas, 12 Apr 1994, *J.F.Hennen & L.D. Ploper 94-129* (LIL 54802, BPI) [II].

on *Setaria parviflora* (Poir.) Kerguélen[A]; **Tucumán:** Cruz Alta, San Agustín, 30 Mar 1994, *J.F.Hennen, M.M.Hennen & J.R. Hernández 94-034* (LIL 54803, BPI) [II].

on *Setaria* sp.[AR]; **Catamarca:** W side of Catamarca, 23 Sep 1997, *J.F.Hennen & J.R.Hernández 97-026* (BPI 841177) [II]. **Tucumán:** Cruz Alta, 23 Jun 1995, *J.R. Hernández 95 083* (BPI) [II]; Las Cejas, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-075* (LIL 54804, BPI) [II]; Monte Redondo, 31 Mar 1996, *J.R.Hernández 96-086* (BPI) [II].

Puccinia chloridis Speg.

on *Chloris virgata* Sw.; **Salta:** Cafayate, 9 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R. Hernández 94-118* (LIL 54786, BPI 841050) [II-III].

Puccinia coronata Corda var. **rangiferina** (S. Ito) Cummins[A]

on *Avena sativa* L.[AR]; **Tucumán:** Dept. Capital, Quinta Agronómica, 20 Oct 1994, *J.R.Hernández 94-172* (BPI 841077) [II-III].

Puccinia cynodontis Lacroix ex Desm.[A]

on *Cynodon dactylon* L.; **Salta:** Cafayate, 9 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R Hernández 94-109* (LIL 54787, BPI 841044) [II-III].

Puccinia inclita Arthur[A]

on *Ichnanthus minarum* (Nees) Döll[A]; **Tucumán:** NW of San Miguel de Tucumán, 31 Mar 1993, *J.F.Hennen & J.R.Hernández 93-083* (LIL 54799, BPI 841007) [II-III]; San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R.Hernández 94-138A* (LIL 54801, BPI) [II-III]; San Javier, Parque Sierras de San Javier, La Cascada., 29 Mar 1996, *J.R.Hernández 96-015* (BPI) [II-III]; Tafí del Valle, 6 Apr 1993, *J.F.Hennen & J.R. Hernández 93-126A* (LIL 54780, BPI) [III].

Puccinia leptochloae Arthur[I]

on *Leptochloa mucronata* (Michaux) Kunth[A]; **Tucumán:** Dept. Cruz Alta, San Agustín, Monte Redondo, 29 Mar 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94 026* (LIL 54788, BPI 841021) [II-III].

Puccinia levis (Sacc.& Bizz.) Magnus var. **panici-sanguinalis** (Rangel) Ramachar & Cummins[A]

on *Ichnanthus minarum* (Nees) Döll[A]; **Tucumán:** San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R.Hernández 94 138* (LIL 54801, BPI 841063) [II]; Tafí del Valle, 6 Apr 1993, *J.F.Hennen & J.R. Hernández 93-126* (LIL 54800, BPI) [II-III].

on *Panicum* sp.[AR]; **Catamarca:** Rio Las Juntas, camping area, 23 Sep 1997, *J.F.Hennen & J.R.Hernández 97-037* (BPI) [II-III]; W side of Catamarca, 23 Sep 1997, *J.F.Hennen & J.R.Hernández 97-032* (BPI 841181) [II-III]; W side of Catamarca, 23 Sep 1997, *J.F. Hennen & J.R.Hernández 97 031* (BPI 841180) [II-III].

Puccinia melanocephala Syd. & P. Syd.

on *Saccharum officinarum* L.; **Jujuy:** San Pedro, 12 Apr 1994, *J.F.Hennen & L.D. Ploper 94-124* (LIL 54789, BPI) [II-III]. **Tucumán:** Dept. Capital, 23 Jun 1996, *J.R.Hernández 96-082* (BPI 841153) [II III]; Santa Lucia, 15 Mar 1988, *L.D.Ploper & G.Würschmidt s.n.* (BPI) [III].

Puccinia oahuensis Ellis & Everh.[A I]

on *Digitaria insularis* (L.) Fedde[AR]; **Jujuy:** Pampa Blanca, 1 Apr 1993, *J.F.Hennen & L.D.Ploper 93-098* (LIL 54791, BPI) [II-III]. **Tucumán:** Dept. Cruz Alta, San Agustín, Monte Redondo, 29 Mar 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-029* (LIL 54792, BPI) [II III]; Las Cejas, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-071* (LIL 54790, BPI) [II]; Monte Redondo, 31 Mar 1996, *J.R.Hernández 96-087* (BPI) [II-III]; San Pedro de Colalao, 31 Mar 1994, *J.F.Hennen & M.M.Hennen 94-044* (LIL 54793, BPI) [II].

on *Digitaria sanguinalis* (L.) Scop.; **Salta:** between Rosario de la Frontera and Horcones, 11 Apr 1994, *J.F.Hennen & L.D.Ploper 94-122* (LIL 54794, BPI 841053) [II-III].

Puccinia purpurea Cooke[I]

on *Sorghum cafrorum* (Thunb.) P. Beauv.[A];

Tucumán: Horco Molle, Parque Sierras de San Javier, 29 Mar 1996, *J.R.Hernández 96-025* (BPI) [II]; Monte Redondo, 23 Oct 1996, *J.R.Hernández 96-080* (BPI) [II].

on *Sorghum halepense* (L.) Pers.; **Tucumán:** Alta Gracia, 19 Nov 1997, *J.R.Hernández 97-089* (BPI 841212) [II-III]; Cevil Pozo, 12-15 km E of San Miguel de Tucumán, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-054* (LIL 54795, BPI) [II]; Dept. Trancas, Vipos, 28 Mar 1996, *J.R.Hernández 96-010* (BPI) [II-III]; San Pedro de Colalao, 31 Mar 1994, *J.F.Hennen & M.M.Hennen 94-049* (LIL 54796, BPI) [II].

Puccinia recondita Roberge ex Desm.

on *Bromus* sp.; **Tucumán:** Tafí del Valle, 15 Jul 1994, *J.R.Hernández 94-169* (BPI) [II]; Tafí del Valle, 6 Apr 1993, *J.F.Hennen & J.R. Hernández 93-119* (LIL 54797, BPI) [II-III].

on *Bromus unioloides* Kunth; **Tucumán:** El Manantial, 8 Oct 1995, *J.R.Hernández 95-041* (BPI 841084) [II].

on *Triticum aestivum* L.; **Tucumán:** Dept. Burruyacu, Loc. La Ramada, Finca Los Lapachos, 19 Sep 1999, *J.R.Hernández 99-011* (BPI 841279) [II-III].

Puccinia sorghi Schwein.

on *Zea mays* L.; **Salta:** Between Rosario de la Frontera and Horcones, 11 Apr 1994, *J.F. Hennen & L.D.Ploper 94-123* (LIL 54798, BPI 841054) [III]. **Tucumán:** Dept. Capital, 14 May 1995, *J.R.Hernández 95-050* (BPI 841091) [III]; Dept. Puccinia sp.[N]

on *Ichnanthus minarum* (Nees) Döll[A]; **Tucumán:** San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R.Hernández 94-138B* (LIL 54801, BPI) [II-III].

Puccinia substriata Ell. & Barth.

on *Digitaria* sp.; **Tucumán:** Dept. Capital, 10 Mar 1996, *J.R.Hernández 96-079* (BPI 841151) [II-III].

Uromyces setariae-italicae Yosh.[I]

on *Setaria* sp.; **Tucumán:** San Javier, Parque Sierras de San Javier, La Cascada., 29 Mar 1996, *J.R.Hernández 96-017* (BPI 841124) [II-III].

POLYGONACEAE

Cerotelium sp.[N]

on *Ruprechtia apetala* Wedd.[G]; **Tucumán:** San Pedro de Colalao, 1 Apr 1994, *J.F.Hennen & M.M.Hennen 94-051* (LIL 54890, BPI) [II-III].

on *Ruprechtia laxiflora* Meisn.[G]; **Tucumán:** Dept. Capital, 15 Aug 1994, *J.R.Hernández 94-135* (LIL 54893, BPI 841060) [II].

on *Ruprechtia* sp.[G]; **Tucumán:** SW of J.B. Alberdi, 22 Sep 1997, *J.F.Hennen & J.R Hernández 97-004* (BPI 841163) [II].

Puccinia polygoni-amphibii Pers.:Pers.[C,S,T]

on *Polygonum acuminatum* Kunth; **Salta:** Cafayate, 9 Apr 1994, *J.F.Hennen, M.M. Hennen & J.R.Hernández 94-116* (LIL 54892, BPI) [II]. **Tucumán:** San Javier, 27 Mar 1993, *J.F.Hennen, L.D.Ploper & J.R. Hernández 93-040* (LIL 54891, BPI) [II].

on *Polygonum hydropiperoides* Michx.; **Catamarca:** El Rodeo, 29 Nov 1997, *J.R. Hernández 97-123* (BPI 841229) [II]. **Salta:** Posta de Yatasto, 6 Dec 1997, *J.R.Hernández 97-157* (BPI 841253) [II]. **Tucumán:** road to Villa Nougués, 5 May 1995, *J.R.Hernández 95-034* (BPI 841081) [II].

on *Polygonum* sp.; **Catamarca:** E of La Viña, 24 Sep 1997, *J.F.Hennen & J.R.Hernández 97-059* (BPI) [II]; W side of Catamarca, 23 Sep 1997, *J.F.Hennen & J.R.Hernández 97-030* (BPI 841179) [II]. **Tucumán:** Road to Balcozna, 22 Sep 1997, *J.F.Hennen & J.R.Hernández 97-012* (BPI) [II].

Uromyces crassipes Dietel & Neger[T]

on *Rumex* sp.; **Tucumán:** El Manantial, Fac. de Agronomía, 10 Oct 1999, *J.R.Hernández 99-010* (BPI 841278) [II].

PORTULACACEAE

Puccinia leptochloae Arthur & Fromme[J,T]

on *Talinum paniculatum* (Jack.) Gaertn.; **Jujuy:** road to Parque Nacional Calilegua, 8 Dec 1997, *J.R.Hernández 97-177* (BPI 841265) [0-I]. **Tucumán:** Dept. Capital, 12 Mar 1997, *M.de la Vega s.n.* (BPI 841249) [0-I].

PTERIDACEAE

Desmella anemiae Syd. & P. Syd.[A]

on *Pteris deflexa* Link[A]; **Tucumán:** SW of J.B. Alberdi, 22 Sep 1997, *J.F.Hennen & J.R. Hernández 97-005* (BPI 841164) [II].

on *Pteris* sp.[AR]; **Tucumán:** J.B. Alberdi, S of Escaba Dike, 28 Nov 1997, *J.R.Hernández 97-110* (BPI) [II].

RANUNCULACEAE

Baeodromus ranunculi J.R. Hern. & J.F. Hennen
on *Ranunculus flagelliformis* Sm.; **Catamarca:** Dept. Ambatos, El Rodeo, 23 Sep 1997, *J.F.Hennen & J.R.Hernández 97-046* (BPI 841190) [III]; Dept. Ambatos, El Rodeo, 14 Nov 1999, *J.R.Hernández 99-008* (BPI 746516) [III].

Puccinia recondita Roberge ex Desm.
on *Clematis montevidensis* Spreng.[?]; **Catamarca:** El Rodeo, 29 Nov 1997, *J.R.Hernández 97-124* (BPI) [0]. **Tucumán:** Alta Gracia, 19 Nov 1997, *J.R.Hernández 97 091* (BPI) [0 I]; El Corte, 15 Feb 1995, *J.R.Hernández 95-068* (BPI 841100) [0 I]; El Siambón, river next to monastery, 3 Nov 1997, *J.R.Hernández 97-148* (BPI) [0]; J.B. Alberdi, road to Escaba, bank of creek, 28 Nov 1997, *J.R.Hernández 97-101* (BPI) [0-I]; NW of San Miguel de Tucumán, 31 Mar 1993, *J.F.Hennen & J.R.Hernández 93-081* (LIL 54895, BPI) [0 I]; NW of San Miguel de Tucumán, 31 Mar 1993, *J.F. Hennen & J.R.Hernández 93-087* (LIL 54894, BPI) [0-I].
on *Clematis sericea* Michx.[?]; **Tucumán:** San Javier, Parque Sierras de San Javier, La Cascada., 29 Mar 1996, *J.R.Hernández 96-016* (BPI 841123) [0-I].

RHAMNACEAE

Phakopsora zizyphi-vulgaris Dietel[A]
on *Zizyphus mistol* Griseb.[?]; **Tucumán:** Las Cejas, 30 Mar 1993, *J.F.Hennen & J.R Hernández 93-079* (LIL 54896, BPI 841006) [II].

ROSACEAE

Frommeella mexicana var. **indicae** J.W. McCain & J.F. Hennen[A]
on *Duchesnea indica* (Andrews) Focke[A]; **Buenos Aires:** Ensanada, date ?, *G.A.Costa & B.L.Ronco s.n.* [II]. **Salta:** Dept. Santa Victoria, Los Toldos, 28 Jun 1996, *J.R. Hernández 96-035* (BPI 841133) [II-III]. **Tucumán:** Dept. Trancas, El Potrero, 28 Oct 1996, *J.R.Hernández 96-068* (BPI) [II]; Dept. on *Thelypteris* sp.[A]; **Tucumán:** Horco Molle, 14 Nov 1997, *J.R.Hernández 97-137* (BPI 841239) [II-III].

TILIACEAE

Puccinia triumfettae Dietel & Holw.[A]

on *Triumphetta* sp.[A]; **Tucumán:** Horco Molle, Parque Sierras de San Javier, 6 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-083* (LIL 54942, BPI 841036) [III]; Tafí del Valle, 6 Apr 1993, *J.F.Hennen & J.R. Hernández 93-121* (LIL 54941, BPI) [III].

VALERIANACEAE

Aecidium sp.

on *Valeriana* sp.[A]; **Tucumán:** J.B. Alberdi, road to Escaba, bank of creek, 28 Nov 1997, *J.R.Hernández 97-102* (BPI 841220) [0].

VERBENACEAE

Prospodium lippiae (Speg.) Arthur[ST]

on *Aloysia gratissima* (Gillies & Hook.) Tronc.; **Tucumán:** Monte Redondo, 31 Mar 1996, *J.R.Hernández 96-088* (BPI 841157) [II].

on *Aloysia polystachia* (Griseb.) Moldenke; **Salta:** Cafayate, 8 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-098* (LIL 54945, BPI) [II-III]. **Tucumán:** Alderetes, 30 Mar 1993, *J.R.Hernández 93-070* (LIL 54944, BPI) [II]; Dept. Capital, 17 Aug 1994, *J.R.Hernández 94-136* (LIL 54946, BPI 841062) [II-III]; Dept. Capital, 15 Dec 1996, *N.Cantón s.n.* (BPI) [II].

on *Aloysia* sp.; **Tucumán:** Cruz Alta, San Agustín, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-058* (LIL 54950, BPI) [II]; Las Cejas, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-063* (LIL 54952, BPI) [II]; Las Cejas, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-080* (LIL 54947, BPI) [II-III]; Las Cejas, 30 Mar 1993, *J.F.Hennen & J.R.Hernández 93-062* (LIL 54951, BPI) [II]; NW of San Miguel de Tucumán, 31 Mar 1993, *J.F.Hennen & J.R.Hernández 93-084* (LIL 54953, BPI) [II].

on *Aloysia virgata* (Ruiz & Pav.) Juss.[AR]; **Salta:** Metán, 2 Apr 1993, *J.F.Hennen & L.D. Ploper 93-104* (LIL 54948, BPI) [II]. **Tucumán:** Cruz Alta, San Agustín, 30 Mar 1994, *J.F.Hennen, M.M.Hennen & J.R.Hernández 94-032* (LIL 54949, BPI 841023) [II-III].

Puccinia lantanae Farl.

on *Lantana* sp.; **Tucumán:** 22 km W of San Miguel de Tucumán, mtn, 27 Mar 1993, *J.F.Hennen, L.D.Ploper & J.R.Hernández 93-017* (LIL 54955, BPI 840994) [III]; El

Manantial, 15 May 1996, *J.R.Hernández 96-094* (BPI) [III]; San Javier, Parque Sierras de San Javier, 23 Jul 1994, *J.R.Hernández 94-163* (LIL 54956, BPI 841073) [III].

on *Lippia alba* (Mill.) N.E.Br.[A]; **Tucumán:** Dept. Capital, 14 May 1995, *J.R.Hernández 95-049* (BPI 841090) [III].

on *Lippia* cfr. *turnerifolia* Cham.[A]; **Tucumán:** Dept. Trancas, 5 May 1995, *J.R.Hernández 95 002* (BPI 841078) [III].

on *Lippia grisebachiana* Moldenke[A]; **Salta:** Dept. Santa Victoria, La Misión, 30 Jun 1996, *J.R.Hernández 96-062C* (BPI 841144) [III]. **Tucumán:** San Pedro de Colalao, 1 Apr 1994, *J.F.Hennen & M.M.Hennen 94-057* (LIL 54954, BPI) [III].

on *Lippia modesta* Briq.[A]; **Tucumán:** J.B. Alberdi, road to Escaba, 28 Nov 1997, *J.R.Hernández 97-100* (BPI) [III].

on *Lippia* sp.; **Salta:** Dept. Santa Victoria, La Misión, 30 Jun 1996, *J.R.Hernández 96-062A* (BPI) [III]. **Tucumán:** J.B. Alberdi, road to Escaba, shrine, 28 Nov 1997, *J.R. Hernández 97-104* (BPI) [III].

on *Lippia turbinata* Griseb.; **Tucumán:** Dept. Trancas, Vipos, 30 Mar 1995, *J.R.Hernández 95-045* (BPI 841088) [III].

VITACEAE

Endophyllum circumscriptum Whetzel & Olive var. **catamarcensis** J.C Lindq.[1]

on *Cissus sicyoides* L.[A]; **Tucumán:** Horco Molle, Parque Sierras de San Javier, 6 Apr 1994, *J.F.Hennen, M.M.Hennen & J.R. Hernández 94-086* (LIL 54957, BPI) [III].

NEW RECORDS

New rust species (N):

Aecidium sp. (on *Dyschoriste* sp.), *Aecidium* sp. (on *Solanum riparium* Pers., *Solanum tucumanense* Griseb., *Vassobia breviflora* (Sendtner) Hunz.), *Cerotelium* sp. (on *Ruprechtia apetala* Wedd., *Ruprechtia laxiflora* Meisn., *Ruprechtia* sp.), *Endophyllum* sp. (on *Fuchsia boliviana* Carrière), *Puccinia* sp. (on *Vernonia fulta* Griseb., *Vernonia* sp.), *Puccinia* sp. (on *Vernonia squamosa* Gardner), *Puccinia* sp. (on *Ichnanthus minarum* (Nees) Döll), *Skierka* sp. (on *Cupania vernalis* Cambess.), *Uredo* sp. (on *Psychotria carthagenensis* Jacq.), *Ypsilospora* sp. (on *Inga edulis* Mart.).

ACKNOWLEDGMENTS

The first author gratefully acknowledges his advisor and friend, L. Daniel Ploper, National University of Tucumán, who provided support in completing his doctoral thesis. Many thanks to María Magdalena Schiavone and her staff at the herbarium of the Fundación Miguel Lillo (LIL), San Miguel de Tucumán, Tucumán, who organized and accessioned many specimens, and to Alberto

Slanis for host plant identifications. The efforts of Erin McCray and David F. Farr in providing accession numbers and assistance in the final publication, respectively, are appreciated as are the encouragement and efforts of Amy Y. Rossman that contributed to the completion of this paper. Finally, I would like to thank my wife, Mary E. Palm, for her invaluable motivation and support.

ABSTRACT

Intensive floristic surveys of the Río Mayo region of the Mexican state of Sonora, particularly the Municipio de Yécora, have uncovered more species of Cyperaceae not previously reported from the region, the state of Sonora, or, in some cases, northern Mexico. Here we present 14 species of Cyperaceae and two species of Juncaceae not previously known to occur in the Río Mayo region, clarify the presence of three varieties of one *Cyperus* (Cyperaceae) species, and discuss the significance of the range extension involved with each new discovery. This brings the total number of Cyperaceae taxa known from the Río Mayo region to 99 and Juncaceae taxa to 14.

RESUMEN

Las herborizaciones florísticas intensivas en la región de Río Mayo en el estado Mexicano de Sonora, particularmente en el Municipio de Yécora, han descubierto más especies de Cyperaceae que no habían sido citadas previamente de esta región, del estado de Sonora, o, en algunos casos, el norte de México. Presentamos quí 14 especies de Cyperaceae y dos especies de Juncaceae que no se conocían previamente de la región de Río Mayo, clarificamos la presencia de tres variedades y una especie de *Cyperus* (Cyperaceae), y se discute el significado del rango de extensión implicado en cada descubrimiento. Esto lleva el número total de táxones conocidos de Cyperaceae de la región Río Mayo a 99 y el taxones de Juncaceae a 14.

Gentry's 1942 Río Mayo Plants was a major contribution to the knowledge of the flora and vegetation of northwestern Mexico. The Río Mayo region includes the area in southern Sonora and adjacent Chihuahua between the Río Fuerte and Río Yaqui drainages. Beginning in the 1970s, a new network of roads, especially Mexico Federal Highway 16 (MEX 16) between Hermosillo, Sonora, and La Junta, Chihuahua, was completed in 1992 and provided access to many areas of the Sierra Madre Occidental not previously explored floristically (Búrquez et al. 1992). A revision of the Río Mayo flora (Martin et al. 1998) incorporated recent floras from the Cascada de Basaseachi (Spellenberg et al. 1996) and Nabogame (Laferriére 1994), Chihuahua. The total of 2825 taxa reported for the Río Mayo region included 11 genera and 77 species of Cyperaceae and two genera and 12 species of Juncaceae.

An intensive floristic survey of the Municipio de Yécora, an area of 3,300 km^2 along MEX 16 in the Sierra Madre Occidental in eastern Sonora, was begun in 1995 (Reina et al. 1999; Van Devender et al. in press). The current total for the Municipio is 1648 taxa, raising the total for the Río Mayo region to over 3000

SIDA 20(1): 339 – 347. 2002

taxa. The families with the most taxa in the Municipio de Yécora flora are Compositae (248 taxa), Gramineae (186 taxa), Leguminosae (168 taxa), Cyperaceae (59 taxa), and Euphorbiaceae (56 taxa). The genus *Cyperus* with 29 species is especially diverse. This ongoing floristic work in the Río Mayo region has uncovered more species of Cyperaceae not previously reported from the region, the state of Sonora, or, in some cases, northern Mexico. Here we present 14 species of Cyperaceae and two species of Juncaceae not previously known to occur in the Río Mayo region, clarify the presence of three varieties of one *Cyperus* (Cyperaceae) species, and discuss the significance of the range extension involved with each new discovery. Specimens were determined by Eric H. Roalson, unless noted otherwise. Most of the noteworthy records are in ciénegas or other moist areas from 1200 to 2100 m elevation in oak woodland and pine-oak forest in the Municipio de Yécora, or the grasslands and mudflow barrens within them (Reina G. et al. 1999).

Bulbostylis barbata (Rottb.) C.B.Clarke

This species is previously known from the southeast United States, Martinique, Guatemala, and the Old World tropics (Kral 1971). *Bulbostylis barbata* appears to be quite weedy and expanding its range in North America (Kral 1971). This is the first report of the species in Mexico.

Voucher specimens. **MÉXICO. Sonora. Municipio de Yécora:** 14.7 km E of Maycoba, 7.7 km E of El Kípor on MEX 16 (KM 342), pine-oak forest, 28°26'04"N 108°33'36"W, 1460 m elevation, locally common herb in soil pocket in bare area within forest, 15 Sep 1999, *Van Devender 99-647* (WS), with A.L. Reina G.

Bulbostylis pubescens (J. & C.Presl) Svenson

This species is widespread in the lowlands to the south along the Pacific slope of the Sierra Madre including the Mexican states of Sinaloa, Nayarit, Jalisco, Guerrero, Mexico, Oaxaca, and Chiapas, and south through Central America and northern South America (Kral 1971; McVaugh 1993). This is the first report of the species from the Río Mayo region and the state of Sonora.

Voucher specimens. **MÉXICO. Sonora. Municipio de Yécora:** NW of the cemetery in Yécora, spare oak woodland on barren volcanic hilltops, 28°22'40"N 108°56'W, 1540 m elevation, locally common on moist rock surfaces, 23 Sep 1997, *Reina G. 97-1172* (ARIZ, CAS, MEXU, NY, WS), with T.R. Van Devender and W. Trauba; 1.9 km SSW of Las Víboras on MEX 16 on road to Trigo Moreno, bare mudstone area in open pine-oak forest, 28°21'50"N 108°49'34"W, 1620 m elevation, locally common annual, 17 Aug 1998, *Van Devender 98-992* (ARIZ, WS), with A.L. Reina G., M.E. Fishbein, and G.M. Ferguson; tributary of Arroyo Los Pilares near bridge, 24.7 km W of Maycoba on MEX 16, oak woodland with scattered pines in shady, narrow, steep canyon, 28°23'40"N 108°47'35"W, 1300 m elevation, locally common annual in moist depressions on bare surfaces, 13 Sep 1999, *Reina G. 99-515* (WS), with T.R. Van Devender.

Carex planostachys Kunze

This species is previously known from Texas to Guatemala, and in Mexico, it is known from as far northwest as Chihuahua (Hermann 1974). This is the first report of this species in Sonora and the Río Mayo region.

Voucher specimens. **MÉXICO. Sonora. Municipio de Yécora:** 5.2 km W of Yécora on MEX 16, pine-oak forest, 28°21'48"N 108°59'12"W, 1720 m elevation, 11 Mar 1996, *Van Devender 96-87* (ARIZ, MEXU, RSA), with A.L. Reina G., S.L. Friedman, and W. Trauba, determined by Merriam C. Fritts.

Carex thurberi Dewey

This species is known from Arizona and localities across Mexico (Sonora, Chihuahua, Jalisco, Veracruz, and Chiapas), as well as Guatemala (Hermann 1974; although see McVaugh 1993; Espejo & López F. 1997). This is the first report of this species for the Río Mayo region.

Voucher specimen. **MÉXICO. Sonora. Municipio de Yécora:** ca. 2 km (by air) W of Yécora, pine-oak forest, 28°22'15"N 108°57'30"W, 1580 m elevation, uncommon herbaceous perennial in moist soil, 21 Jul 1998, *Trauba 425-98* (WS).

Cyperus arsenei O'Neil & Ben.Ayers

This species is previously known from the western Mexican states of Baja California Sur, Nayarit, and Michoacán and the Districto Federal (Tucker 1994). This is the first record of this species in the state of Sonora and the Río Mayo region.

Voucher specimens. **MÉXICO. Sonora. Municipio de Yécora:** 1 km W of Yécora on volcanic ridges/outcrops, W of cemetery, E facing slope with occasional *Arctostaphylos*, *Bouteloua*, other *Cyperus* sp., *Hackelochloa*, *Juniperus*, *Muhlenbergia*, occasional *Pinus*, *Quercus*, *Schizachyrium*, *Scleria*, and *Tradescantia*, 28°22'12"N 108°56'23"W, ca. 1600 m elevation, 5 Sep 1996, *Roalson 1364* (WS).

Cyperus manimae HBK

In Gentry's Río Mayo Plants (Martin et al. 1998), varieties of *C. manimae* were not distinguished. Tucker (1994) recognized three varieties of *C. manimae*, with only one of these (*C. manimae* var. *asperrimus*) known from Sonora. *Cyperus manimae* var. *divergens* is known from Chihuahua and Coahuila south to Chiapas in Mexico and south to Costa Rica and *C. manimae* var. *manimae* is known from Baja California, Sonora, and Durango to Chiapas in Mexico, south to Guatemala and northern South America (Tucker 1994; Espejo & López F. 1997). All three varieties are present in the Río Mayo region. This increases the range of var. *asperrimus* and var. *manimae* into the Río Mayo region, and the range of var. *divergens* west from Chihuahua into Sonora.

var. **asperrimus** (Liebm.) Kük.

Voucher specimens. **MÉXICO. Sonora. Municipio de Yécora:** Río Yepachic near junction with Arroyo Hondo, ca. 2 km (by air) W of Chihuahua border, oak woodland with canyon riparian forest with *Acer*, *Alnus*, *Cupressus*, and *Prunus gentryi*, 28°27'10"N 108°32'15"W, 1380 m elevation, locally common perennial on shady slope, 27 Sep 1998, *Van Devender 98-1783* (WS), with A.L. Reina G.

var. **divergens** (HBK) Kük.

Voucher specimens. **MÉXICO. Sonora. Municipio de Yécora:** Cañada La Ventana (Arroyo El Otro Lado), 2.5 km (by air) ESE of Yécora, rocky stream canyon in pine-oak forest, 28°21'38"N 108°53'55"W, 1520 m elevation, solitary perennial on rocky slope, 18 Sep 1998, *Van Devender 98 1340* (WS), with A.L. Reina G. and W. Trauba; near Rancho El Pedregoso, 15.6 km N of Yécora on road to Agua Blanca, oak woodland with grassland, 26°30'04"N 108°55'38"W, 1460 m elevation, locally common perennial in mud at edge of pond, 24 Sep 1998, *Van Devender 98-1659* (WS), with A.L. Reina G. and W. Trauba.

var. **manimae**

Voucher specimens. **MÉXICO. Sonora. Municipio de Yécora:** Pueblo Viejo on Río Mayo in Navojoa, 27°06'N 109°25'40"W, ca. 35 m elevation, locally common herbaceous perennial, 2 Oct 1995, *Van Devender 95-1127* (ARIZ, WS), with A.L. Reina G.; 2 km E of Yécora, northeast of Las Cabañas Los Champinoñes, disturbed pine-oak forest, 28°22'51"N 108°54'53"W, 1600 m elevation, common 60 cm tall herbaceous perennial in moist places, 3 Oct 1996, *Flores M. 4969* (USON, WS), with J. Sánchez; ca. 2 km NW of Yécora on old road to Santa Rosa, 28°22'33"N 108°56'24"W, 1560 m elevation, uncommon perennial in moist soil, 17 Aug 1998, *Van Devender 98-1009* (EIU, WS), with A.L. Reina G., M.E. Fishbein, and G.M. Ferguson; Cañada La Ventana (Arroyo El Otro Lado), 2.5 km (by air) ESE of Yécora, rocky stream canyon in pine-oak forest, 28°21'38"N 108°53'55"W, 1520 m elevation, uncommon perennial on rocky slope, 18 Sep 1998, *Van Devender 98-1342* (WS), with A.L. Reina G. and W. Trauba; Río Maycoba at MEX 16 (20.5 km W of Maycoba, 28.6 km E of Yécora), 28°22'15"N 108°45'30"W, 1220 m elevation, rare sedge at base of cliff, 26 Sep 1998, *Reina G. 98-1711* (WS), with T.R. Van Devender; road to Río Yepachic from MEX 16 near Arroyo Hondo (11.5 km E of El Kípor on MEX 16), oak woodland, 28°26'50"N 108°32'20"W, 1480 m elevation, very common on disturbed roadside, 27 Sep 1998, *Van Devender 98-1808* (WS), with A.L. Reina G.

Cyperus sphaerolepis Boeck.

This species is known from New Mexico, Arizona, and west Texas south to Puebla and the Districto Federal in Mexico, and has been documented previously from Sonora (McVaugh 1993; Tucker 1994; Espejo & López F. 1997). This species was not listed, however, for the Río Mayo region (Martin et al. 1998). These specimens verify its presence there.

Voucher specimens. **MÉXICO. Sonora. Municipio de Yécora:** 1 km W of Yécora on mudflow ridges/outcrops, W of cemetery, E facing slope with occasional *Arctostaphylos*, *Bouteloua*, other *Cyperus* sp., *Hackelochloa*, *Juniperus*, *Muhlenbergia*, occasional *Pinus*, *Quercus*, *Schizachyrium*, *Scleria*, and *Tradescantia*, 28°22'12"N 108°56'23"W, ca. 1600 m elevation, 5 Sep 1996, *Roalson 1360*, *1362*, and *1363* (all WS); NW of the cemetery in Yécora, sparse oak woodland on barren mudflow hilltops, 28°22'40"N 108°56'W, 1540 m elevation, uncommon sedge in wet area on bare mudflow hilltop, 23 Sep 1997, *Reina G. 97-1162* (WS) and *97-1183* (ARIZ, MEXU, WS), with T.R. Van Devender and W. Trauba; Ciénega de Camilo, 6.3 km E of El Kípor, 11.2 km W of Chihuahua border on MEX 16, sphagnum bog in clearing in shady riparian pine-oak forest, 28°46'43"N 108°31'50"W, 1580 m elevation, solitary in marsh, 25 Sep 1997, *Reina G. 97-1412* (WS), with T.R. Van Devender (Van Devender et al. in press); El Encinal, ca. 3.5 km E of Maycoba, 28°24'07"N 108°37'W, 1600 m elevation, locally common perennial in moist soil in open oak woodland, 20 Nov 1997, *Van Devender 97-1538* (ARIZ, WS), with A.L. Reina G., A.M. Rea, C. Cassa, and A.E. Gondor.

Eleocharis macrostachya Britton

This is a widespread species known from much of the United States, southwestern Canada, and north-central Mexico. In Mexico it is previously known from Chihuahua, Durango, Aguascalientes, Jalisco, Michoacán, Mexico, Querétaro, the Districto Federal, Oaxaca, Puebla, Hidalgo, and San Luis Potosí (McVaugh 1993). This is the first report for its presence in the Río Mayo region and the first report for Sonora.

Voucher specimen. **MÉXICO. Sonora. Municipio de Yécora:** Yécora, freshwater marsh, 28°22'02"N 108°55'47"W, 1505 m elevation, occasional herbaceous perennial in marsh, 16 Jul 1997, *Van Devender 97-816* (ARIZ, MEXU, USON, WS), with A.L. Reina G., D. Larson, P. Merlin, M.J. Martínez C., G. Fergu-

son, M. Kaib, and R.L. Bellsey; below El Llano on Mesa del Campanero (W of Yécora), 28°20'30"N 109°01'55"W, 2100 m elevation, locally common sedge in moist soil around well, 1 Jun 1999, *Reina G. 99-176* (WS), with T.R. Van Devender, K. Baker, P. West, and R. Scarborough.

Eleocharis svensoniana S.González E.

This species was described in 1985 from the state of Durango, Mexico (González E. 1985) and is also known from the states of Jalisco (McVaugh 1993) and Sinaloa (Espejo & López F. 1997). These collections represent the first record of this species in the Río Mayo region and Sonora and are a significant northward expansion of the species distribution from Durango and Sinaloa.

Voucher specimen. **MÉXICO. Sonora. Municipio de Yécora:** NW of the cemetery in Yécora, sparse oak woodland on barren volcanic hilltops, 28°22'40"N 108°56'W, 1540 m elevation, uncommon on moist rock surfaces, 23 Sep 1997, *Reina G. 97-1171* (WS), with T.R. Van Devender and W. Trauba; Ciénega de Camilo, 6.3 km E of El Kípor, 11.2 km W of Chihuahua border on MEX 16, sphagnum bog in clearing in shady riparian pine-oak forest, 28°46'43"N 108°31'50"W, 1520 m elevation, abundant sedge in mud at edge of ciénega, 27 Sep 1998, *Van Devender 98-1827* (WS), with A.L. Reina G. (Van Devender et al. in press).

Eleocharis yecorensis E.H.Roalson

This species was described in 1999 from material collected in a freshwater marsh on the outskirts of Yécora (Roalson 1999). It now appears that this species is quite widespread, with documented localities as far south as Nicaragua (Stevens et al. 2001).

Voucher specimens. **MÉXICO. Sonora. Municipio de Yécora:** 2.0 km S of MEX 16 at Yécora, fresh water marsh in grassland, 28°21'42"N 108°55'48"W, 1540 m elevation, 7 Sep 1996, *Reina G. 96-486* (ARIZ, WS), with T.R. Van Devender and W. Trauba; SSW side of Yécora, 28°22'09"N 108°56'04"W, ca. 1500 m elevation, 8 Sep. 1996, *Roalson 1385* (Type collection; MEXU, MICH, MO, RSA, UC, WS); Yécora, 28°22'02"N 108°55'47"W, 1,505 m, 16 Jul 1997, *Van Devender 97-810* (ARIZ, WS).

Fimbristylis complanata (Retz.) Link

This species is previously known from the New and Old World tropics (Kral 1971; McVaugh 1993), and prior to Martin et al.'s (1998) discovery of it in Chihuahua, the northernmost record of this species in the New World was from Durango. This is the first report of this species from Sonora. This species has also recently been collected by Richard S. Felger and collegues N of Guaymas, Sonora (Municipio de Guaymas, Cañón La Balandrona, N side of Sierra El Aguaje, 28°04.27'N, 111°04.44'W, 825 ft. elevation, 19 Dec 2001, *Felger 01-659* (USON, ARIZ, MEXU), with J. Sánchez E. and P.A. West; R.S. Felger, pers. comm.).

Voucher specimen. **MÉXICO. Sonora. Municipio de Yécora:** Arroyo La Cueva, 8 km N of Yécora on the road to Agua Blanca, rocky stream canyon in pine-oak forest, 28°26'27"N 108°55'29"W, 1520 m elevation, uncommon perennial in moist soil at edge of stream, 24 Sep 1998, *Van Devender 98-1633* (WS), with A.L. Reina G. and W. Trauba.

Fimbristylis decipiens Kral

This species was described by Kral in 1971 "... to represent an intermediate morphology between *F. dichotoma* and *F. annua*." It is difficult to tell *F. decipiens*

from *F. dichotoma* and *F. annua*, but the two specimens listed below seem to fall within Kral's circumscription. Kral recognized this species in the southeast United States, but suggested it was likely in Central and South America and the Old World (Kral 1971). This is the first report for Sonora and the Río Mayo region.

Voucher specimen. **MÉXICO. Sonora. Municipio de Yécora:** 2.1 km W of Arroyo Hondo, 6.1 km W ol Chihuahua border on MEX 16, open pinyon-juniper-oak woodland on steep pink and white volcanic ash, 28°26'24"N 108°33'20"W, 1400 m elevation, 25 Sep 1997, *Reina G. 97-1374* (ARIZ, MEXU, NY, WS), with T.R. Van Devender; Arroyo El Toro on NE edge of Yécora, 28°22'45"N 108°55'15"W, 1520 m elevation, locally common sedge in mud near stream, 2 Oct 1998, *Van Devender 98-1997* (WS), with A.L. Reina G.

Fimbristylis pentastachya Boeck.

This species has been traditionally known from southern Mexico (Kral 1971). McVaugh (1993) listed *F. pentastachya* from southern Sonora and Martin et al. (1998) listed it for the Río Mayo region in Chihuahua. This collection expands its range into the Sonoran portion of the Río Mayo region.

Voucher specimen. **MÉXICO. Sonora. Municipio de Yécora:** 1.0 km SSW of Las Víboras on MEX 16 on road to Trigo Moreno, bare mudstone area in open pine-oak forest, 28°22'18"N 108°49'42"W, 1620 m elevation, uncommon herbaceous perennial in moist soil, 17 Aug 1998, *Van Devender 98-998* (WS), with A.L. Reina G., M.E. Fishbein, and G.M. Ferguson.

Lipocarpha maculata (Michx.) Torr.

This species is previously known from the southeastern United States, in Mexico the states of Nayarit, Jalisco, Veracruz, and Chiapas, Central and South America, and the West Indies, although this species is thought to be uncommon in Mexico (McVaugh 1993). This is the first report of this species from the Río Mayo region and the state of Sonora, with the closest documented locality to the south in Jalisco and Nayarit (Espejo & López F. 1997).

Voucher specimen. **MÉXICO. Sonora. Municipio de Yécora:** SSW side of Yécora, 28°22'09"N 108°56'04"W, approximately 1500 m elevation, 8 Sep. 1996, *Roalson 1389* (WS); Cañada La Ventana (Arroyo El Otro Lado), 2.5 km (by air) ESE of Yécora, rocky stream canyon in pine-oak forest, 28°21'38"N 108°53'55"W, 1520 m elevation, locally abundant dwarf sedge on shallow soil on mud flow slope, 1 Oct 1998, *Reina G. 98-1967* (ARIZ, WS), with T.R. Van Devender and W. Trauba.

Scleria interrupta Rich.

Two collections from the Río Mayo region apparently fall within the circumscription of *Scleria interrupta* (Konraed Camelbeke, pers. comm.). This is an extreme range extension with the closest localities of this species in Chiapas (Espejo & López F. 1997). The two collections vary somewhat in the characteristics of pubescence and extent of the tubercles on the achene. *Reina G. 97-1373* has achenes with a large number of tubercles covering the surface which at times approach a reticulate pattern and most of the bracts subtending the spikes are covered in bristly hairs on the margins and midrib. This appears to fit well within the circumscription of *S. interrupta*, somewhat tending towards the sometimes-segregate *S. pinetorum* Britton which is included in synonymy of *S.*

interrupta here (Core 1936; Raynal 1976; Konraed Camelbeke, pers. comm.). The other collection, *Reina G. 97-1174*, includes plants with achenes that are mostly smooth with a few tubercles at the achene apex and the bracts subtending the spikes are often near glabrous with few, scattered, bristly hairs. These plants do not fit as well in the circumscription of *S. interrupta*, and approach *S. verticillata* Muhl. (due to the lack of bristly hairs), or maybe *S. distans* Poir. (due to the smooth achenes; Core 1936). For now these two collections are treated as *S. interrupta*, but more detailed studies of the variation in achene ornamentation and pubescence in these annual *Scleria* species is necessary.

Voucher specimens. **MÉXICO. Sonora. Municipio de Yécora:** NW of the cemetery in Yécora, spare oak woodland on barren volcanic hilltops, 28°22'40"N 108°56'W, 1540 m elevation, locally common on moist rock surface, 23 Sep 1997, *Reina G. 97-1174* (ARIZ, NY, WS), with T.R. Van Devender and W. Trauba; 2.1 km W of Arroyo Hondo, 6.1 km W of Chihuahua border on MEX 16, open pinyon-juniper-oak woodland on steep pink and white mottled volcanic ash, 28°26'24"N 108°33'20"W, 1400 m elevation, locally common in moist soil depression on rocky slope, 25 Sep 1997, *Reina G. 97-1373* (WS), with T.R. Van Devender.

Juncus dichotomus Elliott

This species is quite widespread, occurring from Alaska, across the United States, Mexico, Central America, and South America (Balslev 1996; Espejo & López F. 1996; Brooks & Clemants 2000). This is the first report of *J. dichotomus* for the Río Mayo region.

Voucher specimens. **MÉXICO. Sonora. Municipio de Yécora:** El Divisidero (El Bordo), 1 km SE of El Llano on road to Bermudez, Mesa del Campanero, pine-oak forest, 28°16'48"N 109°02'31"W, 1800 m elevation, common rush in moist soil, 26 May 1996, *Reina G. 96-244* (ARIZ, MEXU, NY, WS), with T.R. Van Devender, A. Búrquez M., and L. Varela; Mesa del Campanero, Arroyo Largo, upper tributary or Barranca El Salto, pine-oak forest, 28°21'18"N 109°01'48"W, 2000 m elevation, locally common, 14 Jul 1997, *Van Devender 97-698* (ARIZ, WS), with A.L. Reina G., P. Merlin, A. Búrquez M., G. Ferguson, D. Larson, M. Kaib, and M.J. Martínez C.; Arroyo Hondo, 11.5 km E of El Kípor, 4 km W of Chihuahua border on MEX 16, pine-oak forest, 28°26'30"N 108°32'30"W, 1460 m elevation, locally common herbaceous perennial in water in rocks, 25 Sep 1997, *Reina G. 97 1392* (WS), with T.R. Van Devender; 2.3 km above Restaurant Puerto de la Cruz on road to microwave tower, Mesa del Campanero, pine-oak forest, 28°22'18"N 109°01'54"W, ca. 2150 m elevation, uncommon herbaceous perennial on moist roadside, 16 Aug 1998, *Reina G. 98-939* (WS), with T.R. Van Devender, M.E. Fishbein, R. Spellenberg, and G.M. Ferguson; Cañada La Ventana (Arroyo El Otro Lado), 2.5 km (by air) ESE of Yécora, rocky stream canyon in pine-oak forest, 28°21'38"N 108°53'55"W, 1520 m elevation, solitary clump in moist soil in narrow side canyon, 18 Sep 1998, *Van Devender 98-1303* (ARIZ, WS), with A.L. Reina G. and W. Trauba; Ciénega de Camilo, 6.3 km E of El Kípor, 11.2 km W of Chihuahua border on MEX 16, sphagnum bog in clearing in shady riparian pine-oak forest, 28°46'43"N 108°31'50"W, 1520 m elevation, solitary rush in moist soil, 27 Sep 1998, *Van Devender 98 1850* (WS), with A.L. Reina G. (Van Devender et al. in press).

Juncus liebmanii J.F.Macbr. var. **polycephalus** Balslev

This species is known from Chihuahua in Mexico south to Ecuador. The northern Mexican collections are considered part of *J. liebmanii* var. *liebmanii* or var. *polycephalus* Balslev (Balslev 1996). The Sonoran collection belongs to var. *polycephalus*. This is the first report of this species for Sonora and the Río Mayo region.

Voucher specimens. **MÉXICO. Sonora. Municipio de Yécora:** Arroyo La Cueva, 8 km N of Yécora on the road to Agua Blanca, rocky stream canyon in pine-oak forest, 28°26'27"N 108°55'29"W, 1520 m elevation, uncommon perennial in moist soil at edge of stream, 24 Sep 1998, *Van Devender 98-1634* (WS), with A.L. Reina G. and W. Trauba.

ACKNOWLEDGMENTS

We thank Father Bill Trauba for help and companionship in the field and providing shelter in Yécora; George Ferguson, Mark Fishbein, Sam Friedman, and Richard Spellenberg for help in the field and for sharing their collections; Miriam C. Fritts for help with *Carex* identifications; and Richard S. Felger and M. Socorro González E. for helpful comments on a previous version of the manuscript.

RESUMEN

La Sierra "El Viejo" se ubica en el municipio de Pitiquito y Caborca, Sonora, en la porción Centro - Oeste del desierto sonorense. El complejo orográfico Sierra "El Álamo"–Sierra "El Viejo" está catalogado como una Región Prioritaria Terrestre para la conservación en México. Este trabajo tiene por objetivo contribuir al conocimiento florístico de las familias Cactaceae y Agavaceae principalmente en la Sierra "El Viejo." Se hizo una revisión bibliográfica para establecer las especies que, posiblemente, se encontrarían en el área y posteriormente se corroboraron en campo mediante recorridos en diversas localidades. Se registraron 21 especies de cactáceas distribuidas en 10 géneros y 4 especies de Agavaceas en 2 géneros, lo que hace un total de 25 especies distribuidas en las dos familias. Las especies de Cactáceas representan un 21 % del total de las especies presentes en el estado de Sonora. Una especie, *Ferocactus cylindraceus*, cuenta con categoría de protección. La literatura señala que dos de las especies de agaves son endémicas a la Sierra "El Viejo," *Agave pelona* y *A. zebra*. Se sugiere continuar con estudios para la determinación de variedades y formas taxonómicas, así como también estudios ecológicos en algunas especies, para establecer programas de manejo y protección de las poblaciones y el área en conjunto.

ABSTRACT

Sierra "El Viejo" is located in the municipality of Pitiquito and Caborca, Sonora, in the west central portion of the Sonoran Desert; the complex Sierra "El Álamo"–Sierra "El Viejo" is catalogued as a terrestrial high-priority region for nature conservation in Mexico. The objective for this study is to contribute to the floristic knowledge of the families Cactaceae and Agavaceae within this region, mainly in the Sierra "El Viejo." Bibliographical research was carried out and species reported were corroborated in the field by searching different localities in the area. Twenty-one species of cacti, in 10 genera, and 4 species, and 2 genera of the Agavaceae family were recorded. A total of 25 species are recorded in the two families. The total of species in the Cactus family represents 21 % of the total species present in the state of Sonora. One species of cactus is protected by federal law, *Ferocactus cylindraceus*. Two species of agaves, *Agave pelona* and *A. zebra* are endemic to the region. Further floristic and ecological work is needed in the region that will support conservation, management and protection of the natural resources of this particular region.

INTRODUCCIÓN

Importancia

Las familias Cactaceae y Agavaceae cuentan con diversos estudios taxonómicos y de distribución en algunos estados y municipios de la república mexicana. No obstante existen estados en donde se tiene un pobre conocimiento en estas

SIDA 20(1): 349 – 354. 2002

familias en lo que a taxonomía y distribución se refiere. Dada la importancia que estas familias tienen en el ámbito comercial (como plantas de ornato altamente cotizadas, medicinales y de alimento), es necesario promover estudios de estos grupos taxonómicos.

La sierra "El Viejo" está catalogada como una región terrestre prioritaria para la conservación en México (Arriaga et al. 2000; RPT Clave 16). Bajo este criterio, consideramos que para la región, existe un conocimiento de escaso a regular en cuanto a inventarios de especies, por lo que el desarrollo de listados florísticos y faunísticos es de suma importancia para la correcta planeación en acciones de conservación y manejo del área. De igual forma, el mismo autor, considera que la región se encuentra en un excelente estado de conservación y con una alta integridad ecológica, lo que permite una buena oportunidad para llevar con éxito planes de conservación y de manejo.

Objetivos

1) Ampliar el conocimiento florístico y de distribución para las especies de la familia Cactaceae y Agavaceae en la Sierra "El Viejo."
2) Aportar algunos datos sobre su etnobotánica e importancia ecológica.

Área de estudio

La sierra "El Viejo" se encuentra ubicada en los municipios de Caborca y Pitiquito, Sonora, en el noroeste de la republica Mexicana (Fig. 1). Ocupa una extensión aproximada de 1,128 km^2, constituida principalmente por lomeríos y elevaciones montañosas que van desde los 200 a los 1,000 msnm. El clima es desértico o muy seco semicálido BWhw (x')(e'). El ciclo de lluvias es bianual y se presenta en verano y otoño e invierno. La vegetación de la planicie corresponde al matorral desértico micrófilo y en la sierra la vegetación corresponde al matorral micrófilo sarcocaule.

MÉTODO

Durante los meses de enero a diciembre de 1999 se realizaron recorridos por diferentes localidades de la Sierra "EL Viejo" y sus planicies aledañas. Se corroboraron los registros existentes en la literatura y la taxonomía de las diferentes especies de cactáceas que se encuentran en esta área. La identificación taxonómica se hizo siguiendo los criterios de Bravo-Hollis (1978), Bravo-Hollis y Sánchez-Mejorada (1991) y algunas modificaciones según Anderson (2001).

RESULTADOS

Se encontraron un total de 10 géneros y 21 especies para la familia Cactaceae y dos géneros con cuatro especies para la familia Agavaceae (Tabla 1 y 2). Las especies de la familia Cactaceae representan aproximadamente el 21 % del total registrado para el estado de Sonora.

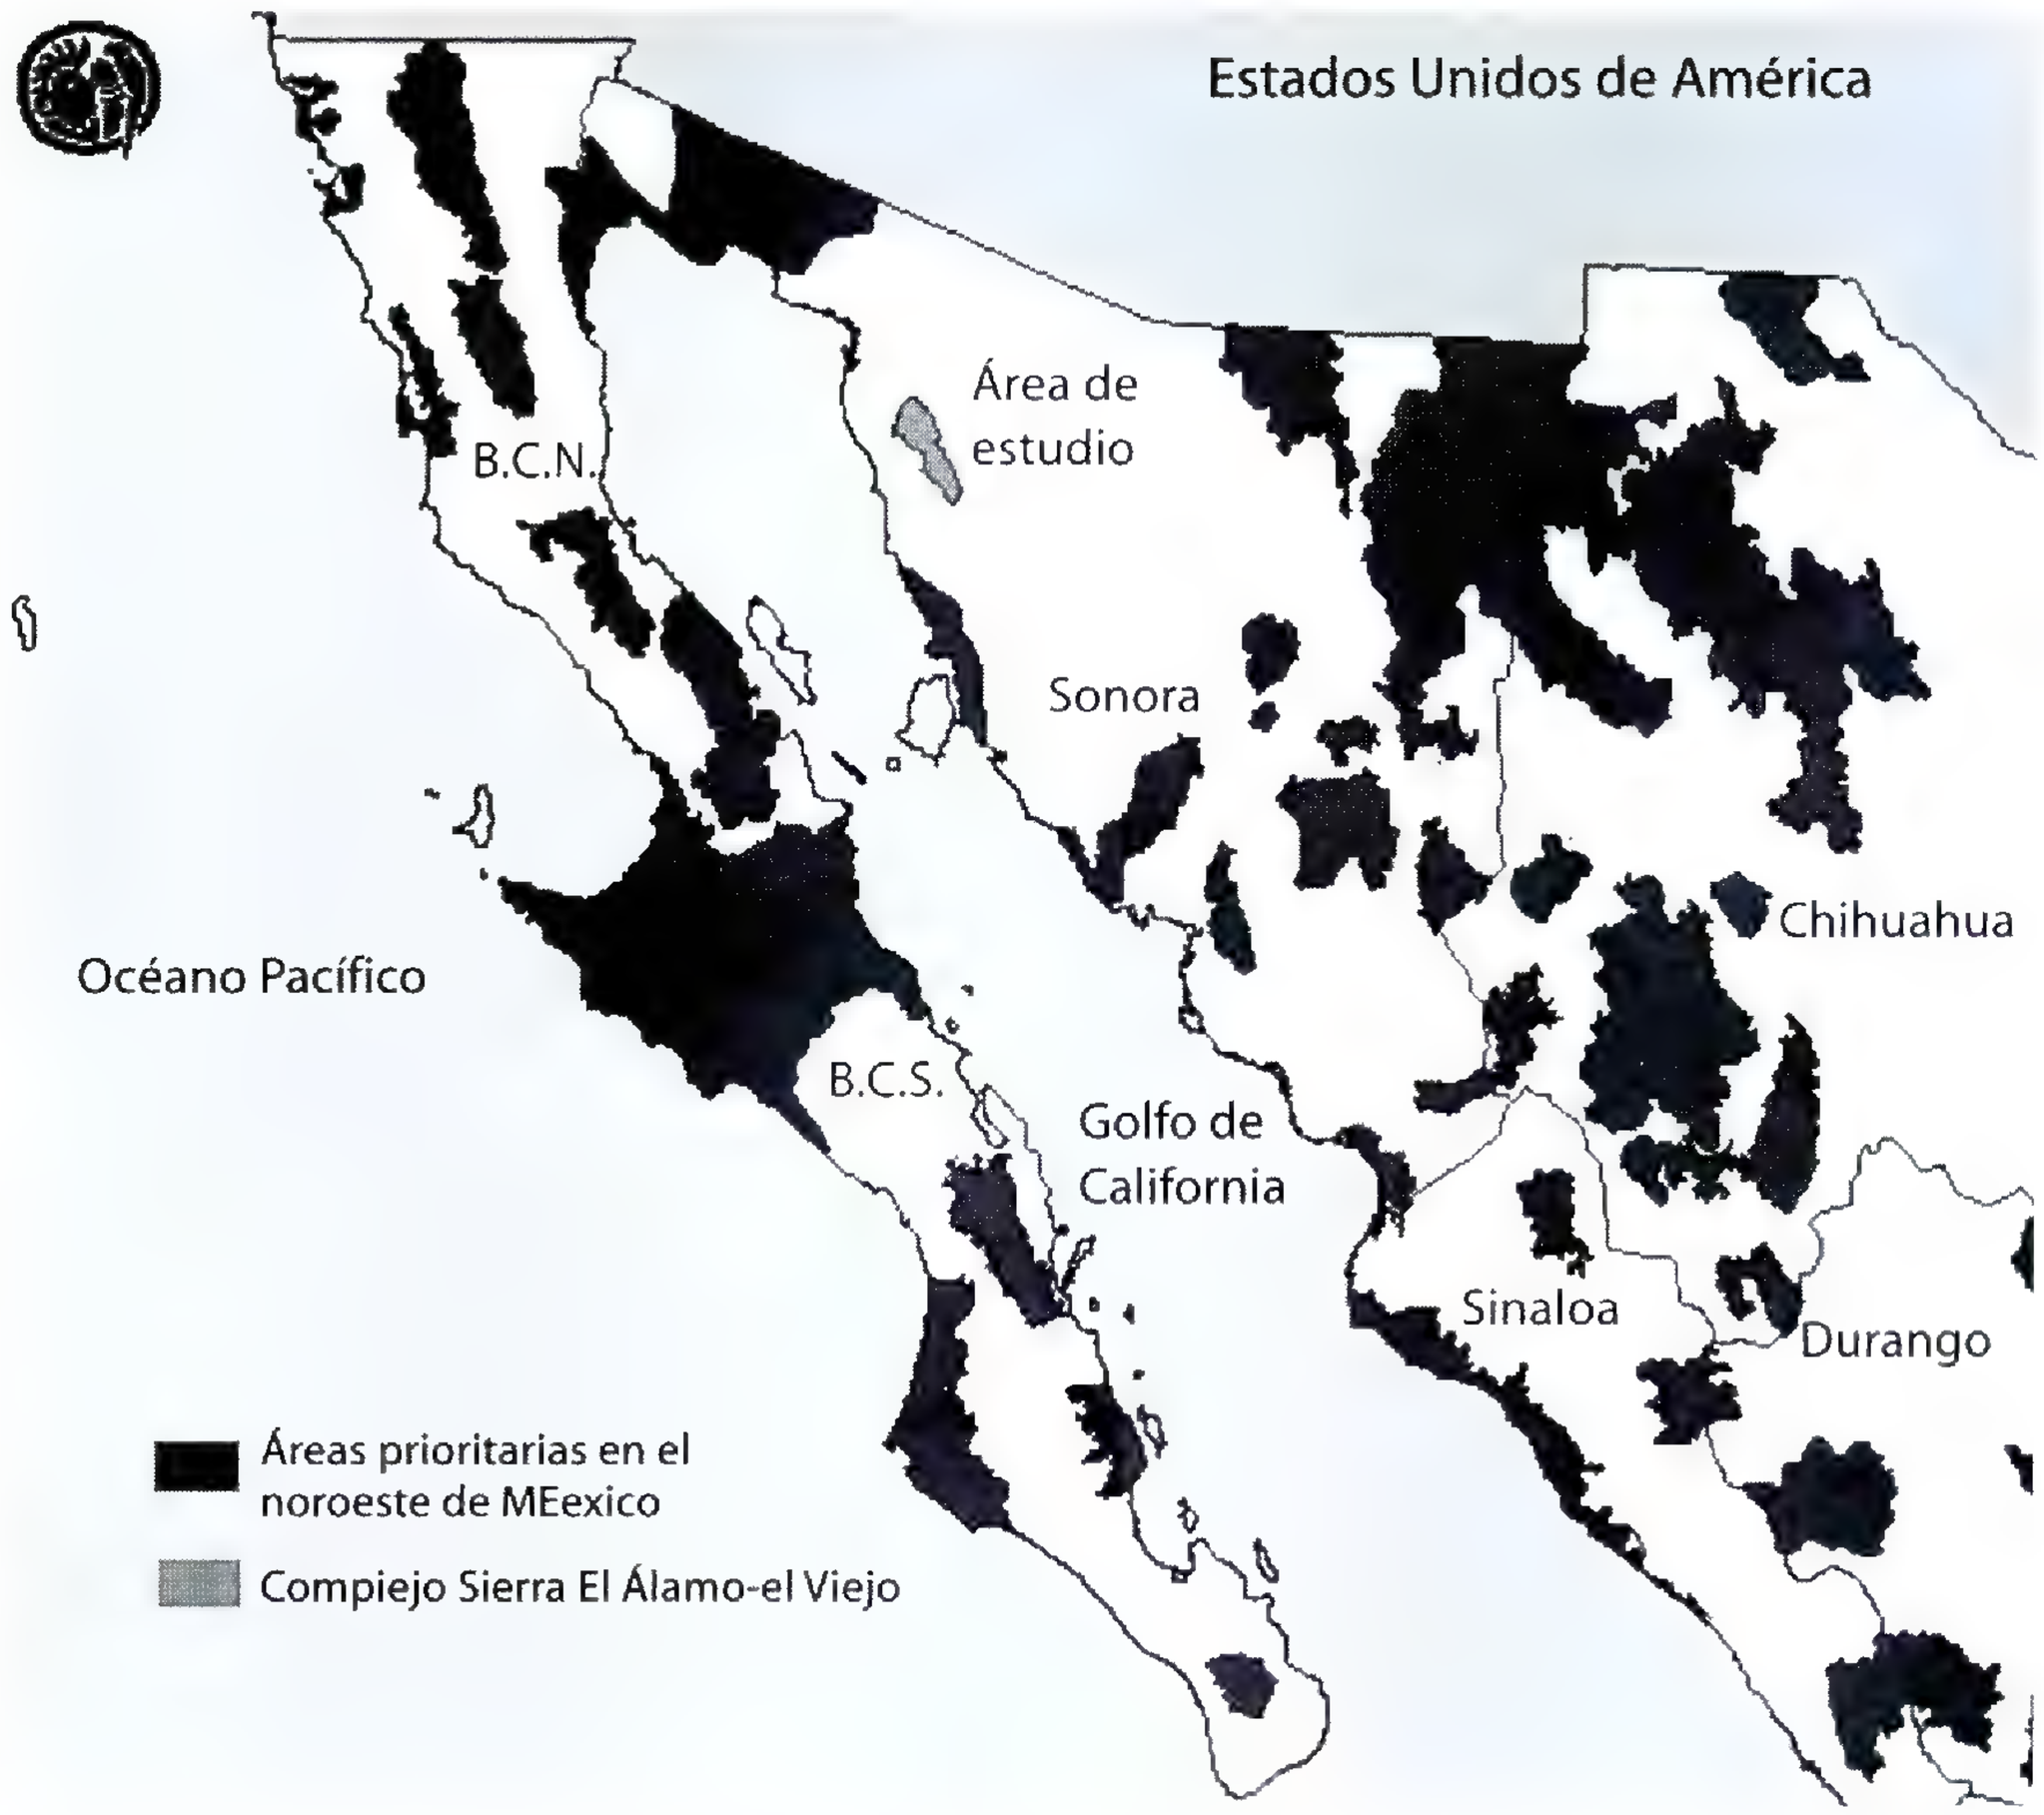

Fig. 1. Localización del área de estudio y su ubicación con respecto a otras áreas prioritarias para la conservación dentro del noroeste de México (Modificado de CONABIO, 2000)

DISCUSIONES Y CONCLUSIONES

Si bien la sierra "El Viejo" ha sido explorada por diversos investigadores (Gentry 1951, 1966; Turner 1980, 1983; Dimmitt 1983; Yatskievych y Fischer 1981 y 1982) es considera por Arraiga (2000), como un área que no ha sido revisada de una manera detallada. El conocimiento botánico en esta área podría aumentar enormemente, teniendo como ejemplo que Yatskievych y Fischer (1984) encontraron los siguientes nuevos registros de la familia Cactaceae: *Ancisirocatus uncinatus*, *Echinocactus horizontalonius*, var. *nicholii*, *Echinocereus scopulorum* y *Mammillaria lasiacantha*, de estas especies se ha podido corroborar la presencia de todas ellas excepto de *E. horizontalonius* var. *nicholii*, esta especie fue encontrada originalmente en la porción norte de la sierra, consistiendo su colecta en un solo ejemplar. Al examinar ejemplares de *Mammilaria lasiacntha*, se tiene cierta reserva al definir esta especie, debido

Opuntia fulgida Engelm. 1856	Cholla plateada
Opuntia leptocaulis A. DC. 1828	Tasajillo o sibirito
Opuntia macrocentra Engelm. 1857	Nopal morado
Pachycereus pringlei (S. Watson) Britton & Rose 1909	Cardón o sabueso
Peniocereus striatus (T. Brandegee) Buxbaum 1975	Sacamatraca
Stenocereus thurberi (Engelm.) Buxbaum 1961	Pitahaya

TABLA 2. Especies de Agavaceas en la Sierra "El Viejo."

Nombre Científico	Nombre Común	Usos Tradicionales
Agave pelona Gentry	Lechuguilla	Extracción de fibras
Agave schotii Engelm.	Amol, amole	Usos medicinales y cosméticos
Agave zebra Gentry	Maguey	Fabricación de bebidas alcohólicas
Yucca arizonica McKelvey	Jobichi, palma	Uso alimenticio

existen diferencias en el color de la flor y la espinación, por lo cuál actualmente se encuentran en revisión para determinar su categoría taxonómica de una manera correcta.

Comparativamente, la Sierra El Viejo se puede considerar rica en especies de cactáceas, ya que Felger (1992), al realizar una sinopsis de las plantas vasculares del noroeste de Sonora, aproximadamente 15,000 km^2 (incluyendo la reserva de la biosfera "El Pinacate"), registra 10 géneros, 26 especies y 7 variedades (reconocidas por Anderson 2001). En la Sierra "El Viejo," área 13 veces menor, se señalan igual número de géneros y cinco especies menos; para la familia Agavaceae solo existen 2 géneros con una especie cada uno.

Hernández (1998) caracterizó la vegetación en el área de la Sierra "El Viejo," y registró nueve cactáceas, además de *Agave* sp. y *Yucca* sp. sin profundizar en su categoría taxonómica. El presente estudio arroja más del doble de especies de cactáceas y determina las especies de agaves mediante la revisión de literatura ya existente. Cabe destacar que dos especies (*Agave pelona* y *A. zebra*) son endémicas de la Sierra «El Viejo» y por lo menos *A. pelona* es parte importante de la dieta y fuente de agua para el borrego cimarrón (*Ovis canadensis mexicana*) que habita la región. Precisamente es con el borrego cimarrón, con quien se observó un fenómeno interesante de interacción entre fauna y flora, durante la época de floración de *A. pelona*, se da un alto consumo de los escapos florales de esta especie por parte del borrego cimarrón y a lo largo del año se consumen plantas enteras para satisfacer las necesidades tanto alimenticias como hídricas.

Cabe destacar que del total de las especies de cactáceas solo una, *Ferocactus cylindraceus*, está dentro de la norma NOM-059-ECOL-1994 (Diario Oficial de la Federación 1994), bajo la categoría de rara y que ninguna de las especies de agaváceas está en alguna categoría de dicha norma, a pesar de que dos de ellas son endémicas del área.

Históricamente y de acuerdo con los pobladores locales, se ha realizado extracción de *Agave pelona* y *A. zebra*. El primero para la extracción de fibras vegetales y el segundo para la elaboración, a pequeña escala, de una bebida alcohólica. A pesar de dicho aprovechamiento (realizado en la primera mitad del siglo XX), las poblaciones se encuentran en un buen estado, ya que se observan individuos de *Agave* de todos los tamaños y clases de edades.

La Sierra "El Viejo," área prioritaria para la conservación en México, mantiene dentro de sus límites un total de 21 especies de cactáceas distribuidas en diez géneros, siendo *Opuntia* el género (7 spp.) más diverso, seguido por *Echinocereus* y *Mammillaria* (3 spp.). Esto representa aproximadamente un 21 % del total de especies registradas para el estado de Sonora (Paredes et al. 2000). Las especies de la familia Agavaceae están representadas por el género *Agave* (3 spp.) y el genero *Yucca* (1 sp.).

AGRADECIMIENTOS

Nuestro más sincero agradecimiento a la Biol. Liliana Ramírez Freire y Erika Gerez Hernández por sus atinados comentarios y correcciones al manuscrito. A Reinaldo Gutiérrez, Jesús Gutiérrez y Martín Armenta que cooperaron en los trabajos de campo. Organización Vida Silvestre A.C. por las facilidades brindadas.

ABSTRACT

A floristic inventory of Big Lake Bottom Wildlife Management Area, a bottomland hardwood forest located on the Trinity River approximately 16 km SW of Palestine in Anderson Co., Texas, was conducted from October 1997 to July 2001. The study area is characterized by eight distinct alliances: 1) Overcup Oak Water Hickory; 2) Willow Oak; 3) Planer Tree; 4) Cottonwood; 5) Sugarberry-Cedar Elm; 6) Bur Oak-Shumard Oak; 7) Post Oak-Blackjack Oak; and 8) Sand Post Oak-Bluejack Oak. The annotated list of taxa includes 99 families, 298 genera, and 459 species.

RESUMEN

Se realizó un inventario florístico del Big Lake Bottom Wildlife Management Area, un bosque de madera dura localizado en el río Trinity unos 16 km al SW de Palestine en el Anderson Co., Texas, desde octubre de 1997 a julio de 2001. El área de estudio se caracteriza por ocho alianzas distintas: 1) Overcup Oak-Water Hickory; 2) Willow Oak; 3) Planer Tree; 4) Cottonwood; 5) Sugarberry-Cedar Elm; 6) Bur Oak-Shumard Oak; 7) Post Oak-Blackjack Oak; y 8) Sand Post Oak-Bluejack Oak. El catálogo florístico de taxa incluye 99 familias, 298 géneros, y 459 especies

INTRODUCTION

The Texas Parks and Wildlife Department began purchasing bottomland in 1991 in an effort to preserve this unique and rapidly disappearing hardwood habitat. Among the first acquisitions was the area now known as Big Lake Bottom Wildlife Management Area (BLBWMA), one of the largest remaining bottomland hardwood tracts of its type in the central Trinity River basin. The area consists of approximately 1684.8 ha that lie within the transition zone between the Pineywoods and the Post Oak Savannah vegetational areas of eastern Texas (Gould 1962), about 16 km SW of Palestine. This alluvial bottomland was formed

SIDA 20(1): 355 – 371. 2002

by the periodic erosion and sedimentation of the river as it flowed through the region. The poorly draining soils and uniform topography produced a forest dominated by hydrophytes.

Because of its unsuitability for most agricultural pursuits, the management area has remained relatively free from outside disturbances. Two of the past major disturbances were selective harvesting of timber in the late 1930s and early 1940s and the clearing of about 65 ha for cultivation in the 1950s. Current use of the property is limited to human recreational activities. Past and present water control and agricultural practices have generally widened the Trinity River, resulting in severe erosion problems along sloughs and creeks. This erosion problem has been compounded by the use of all-terrain vehicles on the management area.

Since the management area was purchased to preserve the bottomland habitat along the Trinity River, this systematic inventory of the vascular flora is imperative for proper management. Results of the study will be used by resource managers in decisions concerning activities that might affect the plant communities and ecosystems of the area. These activities include future land purchases or trades, mineral exploration, granting of rights-of-way and easements, and public use.

Field work was conducted primarily from October 1997 to October 1999, with occasional visits made until July 2001 to search for taxa expected to occur but not previously collected. The survey included more than 50 field visits that produced 532 field collections including ferns, gymnosperms, and flowering plants. Voucher specimens are deposited in the Baylor University Herbarium (BAYLU).

DESCRIPTION OF STUDY AREA

BLBWMA is located within the humid subtropical zone. Temperatures rarely go below -12° C in winter or above 38° C in summer, with the mean temperature being near 20° C (Hatch et al. 1990). The soil of the study area is predominately composed of alluvium and fluviatile terrace deposits and a small area of carbonaceous clay, silt, and ironstone on the Recklaw Formation (University of Texas Bureau of Economic Geology-Palestine Sheet 1993). The deep clay bottomland soils are classified as part of the Kaufman-Trinity Association while the more loamy and sandy uplands belong to the Axtell-Lufkin Association (Coffee 1970). Elevation varies from 57.9–82.3 m above sea level.

Nixon and Willett (1974), in the only previous study of the site located, described 5 bottomland hardwoods types. These were described as coalitions of species and not afforded names as such. Many species were included in more than one type, apparently based upon abundance. These types actually overlapped to some extent, thus we find it advantageous to use the alliance method of community description.

The BLBWMA vegetation areas can be segregated into eight alliances (National Vegetation Classification System (NVCS) 1997) based on dominant species, landscape position, and soil water content. The location, characteristic species, and a short description of each alliance follow.

Overcup Oak (Water Hickory) Seasonally Flooded Forest Alliance

The Overcup Oak (Water Hickory) Alliance is characterized by temporary standing water during and after flood events and consists of approximately 818.3 ha. This alliance is found throughout the site on heavy clay soils (Fig. 1). Dominant trees are *Quercus lyrata*, *Carya aquatica*, *Celtis laevigata* var. *laevigata* and *Ulmus americana*. Other common woody species in this area include *Fraxinus pennsylvanica*, *Ilex decidua*, and *Crataegus viridis*. Common herbaceous species include *Iva annua*, *Xanthium strumarium*, *Justicia ovata*, *Leersia lenticularis*, *Saururus cernuus*, *Lobelia cardinalis*, *Diodia virginiana*, *Gratiola virginiana*, and *Boehmeria cylindrica*.

Willow Oak Seasonally Flooded Forest Alliance

Willow Oak Alliance consists of seasonally flooded areas and is the smallest wet bottomland feature on the area at 50.2 ha. These are depressed areas of periodic inundation in which hardwood trees dominate and form a dense canopy. This alliance is located north of the drainage channel of Big Lake into Keechie Creek, an area that has been carved out by flooding events (Fig. 1). Common tree species include *Quercus phellos*, *Q. nigra*, *Celtis laevigata* var. *laevigata*, *Carya aquatica*, *Nyssa sylvatica*, *Ilex decidua*, and *Liquidambar styraciflua*. Characteristic herbs of this forest include *Carex frankii*, *Juncus coriaceus*, and *Trachelospermum difforme*.

Planer Tree Seasonally Flooded Forest Alliance

Planer Tree Alliance comprises 85.8 ha and consists of mid-story forests in backswamps and sloughs that are produced in soils created by rapid siltation. This alliance occurs along the corridor of Cedar Creek Slough and along Keechie Creek Slough just south of where Keechie Creek joins the Trinity River, as well as in a small section of the Johnson Tract (Fig. 1). Common woody plants include *Planera aquatica*, *Gleditsia aquatica*, *Forestiera acuminata*, *Carya aquatica*, *Cephalanthus occidentalis*, *Fraxinus pennsylvanica*, *Salix nigra*, and *Berchemia scandens*. Herbaceous plants include *Saururus cernuus*, *Boehmeria cylindica*, *Sesbania drummondii*, and *S. exaltata*.

Cottonwood Temporarily Flooded Forest Alliance

Cottonwood Alliance consists of 10.9 ha of periodically flooded forests on sandy alluvium primarily on developed river fronts. It is restricted to a narrow strip adjacent to the Trinity River bank (Fig. 1). Common tree and shrub species include *Populus deltoides*, *Salix nigra*, *Acer negundo*, *Gleditsia aquatica*, *Celtis laevigata* var. *laevigata*, *Betula nigra*, *Ulmus americana*, *Morus rubra*, *Cornus*

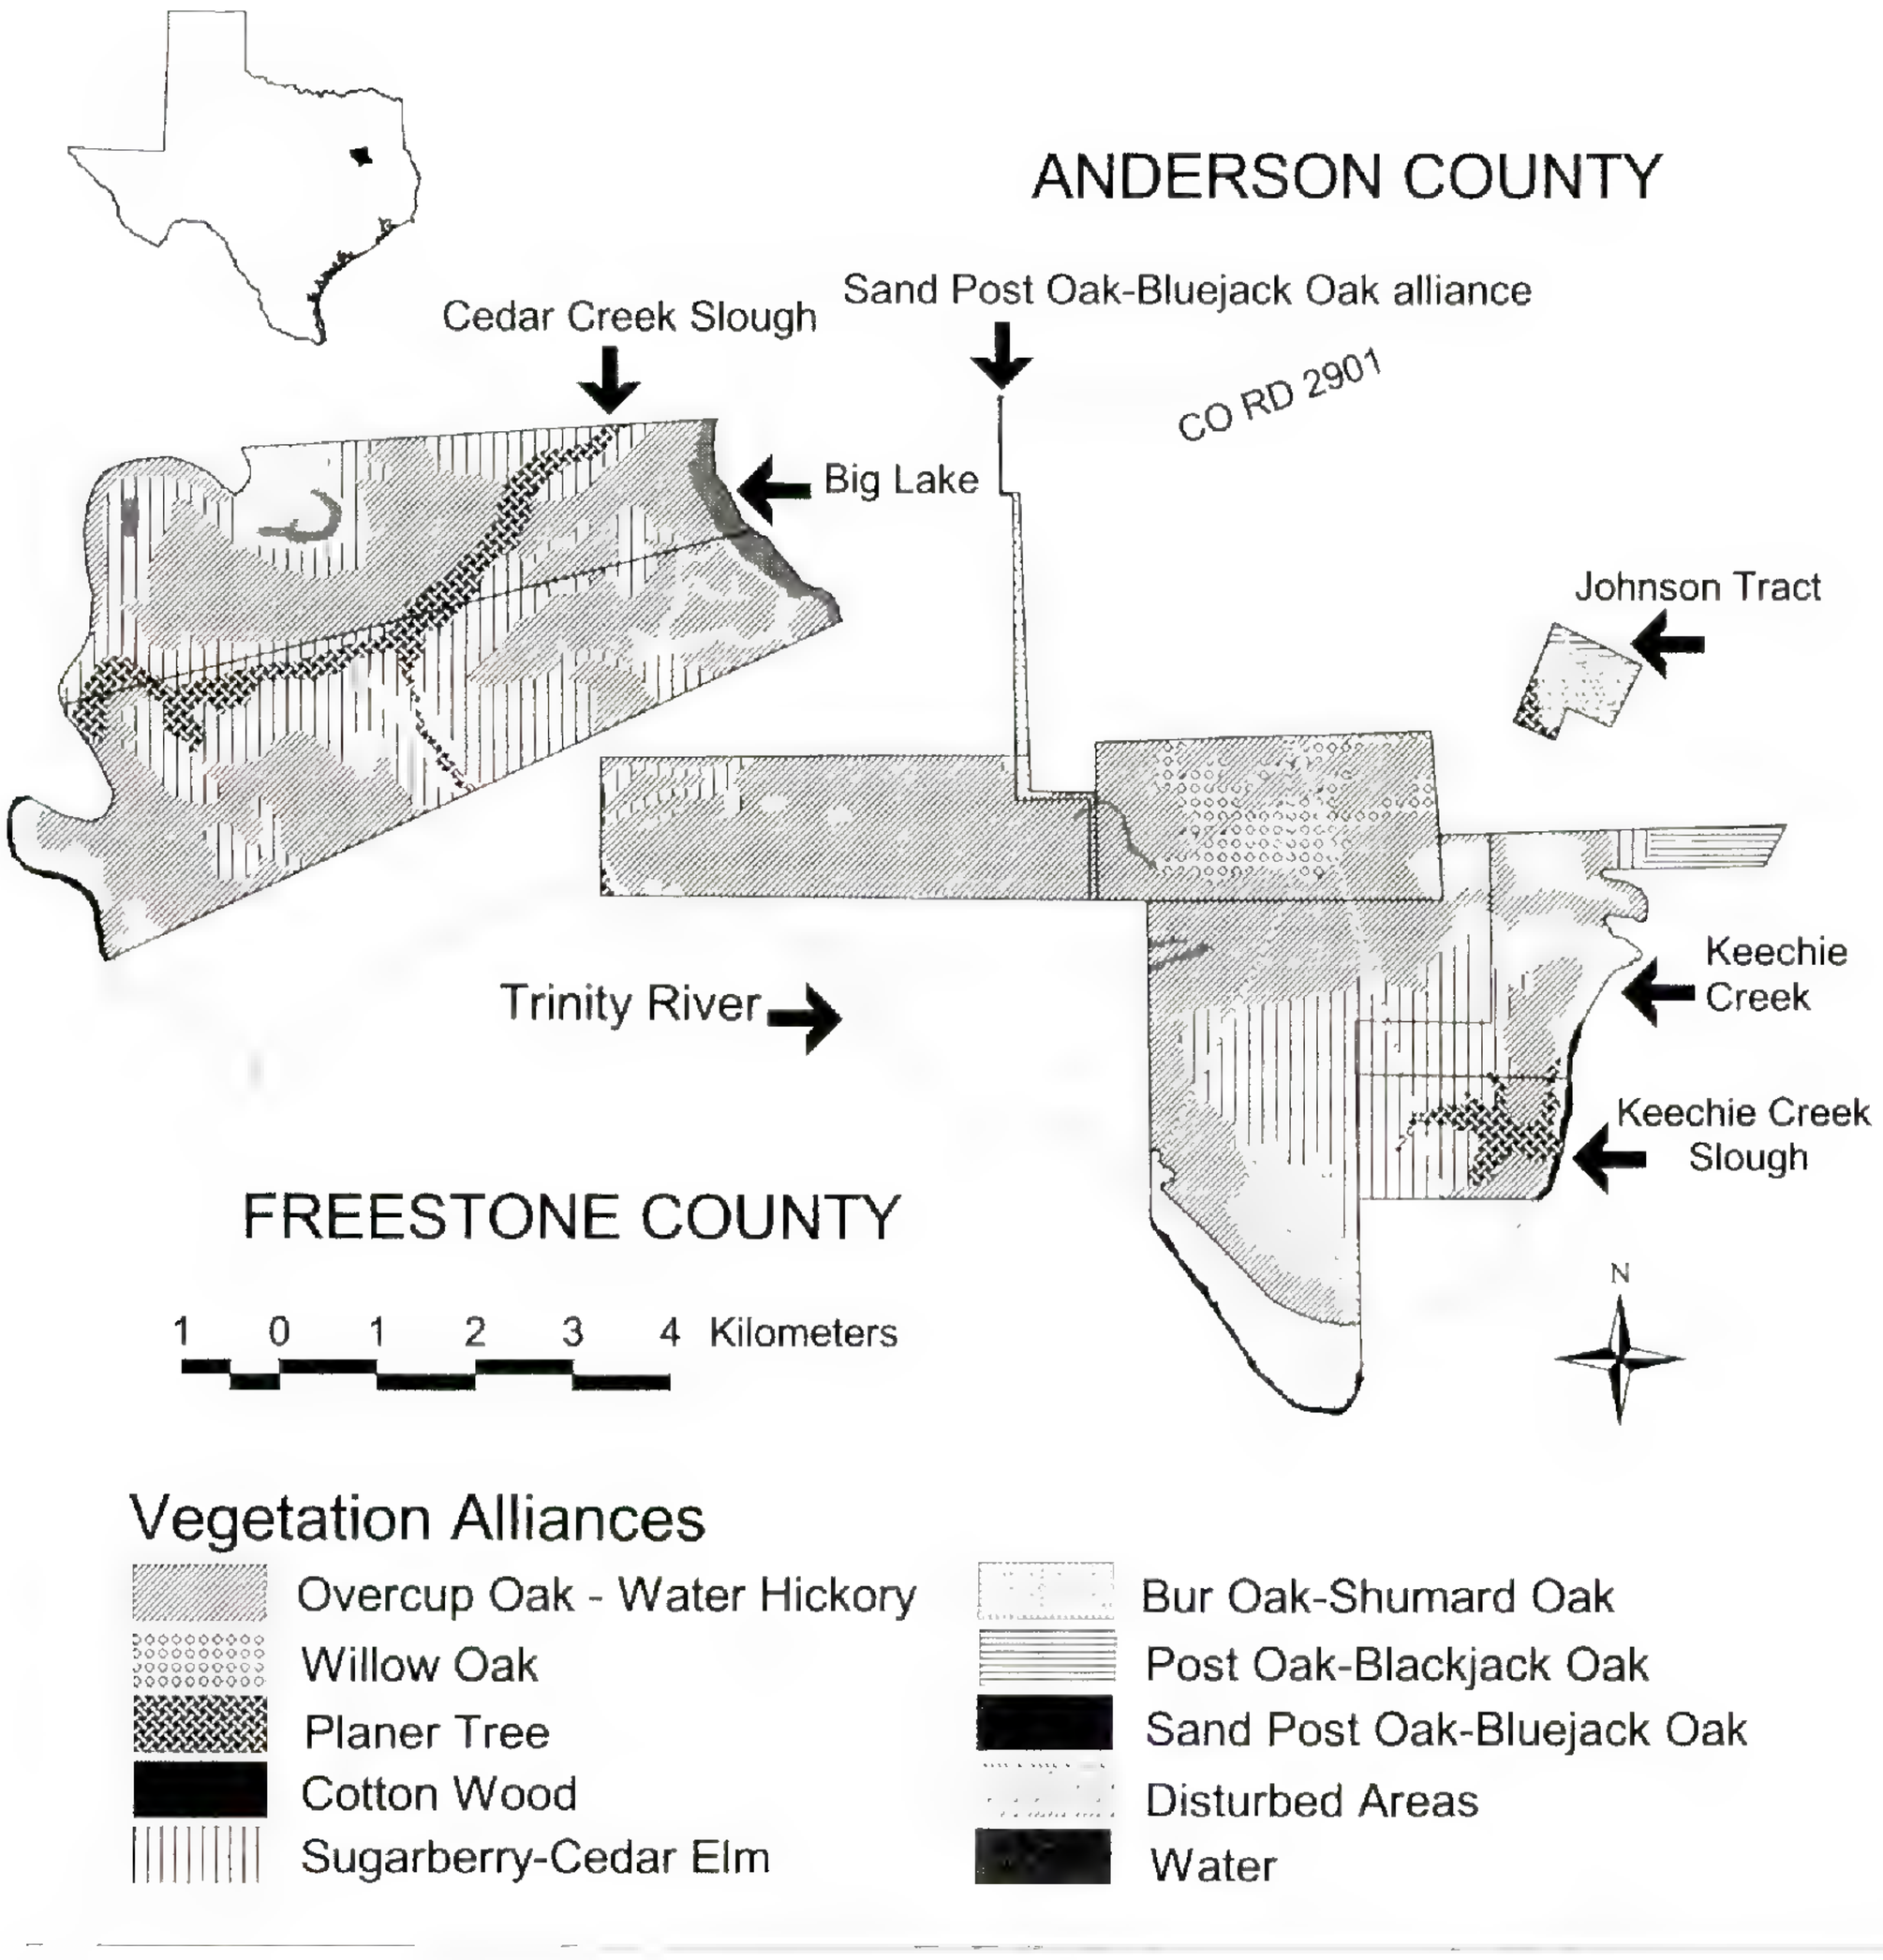

Fig. 1. A vicinity map showing Big Lake Bottom Wildlife Management Area Vegetation Alliances, Trinity River, and Big Lake (ESRI Inc. ArcView ver. 3.1).

drummondii, *Symphoricarpos orbiculatus*, and *Forestiera acuminata*. Herbaceous and woody vines are well represented. Common species include *Mikania scandens*, *Vitis riparia*, *V. palmata*, *Smilax bona-nox*, *S. tamnoides*, *Ampelopsis arborea*, *Toxicodendron radicans*, *Brunnichia ovata*, *Ipomoea cordatotriloba*, and *I. lacunosa*.

Sugarberry-Cedar Elm Temporarily Flooded Forest Alliance

Sugarberry–Cedar Elm Alliance consists of periodically flooded, forested, flat areas with rich base soils. This alliance occupies 412.4 ha along Cedar Creek Slough and along drainages of Keechie Creek (Fig. 1). Common trees include *Celtis laevigata* var. *laevigata*, *Ulmus crassifolia*, *U. alata*, *Gleditsia triacanthos*, *Sapindus saponaria* var. *drummondii*, *Quercus macrocarpa*, *Fraxinus*

pennsylvanica, *F. americana*, and *Crataegus mollis*. Herbaceous plants which typify the area include *Iva annua*, *Carex cherokeensis*, *C. crus-corvi*, *Panicum anceps*, and *Leersia oryzoides*.

Bur Oak-Shumard Oak Forest Alliance

Bur Oak-Shumard Oak Alliance occurs on bluffs and terraces with clay soils and rich humus layers. This alliance also occurs on two bluff areas that originated as a result of severe changes in river direction (Fig. 1). The area occupies 178.9 ha. This alliance was not formally described as occurring in Texas by the NVCS (1997) or as a series level community by Diamond et al. (1987) and consequently is mentioned here as occurring in Texas for the first time. Common trees and shrubs include *Quercus macrocarpa* var. *macrocarpa*, *Q. shumardii*, *Q. stellata*, *Sideroxylon lanuginosum*, *Sophora affinis*, *Juniperus virginiana*, *Crataegus viridis* var. *viridis*, *Celtis laevigata* var. *laevigata*, *Ilex decidua*, and *Cercis canadensis*. Herbaceous plants which typify the area include *Carex cherokeensis*, *Scleria triglomerata*, *Chasmanthium latifolium*, *Poa autumnalis*, *Tradescantia ohiensis*, *Arisaema dracontium*, *Podophyllum peltatum*, *Dioscorea quaternata*, *Clematis pitcheri*, *Urtica chamaedryoides*, *Stachys crenata*, *S. tenuifolia*, *Ruellia nudiflora* var. *runyonii*, *Elephantopus carolinianus*, *Matelea gonocarpos*, *Myosotis macrosperma*, *Scutellaria cardiophylla*, *Euphorbia spathulata*, *Galium circaezans*, *Oxalis violacea*, and *Parietaria pensylvanica*.

Post Oak-Blackjack Oak Woodland Alliance

Post Oak-Blackjack Oak Woodland Alliance comprises 21.5 ha and consists of upland wooded areas on gentle sandy-loam slopes and abrupt deep sand terraces. This alliance is very species rich and found on the small Johnson Tract and near entrances at each of the area gates (Fig. 1). Common trees and shrubs include *Quercus stellata*, *Q. marilandica*, *Q. incana*, *Q. falcata*, *Q. nigra*, *Q. phellos*, *Carya texana*, *Juniperus virginiana*, *Diospyros virginiana*, *Vaccinium arboreum*, *Cercis canadensis*, *Ulmus alata*, *Fraxinus americana*, *Callicarpa americana*, *Crataegus crus-galli*, *C. marshalli*, *Prunus angustifolia* var. *angustifolia*, *P. mexicana*, *P. serotina* var. *serotina*, *Rubus trivialis*, *Rhus copallina*, and *Symphoricarpos orbiculatus*. Herbaceous species include *Chasmanthium sessiliflorum*, *Elymus virginicus*, *Eragrostis secundiflora*, *Commelina erecta*, *Tradescantia hirsutiflora*, *Vitis mustangensis*, *V. rotundifolia*, *Sanicula canadensis*, *Symphyotrichum patens*, *Podophyllum peltatum*, *Hypericum hypericoides*, *Hypericum drummondii*, *Passiflora incarnata*, and *Geum canadense*.

Sand Post Oak–Bluejack Oak Woodland Alliance

This alliance occurs in deep sandy soils on a ridge above the floodplain. It consists of less than 5 ha (Fig. 1) located on the east side of Big Lake. Common tree species include *Quercus margarettiae*, *Q. marilandica*, *Q. incana*, and *Carya texana*. Other woody plants are *Opuntia stricta*, *Yucca louisianensis*, *Rhus copallina* var. *latifolia*, *Cornus florida*, *Vaccinium arboreum*, *Sassafras albidum*,

and *Prunus gracilis*. Herbaceous plants include *Tradescantia hirsutiflora*, *Matelea cynanchoides*, *Eragrotis secundiflora*, *Loeflingia squarrosa*, *Helianthemum rosmarinifolium*, *Lechea tenuifolia*, *Cnidoscolus texanus*, and *Dalea villosa*.

FLORISTICS

The BLBWMA flora includes 459 species in 298 genera in 99 families. Average number of species per genus is approximately 1.5. Families with the largest number of species (in parentheses) are Poaceae (55), Asteraceae (54), Fabaceae (32) and Cyperaceae (25). Other families with a relatively large number of species are Lamiaceae (14), Apiaceae (12), Euphorbiaceae (12), Rosaceae (12), and Scrophulariaceae (10). Genera with the most species include *Carex* (12), *Quercus* (9), *Panicum* (8), *Cyperus* (7), *Smilax* (6), and *Juncus* (5). The number of non-native species is 23, which is about five percent of the total flora.

Three plants collected on BLBWMA are considered threatened by the Texas Parks and Wildlife Department and The Nature Conservancy of Texas (Carr 2001). *Brazoria truncata* var. *pulcherrima* (*B. pulcherrima* Lundell) is considered sensitive and ranked G3 (globally) and S3 (state). Both it and *Yucca louisianensis* are also notable for being included in Estill and Cruzan's (2001) list of narrow endemics of southeastern United States. *Curcurbita texana* is also ranked G3 (globally) and S3 (state). The species was historically widely distributed along major rivers in the eastern half of Texas but much of its habitat has been lost to impoundments, agriculture, and urban development. An accurate assessment of its current status is difficult because of its ephemeral nature. *Cyperus grayoides* is ranked G3 (globally) and S3 (state).

Other noteworthy plants were new to Anderson County. Correll and Johnston (1970) report *Dioscorea quaternata* as mainly occurring in more northeastern Texas. The BLBWMA record is near the most southwestern limit of the species distribution. *Symphyotrichum eulae*, a Texas endemic, also occurs in the area. The distribution of this species is primarily in east-central Texas, where it is considered rare or uncommon. *Rhynchosia minima* var. *minima* is known from the coastal plain and northward to Newton, Houston, Travis, Bexar, Robinson, and Grimes counties. The present record is the northernmost record for the species within the state. *Heliotropium procumbens* is mostly a coastal (and western) species known to occur northward to Liberty, Waller, and Brazos counties. The new record extends the known distribution within the state farther northward. Finally, *Phyllanthus pudens* has been recorded in Texas as far north as Brazos, Madison, and Robinson counties. The Anderson County record extends the distribution farther within the state and provides a new county record.

The area contains the only known occurrence of Bur Oak-Shumard Oak Forest alliance within the state (see above).

ANNOTATED LIST OF VASCULAR PLANT TAXA BIG LAKE BOTTOM WILDLIFE MANAGEMENT AREA, ANDERSON COUNTY, TEXAS

The annotated checklist is divided into pteridophytes, gymnosperms, and flowering plants, which are subdivided into monocots and dicots. Family, genus, and species are arranged alphabetically beneath each major heading. Nomenclature follows that of Correll and Johnston (1970), Correll and Correll (1972), and Gould (1975). As needed, names were updated using Jones et al. (1997). Common names generally follow those of Hatch et al. (1990). Collector and collection numbers are given as: KF = Kay Fleming or JS = Jason Singhurst followed by a number. An asterisk (*) denotes an introduced species.

JUNCACEAE

Juncus coriaceus Mack., Leather rush, *KF 302.*
Juncus effusus L. var. *solutus* Fern. & Weig., Common rush, *KF 305.*
Juncus marginatus Rostk. var. *setosus* Cov., Border rush, *KF 431.*
Juncus scirpoides Lam., Strong rush, *KF 407.*
Juncus tenuis Willd., Slender rush, *KF 474.*

LILIACEAE

Allium canadense L. var. *canadense*, Canada garlic, *KF 289.*
Allium drummondii Regel, Drummond's onion, *KF 275.*
Cooperia drummondii Herb., Rain lily, *KF 709.*
Hymenocallis eulae Shinners, Late spider lily, *KF 529.*
Hymenocallis liriosme (Raf.) Shinners, Spider lily, *KF 326.*
Hypoxis hirsuta (L.) Cov., Common goldstar, *KF 331.*
Nothoscordum bivalve (L.) Britt., Crow poison, *KF 224.*

ORCHIDACEAE

Spiranthes lacera (Raf.) Raf. var. *gracilis* (Bigel.) Luer., Slender ladies' tresses, *KF 212.*
Spiranthes laciniata (Small) Ames, Spring ladies' tresses, *KF 399.*

POACEAE

Agrostis hyemalis (Walt.) B.S.P., Winter bentgrass, *KF 429.*
Agrostis perennans (Walt.) Tuckerman, Autumn bentgrass, *KF 458.*
Aira elegans Willd. ex Kunth, Annual hairgrass, *KF 353.*
Alopecurus carolinianus Walt., Carolina foxtail, *KF 461.*
Andropogon ternarius Michx. var. *ternarius*, Splitbeard bluestem, *KF 653.*
Andropogon virginicus L., Broomsedge bluestem, *KF 425.*
Aristida oligantha Michx., Oldfield threeawn, *KF 624.*
Aristida purpurea Nutt., Red threeawn, *KF 625.*
Bothriochloa ischaemum (L.) Keng. var. *songarica* (Fisch. & Mey.) Celerier & Harlan, King Ranch bluestem, *KF 691.* *
Briza minor L., Little quaking grass, *KF 397.* *
Bromus secalinus L., Rye brome, *KF 380.* *
Bromus catharticus Vahl, Rescuegrass, *KF 264.* *
Buchloe dactyloides (Nutt.) Engelm., Buffalograss, *KF 390.*
Cenchrus spinifex A. Cav., Coastal sandbur, *KF 705.*
Chasmanthium latifolium (Michx.) Yates, Longleaf uniola, *KF 361.*
Chasmanthium sessiliflorum (Poir.) Yates, Sessile flowered chasmanthium, *KF 674.*
Cynodon dactylon (L.) Pers. var. *dactylon*, Bermuda grass, *KF 537.* *
Digitaria ciliaris (Retz.) Koel., Southern crabgrass, *KF 645.*
Echinochloa walteri (Pursh) Heller, Walter's barnyard grass, *KF 686.*
Elymus canadensis L., Canada wildrye, *KF 680.*
Elymus virginicus L. var. *virginicus*, Virginia wildrye, *KF 650.*

Eragrostis hypnoides (Lam.) B.S.P., Teal lovegrass, *KF 639.*
Eragrostis pectinacea (Michx.) Nees *ex* Steud., Carolina lovegrass, *KF 660.*
Eragrostis secundiflora Presl. subsp. *oxylepis* (Torr.) S. D. Koch, Red lovegrass, *KF 398.*
Eragrostis spectabilis (Pursh) Steud., Purple lovegrass, *KF 703.*
Gymnopogon ambiguus (Michx.) B.S.P., Bearded skeletongrass, *KF 651.*
Hordeum pusillum Nutt., Little barley, *KF 269.*
Leersia lenticularis Michx., Catchfly cutgrass, *KF 644.*
Leersia oryzoides (L.) Sw. var. *oryzoides*, Rice cutgrass, *KF 649.*
Leersia virginica Willd., White cutgrass, *KF 673.*
Lolium perenne L., Perennial ryegrass, *JS 6670.* *
Panicum acuminatum Sw. var. *acuminatum*, Woolly rosettegrass, *KF 316.*
Panicum nodatum Hitchc. & Chase, Sarita rosettegrass, *JS 5366.*
Panicum oligosanthes A. Shult., Rosettegrass, *KF 424.*
Panicum anceps Michx., Beaked panicum, *KF 664.*
Panicum dichotomum L., Forked panicum, *KF 659.*
Panicum hemitomon Schult., Maiden cane, *KF 619.*
Panicum ravenelii Scribn. & Merrill, Ravenel's panicum, *KF 315.*
Panicum virgatum L., Switchgrass, *KF 643.*
Paspalum dilatatum Poir., Dallisgrass, *KF 389.*
Paspalum floridanum Michx., Florida paspalum, *KF 620.*
Paspalum notatum Flugge, Bahiagrass, *KF 522.* *
Paspalum urvillei Steud., Vaseygrass, *KF 681.* *
Phalaris caroliniana Walt., Carolina canarygrass, *JS 6671.*
Piptochaetium avenaceum (L.) Parodi, Blackseed needlegrass, *KF 300.*
Poa annua L., Annual bluegrass, *KF 505.* *
Poa autumnalis Muhl. ex Ell., Autumn bluegrass, *KF 280.*
Setaria parviflora (Poir.) Kergeulen, Knotroot bristlegrass, *KF 637.*
Sorghum halepense (L.) Pers., Johnstongrass, *KF 622.* *
Tridens albescens (Vasey) Woot. & Standl., White tridens, *KF 642.*
Tridens flavus (L.) Hitchc., Purpletop, *KF 672.*
Tridens strictus (Nutt.) Nash, Longspike tridens, *KF 621.*
Tripsacum dactyloides (L.) L., Eastern gamma-grass, *KF 958.*
Triticum aestivum L., Wheat, *KF 363.* *
Vulpia octoflora (Walt.) Rydb., Common sixweeks grass, *KF 403.*

SMILACACEAE

Smilax bona-nox L., Sawtooth greenbriar, *KF 284.*
Smilax glauca Walt., Cat greenbriar, *KF 663.*
Smilax rotundifolia L., Common greenbriar, *JS 6679.*
Smilax smallii Morong, Small's greenbriar, *KF 631.*
Smilax tamnoides L., Bristly greenbriar, *KF 283.*

TYPHACEAE

Typha latifolia L., Common cattail, *KF 478.*

DICOTYLEDONEAE

ACANTHACEAE

Dicliptera brachiata (Pursh) Spreng., False mint, *KF 206.*
Justicia ovata (Walt.) Lindau var. *lanceolata* (Chapm.) Long, Lance-leaved water willow, *KF 209.*
Ruellia nudiflora (Englem. & Gray) Urban var. *runyonii* (Tharp. & Barkl.) B.L. Turner, Violet ruellia, *JS 6315.*
Ruellia pedunculata Torr. ex Gray, Low ruellia, *KF 360.*

ACERACEAE

Acer negundo L. var. *negundo*, Box elder, *KF 208.*

AMARANTHACEAE

Amaranthus albus L., White amaranth, *KF 606.*
Amaranthus blitum L., Green amaranth, *JS 6311*
Amaranthus rudis Sauer, Amaranth, *KF 607.*
Froelichia drummondii Moq., Drummond's snake cotton, *KF 542.*

ANACARDIACEAE

Rhus copallina L. var. *latifolia* H. Engler, Wing-rib sumac, *KF 276.*
Toxicodendron radicans (L.) O. Ktze. var. *radicans*, Poison ivy, *KF 310.*

APIACEAE (UMBELLIFERAE)

Chaerophyllum tainturieri Hook., Chervil, *JS 6169.*
Cyclospermum leptophyllum (Pers.) Sprague ex Britt. & P.Wils., Slimlobe celery, *KF 465.*
Cynosciadium digitatum DC., Finger dogshade, *KF 372.*
Daucus pusillus Michx., Wild carrot, *KF 381.*

Eryngium hookeri Walp., Simple leaf eryngo, *KF 487.*
Hydrocotyle verticillata Thunb., Whorled pennywort, *KF 655.*
Limnosciadium pinnatum (DC.) Math. & Const., Arkansas dogshade, *KF 400.*
Polytaenia nuttallii DC., Prairie parsley, *KF 272.*
Sanicula canadensis L., Canada sanicle, *KF 412.*
Spermolepis divaricata (Walt.) Raf. ex Ser., Forked scaleseed, *KF 355.*
Spermolepis inermis (Nutt. ex DC.) Math. & Const., Scaleseed, *KF 287.*
Trepocarpus aethusae Nutt. ex DC., Trepocarpus, *KF 460.*

APOCYNACEAE

Amsonia illustris Woods., Bluestar, *KF 247.*
Trachelospermum difforme (Walt.) Gray, Climbing dogbane, *KF 420.*

AQUIFOLIACEAE

Ilex decidua Walt., Deciduous holly, *JS 6136.*
Ilex opaca Ait. var. *opaca*, American holly, *KF 519.*
Ilex vomitoria Ait., Yaupon holly, *KF 404.*

ASCLEPIADACEAE

Asclepias amplexicaulis Smith, Bluntleaf milkweed, *KF 371.*
Asclepias tuberosa L. subsp. *interior* Woods., Butterfly milkweed, *KF 349.*
Asclepias viridis Walt., Antelopehorn milkweed, *KF 319.*
Matelea cynanchoides (Engelm.) Woods., Milkweed vine, *KF 695.*
Matelea decipiens (Alex.) Woods., Milkweed vine, *KF 667.*
Matelea gonocarpos (Walt.) Shinners, Milkweed vine, *KF 306.*

ASTERACEAE

Acmella oppositifolia (Lam.) Jansen var. *repens* (Walt.) Jansen, Creeping spot flower, *JS 6305.*
Ambrosia psilostachya DC., Western ragweed, *KF 532.*
Ambrosia trifida L., Giant ragweed, *KF 533.*
Baccharis halimifolia L., Eastern baccharis, *KF 516.*
Bidens bipinnata L. var. *biternatoides* E. Sherff, Spanish needles, *KF 608.*
Boltonia diffusa Ell. var. *diffusa*, Small head boltonia, *KF 596.*
Brickellia eupatorioides (L.) Shinners, False bonset, *KF 668.*
Chrysopsis pilosa Nutt., Soft gold aster, *KF 444.*
Cirsium horridulum Michx. var. *elliottii* T. & G., Bull thistle, *KF 327.*
Conyza canadensis (L.) Cronq., Horseweed conyza, *KF 676.*
Conoclinium coelestinum (L.) DC., Blue mist flower, *KF 205.*
Coreopsis basalis (Dietr.) Blake, Golden coreopsis, *KF 346.*
Coreopsis tinctoria Nutt. var. *tinctoria*, Plains coreopsis, *KF 433.*
Croptilon divaricatum (Nutt.) Raf., Scratch daisy, *KF 539.*
Dracopis amplexicaulis (Vahl) Cass., Dracopis, *KF 366.*
Echinacea pallida (Nutt.) Nutt., Purple cone flower, *KF 405.*
Eclipta prostrata (L.) L., Yerba de tago, *KF 594.*
Elephantopus carolinianus Raeusch., Leafy elephant foot, *KF 630.*
Erigeron tenuis T. & G., Slender fleabane, *KF 248.*
Eupatorium compositifolium Walt., Yankeeweed, *KF 623.*
Eupatorium serotinum Michx., Late eupatorium, *KF 545.*
Facelis retusa (Lam.) Sch. Bip., Facelis, *KF 301.**
Fleischmannia incarnatum (Walt.) King & Robinson, Pink eupatorium, *KF 641.*
Gamochaeta purpurea (L.) Cabrera, Greenleaf cudweed, *KF 298.*
Grindelia papposa G. Nesom & Y. Suh, saw-leaf daisy, *KF 1105.*
Helenium amarum (Raf.) H. Rock, Bitter sneezeweed, *KF 483.*
Helianthus annuus L., Common sunflower, *KF 1002.*
Helianthus debilis Nutt., Cucumber leaf sunflower, *KF 378.*
Heterotheca subaxillaris (Lam.) Britt. & Rusby, Yellow camphorweed, *KF 234.*
Hieracium gronovii L. Gronovius' hawkweed, *KF 411.*
Hymenopappus scabiosaeus L'Her., Flattop woollywhite, *KF 325.*
Iva annua L., Sumpweed, *KF 210.*
Krigia cespitosa (Raf.) Chamb., Weedy dwarf dandelion, *JS 6177.*
Lactuca floridana (L.) Gaertn., Florida wild lettuce, *KF 628.*
Liatris squarrosa (L.) Michx., Variable gayfeather, *KF 523.*

Mikania scandens (L.) Willd., Climbing hemp vine, *KF 495.*
Packera tampicana (DC.) C. Jeffrey, Golden groundsel, *KF 243.*
Pluchea camphorata (L.) DC., Camphor weed, *KF 515.*
Pluchea purpurascens (Sw.) DC., Purple camphor weed, *KF 647.*
Pyrrhopappus carolinianus (Walt.) DC., Carolina false dandelion, *KF 468.*
Rudbeckia hirta L., Late coneflower, *KF 383.*
Senecio ampullaceus Hook., Texas groundsel, *JS 6180.*
Solidago canadensis L., Tall goldenrod, *KF 632.*
Solidago petiolaris Ait., Downy goldenrod, *KF 665.*
Solidago radula Nutt., Rough goldenrod, *KF 627.*
Solidago ulmifolia Muhl. ex Willd., Noble goldenrod, *KF 658.*
Soliva pterosperma (Juss.) Less., Lawn burweed, *KF 501.*
Symphyotrichum dumosum (L.) G. Nesom, Bushy aster, *KF 213.*
Symphyotrichum eulae (Shinners) G. Nesom, Simple aster, *JS 6308.*
Symphyotrichum patens (Ait.) G. Nesom, Skydrop aster, *KF 657.*
Verbesina encelioides (Cav.) Benth. & Hook. ex Gray var. *encelioides*, Cowpen daisy, *KF 203.*
Verbesina virginica L. var. *virginica*, Frostweed, *KF 583.*
Vernonia baldwinii Torr., Baldwin's ironweed, *JS 6319.*
Vernonia texana (Gray) Small, Texas ironweed, *KF 463.*
Xanthium strumarium L., Common cocklebur, *KF 489.*

BERBERIDACEAE

Podophyllum peltatum L., May apple, *KF 39.*

BETULACEAE

Betula nigra L., River birch, *KF 540.*

BIGNONIACEAE

Campsis radicans (L.) Seeman ex Bureau, Trumpet creeper, *KF 484*

BORAGINACEAE

Heliotropium indicum L., Turnsole heliotrope, *KF 200.*
Heliotropium procumbens Mill. var. *procumbens*, Fourspike heliotrope, *KF 688.*
Myosotis macrosperma Engelm., Spring forget-me-not, *KF 296.*

BRASSICACEAE

Cardamine parviflora L. var. *arenicola* (Britt.) Schulz., Sand bittercress, *KF 463.*
Cardamine pensylvanica Muhl. ex Willd., Pennsylvania bittercress, *JS 6158.*
Lepedium virgincum L., Poor man's peppergrass, *KF 253.*
Rorippa palustris (L.) Besser, Bog bittercress, *KF 417.*
Rorippa sessiliflora (Nutt. ex T. & G.) Hitchc., Stalkless yellowcress, *JS 6304.*

BUDDLEJACEAE

Polypremum procumbens L., Juniper leaf, *KF 352.*

CACTACEAE

Opuntia stricta (Haw.) Haw., Southern spineless cactus, *KF 393.*

CALLITRICHACEAE

Callitriche heterophylla Pursh subsp. *heterophylla*, Large water starwort, *JS 6178.*

CAMPANULACEAE

Lobelia appendiculata DC. var. *appendiculata*, Earlobe lobelia, *KF 347.*
Lobelia cardinalis L., Cardinal flower, *JS 6314.*
Triodanis perfoliata (L.) Nieuw. var. *perfoliata*, Clasping Venus looking glass, *KF 320.*

CAPRIFOLIACEAE

Lonicera japonica Thunb., Japanese honeysuckle, *KF 329.* *
Lonicera sempervirens L. var. *sempervirens*, Trumpet honeysuckle, *KF 257.*
Symphoricarpos orbiculatus Moench., Coral berry, *KF 364.*
Viburnum rufidulum Raf., Rusty blackhaw, *KF 241.*

CARYOPHYLLACEAE

Arenaria serpyllifolia L. subsp. *serpyllifolia*, Thyme-leaved sandwort, *KF 502.* *
Cerastium brachypodum (Engelm. ex Gray) Robins., Shortstalk chickweed, *JS 6162.*
Cerastium glomeratum Thuillier, Clustered flower chickweed, *JS 6161.* *
Loeflingia squarrosa Nutt. subsp. *squarrosa*, Spreading loeflingia, *KF 435.*
Minuartia drummondii (Shinners) McNeill, Drummond's sandwort, *KF 244.*
Minuartia patula (Michx.) Mattf. var. *patula*, Pitcher sandwort, *KF 312.*

Silene antirrhina L., Seedy catchfly, *KF 382.*
Stellaria media (L.) Vill. subsp. *media*, Common chickweed, *JS 6160.* *

CHENOPODIACAE

Chenopodium ambrosioides L. var. *ambrosioides*, Wormseed, *KF 541.*

CISTACEAE

Helianthemum rosmarinifolium Pursh, Rosemary's rockrose, *KF 351.*
Lechea mucronata Raf., Hairy pinweed, *KF 402.*
Lechea tenuifolia Michx., Narrowleaf pinweed, *KF 410.*

CLUSIACEAE

Hypericum drummondii (Grev. & Hook.) T. & G., Drummond's St. John's wort, *KF 449.*
Hypericum hypericoides (L.) Crantz, St. Andrew's cross, *KF 242.*

CONVOLVULACEAE

Dichondra carolinensis Michx., Ponyfoot, *JS 6170.*
Ipomoea lacunosa L., Pitted morning glory, *KF 202.*
Ipomoea cordatotriloba A. Dennstaedt, Sharp pod morning glory, *KF 605.*

CORNACEAE

Cornus drummondii C. Mey., Roughleaf dogwood, *KF 256.*
Cornus florida L., Flowering dogwood, *JS 6179.*
Nyssa sylvatica Marsh., Black gum, *KF 701.*

CUCURBITACEAE

Cucumis melo L. subsp. *melo*, Muskmelon, *KF 692a.*
Cucurbita texana Gray, Texas gourd, *KF 589.*
Melothria pendula L., Drooping melonette, *KF 964.*

CUSCUTACEAE

Cuscuta pentagona Engelm., Dodder, *KF 543.*

EBENACEAE

Diospyros virginiana L., Common persimmon, *KF 464.*

ERICACEAE

Vaccinium arboreum Marsh., Farkleberry, *KF 406.*

EUPHORBIACEAE

Acalypha gracilens Gray, Slender copperleaf, *KF 661.*
Cnidoscolus texanus (Mull. Arg.) Small, Texas bull nettle, *KF 318.*
Croton capitatus Michx., Woolly croton, *KF 490.*
Croton glandulosus L., Northern croton, *KF 531.*
Croton michauxii G. Webster, Narrowleaf rushfoil, *KF 555.*
Croton monanthogynus Michx., One seed croton, *KF 635.*
Euphorbia dentata Michx., Toothed spurge, *KF 354.*
Euphorbia nutans Lag., Eyebane spurge, *KF 597.*
Euphorbia prostrata Ait., Prostrate euphorbia, *KF 690.*
Euphorbia spathulata Lam., Warty spurge, *KF 469.*
Phyllanthus pudens Wheeler, Birdseed leaf flower, *KF 685.*
Tragia brevispica Engelm. & Gray, Heartleaf noseburn, *JS 6685.*

FABACEAE

Amorpha fruticosa L., Indigo bush amorpha, *KF 441.*
Astragalus crassicarpus Nutt., Ground plum milkvetch, *KF 235.*
Baptisia nuttalliana Small, Nuttall's wild indigo, *KF 342.*
Centrosema virginianum (L.) Benth., Butterfly pea, *KF 446.*
Cercis canadensis L. var. *canadensis*, Eastern redbud, *JS 6132.*
Chamaecrista fasciculata (Michx.) Greene, Partridge pea, *KF 477.*
Clitoria mariana L., Atlantic pigeon wings, *KF 967.*
Dalea villosa (Nutt.) Spreng., Prairie clover, *KF 350.*
Desmanthus illinoensis (Michx.) MacM. ex Robins & Fern., Illinois bundle flower, *KF 615.*
Desmodium laevigatum (Nutt.) DC., Smooth beggar's ticks, *KF 217.*
Desmodium paniculatum (L.) DC., Panicled beggar's ticks, *KF 426.*
Desmodium sessilifolium DC., Sessileleaf beggar's ticks, *KF 1033.*
Galactia regularis (L.) B.S.P., Downy milkpea, *KF 656.*
Gleditsia aquatica Marsh., Water honey locust, *KF 517.*
Gleditsia triacanthos L., Common honey locust, *KF 1017.*
Glottidium vesicaria (Jacq.) R. M. Harper, Bagpod, *KF 604.*
Kummerowia striata (Thunb.) Hook. & Arn., Japanese bush clover, *KF 626.*

Lathyrus pusillus Ell., Low peavine, *KF 262.*
Lespedeza stuevei Nutt., Tall bush clover, *KF 666.*
Medicago minima (L.) L., Small bur clover, *KF 238.*
Mimosa nuttallii (DC.) B.L. Turner, Sensitive briar, *KF 332.*
Neptunia lutea (Leavenw.) Benth., Yellow neptunia, *KF 1058.*
Pediomelum digitatum (T. & G.) Isely, Palmleaf scurfpea, *KF 408.*
Rhynchosia minima (L.) DC. var. *minima*, Least snoutbean, *KF 356.*
Senna occidentalis (L.) Link, Coffee senna, *KF 1022.*
Sesbania drummondii (Rydb.) Cory, Rattlebush, *KF 526.*
Sesbania exaltata (Raf.) Rydb. ex A. Hill., Hemp sesbania, *KF 585.*
Sophora affinis T. & G., Texas sophora, *KF 309.*
Strophostyles helvula (L.) Ell., Trailing wild bean, *KF 957.*
Trifolium carolinianum Michx., Carolina clover, *KF 237.*
Trifolium vesiculosum Savi var. *vesiculosum*, Arrowleaf clover, *KF 340.* *
Vicia ludoviciana Nutt., Deer pea, *KF 291.*

FAGACEAE

Quercus falcata Michx., Southern red oak, *KF 513.*
Quercus incana Bartr., Bluejack oak, *KF 376.*
Quercus lyrata Walt., Overcup oak, *KF 507.*
Quercus macrocarpa Michx. var. *macrocarpa*, Bur oak, *KF 308.*
Quercus margarettiae Ashe ex small, Sand post oak, *KF 1115.*
Quercus nigra L., Water oak, *KF 324.*
Quercus phellos L., Willow oak, *KF 323.*
Quercus shumardii Buckl., Shumard oak, *JS 6689.*
Quercus stellata Wang., Post oak, *KF 374.*

GENTIANACEAE

Sabatia campestris Nutt., Prairie gentian, *KF 394.*

GERANIACEAE

Geranium carolinianum L. var. *carolinianum*, Carolina geranium, *KF 255.*

HALORAGRACEAE

Myriophyllum heterophyllum Michx., Changeleaf parrot's feather, *KF 432.*

HAMAMELIDACEAE

Liquidambar styraciflua L., Sweetgum, *KF 511.*

HYDROPHYLLACEAE

Hydrolea ovata Nutt. ex Choisy, Hairy hydrolea, *KF 521.*
Nama hispidum Gray, Rough nama, *KF 430.*
Nemophila phacelioides Nutt., Large flowered nemophila, *KF 288*
Phacelia hirsuta Nutt., Hairy phacelia, *KF 256.*

JUGLANDACEAE

Carya aquatica (Michx.) Nutt., Water hickory, *KF 371.*
Carya texana Buckl., Black hickory, *KF 373.*
Juglans nigra L., Black walnut, *KF 268.*

LAMIACEAE

Brazoria truncata (Benth.) Engelm. & Gray var. *pulcherrima* (Lundell) M.W. Turner, Centerville brazos mint, *KF 379.*
Hedeoma hispida Pursh, Marsh mermaidweed, *KF 396.*
Lamium amplexicaule L., Henbit, *KF 719.* *
Lycopus rubellus Moench, Water horehound, *KF 439.*
Monarda fistulosa L., Wild horsemint, *KF 480.*
Monarda punctata L., Spotted horsemint, *KF 357.*
Physostegia intermedia (Nutt.) Engelm. & Gray, Intermediate dragonhead, *KF 416.*
Physostegia virginiana (L.) Benth., Virginia dragonhead, *JS 6697.*
Salvia lyrata L., Lyreleaf sage, *KF 240.*
Scutellaria cardiophylla Engelm. & Gray, Heartleaf skullcap, *KF 436.*
Scutellaria parvula Michx., Small skullcap, *KF 279.*
Stachys crenata Raf., Shade betony, *JS 6682.*
Stachys tenuifolia Willd. subsp. *tenuifolia*, Slenderleaf betony, *KF 629.*
Teucrium canadense L., American germander, *KF 654.*

LAURACEAE

Sassafras albidum (Nutt.) Nees, Sassafras, *KF 263.*

LINACEAE

Linum sulcatum Riddell var. *sulcatum*, Grooved flax, *KF 395.*

LYTHRACEAE

Ammannia coccinea Rottb., Purple ammania, *KF 479.*
Lythrum alatum Pursh, Lanceleaf loosestrife, *KF 1086.*

MALVACEAE

Hibiscus laevis All., Scarlet rosemallow, *KF 359.*
Hibiscus moscheutos L. subsp. *lasiocarpos* (Cav.) Blach., Swamp rosemallow, *KF 359.*

Modiola caroliniana (L.) G.Don, Carolina modiola, *KF 277.*
Sida rhombifolia L., Diamond leaf mallow, *KF 618.**
Sida spinosa L., Prickly mallow, *KF 603.*

MENISPERMACEAE

Cocculus carolinus (L.) DC., Carolina snailseed, *JS 6684.*

MOLLUGINACEAE

Mollugo verticillata L., Thread carpetweed, *KF 652.*

MORACEAE

Maclura pomifera (Raf.) Schneid., Osage orange, *KF 510.*
Morus rubra L., Red mulberry, *KF 370.*

MYRICACEAE

Myrica cerifera L., Southern waxmyrtle, *KF 258.*

NYCTAGINACEAE

Mirabilis albida (Walt.) Heimerl, Four o'clock, *KF 464.*

OLEACEAE

Forestiera acuminata (Michx.) Poir., Swamp privet, *KF 225.*
Fraxinus americana L., White ash, *KF 609.*
Fraxinus pennsylvanica Marsh., Red ash, *JS 6683.*
Ligustrum sinense Lour., Chinese privet, *KF 717.**

ONAGRACEAE

Gaura longiflora Spach., Tall guara, *KF 492.*
Gaura parviflora Dougl. ex Lehm., Small flower gaura, *KF 952.*
Ludwigia alternifolia L., Bushy seedbox, *KF 485.*
Ludwigia decurrens Walt., Winged seedbox, *KF 646.*
Ludwigia glandulosa Walt., Creeping seedbox, *KF 440.*
Ludwigia peploides (Kunth) Raven subsp. *glabrescens* Raven, Smooth seed box, *KF 422.*
Oenothera heterophylla Spach subsp. *heterophylla*, Varileaf evening primrose, *KF 374.*
Oenothera laciniata Hill, Cutleaf evening primrose, KF *503.*
Oenothera speciosa Nutt., Showy evening primrose, *KF 270.*

OXALIDACEAE

Oxalis dillenii Jacq. subsp. *dillenii*, Dillen's wood sorrel, *KF 246.*
Oxalis violacea L., Violet wood sorrel, *KF 297*

PAPAVERACEAE

Argemone albiflora Hornem. var. *texana* (G. Owenby) Shinners, White prickly poppy, *KF 448.*

PASSIFLORACEAE

Passiflora incarnata L., Maypop passion flower, KF *617.*
Passiflora lutea L., Yellow passion flower, *KF 634.*

PHYTOLACCACEAE

Phytolocca americana L. var. *americana*, Common pokeweed, *KF 514.*

PLANTAGINACEAE

Plantago virginica L., Paleseeded plantain, *KF 497.*
Plantago wrightiana Dcne., Wright's plantain, *KF 384.*

POLYGALACEAE

ACKNOWLEDGMENTS

We want to thank Ron George and Gary Graham of the Texas Parks and Wildlife Department and Wildlife Division Region 3 staff for their support on this baseline inventory cooperative project. We are also grateful to Tom Wendt of TEX/LL for his assistance. Also, special thanks to Changxiang Liu, Kim Ludeke, Vivian Ackerson, Michelle Valek, and Duane German of the Texas Parks and Wildlife Department Geographic Information Systems Laboratory for their assistance in the vegetation alliance mapping. Thanks to David Riskind, Coordinator of the Natural Resource Program, Texas Parks and Wildlife Department, and Heather White of GREE who read and commented on preliminary versions of the manuscript. We are also grateful to Guy Nesom and Monique Reed for their review of the manuscript. Their comments were exceedingly helpful.

Matt White (Foreword by Greg W. Lasley). 2002. **Birds of Northeast Texas.** (ISBN 0-58544-192-9, hbk.; 0-58544-193-7, pbk.). Texas A&M University Press, John H. Lindsey bldg, Lewis Street, 4354 TAMU, College Station, TX 77843-4354, U.S.A. (Orders: 800-826-8911, 979-847-8752 fax, WJL@tampress.tamu.edu, www.tamu.edu/upress). $44.95 (hbk), $19.95 (pbk), 160 pp., 30 color photos, map, 6" × 9".

Key Words: Texas, northeast Texas, birds, identification, field guide, zoology.

What a nice book the author has given us. The author summarizes the status of 390 species that have been reliably documented and recorded from the 22 counties of northeast Texas. "The brief species accounts explain each species' status, distribution, and period of occurrence in the region." Contents include an introduction followed by chapters on Geography of the Region, Birdwatching Areas, and Species Accounts. The color photos are very nice.

John W. Tunnell, Jr. and Frank W. Judd (Foreword by Richard C. Bartlett). 2002. **The Laguna Madre of Texas and Tamaulipas.** (ISBN 0-58544-133-3, hbk.). Texas A&M University Press, John H. Lindsey bldg, Lewis Street, 4354 TAMU, College Station, TX 77843-4354, U.S.A. (Orders: 800-826-8911, 979-847-8752 fax, WJL@tampress.tamu.edu, www.tamu.edu/upress). $60.00, 372 pp., 83 color photos, 87 figures, 45 tables, 8 1/2" × 11".

Key Words: Texas natural history, Gulf Coast, Laguna Madre Region, natural resources, environment. seagrass meadows, shorebirds and wading birds, sea turtles, fish and invertebrate fisheries organisms, red and brown tides, conservation issues.

From the authors: "This compendium is intended as an overview of the Laguna Madre for an audience of both scientists and nonscientists. It is firmly based in science but also for use by others who want to learn about and take care of the Laguna Madre now and in the future." There is a nice appendix of Laguna Madre researchers and interested parties. The literature cited is 30 pages of references.

Gunnar Brune (Introduction by Helen C. Bese). 2002. **Springs of Texas. Second Editon.** (ISBN 0-58544-196-1, hbk.). Texas A&M University Press, John H. ABSTRACT

This study describes the floristics, soils, and small-scale species richness of xeric sandylands of the post oak savanna region of east central Texas and maps the distribution of xeric sandylands throughout the West Gulf Coastal Plain. The interrelation of xeric sandylands to wetlands and their interest for regional conservation assessment are discussed.

KEY WORDS: xeric sandylands, Post Oak Savanna, flora, Texas, Gus Engeling Wildlife Management Area.

RESUMEN

En este estudio se describe la florística, suelos, y riqueza de especies a pequeña escala de los lugares arenosos xéricos de la región de sabana post oak del centro este de Texas y se cartografía la distribución de los lugares arenosos xéricos de la llanura costera del West Gulf. Se discuten la interrelación de los lugares arenosos xéricos con los humedales y su interés para la evaluación de la conservación regional.

INTRODUCTION

During the past few years, we have been studying wetlands (muck bogs, upland marshes, baygalls, and seeps) in the post oak savanna region of east central Texas and southeastern Oklahoma (Nesom et al. 1997; MacRoberts & MacRoberts 1998b). These wetlands appear to be associated with xeric sandylands (variously referred to as oak-farkleberry sandylands [Ajilvsgi 1979], Post Oak-Black Hickory Series [Diamond et al. 1987], xeric sandylands [MacRoberts & MacRoberts 1994, 1995, 1996], Grossarenic Dry Uplands [Turner et al. 1999], Sand Post Oak - Bluejack Oak Alliance [Singhurst et al. 2000], and *Quercus incana* woodland alliance [Hoagland 2000]). These deep sands act as a reservoir or sponge holding water that feeds adjacent seeps and springs that are the headwaters for the area's wetlands and ultimately the streams and rivers. These upslope soils are porous and drain readily; rainwater percolates through the sand and moves down a gradient created by underlying impermeable or slowly permeable clays. Eventually, water seeps laterally out of the hillside (Martin & Smith 1991; Jones & Carpenter 1995; Drewa 1999; Summer 1999).

As part of our study of muck bogs, upland marshes, and their flora, we

studied these adjacent xeric sandylands since they are clearly the water source for these wetlands.

The primary objectives of this paper are to describe: 1) the distribution of xeric sandylands throughout the West Gulf Coastal Plain, 2) the floristics of this community in the post oak savanna region, 3) the small-scale species richness of this community, and 4) the soils upon which this community occurs.

In addition to our primary objectives for studying this community, we also are stimulated by a recent spate of national and regional conservation assessments (e.g., Diamond et al. 1997; Ricketts et al. 1999a, 1999b; Myers et al. 2000) that propose to pinpoint ecological "hotspots." These assessments are based on diversity, species richness, endemism, endangered species, and unique habitat availability. But, as is so often the case with such large-scale efforts, while some regions are well known, others are not. The post oak savanna region of east Texas is one of the poorest known. This is evident upon examining recent regional descriptions of the area (e.g., McNab & Avers 1994; Keys et al. 1995; Ricketts et al 1999a), where numerous factual errors lead to inaccurate assessments of the region's ecological "temperature."

THE SETTING

In Texas, the post oak savanna region (Fig. 1), consisting of about 30,000 sq. km, is gently rolling and hilly with elevations from 90 to 250 meters. Rainfall ranges from 75 to 115 centimeters. The Carrizo Sands are virtually coterminous with the region (McBryde 1933). Prairies are scattered throughout, notably in the south where some prairies are large (Smeins & Diamond 1983). The predominant floristic character of the region is southeastern without pines (Smeins & Diamond 1986). The area contains a diversity of plant communities, from hillside pitcher plant bogs, peat bogs, and upland marshes to open xeric sandylands and oak-hickory forests and woodlands. Characteristic communities within the post oak savanna region also occur to the east within the pineywoods (Marietta & Nixon 1983; Ward & Nixon 1992). How the post oak savanna region relates biotically to other regions in the area has yet to be studied in detail (Monk et al. 1990; Bryant et al. 1993; Skeen et. al. 1993); however, it appears to be floristically similar to adjoining regions (MacRoberts & MacRoberts pers. obs.) and has no vertebrate endemism (Telfair 1999).

McBryde (1933) conducted the only major floristic/edaphic study of the region. Subsequently, very little research has been done on the post oak savanna except for the inclusion prairies in its southern portion (Smeins & Diamond 1986).

Xeric sandylands are (or at least once were) very common in the Texas post oak savanna region, but they also occur in the pineywoods regions of southeastern Oklahoma, southwestern Arkansas, western Louisiana, eastern Texas,

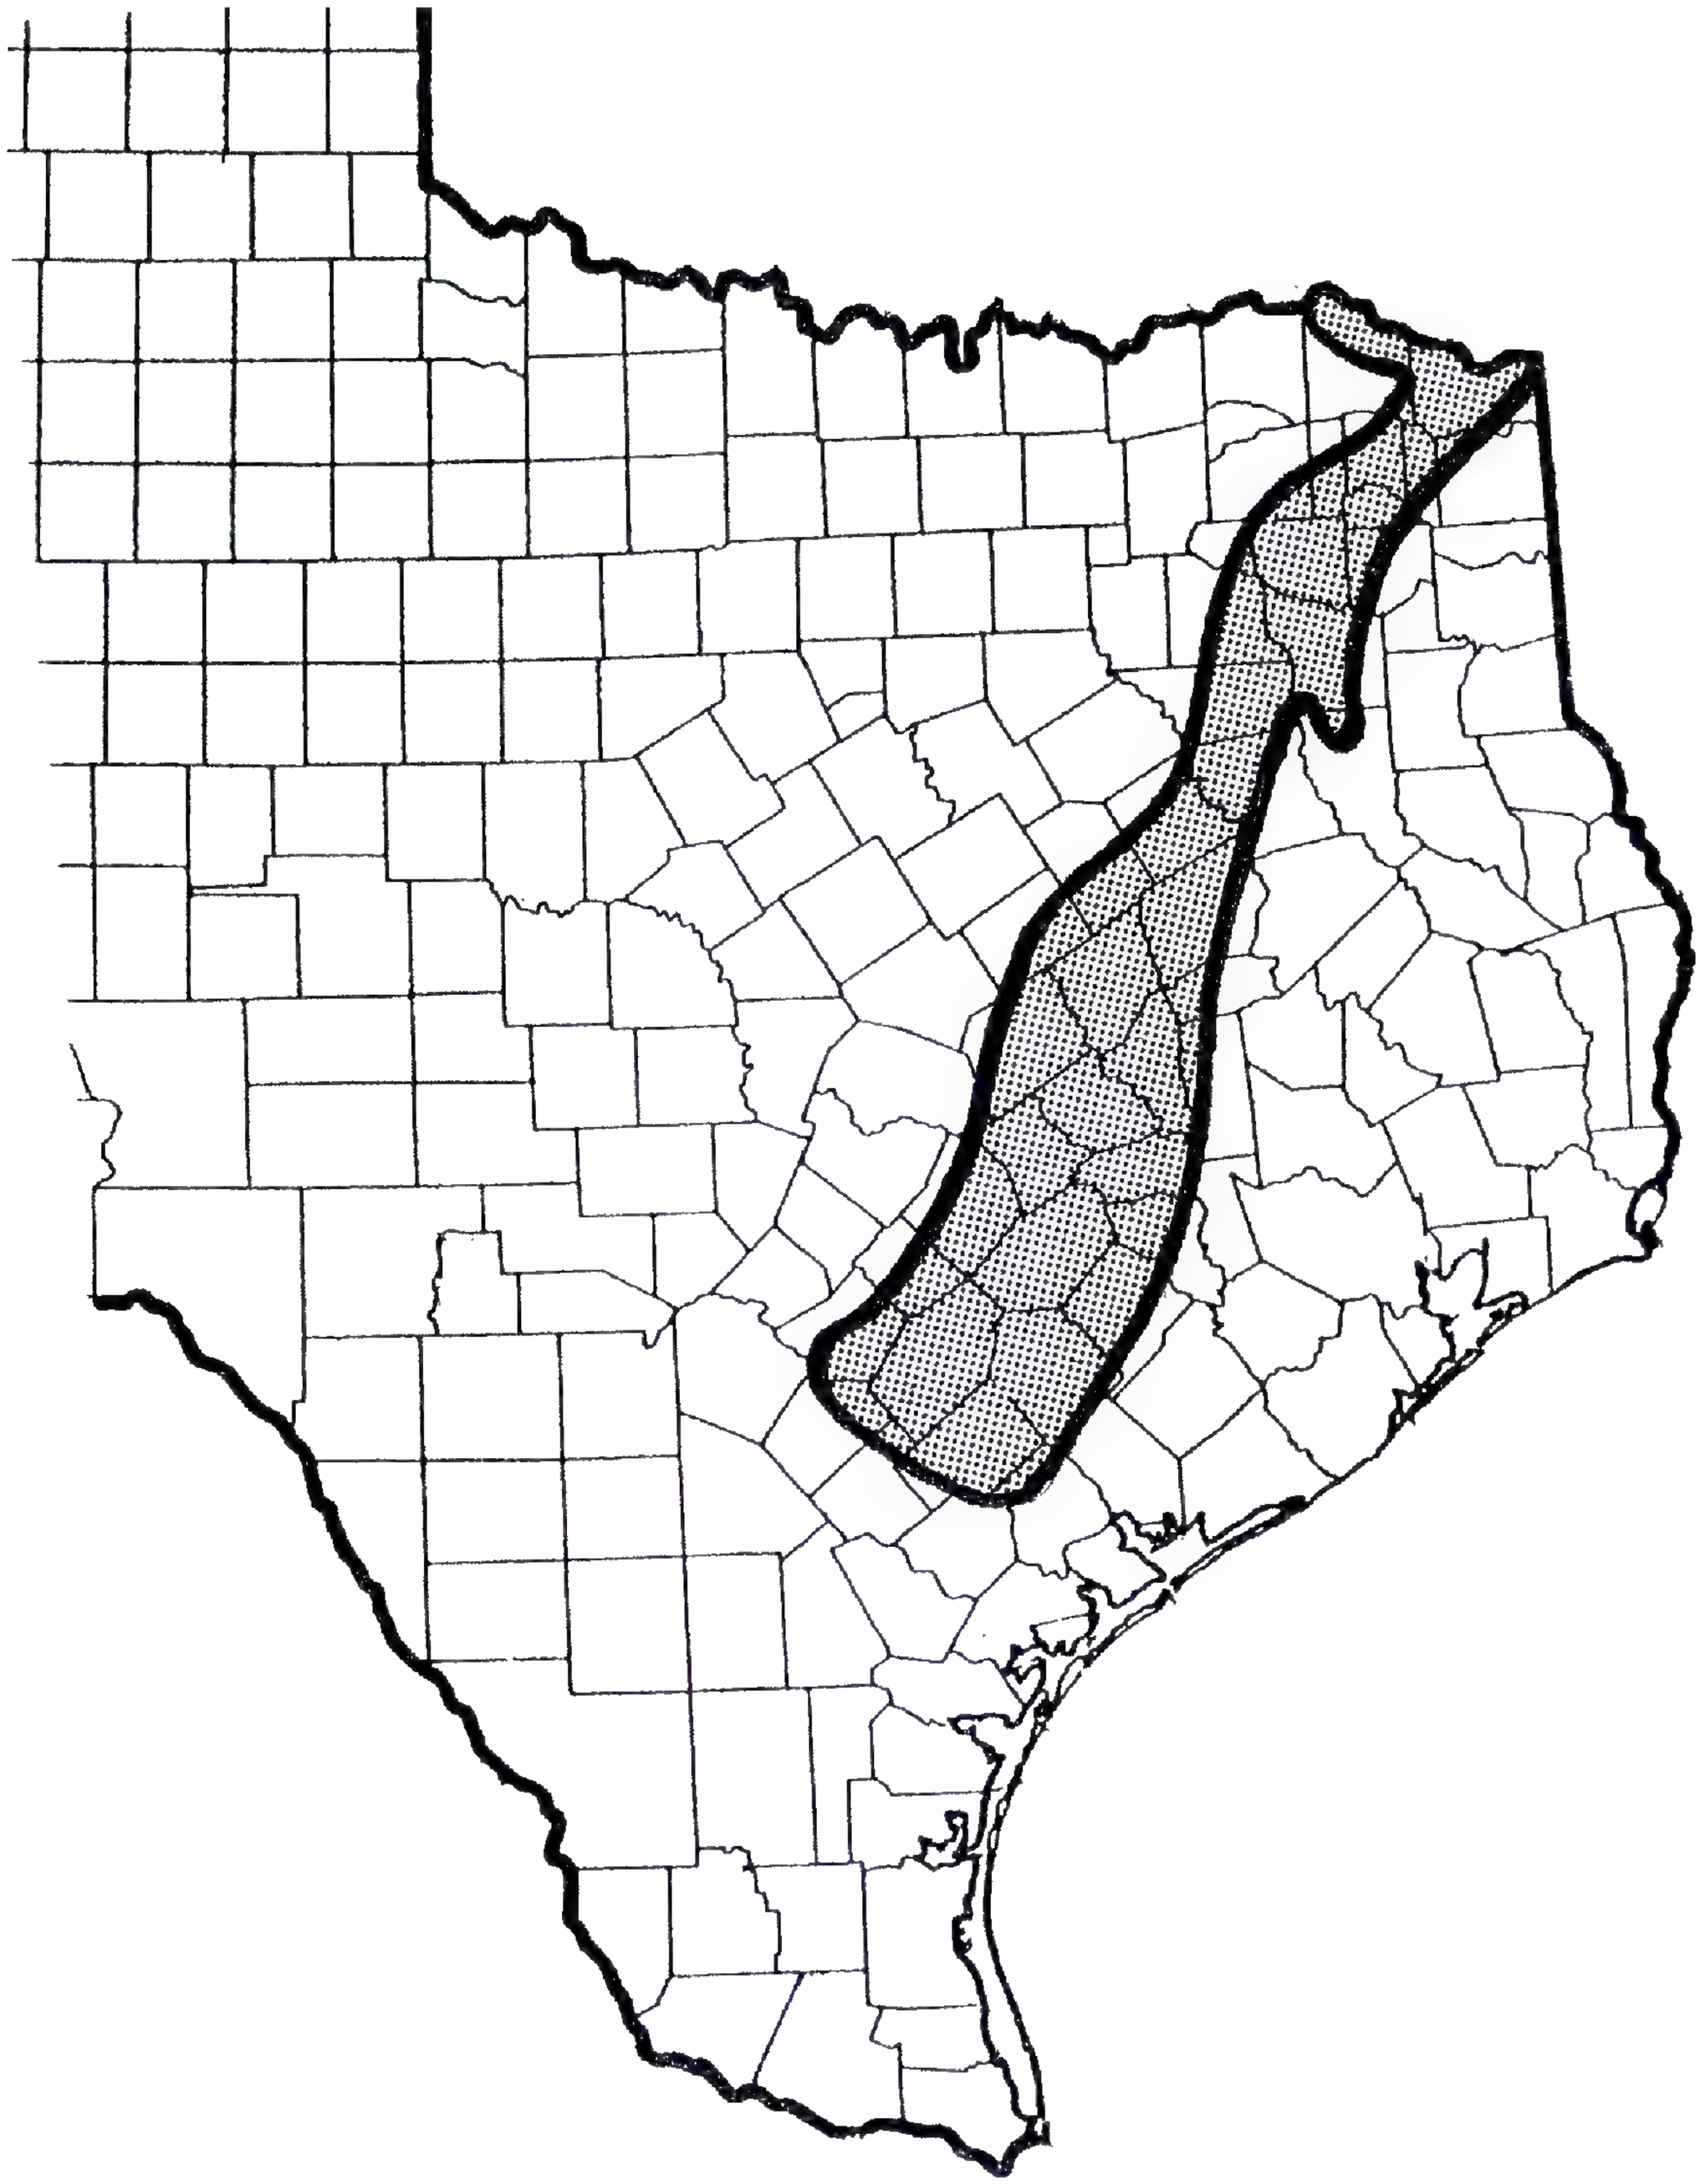

FIG. 1. Post oak savanna region of Texas.

and into the Coastal Bend of Texas (McBryde 1933; Jones 1977; Drawe et al. 1978; Taylor & Taylor 1978; Ajilvsgi 1979; Marks & Harcombe 1981; Louisiana Natural Heritage 1988; Bridges & Orzell 1989; Harcombe et al. 1993; Foti et al. 1994; MacRoberts & MacRoberts 1994, 1995, 1996; Jones & Carpenter 1995; Texas Natu-

ral Heritage Program 1995; Turner et al. 1999; Hoagland 2000). Homologues of xeric sandylands occur east of the Mississippi River (Stout & Marion 1993). It is generally assumed that oak savannas and xeric sandylands, like prairies, are kept open largely by fire (Smeins & Diamond 1986; Cutter & Guyette 1994). While encroachment of woody vegetation is ubiquitous in the absence of fire, there are many areas that remain open even when fire is suppressed, suggesting that edaphic conditions play an integral role. Characteristic tree species of xeric sandylands include *Quercus incana* W. Bartram, *Q. margarettiae* Ashe ex Small, *Q. stellata* Wangenh., and *Carya texana* Buckley, and a variety of fidel herbaceous species (see Methods for list). The area appears to be rich in plant endemism (Sorrie & Weakley 2001), and a large number of West Gulf Coastal Plain endemics are associated with this community, for example, *Brazoria truncata* (Benth.) Engelm. & A. Gray, *Palafoxia reverchonii* (Bush) Cory, *Paronychia drummondii* Torr. & A. Gray, *Pediomelum hypogaeum* (Nutt. ex Torr. & A. Gray) var. *subulatum* (Bush) J. W. Grimes, *Penstemon murrayanus* Hook., *Polanisia erosa* (Nutt.) H.H. Iltis, *Rhododon ciliatus* (Benth.) Epling, *Tetragonotheca ludoviciana* (Torr. & A. Gray) A. Gray ex Hall, *Tradescantia reverchonii* Bush, and *T. subacaulis* Bush.

METHODS

In order to develop an objective idea of the distribution of xeric sandylands, we selected 42 fidel species from the total list of species occurring in this community. We mapped these by county and parish over their ranges (Fig. 2). In the map, the number of fidels per county or parish is indicated in the legend. Parishes or counties with fewer than 10 species are left blank.

The 42 species chosen were *Astragalus leptocarpus* Torr. & A. Gray, *A. soxmaniorum* Lundell, *Berlandiera pumila* (Michx.) Nutt., *Brazoria truncata*, *Clematis reticulata* Walter, *Cnidoscolus texanus* (Muell.-Arg.) Small, *Coreopsis intermedia* Sherff, *Crataegus uniflora* Muenchh., *Croton argyranthemus* Michx., *Cyperus grayioides* Mohlenbrock, *Dalea phleoides* (Torr. & A. Gray) Shinners, *D. villosa* (Nutt.) Spreng., *Eriogonum longifolium* Nutt., *E. multiflorum* Benth., *Froelichia floridana* (Nutt.) Moq. (not distinguished from *F. gracilis* [(Hook.) Moq.]), *Hymenopappus artemisiifolius* DC., *Lithospermum caroliniense* (Walter ex J.F. Gmel.) MacMill., *Loeflingia squarrosa* Nutt., *Matelea cynanchoides* (Engelm.) Woodson, *Minuartia drummondii* (Shinners) McNeill, *Palafoxia hookeriana* Torr. & A. Gray, *P. reverchonii*, *Paronychia drummondii*, *Pediomelum digitatum* (Nutt. ex Torr. & A. Gray) Isely, *P. hypogaeum* var. *subulatum*, *Penstemon murrayanus*, *Phacelia strictiflora* (Engelm. & A. Gray) A. Gray, *Phlox drummondii* Hook., *Physalis mollis* Nutt., *Polanisia erosa* (Nutt.) H.H. Iltis, *Polygonella americana* (Fisch. & C.A. Mey.) Small, *Prunus gracilis* Engelm. & A. Gray, *Rhododon ciliatus*, *Selaginella arenicola* Underwood ssp. *riddellii* (Van Eselt.) R. M. Tryon, *Scutellaria cardiophylla* Engelm. & A. Gray, *Streptanthus*

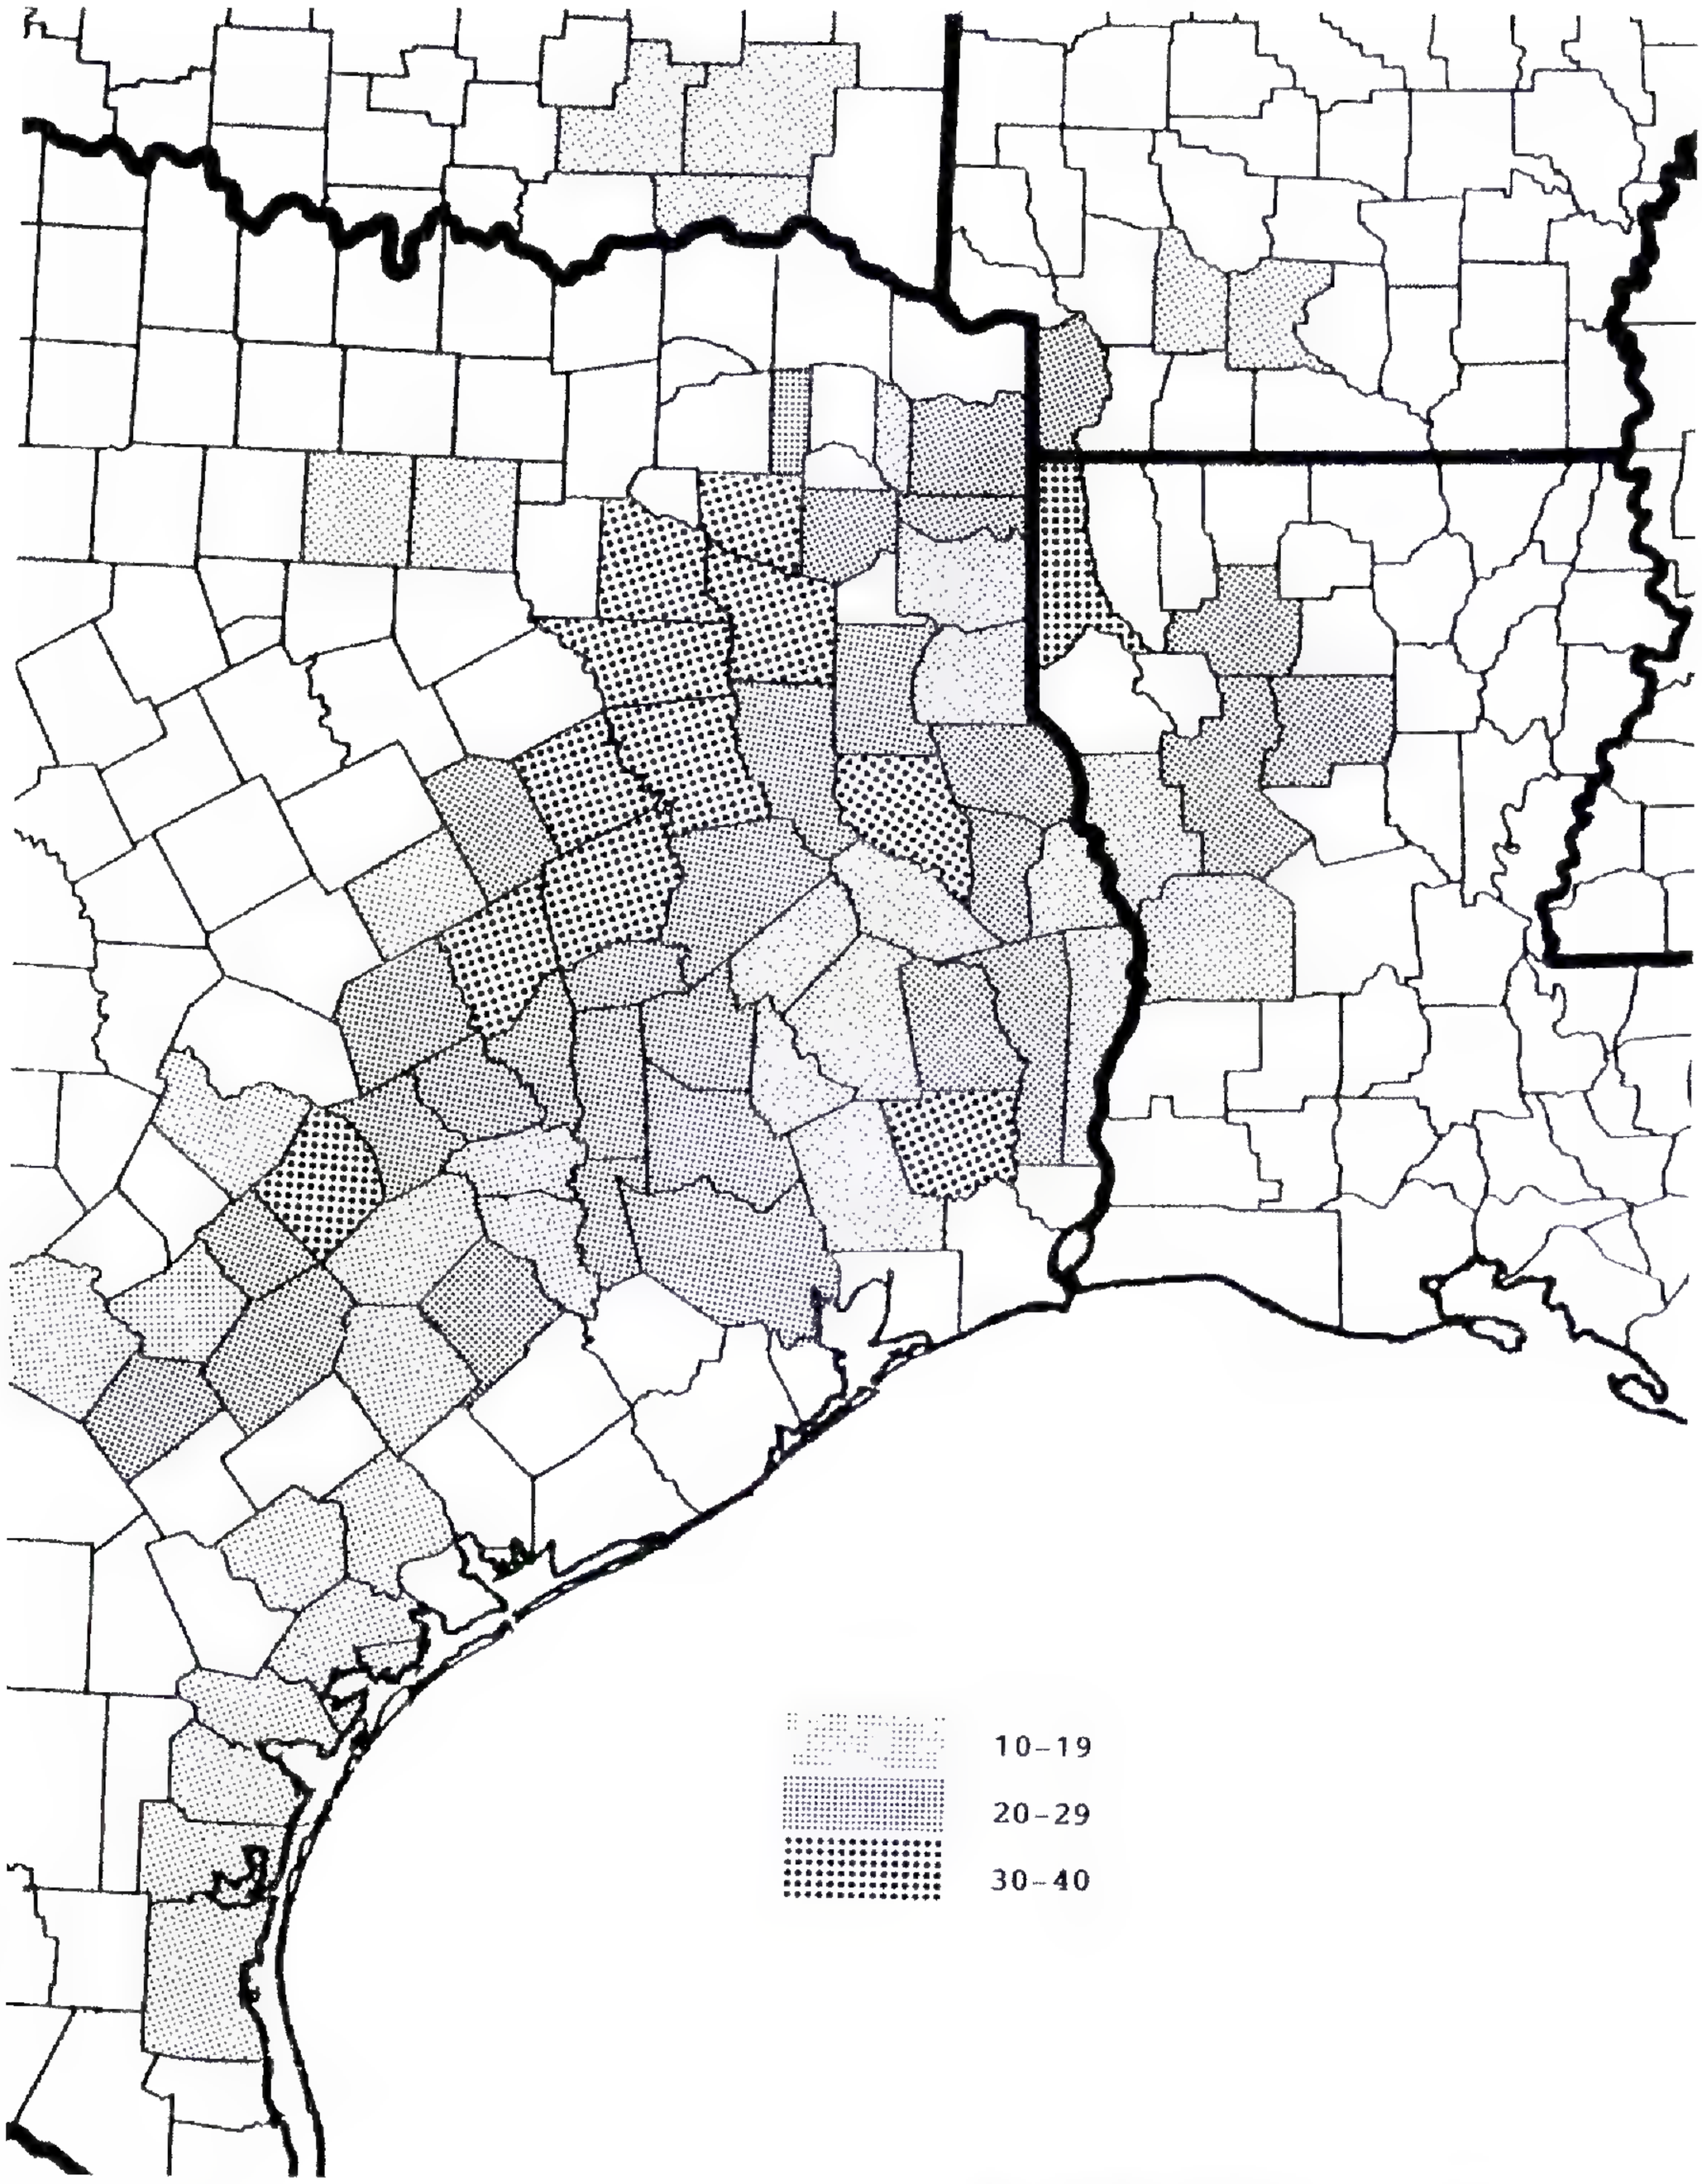

Fig. 2. Xeric sandylands species distribution (see text for key).

hyacynthoides Hook., *Stylisma pickeringii* (Torr. ex M.A. Curtis) A. Gray, *Talinum rugospermum* Holz., *Tetragonotheca ludoviciana*, *Tradescantia reverchonii*, *Yucca louisianensis* Trel., and *Zornia bracteata* J.F. Gmel. Sources for this information consisted of extensive herbarium searches, notably LSU, TAMU (both on line), ASTC, BRIT, Corpus Christi Museum of Science and History, LSUS,

SBSC, SHST, TEX, VDB, WWF, atlases (e.g., Smith 1988; Thomas & Allen 1993-1998; Turner in press), and a variety of literature (e.g., Jones 1977; Taylor & Taylor 1978; Singhurst 1996; Turner 1996; Nesom & Brown 1998) and unpublished sources (Billie Turner pers. comm.; Bruce Hoagland pers. comm.). We also made field searches throughout the West Gulf Coastal Plain to look for the species and the community *in situ*.

We surveyed the flora of xeric sandylands at Gus Engeling Wildlife Management Area (GEWMA), Anderson County, Texas, in the center of the post oak savanna region. The GEWMA occurs in the central part of the Trinity River drainage along Catfish Creek (Telfair 1988). This property consists of approximately 44 sq. km, of which 18 are the sand post oak-bluejack oak community (Singhurst et al. 2000). We established a single study plot measuring 50 m × 100 m (0.5 ha), within which was another single plot measuring 20 m × 50 m (0.1 ha) with two nested 3.16 m × 3.16 m plots (0.001 ha) and 6 nested 1 m × 1 m plots (0.0001 ha) in an opening in this community (see Peet et al. 1998 for plot design). The larger plot ran parallel to the topographic gradient and the adjacent downslope bog and was about 100 meters north of the edge of the bog and a few meters higher than the bog (see MacRoberts & MacRoberts 1998b, 1999; Singhurst et al. 2000 for a description of Andrew's Bog, GEWMA). We surveyed this area monthly from March to October 2000 and listed all plant species in each plot. This gave us information on both total floristics and species/area measures for comparison with similar measures from other plant communities. We estimated ground cover and measured vegetation height in the 0.0001 ha plots. We also surveyed several other xeric sandylands in other parts of the GEWMA. Plant nomenclature throughout this paper follows Kartesz and Meacham (1999). Voucher specimens are deposited at TEX.

We collected soil samples from the upper 15 cm of the two 0.001 ha plots and from the 0.1 ha plot for comparison with this community elsewhere in its range. These were analyzed by A & L Laboratories, Memphis, Tennessee. The soil at the study site is described as deep, well-drained acidic sandy Pleistocene terraces (Arenosa series, Typic Quartzipsammeents, Entisols) (Coffee 1975).

RESULTS

Figure 1 shows the location of the Post Oak Savanna region of East Texas in which xeric sandylands are located. Figure 2 shows the frequency of occurrence of the 42 xeric sandyland fidel species in parishes and counties in the West Gulf Coastal Plain. Counties and parishes with fewer than 10 species are left blank. Table 1 lists the species found within the 0.1 ha plot. Table 2 gives additional species in the 0.5 ha plot. Table 3 shows the number of species occurring in the 0.0001 ha, 0.001 ha, 0.1 ha, and 0.5 ha plots. Table 4 gives the ground cover and vegetation height in the six 0.0001 ha plots in May and August. Table 5 gives the soil information from the study plots.

TABLE 1. Species present in the 0.1 ha study plot at the Gus Engeling Wildlife Management Area (Anderson County, Texas).

AGAVACEAE: *Yucca louisianensis* Trel.

EUPHORBIACEAE: *Cnidoscolus texanus* (Muell. Arg.) Small, *Croton argyranthemus* Michx., *C. capitatus* Michx., *C. glandulosus* L., *C. michauxii* G.L. Webster
FABACEAE: *Astragalus leptocarpus* Torr. & A. Gray, *Baptisia nuttalliana* Small, *Centrosema virginiana* (L.) Benth., *Chamaecrista fasciculata* (Michx.) Greene, *Dalea phleoides* (Torr. & A. Gray) Shinners, *Indigofera miniata* Ortega, *Mimosa nuttallii* (DC.) B.L. Turner, *Pediomelum digitatum* (Nutt. ex Torr. & A. Gray) Isely
FAGACEAE: *Quercus incana* W. Bartram, *Q. margarettiae* Ashe ex Small
HYDROPHYLLACEAE: *Phacelia strictiflora* (Engelm. & A. Gray) A. Gray
KRAMERIACEAE: *Krameria lanceolata* Torr.
LAMIACEAE: *Brazoria truncata* (Benth.) Engelm. & A. Gray, *Monarda punctata* L., *Rhododon ciliatus* (Benth.) Epling
LILIACEAE: *Allium canadense* L.
MOLLUGINACEAE: *Mollugo verticillata* L.
ONAGRACEAE: *Oenothera laciniata* Hill
PLANTAGINACEAE: *Plantago hookeriana* Fisch. & C.A. Mey.
POACEAE: *Andropogon ternarius* Michx., *Aristida desmantha* Trin. & Rupr, *A. lanosa* Muhl. ex Elliott, *Dichanthelium acuminatum* (Sw.) Gould & C.A. Clark, *D. oligosanthes* (Schult.) Gould, *Paspalum setaceum* Michx., *Triplasis purpurea* (Walter) Chapm., *Vulpia elliotea* (Raf.) Fernald.
POLYGONACEAE: *Eriogonum multiflorum* Benth., *Rumex hastatulus* Baldwin.
PORTULACACEAE: *Talinum rugospermum* Holz.
ROSACEAE: *Rubus argutus* Link
RUBIACEAE: *Diodia teres* Walter
SCROPHULARIACEAE: *Nuttallanthus canadensis* (L.) D.A. Sutton
SOLANACEAE: *Physalis heterophylla* Nees
VISCACEAE: *Phoradendron tomentosum* (DC.) Engelm. & A. Gray

DISCUSSION

Xeric sandylands occur from southwest Arkansas and southeastern Oklahoma to central Louisiana and the Coastal Bend of Texas. The distribution of species numbers shown in Figure 2 results in part from differential collecting: Caddo Parish and Anderson County have been well collected while most of east Texas

TABLE 2. Species in the 0.5 ha plot not found in the 0.1 ha plot. Both plots at the Gus Engeling Wildlife Management Area (Anderson County, Texas).

Bulbostylis ciliatifolia (Elliott) Fernald	*Schizachyrium scoparium* (Michx.) Nash
Carya texana Buckley	*Scleria triglomerata* Michx.
Cenchrus spinifex Cav.	*Sisyrinchium albidum* Raf.
Corydalis micrantha (Engelm. ex A. Gray) A. Gray	*Trichostema dichotomum* L.
Glandularia canadensis (L.) Nutt.	*Vaccinium arboreum* Marshall
Mirabilis albida (Walter) Heimerl	*Verbascum thapsus* L.
Oenothera heterophylla Spach	*Vitis aestivalis* Michx.
Penstemon murrayanus Hook.	*Vitis rotundifolia* Michx.

TABLE 3. Species richness in xeric sandylands at the Gus Engeling Wildlife Management Area (Anderson County, Texas).

Plot size (ha)	No. of plots	Av. no. species (range)
0.0001	6	24.5 (19–28)
0.001	2	38.5 (35–42)
0.1	1	74
0.5	1	90

has not. Better sampling would undoubtedly fill in the picture, but the outlines are clear. We have observed the community *in situ* in Miller County, Arkansas; Bienville, Caddo, Natchitoches, Vernon, and Winn parishes, Louisiana; Atoka, Choctaw, and Pushmataha counties, Oklahoma; and Anderson, Angelina, Aransas, Bastrop, Caldwell, Cass, Cherokee, Colorado, Franklin, Gonzales, Guadulape, Hardin, Henderson, Jasper, Lee, Leon, Marion, Milam, Nacogdoches, Panola, Rusk, San Augustine, San Patricio, Shelby, Smith, Tyler, Upshur, Van Zandt, Wilson, and Wood counties, Texas. We have little experience with the Coastal Bend xeric sandylands (Drawe et al. 1978), but this community appears to have affinities with the more northern and eastern xeric sandylands and needs further study. Xeric sandlylands also occur in Hopkins, Navarro, Rains, and Williamson counties and appear to have once occurred on the boundary of Fannin and Grayson counties, Texas (Jason Singhurst, pers. comm.).

There were 74 species in the 0.1 ha plot and 90 species in the 0.5 ha plot. Other taxa in xeric sandylands at GEWMA that did not occur in our plots include *Aphanostephus skirrhobasis* (DC.) Trel., *Apocynum cannabinum* L., *Asclepias amplexicaulis* Sm., *Berlandiera pumila*, *Bouteloua hirsuta* Lag., *Delphinium carolinianum* Walter, *Descurainea pinnata* (Walter) Britton, *Eragrostis secundiflora* J. Presl., *Eriogonum longifolium*, *Hymenopappus artemisiifolius*, *Liatris elegans* (Walter) Michx., *Mirabilis albida*, *Oxalis priceae* Small, *Pediomelum hypogaeum* var. *subulatum*, *Physalis turbinata* Medik., *Polygonella americana*, *Scutellaria cardiophylla*, *Selaginella arenicola* ssp. *riddellii*, *Sideroxylon lanuginosum* Michx.,

TABLE. 4. Ground cover and vegetation height in six 0.0001 ha plots at the Gus Engeling Wildlife Management Area (Anderson County, Texas)

Plot (month)	Average height (cm)	Tallest height (cm)	Percent cover
1 (August)	20	40	20
(May)	10	55	20
2 (August)	20	30	20
(May)	10	25	30
3 (August)	20	40	20
(May)	15	35	30
4 (August)	15	50	15

5 (August)	20	40	20
(May)	15	30	40
6 (August)	20	45	25
(May)	15	30	40

TABLE. 5. Soil characteristics of sample plots at the Gus Engeling Wildlife Management Area (Anderson County, Texas).

		Exchangeable ions (ppm)				
Sample	pH	P	K	Ca	Mg	Organic Matter%
1	4.9	26	27	172	18	1.0
2	4.8	21	20	97	14	0.8
3	4.4	24	18	80	10	0.8

Stillingia sylvatica Garden ex L., *Tetragonotheca ludoviciana*, *Tragia urticifolia* Michx., *Triodanis perfoliata* (L.) Nieuwl., and *Vicia ludoviciana* Nutt. (see also Singhurst et al. 2000).

The ground cover varied from about 15 percent to 40 percent throughout the growing season. Non-vegetated areas always prominently showed and vegetation was never tall. In general, biomass was low and sunlight was directly on the ground.

Species richness can be measured at many scales. At scales of 0.01 ha and larger, tropical rainforests are the most species rich. However, at scales below 0.001 ha and often 0.01 ha, temperate grasslands and open savannas of the southeastern United States are the most species rich. Values of between 20 and 40 species per 0.0001 ha occur but are very uncommon (Peet et al. 1983; Walker & Peet 1983; Peet & Allard 1993; Brewer 1998; Platt 1999). Peet et al. (1983) found that for a broad range of forest and woodland types, no community type exceeded 17 species per 0.0001 ha and none averaged over 13. Even tallgrass prairies, which were the highest, averaged only 18.

While very little information exists on species richness of West Gulf

Coastal Plain plant communties, the scant small-scale information available indicates that wetland pine savannas, bogs, and upland pine savannas average around 20 species in 0.0001 ha plots (Allen et al. 1988; MacRoberts & MacRoberts 1991, 1998a; Carr 2000).

In the light of these figures, it is interesting that the GEWMA xeric sandyland plots show higher species richness at small scales than virtually all other plant communities so far measured in the southeastern United States. These xeric sandylands also show a low "z" value (about 0.19), meaning that there is basically a species doubling for every 100-fold increase in area. In the present case, a 0.0001 ha plot contains roughly one-half of the species found in a 0.01 ha plot, and one-quarter the species found in a 1.0 ha plot (see MacArthur & Wilson 1967; Harris 1984 for discussion of "z" value).

The reason for such high species counts in these small-scale plots is not clear except that, in this case, most species are relatively diminutive with a variety of growth forms (about 60 percent of the species are perennials), and many have very brief above-ground life histories. Species packing is therefore no problem.

The role of fire in maintaining plant communities is well understood (Platt 1999). In the absence of fire, many plant communities (e.g., prairies) are rapidly invaded by shrubs and trees (Packard & Mutel 1997). Oak-hickory savannas and xeric sandylands appear to require fire for natural maintenance (Cutter & Guyette 1994). We noticed in this study that, because of the long drought that the West Gulf Coastal Plain has been experiencing, there has been a significant die-off of woody vegetation, notably in the dryer areas. Fire, therefore, may not be the only important force preventing woody invasion. Periodic droughts may be another factor keeping xeric sandylands, as well as other communities, open.

Soils at GEWMA are virtually identical to soils tested from xeric sandyland sites in Louisiana and east Texas (MacRoberts & MacRoberts 1994, 1995, 1996). They are nutrient-poor and acidic. Soil conditions per se may also preclude woody invasion.

We have emphasized the floristics of xeric sandylands largely to develop baseline information, and we note that the species richness of this community is considerably greater than generally recognized. The hydrologic and geomorphologic properties of these xeric sandhills also are significant, as the water they supply underlies the existence of adjacent wetland communities—bogs, marshes, baygalls, and seeps.

ACKNOWLEDGMENTS

Bruce Hoagland, Connie Taylor, Robert Kalinsky, Suzanne Walker, and the staff of the Gus Engeling Wildlife Management Area and all herbaria where we worked aided with this research. Special thanks to Billie Turner for allowing us to use his unpublished distribution maps for Texas plants. The work was supported by a Texas Parks and Wildlife Section 6, Wildlife Diversity Program Grant: "Status sur-

vey of Dwarf Pipewort (*Eriocaulon kornickianum*) in Texas." Guy Nesom, Ray Telfair, and Jason Singhust made many helpful comments on the paper.

EFFECTS OF FIRE ON TWO PITCHER PLANT BOGS WITH COMMENTS ON SEVERAL RARE AND INTERESTING PLANTS

Eric L. Keith and N. Ross Carrie

Raven Environmental Services Inc.
P.O. Box 6482
Huntsville, TX 77342, U.S.A.

ABSTRACT

Pitcher plant bogs require frequent fires to prevent encroachment of woody vegetation. Little information is available on the relative effectiveness of growing-season burns for maintaining plant communities in bogs and reducing woody encroachment. In this study, the effects of growing-season and dormant-season burns on plant communities were assessed in two pitcher-plant bogs on the Peason Ridge Military Reservation in western Louisiana. Measurements were collected every month from March through November 1996 and from March through October 1997. Floristic composition and forb and woody plant density were determined in both bogs. Both bogs had been burned on 3-year rotations in the dormant season for approximately 20 years. One bog, hereafter Coneflower bog, was burned during the dormant season in December 1995 and is approximately 0.8 hectare (ha). The other bog, Woodpecker bog, was burned during the growing season in August 1996 and is approximately 0.7 ha. Over both years, we found 98 plant species in both bogs together with 94 of the 98 species in Coneflower bog and 90 of the 98 species in Woodpecker bog. No species were eliminated from either bog after the fires. In addition, all species that were present after the growing season fire in Woodpecker bog had been present before the fire. However, several species were much more abundant after the fire than before the fire. The study also contains comments on the occurrence of several rare and interesting species encountered during this study including Sabine coneflower (*Rudbeckia scabrifolia*), Texas pipewort (*Eriocaulon texense*), Red-top panicum (*Panicum rigidulum* var. *combsii*), Slender panicum (*Panicum tenerum*), Beakrush (*Rhynchospora chalarocephala*), Drummond's yellow-eyed grass (*Xyris drummondii*), and Rough-leaved yellow-eyed grass (*Xyris scabrifolia*).

RESUMEN

Las turberas requieren frecuentes fuegos para evitar la invasión de vegetación leñosa. Está disponible poca información sobre la relativa efectividad de los fuegos en la época de crecimiento para mantener las comunidades vegetales en turberas y reducir la invasión de vegetación leñosa. En este estudio, se evaluaron los efectos de las quemas en la estación de crecimiento y en la época de parada de comunidades vegetales en dos turberas en la Reserva Peason Ridge Military en el oeste de Louisiana. Las medidas se tomaron todos los meses de marzo a noviembre de 1996 y de marzo a octubre de 1997. Se determinó la composición florística y densidad de hierbas y plantas leñosas en ambas turberas. Ambas turberas han sido quemadas en rotaciones de tres años en la estación de parada durante unos 20 años. Una turbera, concretamente la Coneflower, se quemó en diciembre de 1995 y tiene aproximadamente 0.8 hectáreas (ha). La otra, Woodpecker, se quemó durante la estación de crecimiento en agosto de 1996 y tiene aproximadamente 0.7 ha. Durante ambos años, encontramos 98 especies en ambas turberas junto con 94 de las 98 especies en la turbera Coneflower y 90 de las 98 especies en la turbera Woodpecker. Ninguna especie fue eliminada de las turberas después de los

SIDA 20(1): 387 – 395. 2002

fuegos. Además, todas las especies que estaban presentes después del fuego en la estación de crecimiento en la turbera Woodpecker estaban presentes antes del fuego. Sin embargo, varias especies eran mucho más abundantes después del fuego que antes. El estudio también contiene comentarios sobe la presencia de varias especies raras e interesantes encontradas durante este estudio incluyendo *Rudbeckia scabrifolia*, *Eriocaulon texense*, *Panicum rigidulum* var. *combsii*, *Panicum tenerum*, *Rhynchospora chalarocephala*, *Xyris drummondii*, y *Xyris scabrifolia*.

INTRODUCTION

Pitcher plant bogs are unique ecosystems found in the southeastern United States. In western Louisiana, they occur in Beauregard, Natchitoches, Rapides, Sabine and Vernon parishes (Allen et al. 1988; Correll & Correll 1972.) Similar pitcher plant bogs can be found in adjacent counties in East Texas as well as areas in southeast Louisiana and eastward to Georgia and Florida (Folkerts 1982; Nixon & Ward 1986). Pitcher plant bogs typically contain saturated sandy soils underlain by an impervious sandstone or clay layer. Water that percolates through the sandy soil and reaches the impervious layer seeps to the surface. Mudstone from the Catahoula Formation usually forms the impermeable layer in bogs in the Peason Ridge area (Hart & Lester 1993).

Pitcher plant bogs are declining in quantity and quality throughout their range. Approximately 97% of pitcher plant bogs have been destroyed or severely altered since European settlement (Folkerts 1982). Public lands are virtually the only areas that this ecosystem can be managed effectively. Pitcher plant bogs require frequent fires to prevent woody encroachment (Folkerts 1982). The absence of fire results in eventual elimination of bog species (Folkerts 1982). Until recently, the flora of pitcher plant bogs was relatively unknown and little information is available on the relative effectiveness of fire for maintaining plant communities in bogs and reducing woody encroachment (Barker & Williamson 1988). Kral (1955), MacRoberts and MacRoberts (1988, 1990, 1991, 1992, 1993), and Nixon and Ward (1986) have recently conducted valuable research on the floristics of bogs in this region, but information is scarce on the effects of growing-season burns on pitcher plant bogs in the West Gulf Coast Plain. This project assesses the effects on vegetation of a growing season fire on a pitcher plant bog compared to a bog burned during the dormant season. We will also comment on several rare and interesting plants encountered during our study.

STUDY SITE/METHODS

The study area was located on Peason Ridge of the Fort Polk Military Reservation at 31° 20' 05"N 93° 17' 00"W. The area surrounding the study sites is an open, sandy longleaf pine forest with gently rolling hills and is dominated by herbaceous vegetation in the under story. The two bogs, hereafter Woodpecker bog and Coneflower bog, are located approximately 100 m apart and are separated by a narrow upland longleaf ridge. They are both open and relatively flat (2% slope) with a few scattered old growth longleaf pines and are composed mainly

of herbaceous vegetation with a few scattered small trees, shrubs, and vines. A small creek runs along the eastern side of both of the bogs. Both bogs were visited monthly from March through November 1996 and from March through October of 1997. The two bogs were chosen because of their close proximity, similar slope and aspect, and because no bog floristic studies have been conducted on Peason Ridge. The nearest study conducted on bogs was 20 km to the northeast of the study site in the Kisatchie District of the Kisatchie National Forest (MacRoberts & MacRoberts 1988.) Woodpecker bog is approximately 0.7 ha, and Coneflower bog is approximately 0.8 ha. Ten 1 × 1 m plots were spaced in a random pattern in each of the bogs (Fig. 1). Herbaceous and woody plant measurements were collected in each of the ten plots. Measurements included species frequency of occurrence and density.

Five 5 × 5 m randomly selected quadrates were also used to measure woody stem density in Woodpecker bog (Fig. 1). Measurements of woody stems were collected in May of 1996 before the summer burn and again in May of 1998 after the burn to allow for a full growing season. Woody stems over 1 m tall were also counted to record the number of mature plants. The growing-season burn in Woodpecker bog was conducted on 20 August 1996 in the afternoon with southerly winds and was effective in completely eliminating most herbaceous and leafy material. Coneflower bog was burned in December 1995.

We follow MacRoberts (1989) and Allen (1992) for scientific nomenclature. Voucher specimens for some species were deposited at the University of Louisiana-Monroe and the Botanical Research Institute of Texas (BRIT).

RESULTS AND DISCUSSION

Burn Affects

We recorded a total of 98 species in both bogs, 94 species in Coneflower bog and 90 species in Woodpecker bog. In Table 1, we list the species present in both bogs; "C" indicates species found only in Coneflower bog, "W" indicates species found only in Woodpecker bog, no letter indicates a species that was found in both bogs. White-topped sedge (*Dichromena latifolia*), Red milkweed (*Asclepias rubra*), and Longleaf milkweed (*Asclepias longifolia*) were the only species found exclusively in Coneflower bog. Species more abundant in Coneflower bog were Bog-buttons (*Lachnocaulon anceps*), Drum heads (*Polygala cruciata*), and Sabine coneflower (*Rudbeckia scabrifolia*). Texas pipewort (*Eriocaulon texense*), Narrow leaved-sunflower (*Helianthus angustifolius*), and Rough-leaved yellow-eyed grass (*Xyris scabrifolia*), and red-top panicum (*Panicum rigidulum* var. *combsii*) were the only species found exclusively in Woodpecker bog. In addition, Rose pogonia (*Pogonia ophioglossiodes*) and Meadow beauty (*Rhexia petiolata*) were much more abundant in Woodpecker bog (Table 2).

Several species numbers were significantly affected by each of the burn treatments (Table 2). Pitcher plant (*Sarracenia alata*) numbers were similar

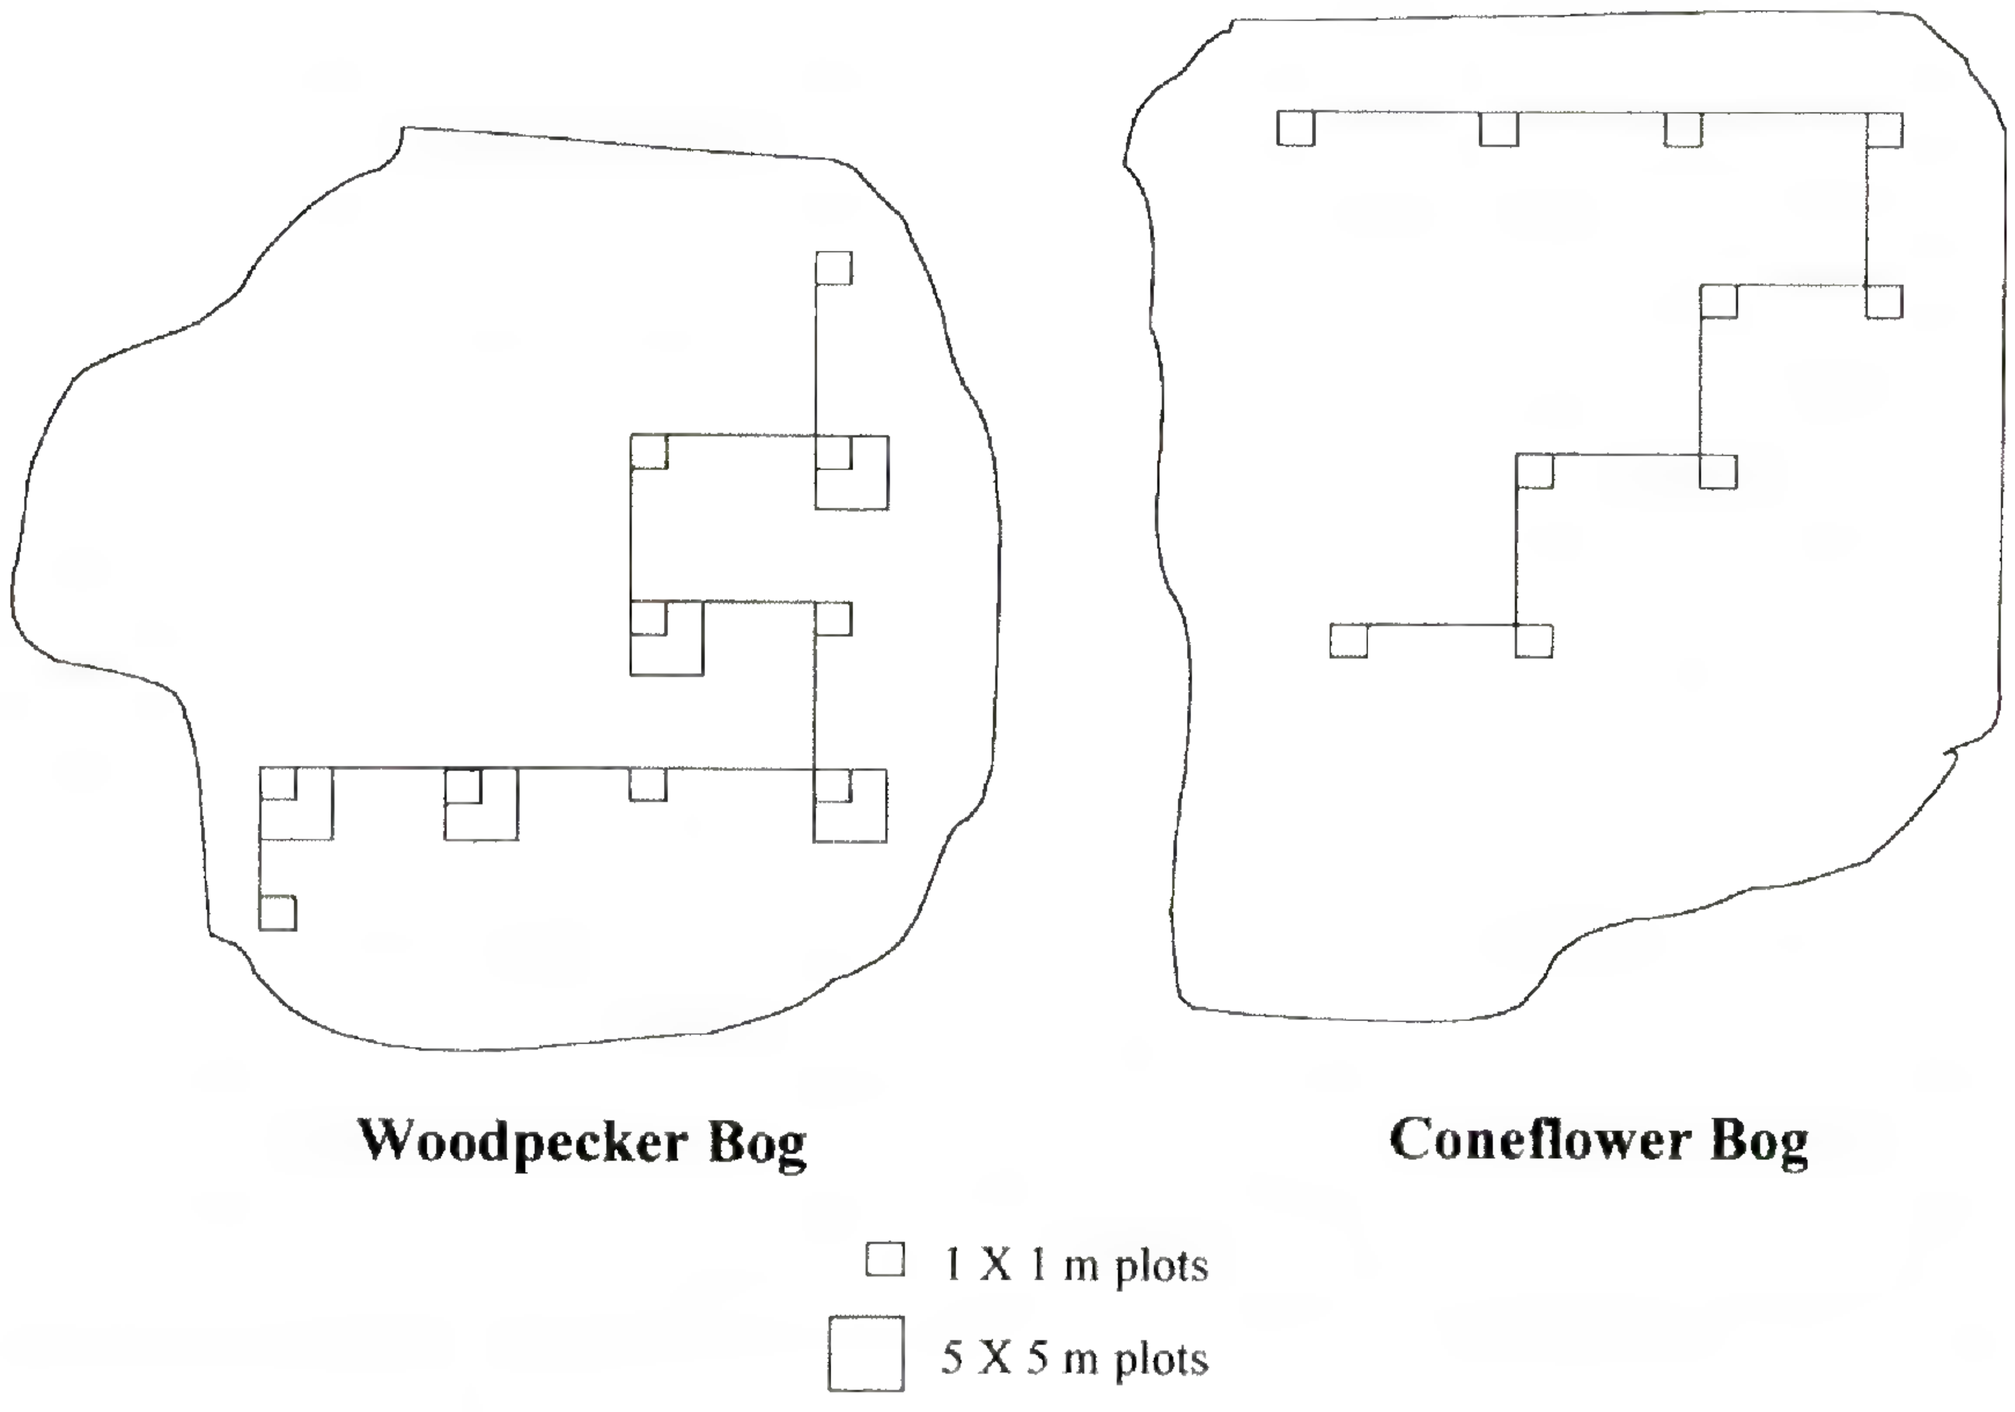

Fig. 1. Plot locations in both bogs.

before and after the growing-season burn. Before the fire, a total of 392 phyllodia were present in the ten one meter plots. One month after the fire, 383 phyllodia were counted, and in the next growing season, 395 phyllodia were present. This burn maintained the number of individuals present, contrary to the findings of Barker and Williamson 1988. They indicated a 24% increase in the number of phyllodia present in the growing season after a winter fire. A 3% increase in the number of phyllodia occurred in Woodpecker bog after this burn. However, in Coneflower bog, 463 phyllodia were present in the ten plots immediately after the fire and only 321 phyllodia were present the next growing season representing a 31% decrease in the number of phyllodia present between subsequent growing seasons. This decrease in phyllodia appears to be due to increased competition from other vegetation that returned after the fire.

Our study and previous studies suggest frequent fires are necessary to maintain the density of certain species over time. Barker and Williamson (1988) indicated an annual decay rate of 36% in *Sarracenia alata* phyllodia in an unburned bog in St. Tammany Parish, Louisiana. At this rate of decay, pitcher plants would lose 95% of their foliage in only 6 years (Barker & Williamson 1988). Bog buttons (*Eriocaulon decangulare*) displayed similar results in our study. We found 41 plants before the growing-season burn and 40 plants after the burn. However, in Coneflower bog, this species declined 59%, from 51 to 21, in just one

growing season. Pitcher plants and bog buttons appear to require frequent fires to maintain their presence.

Other species that also increased immediately after fire and declined after one growing season were Colic root (*Aletris aurea*), *Cynoctonum sessifolium*, milkworts (*Polygala cruciata* and *Polygala ramosa*), Rose pogonia (*Pogonia ophioglossiodes*), Meadow beauty (*Rhexia petiolata*), and Primrose-leave violet (*Viola primulifolia*) (Table 2). Unlike these species, Club moss (*Lycopodium caroliniana*) continued to increase a year after the dormant-season burn. The number of stems continued to increase, from 26 to 179, a year after the dormant-season burn in Coneflower bog. Perhaps this moss-like prostrate species requires more than one growing season to maximize the number of reproductive shoots that it produces.

The total number of woody stems increased after the growing-season burn, however, woody stems greater than one meter tall decreased. (See Table 3 for woody stem counts before and after the growing-season fire.) This increase in stems after the fire can be attributed to the large number of root sprouts from the base of the small hardwood trees, shrubs, and vines. Several small stems replaced one large stem that had been top killed by the fire. However, many shrubs were completely killed by the fire with no root sprouting. Sweet bay

TABLE 3. Woody stem totals in the five 5 × 5 m plots in Woodpecker Bog.

	Total number of stems			Stems over 1 meter tall		
Species	**Pre-burn**	**Post-burn**	**% Change**	**Pre-burn**	**Post-burn**	**% Change**
Aronia arbutifolia	6	41	583	1	2	100

Vaccinium corymbosa	0	6	-	0	4	
Total stems	384	502	31	110	91	-17

(*Magnolia virginiana*) and Loblolly pine (*Pinus taeda*) were the only species that decreased after the fire. In addition, Poison sumac (*Rhus vernix*) and Blueberry (*Vaccinium corymbosum*) were not present in the plots before the fire, but six plants of each species were found in the plots after the fire.

Species Encountered

Rudbeckia scabrifolia was common in the wetter areas of both bogs. This site is the northernmost record for this species. MacRoberts and MacRoberts (1993) did not record this species in Natchitoches Parish and did not find it in their study sites in the Kisatchie National Forest (MacRoberts & MacRoberts 1988, 1990, 1991, 1992). However, our study site is only 2.5 kilometers south of the Natchitoches Parish line suggesting *Rudbeckia scabrifolia* could be found in this parish and elsewhere on Peason Ridge.

Eriocaulon texense was frequent in Woodpecker bog, but not present in Coneflower bog. This plant was the only species that was found commonly in one bog and was absent in the other. This occurrence could also be the northernmost location for this species. MacRoberts and MacRoberts (1993) noted that they did not find this species in the Kisatchie District of the Kisatchie National Forest. The location of this species is approximately 20 kilometers north of any other known location.

Panicum rigidulum var. *combsii* was very uncommon in Woodpecker bog with only two small clumps found, and it was completely absent from Coneflower bog. This occurrence is only the second record for this distinctive variety in Louisiana (Allen 1992).

Panicum tenerum was common in both bogs. This plant was not found on Peason Ridge in a floristic survey (Hart & Lester 1993) and is rare in bogs and flatwoods in the southern part of the state (Allen 1992).

Rhynchospora chalarocephala was abundant in both bogs. MacRoberts and MacRoberts (1993) found this species in two bogs in the Kisatchie District and one bog in the Vernon District. They suggested that this species could be more common than previously believed. We have seen this species quite commonly in many bogs on Fort Polk and on Peason Ridge.

Xyris drummondii was common in wet, bare ground in both bogs as well as many other bogs on Peason Ridge and Fort Polk. This species seems to be more common than previously documented.

Xyris scabrifolia increased drastically after the growing season burn. We found 1 stem in our plots and three stems outside the plots before the burn. After the burn, we found 9 stems in our plots and 50 stems outside the plots. Godfrey and Wooten (1979) suggest that this is the rarest entity of *Xyris* in the southeastern United States, known only from Florida and Georgia. It is possible that this species could be more common than previously thought. In addition, it has been found recently in several locations on Fort Polk (Hart & Lester 1993).

The goal of this study was to collect observational data before and after prescribed fires in two pitcher plant bogs. Although it would have been optimal to collect data in many bogs over several years burned in different growing seasons, logistical problems and other duties prevented such a comprehensive study. Based on data collected through observations over two growing seasons, we conclude numerous bog species respond drastically to fire. The life history and habits of those species suggest frequent burns may be necessary to maintain the unique bog ecosystem. We predict future fire ecology studies will further support the necessary role of fire in the bog ecosystem.

ACKNOWLEDGMENTS

This research was supported in part by appointments to the postgraduate environmental management participation program administered by the Oak Ridge Institute for Science and Education. We would like to thank Charles Stagg, Stephen Parris, Stephanie Stephens, Kenneth Moore, Chris Melder, and Kevin Mundorff of the Fort Polk Environmental and Natural Resources Division and Michael and Barbara MacRoberts of Bog Research for all their help and advice on this project. We would also like to thank Charles Allen at the University of Louisiana-Monroe, Larry Brown at Spring Branch Science Center in Spring Branch, Texas and Guy Nesom at the Botanical Research Institute of Texas for their assistance in identifying specimens; and William Keith of Lufkin, Texas for Spanish translation of the abstract.

(Orders: 800-826-8911, 979-847-8752 fax, WJL@tampress.tamu.edu, www.tamu.edu/upress). $29.95 (hbk), $15.95 (pbk), 208 pp., 15 color photos, 28 b/w photos, 90 line drawings, 6" × 9".

Key Words: Texas natural history, Big Bend, identification, field guide, zoology, botany, trees and shrubs, wildflowers, cacti, mammals, birds, reptiles, amphibians, fish, butterflies, invertebrates.

This is quite an impressive little guide to Big Bend. The 90 line drawings are of the more common trees, shrubs, and wildflowers. Good job. The 41-page bibliography is roughly 20% of the book. Although not intended to be a complete list of publications, it sure is a nice contribution in one place.

David J. Schmidly (forewords by Andrew Sansom and Robrt J.Potts, afterword by Clyde Jones). 2002. **Texas Natural History: A Century of Change.** (ISBN 0-89672-469-7, hbk.). Texas Tech Press, Box 41037, Lubbock, TX 79409-1037, U.S.A. (Orders: 800-832-4042, www.ttup.ttu.edu, ttup@ttu.edu). $39.95 (hbk), 576 pp., 144 b/w photos, 43 maps, 6" × 9".

Key Words: Science, natural history, Texas, U.S. biological survey, wildlife heritage, mammals, plants, natural environment, changes in landscapes, land use, early twentieth century, wildlife conservation.

This is quite an accomplishment on Texas history. The author, Dr. David J. Schmidly, is president of Texas Tech University. Congratulations on a tremendous resource for Texas!

ABSTRACT

Twelve species or varieties of vascular plants, all native to the southeastern U.S.A, are reported as new or noteworthy for Kentucky. Ten of these are the first documented records for the state: *Bromus nottowayanus*, *Carex corrugata*, *C. oklahomensis*, *C. ouachitana*, *C. oxylepis* var. *pubescens*, *C. roanensis*, *Eleocharis tuberculosa*, *Gentiana andrewsii*, *Vaccinium erythrocarpum*, and *Viburnum lantanoides*. Additional counties are reported for two rare species: *Carex buxbaumii* and *C. seorsa*

RESUMEN

Se presentan 12 especies o variedades de plantas vasculares, todas nativas de la región sudeste de los Estados Unidos y se citan como nuevas o de interés para el estado de Kentucky. Diez de estas plantas son las primeras citas documentadas del estado que son: *Bromus nottowayanus*, *Carex corrugata*, *C. oklahomensis*, *C. ouachitana*, *C. oxylepis* var. *pubescens*, *C. roanensis*, *Eleocharis tuberculosa*, *Gentiana andrewsii*, *Vaccinium erythrocarpum*, y *Viburnum lantanoides*. Al nivel del condado, se presentan dos especies raras: *Carex buxbaumii* y *Carex seorsa*.

INTRODUCTION

Recent field and herbarium work have resulted in the discovery of several species of native flowering plants new to Kentucky or very rare in the state. These findings will update Kentucky distribution records as listed by Beal and Thieret (1986), Browne and Athey (1992), and Medley (1993). Kentucky rarity status—Special Concern, Threatened, Endangered, or Historical, is based on KSNPC (2000, 2001). Additional information on Clinton County records is provided by Gorton (2000). Terminology for physiographic regions is based on Browne and Athey (1992), and herbarium abbreviations follow Holmgren et al. (1990).

TAXA NEW OR OTHERWISE SIGNIFICANT FOR KENTUCKY

Bromus nottowayanus Fernald (POACEAE). Though Kentucky is well within the geographic range of this species as provided by Pavlick (1995), this record is apparently the first published for the state. Almost certainly, earlier Kentucky collections exist for this woodland grass.

SIDA 20(1): 397 – 402. 2002

Voucher specimen: **Kenton Co.:** mesic deciduous forest, Independence, 10 Aug 1995, *R. Naczi 4911 & B. Dalton* (KNK).

Carex buxbaumii Wahlenb. (CYPERACEAE). This is the second county in Kentucky documented for this species. Earlier records for this species are from Ballard County, in the westernmost portion of Kentucky, in the Coastal Plain region (Medley 1993). These records are over 20 years old, and the species is currently listed in Kentucky as Historical. This collection therefore provides a redocumentation of the species for the state, and is also the first record from the Mississippian Plateau region of the state. Kentucky is near the southern limit of this species; east of the Mississippi River, it ranges south to North Carolina and Tennessee (Radford et al. 1968; Gleason & Cronquist 1991; Chester et al. 1993).

Voucher specimen: **Clinton Co.:** hardwood swamp NW of Albany, 20 May 1999, *R. Naczi 8008* (DOV, EKY, KNK).

Carex corrugata Fernald (CYPERACEAE). These specimens represent the first record of the species from the state. Kentucky is the northern limit of this sedge, which is most common on river floodplains in the Coastal Plain of the southeastern U.S.A. (Naczi 1992). Most of the collections cited here are from sites along the Ohio or Mississippi rivers.

Voucher specimens: **Butler Co.:** Mudd River/Green River junction at Butler/Muhlenberg County line, 3 May 1995, *L. McKinney 6373* (MICH). **Campbell Co.:** Silver Grove, forested floodplain of Ohio River, 12 May 1995, *R. Naczi 4581 & J. C. Ganss* (DOV, MICH); Melbourne, forested floodplain of Ohio River, 17 May 1999, *R. Naczi 7874* (DOV). **Fulton Co.:** SW of Hickman, 5 May 1990, *L. McKinney 4124* (EKY). **Hardin Co.:** Prewitt's Lake, 29 May 1977, *R. Cranfill 239a* (MICH). **McCracken Co.:** Reidland, 26 May 1969, *R. Athey 641* (MUR). **Union Co.:** near Caney Mound School, 6 Jul 1936, *H. Shacklette 401* (GH).

Carex oklahomensis Mack. (CYPERACEAE). These specimens represent the first record of the species from the state. This species also occurs in the midwestern U.S.A., from Missouri and Kansas south to Texas, and in the eastern U.S.A. in Mississippi, North Carolina, Tennessee, and Virginia (Jones & Reznicek 1995; Bryson et al. 1996; Wieboldt et al. 1998).

Voucher specimens: **Calloway Co.:** wet fallow field, Snipe Creek Embayment, 5 Jun 1989, *J. Grubbs 1501* (MUR). **McCracken Co.:** wet ditches on the Ichneidman Road, 24 May 1970, *R. Athey 932* (KNK, MUR). **Marshall Co.:** wet woods, Sharp Elva Road off US 68, 10 May 1972, *R. Athey 1666* (MUR).

Carex ouachitana Kral, Manhart & Bryson (CYPERACEAE). This recently described sedge is known from sites in western Arkansas and eastern Oklahoma (Kral et al. 1987; Naczi & Bryson 1990), and a single site in Clay County, Tennessee (McNeilus 1992). This collection from Clinton County, Kentucky, only a few km from the Clay County site, represents a new record for Kentucky, and the second record of the species from east of the Mississippi River.

Voucher specimen: **Clinton Co.:** dry-mesic slope N of Albany, 11 Apr 1998, *M. Gorton 98-147* (EKY); 21 Apr 1999, *M. Gorton 99-109* (EKY).

Carex oxylepis Torr. & Hook. var. **pubescens** J.K.Underwood (CYPERACEAE). Though *C. oxylepis* var. *oxylepis* is known from Kentucky (Medley 1993), this collection appears to be the first of *C. oxylepis* var. *pubescens* from the state. Additionally, the population documented by this record represents a portion of the northern range limit of this variety. This taxon appears to be rare; literature reports are from only one county in Alabama (Bryson et al. 1992), ten counties of Arkansas (Hyatt 1998), one county of Illinois (Basinger & Shimp 1999), one county of Mississippi (Bryson et al. 1992), and four counties of Tennessee (Chester et al. 1993).

Voucher specimen: **Clinton Co.:** mesic deciduous-juniper forest NE of Albany, 20 May 1999, *R. Naczi 7982* (DOV, EKY, KNK).

Carex roanensis F.J.Herm. (CYPERACEAE). This is the first record of this sedge from Kentucky. It was previously known from only a few populations in Georgia, North Carolina, Tennessee, Virginia, and West Virginia, mostly from high elevation sites (Wieboldt et. al 1998). It was found at several sites on Black Mountain, at elevations between 1100-1150 m, but these sites are threatened by strip mining activities. It has recently been added to the Kentucky list of rare plants as Endangered.

Voucher specimen: **Harlan Co.:** Black Mountain, wooded S-facing slopes above Razor Fork, 19 Aug 1998, *R. Jones and J. Metzmeier 8737b, 8757* (EKY).

Carex seorsa Howe (CYPERACEAE). These records add two counties to the two previously reported, Bath and Graves (Ousley & Risk 1998; McKinney et al. 2000). This species is most common on the Coastal Plain, and populations outside of that physiographic province are very few (Reznicek & Ball 1980). It is currently listed as a Special Concern taxon in Kentucky.

Voucher specimens: **Calloway Co.:** Blood River Embayment, 23 May 1989, *J. Grubbs 1383* (MUR). **Clinton Co.:** hardwood swamp NW of Albany, 22 May 1998, *Naczi 7175 & Ford* (DOV); 20 May 1999, *R. Naczi 7986* (KNK).

Eleocharis tuberculosa (Michx.) Roemer & Schultes (CYPERACEAE). This collection represents a state record for Kentucky. It ranges mostly on the Coastal Plain, and it is quite rare outside of that province (Svenson 1937), though it does occur nearby in Fentress County, Tennessee (Chester et al. 1993).

Voucher specimens: **Clinton Co.:** openings in hardwood swamp NW of Albany, 20 May 1999, *R. Naczi 8002* (DOV, EKY, KNK); 3 Aug 2000, *R. Naczi 8598 & M. Wessel* (DOV, EKY, KNK).

Gentiana andrewsii Griseb. (GENTIANACEAE). This collection is apparently the first documented record of this species for Kentucky. Browne and Athey (1992) cited specimens from the Mississippian Plateau and the Bluegrass regions, but these citations were apparently based on a specimen from Mammoth Cave (*J. Bruna s.n.*, 23 Oct 1965, EKY!), which has now been annotated by R. Jones

as *Gentiana saponaria* L., and on a specimen once housed at the University of Kentucky Agricultural Herbarium—this specimen was searched for but could not be located. The collection cited by Medley (1993) as a voucher for Kentucky, (*Short s.n.*, 1837, MICH!) lacks locality data. The "Lexington, Kentucky" pre-printed on the label was Short's residence at the time (Stafleu & Cowan 1985), and not the place where the plant was collected. Short's habit was to write the collection locality on the label, in the space above pre-printed information. Since his label lacks such an inscription, it must be regarded as of unknown provenance. Pringle (1967) cited no Kentucky specimens of *G. andrewsii*, and states that this Campbell County collection is the first he has seen for the state (J. Pringle, pers. comm.). The site of the collection is at or near the southern range limit for *G. andrewsii*, which is known from nearby southern Indiana and southern Ohio (Pringle 1967). At the Campbell County locality, the gentians were locally common in an open, wet-mesic, deciduous floodplain forest dominated by young *Acer rubrum* and *Quercus palustris*.

Voucher specimen: **Campbell Co.:** Silver Grove, floodplain of Ohio River, 13 Oct 1997, *R. Naczi 7059* (KNK), dupl. det. by James S. Pringle; 29 Sep 1998, *R. Naczi 7735* (KNK).

Vaccinium erythrocarpum Michx. (ERICACEAE). The mountain cranberry is restricted to the southern Appalachians, from West Virginia to Georgia, mostly above 1000 m. Medley (1993) reported a possible sterile specimen of this species collected from Harlan County (*L. Pounds 85-138*) deposited at the University of Tennessee Herbarium, but a recent search failed to locate any Kentucky collection (B. E. Wofford, pers. comm.). This fruiting specimen substantiates the presence of the species in Kentucky. The site, however, is likely to be destroyed by strip mining activities. It has recently been added to our state list of rare plants as Endangered.

Voucher specimen: **Harlan Co.:** S slope of Black Mountain, woodland edge along mining road toward Left Fork of Fugitte Creek, elevation 900 m, 14 Aug 1998, *R. L. Jones & J. Metzmeier 8639* (EKY).

Viburnum lantanoides Michx. (CAPRIFOLIACEAE). This is the first record of *Viburnum lantanoides* for Kentucky. Earlier reports were unsubstantiated or based on misidentifications (Weckman 1999). The species is common in some high elevation areas of the southern Appalachians, usually above 1000 m. It has been documented from several western Virginia counties, including contiguous Wise County (Harvill et al. 1986), but is not yet known from Tennessee counties adjacent to the Kentucky border (Chester et al. 1997). A single population of about 50 individuals was discovered in the Razor Fork streamhead, growing with *Betula alleghaniensis* and *Magnolia fraseri*. Persistence of this Kentucky population is threatened by potential valley fill associated with proposed strip mining on Black Mountain. It has recently been added to the Kentucky list of rare plants as Endangered.

Voucher specimen: **Harlan Co.:** Black Mountain, at head of Razor Fork, elevation 1050 m, 19 Aug 1998, *R. L. Jones & J. Metzmeier 8804* (EKY); 5 Sep 1998, *T. Weckman 4349* (EKY).

NEW RECORDS IN ASTERACEAE FOR ALABAMA AND ARKANSAS

Guy L. Nesom

Botanical Research Institute of Texas
509 Pecan Street
Fort Worth, TX 76102-4060, U.S.A.

Continuing study of Asteraceae brings to light additions to the Arkansas and Alabama floras.

Pluchea yucatanensis Nesom. When first described (Nesom 1989), *P. yucatanensis* was known in the USA from only one collection in Hancock Co., Mississippi. It is now recorded from four contiguous counties in Alabama (first report here) and Mississippi and appears to be an established element of the flora in that area of the Gulf Coast. Its larger range is in Central America (Belize) and Mexico (Veracruz, Campeche, and Quintana Roo).

Voucher specimens. **ALABAMA. Mobile Co.:** just N of jct. Co. Rd 59 and Ala. Hwy 188, sandy edge of salt marsh in slash pine, 15 Jul 1969, *Kral 35624* (VDB). **MISSISSIPPI. Hancock Co.:** S of Kiln, sandy area along Jordan River, coastal flatwoods, 26 Aug 1966, *Jones 9575* (NCU); S of Kiln, sandy, low area along Jordan River, edge of mixed woods with *Serenoa*, *Sabal*, *Nyssa*, *Taxodium*, 30 May 1967, *Jones 12656* (TEX); S of Kiln, low sandy soil along Jordan River, 6 Jul 1967, *Jones 14155* (NCU). **Harrison Co.:** SW of Wool Market, low sandy soil along Biloxi River, R 10W T 7S Sec 8, 23 Jul 1967, *Jones 14818* (GH). **Jackson Co.:** Ocean Springs P.O., low wet areas, 2 Jul 1952, *Demaree 32262* (BRIT-SMU, GH); E of Ocean Springs, near borrow pit on Hwy 90, 25 Jul 1966, *Deramus 548* (VDB); Ocean Springs, 30 Jul 1896, *Pollard 1129* (GH).

Pluchea yucatanensis is similar in habit and general appearance to *P. foetida* (L.) DC. and *P. rosea* Godfrey and has been misidentified as both. The rose-tinted phyllaries and florets are more similar to *P. rosea*, but the glabrous, slightly thickened, shiny leaves and glabrous phyllaries are unambiguous recognition characters for *P. yucatanensis*.

Pseudognaphalium luteoalbum (L.) Hilliard & Burtt. A recent report expanded the known range of this species into Texas and New Mexico (Nesom 2001). It probably should be expected in Oklahoma and other states eastward. It is already documented in Florida by many collections.

Voucher specimen. **ARKANSAS. Nevada Co.:** flat clear-cut woods along Co. Rd 221 E of Co. Rd 37, N of Missionary Grove Baptist Church, N of Prescott, 19 Aug 1999, *Thomas* and *Young 162,394* (TEX).

Symphyotrichum puniceum (L.) A. & D. Löve var. **scabricaule** (Shinners) Nesom. Variety *scabricaule* previously has been recorded from localities in Texas, Louisiana, and Mississippi (Nesom 1997).

Voucher specimen. **ALABAMA. Chambers Co.:** 1.9 mi NW of Penton, seepage area in granite outcrop area, 17 Oct 1969, *Kral 37887* (BRIT, VDB-5 sheets).

SIDA 20(1): 403 – 404. 2002

The occurrence of *Symphyotrichum puniceum* in Alabama was documented by Mohr (1901), who noted that the only collection was by F.S. Earle from Auburn in Lee County in the east-central section of the state (immediately adjacent to Chambers County). Mohr noted that the plants grew in "swampy borders of woods" in "metamorphic hills" of the "mountain region." Both Alabama localities are at the southwestern extreme of the southward Appalachian extension of the range of *S. puniceum* through Georgia. Some of the distinctly montane Georgia populations are typical in morphology (var. *puniceum*) while others (e.g., Haralson Co., *Kral 77182*-VDB) show features of var. *scabricaule*, especially in reduction of the uppermost leaves. Prior to this report, var. *scabricaule* was considered a Gulf coastal plain endemic (Nesom 1997). Chambers and Lee counties are slightly north of the coastal plain (as marked by the boundary between Cretaceous and older Paleozoic formations, e.g., see Sorrie & Weakley 2001). Lee County, however, is included in four of the geographic patterns of coastal plain endemism shown Sorrie and Weakley.

Kartesz (1999) includes *Symphyotrichum puniceum* for Alabama as var. *puniceum*, but the morphology of the plants suggests that identification as var. *scabricaule* is more appropriate. The lower leaf surfaces are about the same color as the upper surfaces, without a reticulum of dark veins, the main veins of the upper leaf surfaces are shallowly impressed, giving a slightly rugose appearance, and the leaves of the capitulescence are markedly reduced in size compared to the lower.

ACKNOWLEDGMENTS

I am grateful to the staffs at BRIT, GH, NCU, TEX, and VDB for help during recent studies in those herbaria and to Bob Kral and Michael Woods for review comments.

SIX NON-NATIVE SPECIES NEWLY DISCOVERED IN THE IOWA VASCULAR FLORA

Allison W. Cusick

Division of Natural Areas and Preserves
Ohio Department of Natural Resources
1889 Fountain Sq. Ct., F-1
Columbus, OH 43224, U.S.A.

With the continuing invasion of indigenous floras by non-native elements, it is important to document early appearances of alien species. This paper focuses on six species that have appeared in the Iowa vascular flora in recent years. Two species were first noted in 1976 and 1981, the remainder in 2000. None of these species are included in the checklist of Iowa vascular plants by Eilers and Roosa (1994). Single populations of two species were first reported in Norris et al. (2001). This paper documents additional populations. Although these species are not widespread as yet in the state, there probably is no barrier to their spread. Most are weeds of ornamental plantings and are spread primarily via horticultural materials. Most previous studies of horticultural introductions have focused on the spread of woody landscape plants (Vincent & Cusick 1998). The present work concerns the incidental introduction of herbaceous species. One shrub discussed below, *Tamarix parviflora* DC., potentially is a serious pest species, however. Careful searching should yield additional Iowa populations of all six species.

Specimen citations are abbreviated and full details are available from the author.

Anethum graveolens L. (APIACEAE). Culinary dill is a sporadic waif in North America. Apparently, this is the first report of this herb in the Iowa flora.

Des Moines Co.: bank of Mississippi River, US Hwy. 34 bridge, Burlington, 15 Jul 2000, *Cusick 35548* (ISC, MICH).

Fatoua villosa (Thunb.) Nakai (MORACEAE). Mulberry-weed is an annual species from Asia which now is common throughout the southeastern United States. It typically grows in nurseries and amid ornamental plantings. It also is a common adventive in greenhouses. The Iowa population is a northwestern range extension from southern Missouri and central Ohio (Wunderlin 1997). In the north, *Fatoua villosa* is restricted to protected situations, such as walls and south-facing slopes. The climate at the Muscatine County site is moderated by the nearby Mississippi River. Mulberry-weed likely will be found at other places along the river in southern Iowa.

SIDA 20(1): 405 – 407. 2002

Muscatine Co.: nursery on terrace of Mississippi River, St. Hwy. 22, Muscatine, 21 Jul 2000, *Cusick 35602* (ISC, MICH, MU, OSH).

Oxalis corniculata L. (OXALIDACEAE). This species is adventive from tropical America. In the southern U.S., it is widespread in ornamental plantings. It is common in greenhouses as well (Lourteig 1979). As with *Fatoua villosa*, it apparently spreads as a contaminant with potted ornamentals, based upon the author's personal observations of nursery material.

Black Hawk Co.: lawn, Gilchrist Hall, University of Northern Iowa campus, 1 Apr 1981, *T. Lammers 4028* (ISC). **Muscatine Co.:** nursery on terrace of Mississippi River, St. Hwy. 22, Muscatine, 21 Jul 2000, *Cusick 35603* (ISC).

Sagina procumbens L. (CARYOPHYLLACEAE). European pearlwort was first reported in Iowa from Story County where it was discovered in 2000 (Norris et al. 2001). It is common throughout the northeastern and northwestern U.S., but sporadic in Midwestern states. This perennial species typically grows in crevices in walls and sidewalks and as a weed in ornamental plantings. The similar annual, *Sagina decumbens* (Ell.) T.&G., grows in comparable situations and occurs near Iowa in northcentral Illinois (Crow 1978).

Cerro Gordo Co.: garden store, 4th St. SW & S Polk Ave., Mason City, 19 Jul 2000, *Cusick 35588* (ISC); **Muscatine Co.:** nursery on terrace of Mississippi River, St. Hwy. 22, Muscatine, 21 Jul 2000, *Cusick 35601* (ISC).

Tamarix parviflora DC. (TAMARICACEAE). Salt cedar is a widespread invasive species of riparian corridors throughout the western United States. It is a serious pest, often forming a monoculture that reduces natural biodiversity (Weisenborn 1996). The plants are isolated at the Des Moines County station, with no planted material nearby. Its presence in the Iowa flora should be closely monitored. Extirpation of the shrubs at the single known site probably is warranted.

Des Moines Co.: two tall shrubs, edge of pond, Sullivan Slough Rd., S of Burlington, 15 Jul 2000, *Cusick 35555* (ISC, MICH).

Viola arvensis Murray (VIOLACEAE). A single previous collection of European field pansy from Story County, Iowa in 1998 has been reported (Norris et al. 2001). Unlike most violets, this is an annual species that may bloom in any month of the growing season.

Cerro Gordo Co.: nursery, St. Hwy . 122, Mason City, 17 Jul 2000, *Cusick 35585* (ISC). **Des Moines Co.:** flowerbed, 1326 Griswold St, Burlington, 4 Jul 1976, *T. Lammers 876* (ISC).

ACKNOWLEDGMENTS

I thank Diana H. Horton of the University of Iowa and Deborah Q. Lewis of Iowa State University for their assistance with this article. My research was supported in part by the Division of Natural Areas and Preserves, Ohio Department of Natural Resources.

ABSTRACT

The authors provide a list of 41 additions, reinstatements, and significant range extensions for the flora of Arkansas. *Alternanthera paronychioides, Bowlesia incana, Eleocharis montevidensis, Hypoxis curtissii, Nandina domestica, Polygonum setaceum,* and *Trifolium lappaceum* are reported as new and persistent elements, while *Ipomea ×leucantha, Mirabilis jalapa, Najas minor,* and *Veronica polita* are reinstated to the state flora. A number of alien weeds –*Cynoglossum zeylanicum, Eleusine tristachya, Euphorbia hirta, Scoparia dulcis, Tragopogon pratensis, Trifolium nigrescens, Verbena montevidensis*– are noticed and documented for the first time, however, their persistence is not known

RESUMEN

Los autores proporcionan una lista donde se enumeran 41 adiciones, restablecimientos, y extensiones de área significativas para la flora de Arkansas. *Alternanthera paronychioides, Bowlesia incana, Eleocharis montevidensis, Hypoxis curtissii, Nandina domestica, Polygonum setaceum,* y *Trifolium lappaceum* son citadas como componentes nuevos y persistentes del área, mientras que *Ipomea X leucantha, Mirabilis jalapa, Najas minor,* y *Veronica polita* son una rehabilitación paraa la flora del estado. Un número de malas hierbas de origen alóctono—*Cynoglossum zeylanicum, Eleusine tristachya, Euphorbia hirta, Scoparia dulcis, Tragopogon pratensis, Trifolium nigrescens, Verbena montevidensis* – son mencionadas y documentadas por primera vez, sin embargo, su persistencia no es conocida.

The authors provide a list of 41 taxa representing additions and reinstatements to the Arkansas flora as well as noteworthy range extensions within the state. Herbarium abbreviations are taken from Holmgren et al. (1990).

AMARANTHACEAE

Alternanthera paronychioides St. Hilaire. Thomas discovered large populations of this prostrate chaff-flower around the edge of borrow pits inside the Mississippi River levee, in Chicot and Lincoln counties, in August and September, 2000. Duplicate specimens were confirmed by Kenneth R. Robertson of the Illinois Natural History Survey in Champaign.

Voucher specimens: **Chicot Co.:** *Thomas 166,893 & 167,194* (NLU, UAM). **Lincoln Co.:** *Thomas & Sundell 167,417* (NLU, UAM).

SIDA 20(1): 409 – 418. 2002

APIACEAE

Bowlesia incana Ruiz and Pavon is a decumbent annual of low woods, clearings, lawns, and other moist, weedy places, occurring sporadically in Louisiana and eastern Texas (Thomas and Allen 1996, Diggs et al. 1999). We record its first appearance in Arkansas from Chicot County in the southeast corner of the state, along a road bank as well as in alluvial woods along Indian Creek south of Eudora.

Voucher specimens: **Chicot Co.:** *Thomas 164,552* (NLU), *164,589* (NLU, UAM).

Sanicula smallii Bickn. Smith (1988) documents this cryptic black snakeroot from two counties in the Ozark Mountains. We add collections from the Ouachita Mountains and the Coastal Plain and suggest that the species might be undercollected in Arkansas. It is distinguished in the field from the widespread *S. canadensis* by rather subtle characters: sessile, slightly larger fruits and semi-succulent leaves. (The tuberous, thickened roots are only helpful *after* the plant has been recognized.) In addition, in at least one of our populations the two woodland species were mixed, with *S. canadensis* much the more common.

Voucher specimens: **Bradley Co.:** *Leslie 438B* (NLU) **Lafayette Co.:** *Sundell, Thomas, & Amason 12,300* (UAM). **Montgomery Co.:** *E. & J. Sundell 11,826* (UAM). **Ouachita Co.:** *Thomas & Doffitt 163,219* (NLU). **Union Co.:** *Thomas 104,816* (NLU).

ASTERACEAE

Hypochoeris glabra L. Smith (1988) documents smooth cat's ear, a European weed, from two counties in south Arkansas. We supply voucher specimens for his two *Atlas* reports ("R" for Ashley and Bradley counties) and add eight additional counties to the record.

Voucher specimens: **Ashley Co.:** *Hooks 253* (NLU). **Bradley Co.:** *Leslie 1756* (NLU). **Cleveland Co.:** *Thomas 135,389* (NLU). **Conway Co.:** *Edwin B. Smith 4032* (UAM). **Lafayette Co.:** *Thomas, Sundell & Amason 127,585* (NLU). **Miller Co.:** *Thomas 160,883* (NLU). **Nevada Co.:** *Thomas & Slaughter 104,341* (NLU, UAM). **Ouachita Co.:** *Thomas & Doffitt 169,040* (NLU). **Sevier Co.:** *Thomas, Sundell & Amason 166,304* (NLU). **Union Co.:** *Sundell, Thomas, & Amason 8210* (UAM).

Marshallia caespitosa Nutt. In May, 1999, lavender-flowered Barbara's buttons was known in Arkansas from eleven occurrences recorded in the Arkansas Natural Heritage Commission data base. During a field study commissioned by the Heritage Commission, ten of those populations, scattered in glades and open, riparian communities in the Ozark and Ouachita highlands, were relocated and several voucher specimens made.

Voucher specimens (**M. caespitosa** Nutt. var. **caespitosa**): **Carroll Co.:** *Sundell & Wallace 12,617* (UAM). **Madison Co.:** *Dalton & Dow 1a* (UARK). **Montgomery Co.:** *Sundell & Wallace 12,576* (UAM, UARK), *Sundell & Wallace 12,585* (UAM).

Voucher specimens (**M. caespitosa** Nutt. var. **signata** Beadle & Boynt): **Perry Co.:** *Thomas 139,690* (NLU). **Pulaski Co.:** *Sundell & Wallace 12,574* (UAM).

Tragopogon pratensis L. lacks the inflated peduncles of *T. dubius*, the common

goat's beard of the roadsides of north Arkansas. *T. pratensis* is widely established in the northern U.S., extending south to Tennessee (Cronquist 1980), but has not previously been reported from Arkansas.

Voucher specimen: **Lawrence Co.:** *Sundell 10,417* (UAM).

BERBERIDACEAE

Nandina domestica Thunb. A candidate for the most popular ornamental shrub in south Arkansas, "heavenly bamboo" is not documented as a naturalized species of the state flora. It both persists after cultivation and escapes (presumably dispersed by birds) to open areas and wood margins where it is sufficiently competitive to reach reproductive maturity.

Voucher specimen: **Ashley Co.:** *Sundell & McDonald 7619* (UAM).

BORAGINACEAE

Cynoglossum zeylanicum (Hornem.) Thunb. ex Lehm. This previously unreported hound's tongue grew as an aggressive pasture weed in Sevier County in the foothills of the Ouachita Mountains. In addition, a second collection is reported from sandy soil in Union County. The species is known in the Southeast from Texas (Jones et al. 1997; Diggs et al. 1999) and Louisiana (from Claiborne and Union parishes along the Arkansas border) (Thomas and Allen 1996). The burs (mericarps) are 3-4 mm long, smaller than those of *C. virginianum* and *C. officinale*.

Voucher specimens: **Sevier Co.:** *Tyler s.n.* (NLU, UAM, UARK). Union **Co.:** *Thomas 116,853* (NLU).

CAMPANULACEAE

Wahlenbergia marginata (Thunb.) DC. was first reported for Arkansas (Thomas et al. 1991) from a road bank in Union County. The species was rediscovered in 2000 along railroad tracks on the south side of Camden.

Voucher specimen: **Ouachita Co.:** *Thomas & Doffitt 167,860* (NLU).

COMMELINACEAE

Murdannia keisak (Hassk.) Hand.-Mazz. We add two more documented occurrences of this easily overlooked, rambling, succulent-stemmed herb, previously known in Arkansas from two localities (Sundell et al. 1999).

Voucher specimens: **Faulkner Co.:** *Thomas & Sundell 164,429* (NLU). **Ouachita Co.:** *Thomas & Doffitt 63,274* (NLU).

CONVOLVULACEAE

Ipomea × **leucantha** Jacq. The pink bindweed treated by Fernald (1950) and Smith (1988) as *Ipomoea lacunosa* L. forma *purpurata* Fern. is recognized by Austin (1978) as a natural hybrid between *I. lacunosa* and *I. trichocarpa* Ell. (*I. cordatotriloba* Dennst.). We add a third county record to the two cited in Smith, all three in the Mississippi Delta of southeast Arkansas.

Voucher specimen: **Drew Co.:** *Sundell & Wiley 8686* (UAM).

Ipomea cordatotriloba Dennst. We add three county records, from agricultural sites, to the documented Arkansas distribution (Lafayette County, Smith 1988) of this weedy purple morning glory.

Voucher specimens: **Crittenden Co.:** *Thomas 113,405* (NLU, UAM). **Jefferson Co.:** *Thomas 147,277* (NLU, UAM). **Ouachita Co.:** *Thomas & Doffitt 167,857* (NLU)

CUCURBITACEAE

Citrullus lanatus (Thunb.) Matsum. & Nikai var. **lanatus**. Six collections from southeast Arkansas document the status of watermelon at least as a waif in the state flora.

Voucher specimens: **Bradley Co.:** *Thomas & Amason 141,965* (NLU, UAM). **Calhoun Co.:** *Sundell et al. 12,536* (UAM). **Chicot Co.:** *Thomas 164,414* (NLU). **Lincoln Co.:** *Thomas & Sundell 167,480* (NLU). **Ouachita Co.:** *Thomas & Doffitt 167,999* (NLU). **Union Co.:** *Thomas 111,808* (NLU).

CYPERACEAE

Eleocharis montevidensis Kunth is known from northern Louisiana (Thomas and Allen 1993) and included in Smith's *Keys to the flora of Arkansas* (1994) as a possible addition to the state flora. We document its occurrence with a collection from Lake June in Stamps, in southwest Arkansas.

Voucher specimens: **Lafayette Co.:** *Sundell, Thomas, & Amason 12,273* (UAM, UARK).

Websteria confervoides (Poir.) Hooper (*Scirpus confervoides* Poir. in Lam.). Walker and Campbell (1997) first reported this submersed, aquatic sedge in Arkansas from a Jefferson County collection. We add two collections from Union County. The species is rather broadly distributed in Louisiana (twelve parishes, four along the Arkansas border; Thomas & Allen 1993) and probably more widespread in southern Arkansas than we know.

Voucher specimens: **Jefferson Co.:** *Walker 1206961* (UAM). **Union Co.:** *Thomas & Amason 143,312* (NLU, UAM); *Crossland s.n.* (UAM).

ELATINACEAE

Bergia texana (Hook.) Seub. ex Walp. Collections from the banks of the Red River and the Arkansas River represent the third and fourth confirmed occurrences of this species in Arkansas.

Voucher specimens: **Lafayette Co.:** *Thomas 120,776* (NLU). **Lincoln Co.:** *Thomas & Sundell 167,421* (NLU).

EUPHORBIACEAE

Caperonia palustris (L.) St.-Hil. is a wetland weed of tropical American origin known to occur in the U.S. in south Florida, Louisiana and southeast Texas (Godfrey & Wooten 1981). Smith (1988) has seen specimens from three Mississippi Delta counties in southeast Arkansas to which we add a fourth, where plants were collected from a rice field.

Voucher specimen: **Jefferson Co.:** *Brady Harmon s.n.* (UAM).

Euphorbia hirta L. was found growing as a weed in a flower bed in southeast

Arkansas, its stems ascending above a mat of *E. maculata* L. The species is previously unreported for Arkansas.

Voucher specimens: **Bradley Co.:** *Sundell 15,130* (BRIT-SMU, NLU, NY, UAM, UARK).

Phyllanthus tenellus Roxb. was reported (Sundell et al. 1999) as a tentative addition to the Arkansas flora from weeds escaping their containers at a Drew County nursery. We add a second locality, Ellis's Nursery in Fountain Hill, Ashley County, where again plants arriving as weeds in containers from Louisiana and Texas have spread aggressively throughout the nursery's grounds and greenhouses.

Voucher specimens: **Ashley Co.:** *E. & M. Sundell 13,039* (BRIT-SMU, NLU, UAM, UARK).

FABACEAE

Lathyrus aphaca L. Previously documented only from Miller County in southwest Arkansas (Smith 1988), this unique Eurasian peavine (the stipules functionally replace the leaflets) was collected on a roadbank in central Arkansas. Established on the West Coast (Isely 1998), the species is apparently taking hold in the Southeast as well. It was first reported for the region from Tennessee in 1972 (Beardsley and Browne) and recently from Texas in 1997 (Jones and Reznicek). Thomas and Allen (1998) map collections from four Louisiana parishes.

Voucher specimens: **Conway Co.:** *Thomas & Amason 135,545* (NLU, UAM).

Medicago minima (L.) Bartal. A fourth Arkansas county is added to the record for little bur clover.

Voucher specimen: **Washington Co.:** *Sundell, Thomas & Amason 14,155* (UAM).

Trifolium lappaceum L. Lappa clover is a distinctive Old World clover naturalized on the Gulf Coast from Alabama to east Texas (Isely 1990). It is reported here as new to Arkansas from Grandview Prairie, near Columbus, in Hempstead County. The Arkansas Game and Fish Commission is successfully restoring this blackland prairie site to its original vegetation. Plants were collected in a restored area dominated by compass plant (*Silphium laciniatum*) and purple and white prairie clovers (*Dalea purpurea, D. candida*)—a spring alien among summer natives.

Voucher specimen: **Hempstead Co.:** *Sundell 12,371* (UAM).

Trifolium nigrescens Viviani. Ball clover is a sprawling, weedy annual from southern Europe and southwest Asia recently introduced into the southeastern United States (Isely 1998). Two collections from ruderal sites document its occurrence and extend its range as a naturalized species in Arkansas. Ball clover is easily mistaken for alsike clover (*T. hybridum*) but distinguished by the smaller umbels and scarious (rather than membranous), more subulate stipules.

Voucher specimens: **Bradley Co.:** *Thomas & Leslie 92,208 & 974* (NLU, UAM). **Drew Co.:** *Sundell 13,172* (NLU, UAM, UARK).

HYPERICACEAE

Hypericum nudiflorum Michx. Smith (1988) documents this shrubby St. John's wort from Drew County in southeast Arkansas. We here confirm his report (no voucher specimen was seen) of the species' presence in Ashley County with two collections, and we document two additional counties.

Voucher specimens: **Ashley Co.:** *Sundell, Hartrick, & Etheridge 7234* (UAM); *Thomas 97,093* (NLU). **Poinsett Co.:** *Thomas 10,314* (NLU). **Union Co.:** *Thomas 107,901* (NLU).

LAMIACEAE

Melissa officinalis L. Smith (1988) records lemon balm as an adventive from several Ozark and Ouachita Mountain counties. We here make note of a collection from the Coastal Plain.

Voucher specimen: **Grant Co.:** *Thomas & Sundell 164,430* (NLU).

LILIACEAE

Hypoxis curtissii J. Rose (*H. leptocarpa* (Engelm. & Gray) Small) grows in swamps and floodplain forests of the Atlantic and Gulf coastal plains (Godfrey and Wooten 1979). We record it as new to the state from Bodcaw Creek, in southwest Arkansas, where it occurred with *Styrax americana, Planera aquatica, Fraxinus caroliniana,* and *Crataegus opaca* under an overstory of *Quercus lyrata.*

Voucher specimens: **Lafayette Co.:** *Sundell, Thomas, & Amason 12,342* (UAM, UARK).

Lycoris radiata (L'Her.) Herb. With its leaves appearing in autumn after the flowers, red spider lily is nicely adapted to the annual lawn mowing rhythms of most homeowners and has become a common lawn weed in southeast Arkansas as well as an occasional waif in other disturbed sites. We note its presence in the Arkansas flora with three collections.

Voucher specimens: **Chicot Co.:** *Thomas 163,666* (NLU). **Drew Co.:** *Sundell 9,239* (UAM). **Ouachita Co.:** *Thomas & Doffitt 167,947* (NLU)

NAJADACEAE

Najas minor Allioni. Northeast Arkansas is included by Haynes (1979) within the range of this distinctive Old World naiad, but neither localities nor specimens are cited. Thomforde's collection from the shallow margin of a goldfish pond in central Arkansas (21 August 2000) reconfirms the species' occurrence in the state. Recent north Louisiana collections unknown to Haynes (Thomas & Allen 1993) suggest that *Najas minor,* which apparently invaded North America around 1930, may still be extending its range to the west and is likely more widespread in Arkansas than we know.

Voucher specimen: **Lonoke Co.:** *Thomforde s.n.* (UAM)

NYCTAGINACEAE

Mirabilis jalapa L. Reported by Leslie (1986) but excluded by Smith (1988) as a naturalized element in Arkansas, four o'clock is reinstated with roadside col-

lections from the Ozark Highlands and the Coastal Plain. At none of the sites did plants appear to be merely persisting after cultivation. Four o'clock is mapped by Thomas and Allen (1998) from six of eight of Louisiana's northern tier of parishes.

Voucher specimens: **Bradley Co.:** *Thomas & Amason 142,066* (NLU, UAM). **Newton Co.:** *Thompson 685* (NLU). **Union Co.:** *Thomas & Amason 111,373* (NLU, UAM).

POACEAE

Andropogon ischaemum L. var. **songaricus** Rupr. ex Fisch. & Mey. (*Bothriochloa ischaemum* (L.) Keng var. *songaricus* (Rupr.) Celerier & Harlan), an intrusive, pernicious Eurasian bluestem, is common to the roadsides and pastures of the southern Great Plains (Gould 1975, Great Plains Flora Association 1986). It has become widespread in Louisiana (Thomas & Allen 1993) and an occasional weed east to Florida (Wunderlin 1998). We add three counties to its documented occurrence (Franklin Co.) in Arkansas.

Voucher specimens: **Drew Co.:** *Sundell 15,128* (NLU, NY, UAM, UARK). **Miller Co.:** *Miesner s.n.* (UAM). **Ouachita** Co. *Thomas & Doffitt 168,023* (NLU).

Eleusine tristachya (Lam.) Lam., a diminutive goosegrass of African origin, is known as a waif in North America from a few scattered localities (Hitchcock and Chase 1950, Kucera 1998) and is apparently naturalized in California (Smith 1993). We report it as a new record from northeast Arkansas, where it occurred as a lawn weed.

Voucher specimen: **Independence Co.:** *S.D. Carter s.n.* (UAM).

POLYGONACEAE

Fagopyrum esculentum Moench. Buckwheat spreads easily from cultivation to waste places but seldom persists (Great Plains Flora Association 1986, Steyermark 1963). Collections from a small population at the edge of a campus parking lot mark the species' first documented occurrence as a waif in Arkansas.

Voucher specimens: **Drew Co.:** *Sundell 12,567* (UAM, UARK).

Polygonum setaceum Baldwin. Godfrey and Wooton (1981) include Arkansas within the range of this widespread smartweed, and Smith (1988) made note of the species as a possible addition to the state flora based on its occurrence in several Louisiana parishes along Arkansas' southern border (MacRoberts 1988). We confirm its presence with voucher specimens from three counties.

Voucher specimens: **Chicot Co.:** *Thomas 163,358* (NLU). **Hot Spring Co.:** *Sundell & Crank 10,733* (UAM). **Union Co.:** *Thomas 112,374* (NLU).

RUBIACEAE

Diodia dasycephala C.&S. Especially in the field, "perennial poorjoe" so closely resembles *Spermacoce glabra* (rather than either of the common, congeneric

buttonweeds, *D. teres* and *D. virginiana*) that it has perhaps been overlooked and misidentified as often as any taxon in southern Arkansas. The two can be distinguished vegetatively. Leaves of the *Diodia* are shorter and dry greener; those of the *Spermacoce* are more prominently veined beneath. *Spermacoce glabra* bears numerous, whitish scalelike hairs at the stipular sheath summit beneath and between the bristles while *D. dasycephala* possesses a (more or less) prominent vein that traverses the broader summit of the glabrous stipular sheath just below its bristle-bearing margin. *Diodia dasycephala* is documented from six parishes in north Louisiana (Thomas & Allen 1998) and two counties in southeast Arkansas (Smith 1988). We add three more counties to the record, one from central Arkansas.

Voucher specimens: **Chicot Co.:** *Thomas 164,170* (NLU). **Faulkner Co.:** *Sundell & Thomas 15,954* (NY, UAM, UARK). **Lafayette Co.:** *Thomas, Sundell, & Amason 156,442* (NLU).

SCROPHULARIACEAE

Lindernia crustacea (L.) F. von Muell. is a wetland species, originally from southern Asia, that occurs sporadically in the coastal plain of the Southeast (Godfrey & Wooten 1981). Our collection represents the second documented occurrence in Arkansas.

Voucher specimen: **Pulaski Co.:** *Sundell 12,437* (UAM).

Scoparia dulcis L. Thomas and Amason collected this tropical American weed in a clearcut. It is known regionally from the Gulf Coast states (Correll & Johnston 1970) but unreported for Arkansas.

Voucher specimens: **Cleveland Co.:** *Thomas & Amason 158,319* (NLU, UAM).

Veronica hederifolia L. is confirmed by Smith (1988) for two northwest Arkansas counties. We add four more counties to the record of this relatively distinctive speedwell.

Voucher specimens: **Chicot Co.:** *Thomas 164,620* (NLU). **Mississippi Co.:** *Barbee 24* (UAM). **Pulaski Co.:** *Burgess & Bernstein 001* (UAM). **Saline Co.:** *Thomas & Amason 148,563 (NLU).*

Veronica polita Fries appears sufficiently distinct from *V. agrestis* to be recognized as a separate species. Specimens seen by Smith (especially at UARK), who merges the two in the Arkansas *Atlas* (1988), should probably be reexamined for additional material of the former species. We document the presence of *V. polita* in Arkansas from four counties.

Voucher specimens: **Baxter Co.:** *Hyatt 1063.03* (UAM). **Drew Co.:** *Sundell 10,755* (UAM). **Garland Co.:** *Demaree 59,995* (NLU). **Washington Co.:** *Sundell 12,263* (UAM).

VERBENACEAE

Verbena montevidensis Spreng. Thomas and Allen (1998) record this slender vervain from three parishes in central and eastern Louisiana. Four collections from south Arkansas suggest that it may have become established in this state as well.

Voucher specimens: **Ashley Co.:** *Thomas and Hooks 92,761* (NLU, UAM). **Bradley Co.:** *Thomas 90,519* (NLU). **Chicot Co.:** *Thomas 166,906* (NLU). **Union Co.:** *Thomas & Amason 111,853* (NLU).

ZANNICHELLIACEAE

Zannichellia palustris L. Horned pondweed is documented from three counties in the Ozark Plateau of northeast Arkansas (Smith 1988). Two collections of the submersed aquatic from central and southwest Arkansas extend its range to the Mississippi River Alluvial Plain and West Gulf Coastal Plain.

Voucher specimens: **Howard Co.:** *Lawson 2117* (NLU). **Lonoke Co.:** *Thomforde s.n.* (UAM).

ACKNOWLEDGMENTS

The authors express their appreciation to Isabel Bacon of the School of Arts and Humanities, University of Arkansas at Monticello, for translating the English abstract into Spanish. Thanks also to Ralph W. Tyler of the Sevier County Extension Service for his efforts in collecting additional specimens of *Cynoglossum zeylanicum*, to Hugh Thomforde of the Lonoke Agricultural Center for his collections of *Najas minor* and *Zannichellia palustris*, and to Judy Griffith of Ninestone Land Trust in Carroll County for leading us to a splendid population of *Marshallia caespitosa* in full bloom.

ABSTRACT

A population of the federal noxious weed *Commelina benghalensis* L. (Commelinaceae) was recently identified in a soybean field in North Carolina. Voucher specimens are cited and an updated key to *Commelina* in the Carolinas is presented.

RESUMEN

Se identifica una población de la hierba nociva federal *Commelina benghalensis* L. (Commelinaceae) en un campo de semilla de soja en Carolina del Norte. Citamos especímenes y presentamos una clave nueva para *Commelina* en las Carolinas.

A common paleotropical weed, *Commelina benghalensis* L. (Tropical spiderwort, Benghal dayflower) has been previously collected in the southeastern United States only in Florida, Georgia, and Louisiana (Faden 1993; Thomas & Allen 1993). The taxon has not been reported for North Carolina by Radford et al. (1968), Kral (1981), or Faden (1993, 2000). Federally listed as a noxious weed in 1983 (Lasseigne 1983), *C. benghalensis* has primarily been found in citrus plantations, fields, yards, and other cultivated and disturbed sites in the southeast as far north as Georgia, as well as in California (Faden 1993). During a field survey, a population of this weed was identified in a soybean field in Goldsboro, Wayne County, in the Coastal Plain of North Carolina. The infestation occurs over an area of less than 2 ha, north of SR 1008 and near the Southern Railway. The density is quite high at the edges of the crop plots and lower in neighboring (intensively managed) cotton and soybean plots. The weed was first noticed about three years ago, but was thought to be a different species (*Commelina caroliniana* Walter occurs in a neighboring field). Representative material was prepared for deposit at NCSC, US, and USCH in Oct 2001.

SIDA 20(1): 419 – 422. 2002

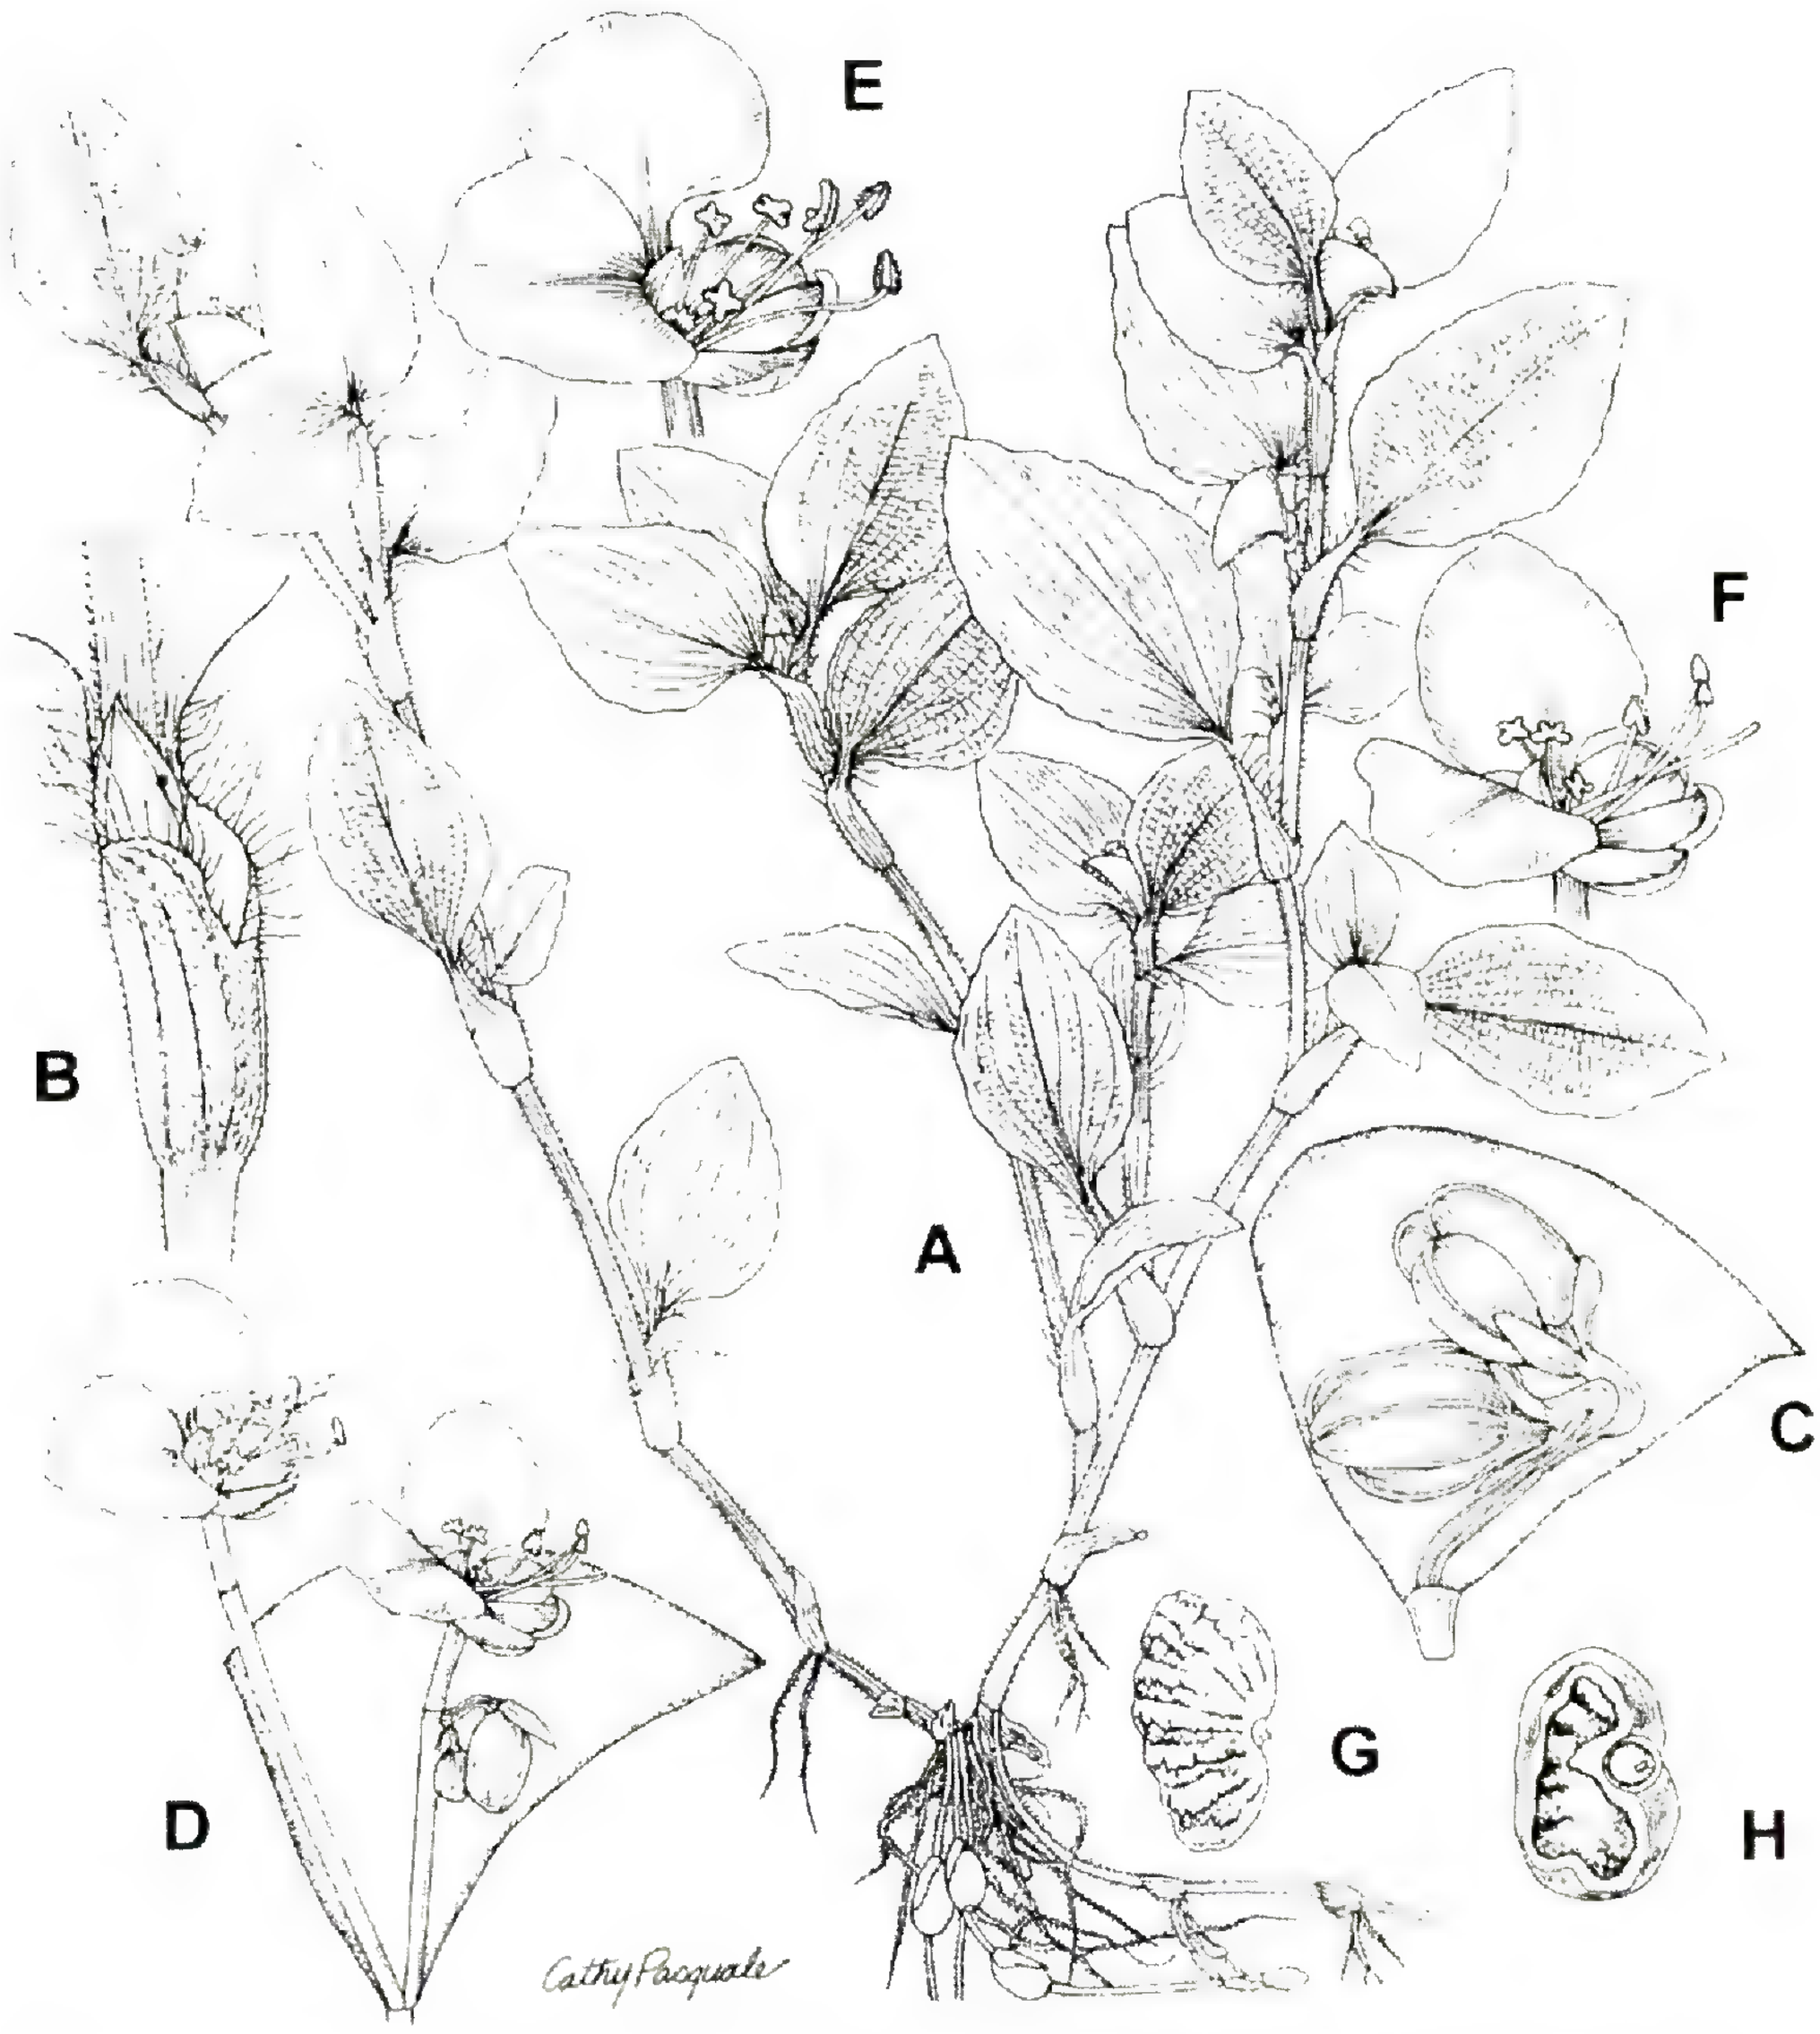

FIG. 1. *Commelina benghalensis* L. A, Whole plant, showing above ground and below ground inflorescence; B, Leaf sheath; C, Dissection of spathe with buds; D, Dissection of spathe, showing position of flowers; E, Imperfect, staminate flower; F, Perfect flower; G, seed from below ground fruit; H, Dissection of seed from above ground fruit. A-B based on *Tsiang 2498* (NY); C-H based on *Seydel 203* (MO). Illustration by Cathy Pasquale, courtesy of the U.S. Dept. Agric., Animal and Plant Health Inspection Service.

Voucher specimens: **U.S.A. NORTH CAROLINA. Wayne Co.:** Goldsboro, in a soybean field, 35.397 deg N, 78.046 deg W, 27 Sep 2001, *Burton, Hoyle, and Mendoza s.n.* (NCSC, US, USCH).

Commelina benghalensis L. (Fig. 1) can be distinguished from its southeastern congenerics by the often clustered, infundibuliform spathes, the relatively broad leaves, often bearing reddish hairs on the sheath apex, and the basally-borne,

sometimes subterranean cleistogamous flowers in addition to chasmogamous flowers. An updated key, largely adapted from Faden (2000) follows:

KEY TO *COMMELINA* IN THE CAROLINAS

1. Spathes with margins connate basally.
   2. Roots stout; leaf sheaths auriculate apically; proximate petal white, minute; locules all 1-seeded _____ **Commelina erecta** L.
   2. Roots thin; leaf sheaths not auriculate; proximate petal blue to lilac or lavender, conspicuous; some locules 2-seeded.
      3. Perennial with erect to ascending stems; lamina lanceolate-elliptic to lanceolate oblong, the apex acuminate; spathes 1.5–3.5 cm long; subterranean, cleistogamous flowers absent _____ **Commelina virginica** L.
      3. Annual with ascending to decumbent or occasionally scrambling stems; lamina ovate to lanceolate-elliptic, the apex rounded, obtuse, or acute; spathes 0.5–2 cm long; subterranean, cleistogamous flowers usually present _____ **Commelina benghalensis** L.
1. Spathes with margins free to base.
   4. Spathes typically discolored whitish or pale green near peduncle with contrasting, darker green veins; proximal petal whitish or paler than the others; capsules 2 locular; seeds rugose pitted-reticulate _____ **Commelina communis** L.
   4. Spathes uniformly colored, without contrasting veins; proximal petal essentially colored as the others; capsules 3-locular; seeds reticulate or smooth to somewhat alveolate.
      5. Spathes typically distinctly falcate; distal cyme in larger spathes usually well-developed, 1-several-flowered; seeds reticulate _____ **Commelina diffusa** Burman f.
      5. Spathes not falcate to only slightly so; distal cyme in larger spathes usually vestigial (rarely well-developed, 1-flowered); seeds smooth to somewhat alveolate _____ **Commelina caroliniana** Walter

ACKNOWLEDGMENTS

We thank: Jamie Hinton and Steve Hoyle (North Carolina State University) for their attention to detail; Gene Cross and David Patterson (NC Dept. Agric. & Consumer Services) for assistance in obtaining necessary transport permits; Rodney Young (APHIS) and Robert Faden (US) for confirming our identification; Robert Faden and an anonymous reviewer for thoughtful comments on the manuscript.

ABSTRACT

Agrostis avenacea J.F. Gmel. is reported from temporary and permanent ponds of the region of Huimilpan and Amealco of the state of Queretaro, Mexico. Previously, it was only known from Australia, south Africa, Argentina, Chile, United State of America, the Hawaiian Islands and recently from Costa Rica. Diagnostic morphological and anatomical characters and illustrations are provided, and collection data and voucher specimens are cited.

RESUMEN

Agrostis avenacea J.F. Gmel. se cita de charcos temporales y permanentes de la región de Huimilpan y Amealco en el estado de Querétaro, México. Anteriormente sólo se conocía de Australia, sur de África, Argentina, Chile, Estados Unidos de América, Islas Hawai y recientemente de Costa Rica. Se proporcionan caracteres morfológicos y anatómicos diagnósticos e ilustraciones y se citan los datos de las colectas y especímenes examinados.

INTRODUCTION

Agrostis is a genus of grasses that was described by J.F. Gmelin in 1791. The genus is included in the Aveneae tribe and Alopecurinae subtribe (Pohl & Davidse 1994; Valdés-Reyna & Dávila-Aranda 1995). As presently circumscribed, the genus includes about 125–220 species (Acosta-Castellanos 1990; Beetle 1983; Clayton & Renvoize 1986; McVaugh 1983; Watson & Dallwitz 1992) which grow in temperate and cold regions from both hemispheres. In the tropics, they are mostly restricted to the high altitude mountains. Currently, the most recent list of species for Mexico (Espejo-Serna et al. 2000) shows that 23 species are registered for Mexico. While conducting an aquatic flora project of the Queretaro state Mahinda Martínez made a collection of subaquatic grasses from the Huimilpan and Amealco municipalities that proved to be *Agrostis avenacea* J.F. Gmel. This collection represents the first record of *A. avenacea* from Mexico and increases the number of species to 24.

Plants annual, cespitose. Culms erect, thin, breakable, 20–60 cm tall, 1–2 mm broad. Leaf blade flat, 5–20 cm long, 1–3 mm broad. Ligule 2–5 mm long. Panicle open, lax, 15–30 cm long; branches thin, slender, inferiors as longer as inflorescence axis, spikelets on the tips of the branches. Glumes acute, 2–5 mm long, 1-nerved, scabrous on the keel. Lemma membranous, pilose, 1.4–1.6 mm long, 5-nerved, with a mid-dorsal once-geniculate awn. Palea membranous, 1.1–1.3 mm long, nearly as long as lemma, 2-nerved, tip bifid, callus pubescent. Chromosome number: 2n = 28. (Fig. 1A–F)

Habitat.—*Agrostis avenacea* grows on dry to moist soils, with abundant clay and from 15 to 2350 m in elevation. In Mexico, it is grows around small streams, temporary and permanent ponds, and at sites at 2280–2350 m in elevation. it is found as a member of the subaquatic vegetation (Fig 2B).

Distribution.—This species is native to Australia (Canberra, New South Wales, Queensland and Tasmania) and New Zealand. In the Missouri Botanical Garden's herbarium and VAST nomenclatural database (W^3 TROPICOS) (www.mobot.org), there are records of its introduction in South Africa, Argentina (Buenos Aires, depression of El Salado, Entre Ríos and Santa Fé) and Chile (Isla de Pascua) (Nicora & Rugolo 1987), as well as, some temperate regions of the United States of America (California, Texas and Ohio), and the Hawaiian Islands (Hawaii, Kauai, Molokai, Oahu) (Hitchcock 1950). Recently, it was recorded from San José, Costa Rica (Davidse 1998). In Australia, it is an abundant weed of inundated places (Vickery 1941). Nicora and Rugolo (1987) and Zuloaga et al. (1994) recognize this taxon in the segregate genus *Lachnagrostis*.

In Mexico, *Agrostis avenacea* was collected from the municipalities of Huimilpan and Amealco, in the southern portion of the state of Queretaro (Fig.

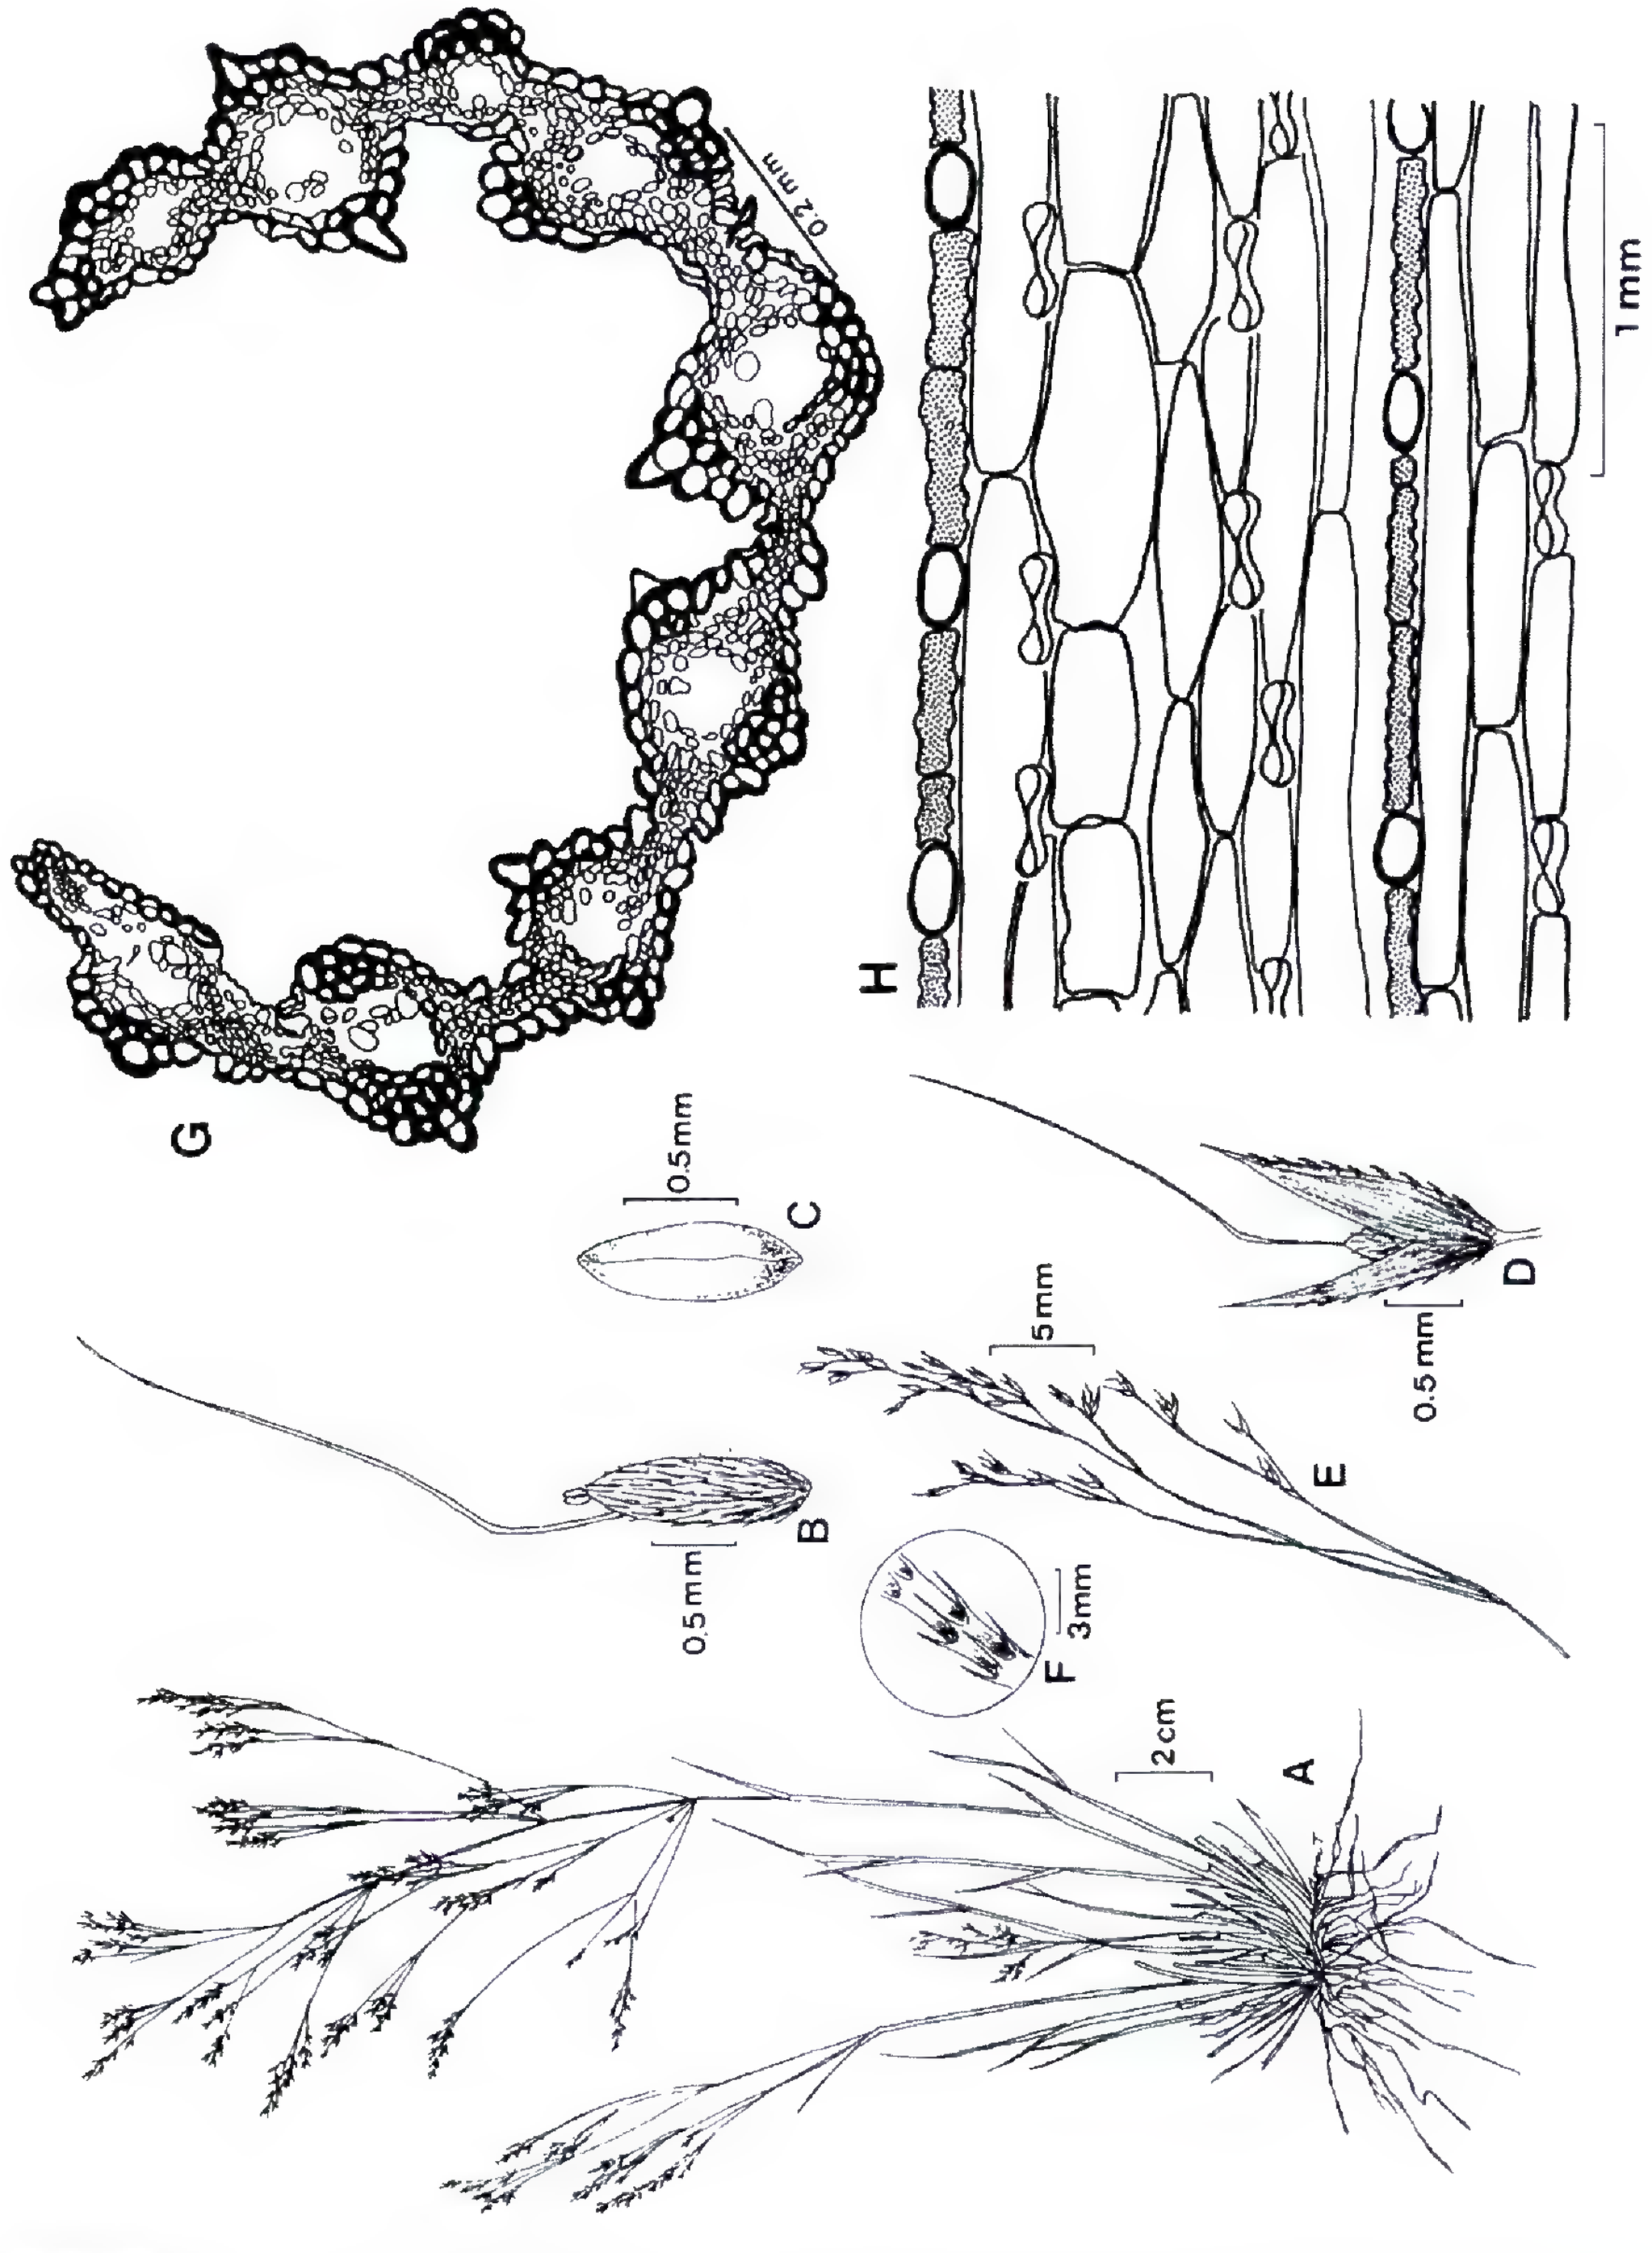

Fig. 1. *Agrostis avenacea* J.F. Gmel. (*M. Martínez 2936*, QMEX). A. Habit. B. Floret. C. Caryopsis. D. Spikelet. E. Inflorescence branches. F. Indument of inflorescence branches. G–H. Leaf blade anatomy. G. Detail of transverse section (*M. Martínez 2936*, QMEX). H. Abaxial epidermis as seen in surface view (*M. Martínez 2953*, QMEX). Stippling indicates the costal region in H.

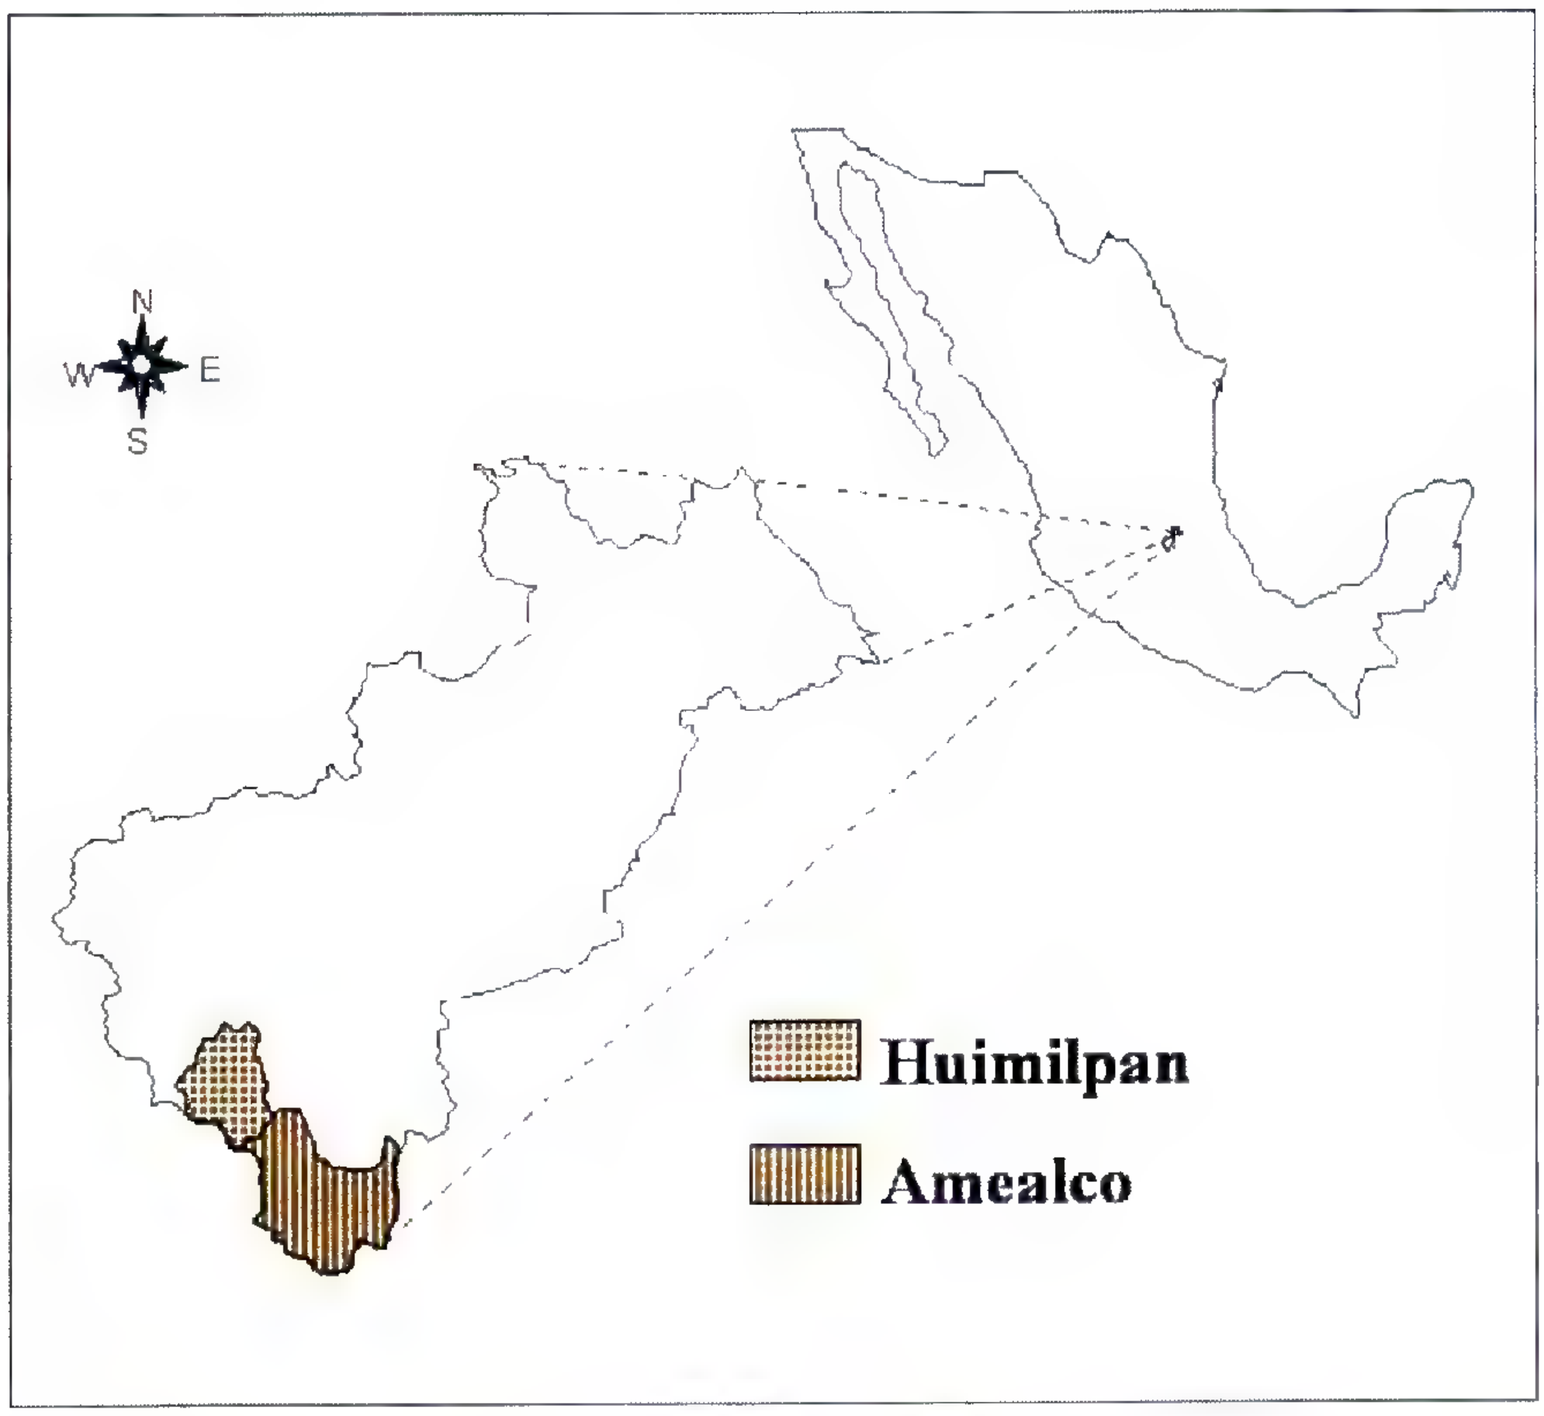
2A). This species has not been previously reported in any floristic study from Mexico. This taxon was introduced to U.S.A (Hitchcock 1950; Davidse et al. 1998). In California and texas, plants of *A. avenacea* act like tumble weeds and its dried panicles are carried widely by wind and in the process dispersing seeds. It is unknown whether the populations of *A. avenacea* from Mexico is the result of long-range wind dispersion, or by some other manner, such as by vehicles passing through wetlands and picking up spikelets and panicles. It is probable that this taxon is growing in other states of Northern Mexico, as well.

Specimens examined: **MÉXICO: Querétaro:** Mpio. Huimilpan, arroyo La Beata, km 42 carretera Querétaro-Amealco-La Beata, 20° 21' LN y 100° 13' LW, 2350 msnm, 15 May 1996, *Martínez 2936*. Mpio. Huimilpan, "La Calle," km 33 Carretera Querétaro-Amealco, hacia las afueras de Huimilpan, 20° 22.5' LN, 100° 16.5' LW, 2280 msnm, 15 May 1996, *Martínez 2952, 2953, 2955*; Mpio. Amealco, km 31 carretera Amealco-San Juan del Rio, 2 km al E de Amealco, charco permanente a la orilla de la carretera, 20 12.84' LN, 100° 9.16' LW, 2490 msnm, 25 Jul 1996, *Martínez 3331, 3333*; Mpio. Amealco, km 5 carretera Amealco-San Ildelfonso, charco temporal, 20° 10.80' LN, 100° 5.40' LW, 2640 msnm, 5 Nov 1996, *Martínez 3667* (QMEX, duplicates for distribution to IEB and MEXU)

Agrostis avenacea is distinguished by its slender, thin and lax inflorescences. The spikelets of mature inflorescences are easily dispersed by the wind.



Leaf blade anatomy

The abaxial epidermis and inner structure of the leaf blade were studied. The epidermis and transverse sections were obtained following Gomez-Sánchez and Koch (1998).

Abaxial epidermis.—Differentiation of the costal and intercostal zones inconspicuous. Long cells, fusiform, longer than wide. Stomata abundant, 37–39 µm long, parallel-sided subsidiary cells, guard cells hidden by interstomatal long cells. Papillae absent. Prickles a few in the costal zone. Silica bodies, microhairs and macrohairs absent (Fig. 1H).

Transverse section.—Outline of the blade U-shaped, nodular. Abaxial and adaxial surface with rounded ribs associated with all vascular bundles; abaxial and adaxial furrows broad and deep. Vascular bundles nine; usually first order vascular bundles. Outer vascular bundle sheaths absent. Sclerenchyma costal strands present, the abaxial in 2–4 cells wide and 1–2 cells tall, the adaxial in 1–3 cells wide and 1–2 cells tall or absent. Chlorenchyma nonradiate, its cells of various sizes and shapes, continuous between adjacent vascular bundles. Colorless parenchyma cells absent. Bulliform cells in fan-shaped, adaxial groups no conspicuous, central cell relatively small, or absent (Fig. 1G).

Agrostis avenacea is clearly a member of the Pooideae in its anatomical features. It is a Non-Kranz species, with C_3 photosynthetic metabolism (Hattersley & Watson 1975). It has a typical "pooid" anatomy, characteristic of those species that grow in temperate climates. The leaf blade is nodular with ribs and deep furrows in the abaxial and adaxial surfaces. The limited development of

FIG. 2. Region of Mexico where *Agrostis avenacea* was colected. 2A. Map showing Municipalities of Amealco and Huimilpan of the State of Querétaro, Mexico. 2B. Temporary pond in the Municipality of Amealco in the Satate of Queretaro.

abaxial and adaxial sclerenchyma explains the presence of the breakable and lax culms and suggests that *Agrostis avenacea* is adapted to wet habitats.

Several taxonomic treatments of *Agrostis* exist (Acosta-Castellanos 1990; Pohl 1980; Pohl & Davidse 1994; Davidse 1998), however these treatments are partial and taxonomic affinities of the species are uncertain. The genus *Agrostis* urgently needs a world revision (Pohl & Davidse 1994; Davidse 1998). In addition to the morphological, anatomical, micromorphological work, the development of molecular studies will be a very important contribution to circumscription of *Agrostis* species.

ACKNOWLEDGMENTS

We are grateful to the curators of the ENCB, IEB, MEXU and QMEX herbaria who so kindly accommodated our visit, to Mahinda Martinez who provided the collections, to Clara Tinoco who prepared Figure 1A–F, and to Robert Jones and an anonymous reviewer for helpful comments. Research was supported by CONACyT through 29106-N project.

AN UPDATE TO THE VASCULAR FLORA OF CALCASIEU PARISH, LOUISIANA

Ray Neyland

Department of Biological & Environmental Sciences
McNeese State University
Lake Charles, LA 70609, USA

ABSTRACT

The publication of a vascular flora survey of Calcasieu Parish, Louisiana by Neyland et al. in 2000 is updated and revised. Subsequent field and herbarium research has yielded the discovery of four new species for the parish. Additionally, six species that had been previously reported by other sources to occur the parish but were not discovered during Neyland et al,'s original survey have been collected. Two corrections from the original survey are also noted.

KEY WORDS: Vascular Plant Survey, Calcasieu Parish, Louisiana

RESUMEN

La publication de un inventario de flora vascular de Calcasieu Parish, Louisiana por Neyland et al. en 2000 se pone al día y se revisa. La investigación subsiguiente de campo y herbario ha tenido como consecuencia el descubrimiento de cuatro nuevas especies para parroquia. Adicionalmente, se han colectado seis especies que habían sido citadas previamente por otras fuentes en la parroquia pero no fueron descubiertas durante la inspección original de Neyland et al. Se hacen también dos correcciones al catálogo original.

This paper updates and revises the original vascular flora survey of Calcasieu Parish, Louisiana of Neyland et al. (2000). Specifically, the purpose of this study is to list new collections from the Parish and to correct errors from the original survey.

METHODS

Since the publication of the original survey by Neyland et al. (2000) until present, plant collections from Calcasieu have continued. Voucher specimens were prepared using standard herbarium practices and are housed at the McNeese State University (MCN) Herbarium. Additionally, specimens from other herbaria have been examined. Nomenclature follows Kartesz (1999).

RESULTS

The following entries are new additions to the vascular flora of Calcasieu Parish. These taxa have not been reported previously as occurring in the parish. Specimen references follow the same format as in the original survey (Neyland et al. 2000). Authorities are abbreviated according to Brummitt and Powell (1992). Following the collection data is an abbreviation for the vegetative region

where each species typically occurs: prairie (Pr); longleaf pineland (Pi). Although not a vegetation region, disturbed areas such as pastures, fallow fields, ditches, urban areas and roadsides are collectively abbreviated (D).

AMARYLLIDACEAE
Zephyranthes candida (Lindl.) Herbert (MCN) *Neyland 1944* D

ASTERACEAE
Bidens alba (L.) DC. (MCN) *Neyland 1940* D

LAMIACEAE
Nepeta cataria L. (MCN) *Walker s.n.* D

ORCHIDACEAE
Platanthera integra (Nutt.) Gray ex Beck (AMES) *Cocks s.n.* Pi

The following entries have been previously reported in the parish but were not collected during the original survey of Neyland et al. (2000). Therefore, these collections provide recent evidence for their presence in Calcasieu Parish.

ASTERACEAE
Coreopsis pubescens Ell. var. *debilis* (Sherff) E.B. Smith (MCN) *Neyland 1951* D, Pi
Silphium integrifolium Michx. (MCN) *Neyland 1947* D, Pr

EUPHORBIACEAE
Chamaesyce hirta (L.) Millsp. (MCN) *Neyland 1939* D

JUNCACEAE
Juncus bufonius L. *Haning 8* (MCN) D, Pi, Pr

LAMIACEAE
Scutellaria drummondii Benth. (MCN) *Neyland 1927* D

OXALIDACEAE
Oxalis violacea L. (MCN) *Neyland 1945* D, Pi, Pr

The following entries were misidentified in the original survey. Subsequent annotations have resulted in the noted corrections.

1. The specimen originally reported as *Asclepias variegata* L. *Neyland 1763* **Pi** is *Asclepias obovata* Ell. Therefore, this species is removed from the survey.

2. The specimen reported as *Juncus elliottii* Chapm. *Brooks 609* (MCN) **D, Pi, Pr** is *Juncus acuminatus* Michx. However, the species does occur in the parish as evidenced by the specimen designated as *Juncus elliottii* Chapm. *Giltner 37* (MCN) **D, Pi, Pr.**

DISCUSSION

The most notable addition to the flora of Calcasieu Parish is the discovery of a specimen of *Platanthera integra* in the Oakes Ames Herbarium at Harvard. This specimen was collected by R.S. Cocks in September, 1906; however, additional collection information is absent from the herbarium sheet. *P. integra* is presently rated by The Natural Heritage Program of the Louisiana Department of Wildlife and Fisheries as "S2" which is defined as rare and local throughout

the state or found locally in a restricted region of the state. This apparently is the only known specimen that has ever been collected in Calcasieu Parish. Because suitable habitat for this species largely has been destroyed in the parish (Neyland et al. 1998), it may be extirpated.

As a result of these revisions to the original vascular flora survey of Calcasieu Parish, the number of confirmed specific and subspecific entries for the parish is increased to 1,153. The number of reported but unverified entries for the parish is reduced to 131.

ACKNOWLEDGMENTS

I thank Sara Thames, University of Louisiana at Monroe, Monroe, LA, John Miller, Lake Charles, LA, Bruce A. Sorrie, Longleaf Ecological, Whispering Pines, NC and Lowell E. Urbatsch, Louisiana State University, Baton Rouge, LA for their assistance.

Books Received/Notices

Annotations and comments by the Editor

Horticulture/Gardening

Loran M. Whitelock. 2002. **The Cycads.** (ISBN 0-88192-522-5, hbk.). Timber Press, Inc., 133 S.W. Second Avenue, Suite 450, Portland, OR 97204-3527, U.S.A. (Orders: www.timberpress.com, 800-327-5680, 503-227-2878, 503-227-3070 fax). $59.95, 532 pp., 505 color photos, 13 line drawings, 8 1/2" × 11".

Key Words: Cycads, horticulture, cultivation, propagation, distribution, classification, morphology, reproduction, conservation, 11 genera, ca. 300 species.

This is one encyclopedia of information on cycads. The 505 color plates are exceptionally nice. If you are into cycads then you will want this book.

John Bryan. 2002. **Bulbs, Revised Edition.** (ISBN 0-88192-533-0, hbk.). Timber Press, Inc., 133 S.W. Second Avenue, Suite 450, Portland, OR 97204-3527, U.S.A. (Orders: www.timberpress.com, 800-327-5680, 503-227-2878, 503-227-3070 fax). $89.95, 896 pp., 1171 color photos, 10 line drawings, 2 charts, 8 1/2" × 11".

Key Words: Bulbs, landscape, horticulture, gardening, catalog, worldwide.

This is an impressive revised edition. The book is worth the price in just the color plates alone. There are many color plates reproduced from Curtis's Botanical Magazine. Just beautiful!

Jane McGary (editor). 2001. **Bulbs of North America.** (ISBN 0-88192-517-9, pbk.). Timber Press and North America Rock Garden Society (Orders: Timber Press, 133 SW Second Ave., Suite 450, Portland, OR 97204-3527, U.S.A., www.timberpress.com, 800-327-5680, 503-227-2878, 503-227-3070 fax). $34.95, hbk., 308 pp., 101 color photos, 4 line drawings, 2 maps, 6" × 9".

Key Words: Bulbs, landscape, horticulture, gardening, catalog, North America.

Contents include: 1) The Genus *Allium*; 2) Amaryllidaceae of North America; 3) The *Brodiaea* Alliance: *Bloomeria*, *Brodiaea*, *Dichelostemma*, and *Triteleia*; 4) The Genus *Calochortus*; 5) The Genus *Erythronium*; 6) The Genus *Fritillaria*; 7) Irids of the Southeast; 8) The Genus *Lilium*; 9) Bulbs of the Northwest; 10) Bulbs of the Southwest; and 11) Bulbs of Eastern North America. Information is provided on sources of bulbs and seeds.

NEW VASCULAR PLANT RECORDS FOR TEXAS

Guy L. Nesom and Robert J. O'Kennon

Botanical Research Institute of Texas
509 Pecan Street
Fort Worth, TX 76102-4060, U.S.A.

Study of previous collections brings to light records for two species (Asteraceae, Caryophyllaceae) previously unreported for the state of Texas.

Anaphalis margaritacea (L.) Benth.

Anaphalis margaritacea occurs over most of the western and northern United States and Canada—it has not been recorded from Texas, Oklahoma, and states of the southeastern USA (Kartesz 1999). In Mexico it is known from localities in northern Baja California (Wiggins 1980). It is reported from eight primarily montane counties in New Mexico (Martin & Hutchins 1981), where it occurs at 7000–10,000 feet elevation, and from several prairie counties in Colorado (Great Plains Flora Association 1976). The record from the Texas panhandle reported here is a southeastward 'outlyer' from the main range but it is a relatively small step eastward from the known localities in New Mexico and Colorado. The Brewster Co. collection is disjunct southward about 350 kilometers from the closest localities in Lincoln Co., New Mexico. Other UNM collections (fide Jane Mygatt, UNM Collection Manager) confirm that Ora Clark was botanizing in Brewster County in the first week of August 1931, adding a degree of confidence that the *Anaphalis* collection did originate from there.

Voucher specimen: **TEXAS. Brewster Co.:** "arroyas, s. Terlingua, Texas," 5 Aug 1931, *Clark 4199* (UNM). **Hale Co.:** Plainview, E of Co-op Cotton Compress on side of railroad, sandy soil, 3350 ft, 11 Sep 1967, *Hall s.n.* (WIS).

Gypsophila elegans M. Bieb.

Gypsophila elegans (var. *elegans*) is native to Russia (Black Sea region), Crimea, Caucasus, eastern Turkey, and Iran (Caspian Sea region) and is adventive in western Europe and North America (Barkoudah 1962), where it is grown as a garden plant. *Gypsophila elegans* var. *latipetala* Barkoudah is known only from "Turkey and Transcaucasia" (fide Barkoudah 1962). Variety *elegans* is known from scattered localities in Canada and the USA (including California, Utah, Colorado, Kansas, Illinois, North Carolina (Kartesz 1999). The central and north-central Texas localities reported here are the southernmost known stations in North America.

A key in the treatment of *Gypsophila* for California (Hartman 1993) separates *G. elegans* from *G. paniculata* L. and *G. scorzonerifolia* Ser. Gleason and

SIDA 20(1): 435 – 436. 2002

Cronquist (1991, p. 127) included a brief description and comment regarding *G. elegans*, following the description of *G. muralis* L., noting that it "occasionally escapes from cult. in our range." It is possible that the Texas plants are from direct roadside seeding—the species is distributed as part of 'Texas/Oklahoma,' 'Mountain,' 'Northeast,' Gulf Coast/Caribbean,' and 'Southeast' wildflower seed mixes (see www.prairiefrontier.com/pages/pfmixpg/regional.html). Another website touts the species as "One of the easiest seeds to grow. This plant literally pops out of the ground in any soil, ready to bloom." A search for the Tarrant County plants at the Keller site in 2002 was unsuccessful, however, suggesting that the species is not successfully reproductive in north central Texas.

The common name of *Gypsophila elegans* is Annual Baby's Breath or Showy Baby's Breath. Many photos of the species are available on the internet, including an excellent one of a herbarium specimen (linnaeus.nrm.se/flora/di/caryophylla/gypso/gypsele.html).

Voucher specimen: **TEXAS. Erath Co.:** roadside of Hwy 377, ca. 7 mi S of Stephenville at intersection of Co. Rds. 379 and 380, in ditch on NW side of highway, with 'oats, wheat, bermudagrass, rescuegrass and bluebonnets,' 15 Apr 2001, *Kunselman 23* (TAC). **Tarrant Co.:** along railroad tracks in township of Keller, NE of Fort Worth, Apr 2001, *O'Kennon* (sight record only).

ACKNOWLEDGMENTS

The new records reported here are from among specimens in loans to BRIT from WIS, TAC, and UNM. The Tarrant County collection of *Gypsophila* was independently identified by Richard Rabeler. Review comments of Lindsay Woodruff are greatly appreciated. Jane Mygatt provided helpful information on Ora Clark and his collecting schedule.

ABSTRACT

The following ten taxa are documented new to Texas: *Aster laevis* var. *purpuratus*, *Bidens alba* var. *radiata*, *Tridax procumbens*, *Raphanus raphanistrum*, *Calycanthus floridus* var. *glaucus*, *Lyonia lucida*, *Hyptis mutabilis*, *Lilium longiflorum*, *Lythrum lineare*, and *Myrtus communis*. Significant new collection records are provided for eight: *Hypochaeris glabra*, *Cyperus cephalanthus*, *Rhynchosia tomentosa*, *Quercus arkansana*, *Allium stellatum*, *Cuphea viscosissima*, *Oenothera elata* subsp. *hirsutissima*, and *Leptochloa dubia*. Taxa are listed alphabetically by family, genus, and species with comments and citation of voucher specimens.

RESUMEN

Los siguientes diez taxa se citan nuevos para Texas: *Aster laevis* var. *purpuratus*, *Bidens alba* var. *radiata*, *Tridax procumbens*, *Raphanus raphanistrum*, *Calycanthus floridus* var. *glaucus*, *Lyonia lucida*, *Hyptis mutabilis*, *Lilium longiflorum*, *Lythrum lineare*, y *Myrtus communis*. Se hacen citas significativas de otros ocho nuevas recolecciones: *Hypochaeris glabra*, *Cyperus cephalanthus*, *Rhynchosia tomentosa*, *Quercus arkansana*, *Allium stellatum*, *Cuphea viscosissima*, *Oenothera elata* subsp. *hirsutissima*, y *Leptochloa dubia*. Los taxa se listan alfabéticamente por familia, género y especie con comentarios y cita de los especimenes testigo.

INTRODUCTION

Floristic work in the Houston area and other east Texas counties, coupled with plants sent to the SBSC herbarium for identification, has revealed a number of plants new to Texas and significant new records for others.

Unless otherwise indicated, all collections cited in this paper are in the Spring Branch Science Center Herbarium (SBSC), Houston, Texas. Duplicates of some collections are at the other indicated herbaria. Herbarium acronyms follow Holmgren et al. (1990).

ASTERACEAE

Aster laevis L. var. **purpuratus** (Nees) A.G. Jones.—*Aster laevis* has been represented in Texas by the western variety *geyeri* in the Guadalupe Mts of Culberson Co. (Nesom 1993). Here we report variety *purpuratus*, the narrow leaved southeastern entity, from two east Texas counties. Thomas and Allen (1996)

SIDA 20(1): 437 – 444. 2002

mapped it in six, mostly north central, Louisiana parishes. Kartesz (1999) mapped it, as *Symphyotrichum laeve* (L.) A. & D. Love var *purpuratum* (Nees) Nesom, in Georgia, Alabama, Mississippi, Louisiana, Arkansas, and Texas. At the Polk County site, *A. laevis* var. *purpuratus* is distinguished from the similar and more numerous plants of *A. oolentangiensis* Riddel by smooth leaves in contrast to the harshly scabrous leaves of *A. oolentangiensis*.

Voucher specimens: **Polk Co.:** growing in a native calcareous prairie surrounded by pine-oak woods at the intersection of Lone Wolf Road and Windham Road, N of Hwy 1988 between Goodrich and Providence, S of Livingston, 30° 37'33"N and 94° 55'33"W, 28 Oct 2000, *Brown 24913*; same site, 23 Sep 1999, *Brown 23563*. **Tyler Co.:** collected in a calcareous prairie barren on U.S. Hwy 190, ca. 4.5 mi W of intersection with FM 92, 12 Jun 2000, *J. Liggio s.n.*

Bidens alba (L.) A. DC. var. **radiata** (Sch. Bip.) Ballard ex T.E. Melchert.—Ballard (1986) divided the *B. pilosa* complex into three mostly tropical American species, namely *B. alba*, *B odorata* Cav., and *B. pilosa* L. He mapped United States records of *B. alba* var. *radiata* in Florida and *B. pilosa* in California. Wunderlin (1998) reported *B. alba* var. *radiata* as common and distributed nearly throughout Florida. Gandhi and Thomas (1989) reported *B. pilosa*. in Louisiana but indicated that Ballard's description of *Bidens alba* var. *radiata* was in concurrence with their description of *B. pilosa*. Thomas and Allen (1996) maintained *B. pilosa* in Louisiana and mapped it in thirteen parishes. We report *B. alba* var. *radiata* (sensu Ballard) from four Texas counties. There is a photograph of the taxon in Tveten and Tveten (1993).

Voucher specimens: **Cameron Co.:** common in a vacant lot in Brownsville, 1 Apr 1983, *Brown 5954*. **Chambers Co.:** along I-10 at the bridge over the Trinity River near the village of Wallisville, 29° 50' 12"N and 94° 39'08"W, 8 Oct 2000, *Brown 24801*. **Harris Co.:** weed along Old Katy Rd at Bunker Hill in Houston, 19 Oct 1990, *Tveten b-390*; weedy plants at the intersection of Dell Dale and Brentwood Streets in Channelview, 21 May 1992, *Brown 16084*. **Montgomery Co.:** edge of small woodland next to parking lot near Woodlands Parkway, 1/4 mi W of I 45, 8 Dec 2001, *E. Keith 31*.

Hypochaeris glabra L.—Diggs et al. (1997) reported this European weed new to Texas from Williamson County. Since then additional collections have been made in other regions of the state.

Voucher specimens: **Harris Co.:** weedy plants in a subdivision adjacent to a small native prairie at intersection of Greenhouse Rd and FM 529, 29° 52'42"N and 95° 42'14"W, 12 Mar 1999, *Brown 22866*; plants on sandy soil in pasture on south side of the Harris County Katy Park, N of Katy, 29° 48'34"N and 95° 48'20"W, 14 Apr 2001, *Brown 25083*. **Leon Co.:** growing on sandy soil in the Boykin Cemetery off of Hwy 831 between Oakwood and Flo, 18 Apr 2001, *Brown 25090*. **Waller Co.:** on sandy soil at the intersection of Holik Rd and Hwy 1887, west of the Monaville cemetery and between Hempstead and Pattison, 29° 56'58"N and 96° 04'51"W, 8 May 2002, *Brown 26702*.

Tridax procumbens L.—Kartesz (1999)reported this exotic and federal noxious weed in Florida and Hawaii. Wunderlin (1998) reported it frequent in the central and southern peninsula of Florida. John Tveten recently sent a collection of it from the Valley Nature Center in Hidalgo County for identification. Regarding the history of the plant in Texas, the following communication was

received from Ken King and Martin Hagne of the Valley Nature Center; "Seed was collected in the Brownsville area by a native grower several years ago. That grower is no longer in the area and we do not know the exact Brownsville location. The plants at the Valley Nature Center were planted here from those seedlings. This comp is growing in empty lots throughout Weslaco and has been in the area for at least fifteen years. We have seen several local establishments around town. There are at least two south Texas counties that have communities of this plant; Hidalgo and Cameron." Alfred Richardson (1995) did not include this taxon for the Rio Grande Delta area.

Voucher specimen: **Hidalgo Co.:** spreading along trails in open spots in mesquite bush in the Weslaco Valley Nature Center, 20 Nov 2001, *Tveten s.n.*

BRASSICACEAE

Raphanus raphanistrum L.—Rollins (1993) distinguished the genus *Raphanus* by a segmented fruit with the lower segment inconspicuous and seedless. The petal colors vary from white, yellow, lilac, to violet. Rollins (loc cit.) reported two introduced weedy species in North America, *R. raphanistrum* and *R. sativa*. He indicated that in *R. raphanistrum* the fruits are linear, longitudinally grooved, and strongly constricted between the seeds. The petals are yellow and fade to whitish or white. In *R. sativus* the fruit body is widest at the base, smooth or very slightly grooved, and is not or only poorly constricted between the seeds. The petals are usually purple. The petal veins are prominent in yellow flowered *R. raphanistrum*, which can distinguish it from yellow petaled plants of *Brassica* and *Sinapsis*, if one does not notice the small lower fruit segment. Kartesz (1999) mapped it in Texas *fide* Gould (1975a) but no voucher was provided. It is not listed in Correll and Johnston (1970) nor any of the recent checklists. We report voucher material with the traits of *R. raphanistrum* from three Texas counties. Thomas & Allen (1996) mapped *R. raphanistrum* in numerous northern and southern Louisiana parishes. Two of these parishes are adjacent to Texas. In contrast, *R. sativus* is known from only seven parishes. Wunderlin (1998) found *R. raphanistrum* more common in Florida than *R. sativa*. A reexamination of Texas material may reveal the same situation in Texas.

Voucher specimens: **Fort Bend Co.:** yellow flowered weedy plant along a gravel road above a drainage ditch at extreme SW edge of Barker Reservoir, ca. 1/2 mi E of Mason Rd and ca. 1/2 mi N of FM 1093, 10 Mar 1995, *Brown 18435*. **Harris Co.:** Brays Bayou at Buffalo Speedway in Houston, 18 Mar 2000, *D. Johnson s.n.* **San Jacinto Co.:** collected along roadside of Hwy 945 near the Evergreen Cemetery in the village of Evergreen, 9 Mar 2001, *E. Keith s.n.*

CALYCANTHACEAE

Calycanthus floridus L. var. **glaucus** (Willd.) Torr. & A. Gray.—At least fifteen plants of this shrub are present in woods adjacent to the David and Patricia Lewis residence in Newton County. In a personal communication, the Lewises indicated that these plants were here when they established a residence on the

site. Thomas and Allen (1996) were unsure of the native status of a collection from West Feliciana Parish, Louisiana. Likewise we are uncertain of their native status here; however, they are well established and naturalized shrubs and should be considered a member of the Texas flora.

Voucher specimens: **Newton Co.:** plants on a mesic slope woodland above Screw Pin Branch adjacent to CR 3062, W of Hwy 87 N of Bleakwood, 22 Jul 2000, *Brown & Elsik 24437* (SBSC, BRIT); same site, 13 Apr 1999, *Lewis, Lewis & Elsik 6169* (SBSC, TEX).

CYPERACEAE

Cyperus cephalanthus Torr. & Hook.—Carter and McInnis (1993) reported the type locality of this sedge from somewhere near Galveston Bay. The type collection was made in 1835 and the species has not been recollected in Texas since. We here report a recent collection from Harris County. Richard Carter (VSC) has verified the identification.

Voucher specimen: **Harris Co.:** tall plants with thick stem in a moist prairie depression a few hundred feet SE of the Texas Chiropractic College, on the S side of Spencer Blvd, a few hundred feet E of Beltway 8 in Pasadena, 29°39'39"N and 95°08'50"W, 29 May 1999, *Brown 23076* (BRCH, SBSC, TEX).

This site is owned by the Harris County Flood Control District and is soon to be formed into a detention basin for downstream flood control along Armand Bayou. However, Ralph Taylor of the Flood Control Environmental Services has removed all plants from the site and replanted them in their nursery near Lake Houston. Plants have been given to the Mercer Arboretum and Botanic Gardens and to the Armand Bayou Nature Center for establishment on their lands.

ERICACEAE

Lyonia lucida (Lam.) K. Koch.—Specimens of these shrubs, with flowers in March and fruits in summer, have been recently collected in Newton County. The shrubs were on the property of David and Patricia Lewis when they set up a residence north of Bleakwood. There was no evidence of a prior human occupation of the site. David has discovered six populations with well over a hundred total plants (per. comm.) along Screw Pin Branch. Fetterbush is native and common in the adjacent Sabine Parish of Louisiana (personal observation by the second author, Thomas and Allen 1996). It is our opinion that this is also a native population.

Voucher specimens: **Newton Co.:** shrubs along Screw Pin Branch, ca. 300 m W of Hwy 87, 1 mi N of the intersection with Hwy 363 in community of Bleakwood, 30°42'29"N and 93°49'34"W, 24 Mar 1999, *Lewis & Elsik 6168a* (SBSC, nine duplicates to be distributed to other herbaria); same site, 22 Jul 2000, *Brown & Elsik 24436*. (SBSC, BRIT).

FABACEAE

Rhynchosia tomentosa (L.) Hook. & Arn.—Turner (1959), Correll and Johnston (1970), Johnston (1990), Hatch et al. (1990), Jones et al. (1997), and Isely (1998) all reported this legume for Texas. Turner (1959) reported a collection by Charles

Wright that lacks locality data. Isely (1998) did not map it in the state. It is also not mapped in the state by Turner et al. (in press). We here report an authentic Texas collection from what is now the Little Rocky Preserve of The Nature Conservancy of Texas.

Voucher specimen: **Jasper Co.:** Little Rocky Nature Conservation area, 13 mi N of Jasper on Hwy 96 to Browndel, then ca. 3 mi E of Browndel on Hwy 1007, 15 Aug 1982, *Peterson 631*.

FAGACEAE

Quercus arkansana Sarg.—Hunt et al. (1995) first reported this oak as new to Texas. They found two small populations in Cass County and an historical record for Jasper County. We here report recent collections from Jasper and Hardin counties. Jensen (1997) mapped it in the extreme northeast and southeast portions of the state.

Voucher specimens: **Jasper Co.:** deep sandy hillside about 2 mi N of the end of FM 2800, NW of Jasper in the headwaters of Hog Creek, 3 Jul 2001, *E. Keith 11b*.

LAMIACEAE

Hyptis mutabilis (Rich.) Briq.—Kartesz (1999) reported this exotic weed in seven southeastern states from Virginia to Louisiana. Thomas and Allen (1998) mapped it in three parishes east of the Mississippi. River. We here report a collection for Texas.

Voucher specimen: **Liberty Co.:** plants growing in a fenced field on S side of the Davis Hill Salt Dome adjacent to the Davis Hill Estates subdivision, east of Cleveland and off of Hwy 105, 30° 18'32"N and 94° 51'01"W, 5 Jul 1999, *Brown 23169*.

LILIACEAE

Allium stellatum Ker.—Turner et al. (in press) mapped this onion in five, mostly north central Texas counties. We here report collections far south of those mapped.

Voucher specimens: **Polk Co.:** in a native prairie surrounded by pine-oak forest along Lone Wolf Rd N of Hwy 1988 between Goodrich and Hwy 146 S of Livingston, 17 Nov 1996, *Brown 19809*. **Brazos Co.:** population of red flowered plants on a gravel slope above Lick Creek, NE of the intersection of Hwy 6 and Greens Prairie Rd, probably within the city limits of College Station, 2 Nov 2001, *Brown 26401* (SBSC, TAMU).

Lilium longiflorum Thunb.—In the summer of 2000, we found this tall white flowered plant to be common and conspicuous along roadsides near Newton. It is also found as an escape from cultivation in Alabama, Florida, and Utah (Kartesz 1999). We identified it to this species with the key in Wunderlin (1998). Thomas and Allen (1993) reported *L. formosum* in Louisiana, but our plants have the totally white flowers of *L. longiflorum*, in contrast to the red-purple outer perianth of *L. formosum*.

Voucher specimens: **Newton Co.:** growing along the gravel CR 3062 between Screw Pin Branch and

Thickety Creek, west of Hwy 87, N of Bleakwood, 22 July 2000, *Brown & Elsik 24438*. **Tyler Co.:** 1.1 mi N of jct Hwy 190/FM 256 W of Woodville, 3 Aug 1991, *Schultz 061*.

LYTHRACEAE

Cuphea viscosissima Jacq.—Correll and Johnston (1970) reported Blue Waxweed in Texas but without a specific locality. Graham (1975) eliminated it from Texas, as did Johnston (1990), Hatch et al. (1990), Jones et al. (1997), Kartesz (1999), and Turner et al. (in press). We here report a voucher to confirm its presence in Texas.

Voucher specimen: **San Augustine Co.:** 8 mi W of San Augustine on Hwy 21, then 1 mi S, Weches formation, 16 Jul 1976, *George & Nixon 43* (SBSC, ASTC).

Lythrum lineare L.—Correll and Johnston (1970), Graham (1975), Johnston (1990), Hatch et al. (1990), Jones et al. (1997), and Turner et al. (in press) did not report this species in Texas. However, Kartesz (1999) listed Texas within its distribution. We provide two vouchers to support its presence in the state. The identification was verified by S. Graham (KE).

Voucher specimens: **Chambers Co.:** Anahuac National Wildlife Refuge, brackish marsh in the Jackson Ditch Unit, 29°35'24"N and 94°25'09"W, 3 Oct 2000, Brown *24774*; Anahuac National Wildlife Refuge, brackish marsh in the East Unit, 29°39'N and 94°28'W, 20 Jul 2000, *Brown 24399* (SBSC, KE)

MYRTACEAE

Myrtus communis L.—Kartesz (1999) did not report this cultivated ornamental plant as occurring wild in the United States. The first author found many well developed shrubs scattered across a salt dome in coastal Texas. These plants had mature fruits and were rather large, suggesting they have been here for some time. The salt dome is isolated and surrounded by a coastal prairie and is for the most part undeveloped except for some old machinery and buildings associated with prior oil extraction.

Voucher specimen: **Brazoria Co.:** shrubs with fruits along gravel road to the center of Hoskins Mound, Galveston-Brazoria Key Map 861 D and H, near 29°08'26"N and 95°13'26"W, 6 Aug 2000, *Brown 24588* (SBSC, TEX, ASU).

ONAGRACEAE

Oenothera elata Kunth subsp. **hirsutissima** (A. Gray ex S. Wats.) W. Dietr.—Dietrich et al.(1997) mapped this taxon largely in Trans-Pecos Texas with one collection from the Panhandle. They also mapped three populations in east Texas in Anderson, Brazos, and Leon counties. Plants matching the key traits and description of this taxon have been collected in Harris and Liberty counties. They are more common on sandy soil in Liberty County. These are tall plants with large yellow flowers whose stigmas are elevated above the stamens.

Voucher specimens: **Harris Co.:** tall herb along Hwy 59 at the San Jacinto River bridge, 28 Jul 1991, *Gregg s.n.* **Liberty Co.:** plants growing on sands along the Trinity River at the Hwy 105 bridge west of Moss Hill, 30°16'39"N and 94°47'57"W, 1 Oct 2000, *Brown 24758*; along the Ace Hwy S of the village of Ace, across from the southern border of the Menard Creek Unit of the Big Thicket Biological Pre-

serve, 30°28'59"N and 94°50'19"W, 25 Aug 2000, *Brown 24680a*; tall plants with rather large flowers on deep sands along the Trinity River, Trinity River Nat Wildlife Refuge at Sevenmile Bend on the Davis Hill 7.5'quad, 30 Aug 1996, *Brown 19528*; large flowered primrose on dry sandy soil along CR 2252 near the Davis Hill Baptist Church E of Cleveland and N of Hwy 105, 15 Sep 1996, *Brown 19693*; a single tall plant at edge of Hwy 146, ca 3 mi N of Moss Hill, 21 Aug 1994, *Brown 18124*; tall weedy plants with large yellow flowers, along dirt road in the Dayton Lake Estates E of Hwy 1008, adjacent to the Trinity River, N of Dayton, 9 Sep 1994, *Brown 18180*.

POACEAE

Leptochloa dubia (H.B.K.) Nees.—Gould (1975b) reported this grass from all regions of the state except for the east Texas pineywoods and the post oak savannah area. We here report collections from two east Texas counties.

Voucher specimens: **Harris Co.:** plants on dark clay soil along a newly constructed road into a prairie at the intersection of Underwood St. and Fairmont Parkway in Deer Park, 29 Sep 1984, *Brown 8100*. **Hardin Co.:** fairly frequent tall grasses on verge of hwy between village of Honey Island and Hwy 69/287, N of Kountze, 6 Sep 1996, *Brown 19565*.

ACKNOWLEDGMENTS

We wish to thank Tom Wendt (TEX) and Leslie Landrum (ASU) for the identification of *Myrtus communis*, Richard Carter (VSC) for the verification of *Cyperus cephalanthus*, and S. Graham (KE) for the verification of *Lythrum lineare*. Michael MacRoberts provided a literature source and Guy Nesom (BRIT) helped with some nomenclatural questions. Justin Williams (SHST) and Monique Reed (TAMU) reviewed the paper and provided many helpful suggestions. The first author is thankful to the Houston Community College for a sabbatical leave during the spring semester of 2002 that allowed him to complete this project. Publication funds were provided by Rice University.

Negrete et al. wish to correct their paper, *A checklist for the vascular plants of Padre Island National Seashore* published in the December 1999 issue of SIDA (volume 18, number 4, pp. 1227-1245) by deleting *Sesuvium trianthemoides* from the checklist, which will change the total number of species to 455.

THE RUPERT BARNEBY AWARD

The New York Botanical Garden is pleased to announce that Aaron Liston, currently at the Department of Botany & Plant Pathology, Oregon State University, is the recipient of the **Rupert Barneby Award** for the year 2002. Dr. Liston will be studying the phylogenetic systematics of *Astragalus* and *Trifolium*.

The New York Botanical Garden now invites applications for the **Rupert Barneby Award** for the year 2003. The award of US $1,000.00 is to assist researchers to visit The New York Botanical Garden to study the rich collection of Leguminosae. Anyone interested in applying for the award should submit their curriculum vitae, a detailed letter describing the project for which the award is sought, and the names of 2-3 referees. Travel to the NYBG should be planned for sometime in the year 2003. The application should be addressed to Dr. James L. Luteyn, Institute of Systematic Botany, The New York Botanical Garden, 200th Street and Kazimiroff Blvd., Bronx, NY 10458-5126 USA, and received no later than December 1, 2002. Announcement of the recipient will be made by December 15.

Anyone interested in making a contribution to **THE RUPERT BARNEBY FUND IN LEGUME SYSTEMATICS**, which supports this award, may send their check, payable to The New York Botanical Garden, to Dr. Luteyn.

SIDA 20(1): 446. 2002

BOOK REVIEWS

MARTCO LAMBERTINI (Translated by John Venerella). 2000. **A Naturalist's Guide to the Tropics.** (ISBN 0-226-46828-3, pbk.). The University of Chicago Press, 5801 S Ellis Ave., Chicago, IL 60637-1496, U.S.A. (Orders: 773-702-0279, 773-702-7956 fax, da@press.uchicago.edu, www.press.uchicago.edu). $25.00, 338 pp, 57 color photos, 11 color plates, numerous b/w halftones, 5 1/2" × 7 1/2".

Though unknown to most American readers, the author apparently is professionally trained and works as a conservationist with BirdLife International (UK) and as a freelance scientific journalist. His focus is to educate the public about the importance of conserving the tropics. As he says in the preface, "This is a work that is intended to establish among prospective world travelers a knowledge of the natural life and ecology of the Tropics, to make them seem less distant and unreachable, less unknown and mysterious." In this, I would say he has achieved his goal.

On the other hand, the publisher's flier highlights this book as "the first field guide in English to cover *all* the world's tropics in one volume" and the author states, "a guide to skim before the trip as well as to take along." I would say, "a reference to absorb thoroughly before the trip only." If you are looking for an all-in-one field guide (i.e., birds, mammals, reptiles, sea shells, trees, and flowers), you will be sorely disappointed. If, instead, you want to understand the factors shaping the tropical landscapes that you will be seeing or you want to understand why the tropics are so important, then this is book is worth your money and time.

The first three chapters cover the major physical factors—geologic history, climate and soils—while the next two cover general features of tropical plants and animals. There are five chapters detailing the structure and species of the major ecosystem types in the tropics, i.e., mangroves, forests, coral reefs, savannas, and deserts. The book concludes with an overview of tropical conservation and a series of precautions that travelers should observe to avoid elephant attacks and yellow fever, among others. The layout is very readable and includes many sidebars to extract more difficult or specific information from the general flow of the text. The color photographs are beautiful, and the drawings generally augment the writing.

The introductory chapters are well written and provide a good foundation for understanding tropical environments. The soils chapter should have been longer to relate the greater diversity of tropical soils and the factors giving rise to them. Also, I was surprised that the term, mycorrhizae, was not introduced, although the author did discuss "elevated recycling of nutrients". These chapters cover essential topics, such as, seasonality reflected in the structure and behavior of organisms, primary production, comparisons of similar conditions on different continents, species interactions, and human use. Standard evolutionary explanations are given for the phenomena of symbiosis, defense, population regulation, biodiversity, niches, dispersal, and convergence. The colored plates of birds given in this section are disappointing: 7 species each from Africa and Australasia, 8 from the Americas. The sidebar on palms was illustrated by drawings of only seven species. Having studied this group, I found at least three errors. 1) The drawing of *Phytelephas macrocarpa*, was incorrect. The species pictured represented an entirely different subfamily, probably a poorly drawn *Sabal*. 2) *Licuala grandis* is Asian not South American. 3) Coconut is pantropical, not just Indo-Pacific, although it may have originated there.

The ecosystem chapters are very informative, especially the one on mangroves, in terms of features common to that ecosystem type on all continents. For example, the one on forests distinguishes primary and secondary forests and describes canopy structure, forest characteristics (e.g., root buttresses, lianas, and epiphytes), light gaps and pioneer species, life histories of forest plants, fig-wasp symbiosis, growth of stranglers, ecology of forest animals (sidebars on cicadas, butterflies, ants, poi-

son dart frogs, treehoppers), adaptations of arboreal animals, and pollination and dispersal in the forest.

The last two chapters—conservation and traveling precautions—make this book especially useful and timely.

My recommendation is: Buy this book and read it in depth, book a tropical ecotour, then buy some good field guides for that specific region actually to take with you. And, as the author says, "Buon viaggio!"—*Roger W. Sanders, Associate Collections Manager, Botanical Research Institute of Texas, Fort Worth, TX 76102-4060, U.S.A.*

DAVID BIEK. 2000. **Flora of Mount Rainier National Park.** (ISBN 0-87071-470-8, pbk.) Oregon State University Press. 101 Waldo Hall, Corvallis, OR 97331-6407. (Orders: http://osu.orst.edu/dept/press/osupress.htm, 800-426-3797, 541-737-3166, 541-737-3170 fax). $29.95, 520 pp, 64 color photos, line drawings, 6" × 9".

This publication marks the first comprehensive treatment of the flora of Mount Rainier subsequent to George Neville Jones' work published in 1938. Mount Rainier was designated a National Park in1899 and since then much information has been gathered on the biota of the area. The *Flora of Mount Rainier National Park* by David Biek seeks to update Jones' earlier flora and covers the entire area within the boundaries of the park. According to the author, the goal of this book is "to provide a complete list of the native and introduced plants found in the Park, with keys and descriptions sufficient to distinguish each species from the others."

The volume begins with an introduction on how to use the book and clarifies its scope and intent. The author provides information on how to use the keys to identify plants and forewarns his readers of the inconstant nature of scientific names of plants. Next, facts on the Park, including location, topography and climate are given. The author follows with a discussion of plant communities and associations, citing 19 different types present in the Park and the groups of plants that can be found growing in each zone or community. A brief discussion of plant geography, distribution, weeds and rare plants allow the reader to become familiar with the flora of the Park. Last, a historical overview of explorations and studies, including ecological research on Mount Rainier, gives evidence of the long significance this area has had in our national heritage.

Of course, a majority of the book is dedicated to plants included in the flora and the treatment begins with a key to the major groups of vascular plants. After this key, the major groups are presented, fern and fern allies first, followed by gymnosperms, then dicots and finally monocots. Within each group, the families are listed alphabetically, followed by genera and species. There is a key to accompany each family and genus description so the reader can ascertain the taxon at hand. Species descriptions include scientific name and common name, a brief description of diagnostic characters, elevation, habit and habitat, as well as locations where it has been collected in the Park. Illustrations, reprinted from Hitchcock's *Vascular Plants of the Pacific Northwest*, are adjacent to most species descriptions. Color photos of selected species are found in the middle of the book. An appendix includes 79 plants added to the flora, which were observed by the author in the field or from herbarium specimens between 1996 and 1999. A brief glossary clarifies some essential terms and the bibliography cites critical publications. The author provides a single index with accepted names, synonyms, names misapplied and common names used in the book

Although it is very convenient to have illustrations directly adjacent to the species descriptions, the limited margin results in a small space for inadequate illustration printing. The effect for

some of the illustrations is a print too small to be useful. For example, the illustration for *Pseudotsuga menziesii* includes a cross section of both leaf and stem. Both of these figures are too small to be useful to a reader. Likewise, an illustration of a branch of *Tsuga heterophylla* is so small it is hard to identify the ovulate cones. Perhaps it would have been more useful had the author provided the illustrations in a separate section following the species descriptions that cross-referenced them. The color photos in the middle of the book would be more valuable if scale bars or another unit of measure were included. As the plates are presented, the reader has no frame of reference for how large or small each plant is in the photo. Moreover, it would have been useful to identify each photo with some sort of letter or number so as to be easily cross-referenced with the caption. The discussion on forest communities of Mount Rainier proves a bit confusing. Following the forest classification of another author, Biek states that there are four different forest zones within the Park. These zones are further divided into 19 associations, seven of which have two or more phases. An attempt is made to identify plants commonly growing in each zone, but clearly the distribution and limits of these forests are dependent on innumerable factors, including annual precipitation, disturbance, elevation and temperature. From reading this discussion, it seems likely that many of the communities listed herein are intertwined and thus difficult to classify.

The book has some handy features that are rather noteworthy. Most keys are written with a minimal amount of technical terminology, making them accessible to those with limited botanical knowledge. The author has provided a map of the Park on the inside cover for quick reference to its readers. In addition, a metric ruler provided on the back cover proves convenient when keying out a specimen in the field.

Without doubt, this book is an important update to the knowledge of the flora of Mount Rainier. Those who enjoy the flora of this area would certainly benefit by purchasing a copy of this book, which should prove a worthy and practical field tool. This is a must-have for amateur and professional botanists who enjoy the Northwest United States.—*Amy Trauth Nare, Botanical Research Institute of Texas, Fort Worth, TX 76102-4060, U.S.A. amy trauth@yahoo.com*

DONALD H. MANSFIELD. 2000. **Flora of Steens Mountain.** (ISBN 0-87071-471-6, pbk.) Oregon State University Press. 101 Waldo Hall, Corvallis, OR 97331-6407. (Orders: http://osu.orst.edu/dept/press/osupress.htm, 800-426-3797, 541-737-3166, 541-737-3170 fax). $29.95, 424 pp, 64 color photos, line drawings, 6" × 9".

According to the Mansfield, the flora of Steens Mountain, Oregon includes "all of Steens Mountain from Long Hollow near Fields to Riddle Mountain east of Diamond, the entire Alvord Basin, the Pueblo Valley, Catlow Rim and the eastern edge of Catlow Valley, Diamond Craters, and the Malheur Marsh." The author also claims this book would be useful for the surrounding Pueblo Mountains and Harney Basin as well as most of southeastern Oregon, southwestern Idaho, and northern Nevada. Indeed, this publication would provide a useful tool for those interested in the flora of the northwestern United States.

The book's introduction begins with a discussion on how it is organized, specifics on the geographic region covered and more detailed information on Steens Mountain and surrounding areas. A short geologic and biogeographic history of Steens follows, then a floristic overview of Steens Mountain and an explanation of vegetation zones and plant communities. Mansfield provides an interesting discussion on what makes a plant rare, followed by a listing of some rare plants of Steens. Next, a brief history of botanical exploration on Steens is given, as well as information on how to use the

keys in this book and how to make a proper plant collection. Last, a brief discussion of scientific and common names and the benefits and detriments of each is provided.

A large portion of the book is dedicated to plants included in the flora, begins with a key to the families, and is followed by an alphabetical, rather than phylogenetic, listing of families. Within each family contains the genera and species found on Steens. The author has provided recognition features, or identifying characters, for each family; those that would be especially useful for an amateur botanist. As well, he includes interesting tidbits of information on each family, such as the economic importance of Poaceae and the fruit-bearing cultivars of Rosaceae. The etymology of each genus helps the reader understand the origins of sometimes difficult scientific names. Within each genus is a key to species, followed by a brief description of each species, common names, habitat and distribution. After the listing of families, a useful glossary follows, which clearly defines potentially confusing terms and cross references line drawings that follow. These illustrations would be particularly useful in teaching the amateur botanist about the seemingly infinite morphological diversity of angiosperms. The author provides three separate indices for families, genera and common names, respectively.

Although this book is in general well written, I have but a few minor criticisms. The author claims that the keys are written with the motivated novice in mind. As with most useful keys, however, much technical verbiage is included and could pose difficulty for someone with a limited knowledge of botanical terminology or diagnostic morphologic characters of flowering plant families. On the positive side, the glossary included at the end of the book is useful for clarifying any 'confusing' terms. In his discussion of rare plants on Steens Mountain, Mansfield explains why plants are endemic, citing two types, paleoendemics and neoendemics. While he states that the endemic plants of Steens are neoendemics, he provides no evidence for this observation other than a passing comment on alpine habitat (p.14). The discussion also includes a brief discussion of rare plants in the context of geologic history. Few, if any, amateur botanists or outdoor enthusiasts would have any understanding of geologic time periods. This discussion may be confusing or have little value for the novice reader. By comparison, the information that follows on how to use a key and make proper plant collections are integral in training the reader in proper botanical exploration and collection. In the center of the book, the author provides some high quality color plates, but these photos would be more valuable had scale bars or another unit of measure was provided. As they are given, the reader has no frame of reference for how large or small each plant is in the photo. In addition, it would have been useful to identify each photo with some sort of letter or number so as to be easily cross-referenced with the caption. To the author's credit, his introduction includes comments regarding the completeness of the *Flora of Steens Mountain*, noting that "the flora of Steens Mountain is certainly not finished...there will undoubtedly be more collections of plants not now included in the flora." Too often, this point is forgotten when a work such as this is published. Knowledge of biodiversity is certainly not complete and the dynamic nature of systematics ensures that we will continue learning about the flora of our continent.

This book provides a valuable addition to the knowledge of the flora of the Northwest. Certainly, outdoor enthusiasts and naturalists of southwest Oregon and surrounding areas would benefit by purchasing a copy of *Flora of Steens Mountain*. It is the perfect size for a field guide and would prove a valuable tool for those who tool around Oregon.—*Amy Trauth Nare, Botanical Research Institute of Texas, Fort Worth, TX 76102-4060, U.S.A., amy trauth@yahoo.com*

ROBERT H. MOHLENBROCK. 2001. **The Illustrated Flora of Illinois. Grasses: Panicum to Danthonia, Second Edition. Illustrations by Miriam W. Meyer and Paul W. Nelson.** (ISBN 0-8093-2360-5, hbk.) Southern Illinois University Press. P.O. Box 3697, Carbondale, IL 62902-3697. (Orders: 618-459-6633, 618-453-1221 fax). $50.00, 455 pp, 306 line drawings, 5 1/2" × 8 1/2".

ROBERT H. MOHLENBROCK. 2001. **The Illustrated Flora of Illinois. Flowering Plants: Pokeweeds, Four-o'clocks, Carpetweeds, Cacti, Purslanes, Goosefoots, Pigweeds, and Pinks. Illustrations by Paul W. Nelson.** (ISBN 0-8093-2380-X, hbk.) Southern Illinois University Press. P.O. Box 3697, Carbondale, IL 62902-3697. (Orders: 618-459-6633, 618-453-1221 fax). $59.95, 277 pp, 139 line drawings, 6" × 9".

ROBERT H. MOHLENBROCK. 2001. **The Illustrated Flora of Illinois. Sedges: Cyperus to Scleria, Second Edition. Illustrations by Fredda Burton and Mark W. Mohlenbrock.** (ISBN 0-8093-2358-3, hbk.) Southern Illinois University Press. P.O. Box 3697, Carbondale, IL 62902-3697. (Orders: 618-459-6633, 618-453-1221 fax). $39.95, 223 pp, 128 line drawings, 5 1/2" × 8 1/2".

These three books provide one new edition and two revised editions to the flora of Illinois. Each book begins with a county map of Illinois and a brief introduction about the groups covered within. Taxonomic descriptions, illustrations and distribution maps for each species follow the introduction. The books also contain a list of species excluded, a brief and basic glossary, literature cited, and a single index for both common and scientific names. The editions of *Grasses* and *Sedges* have appendices, which follow the species descriptions. These appendices seek to update any changes in nomenclature and classification since the first edition. In the appendices, only taxa new to the flora are illustrated and distribution maps are not provided.

The *Grasses* volume covers half of the 99 genera found in the Illinois flora, including those in the following subfamilies: Panicoideae, Eragrostoideae, Bambusoideae, Oryzoideae, and Arundinoideae. The introduction to the *Grasses* volume includes a short, but nonetheless informative, discussion of the morphology of grasses. The author also includes a discussion of the variety of grass habitats in Illinois. The key to the genera of *Grasses* is illustrated and would serve novice agrostologists well. Each subfamily, tribe and genus has a brief description, which is followed by species descriptions. Each species description includes only the most important features for identification and is written from observations of Illinois material. Also included are common name, habitat, geographic range, Illinois distribution and any pertinent taxonomic information. Following each species name is date and place of publication, synonyms, if applicable, and is cross-referenced with an accompanying illustration.

The *Sedges* volume covers all genera of Cyperaceae except *Carex*. The *Sedges* bears many similarities to the *Grasses* volume. Like *Grasses*, the introduction provides a short and informative discussion on the morphology and distribution of sedges. Mohlenbrock also discusses the relationship of sedges to other monocot families and describes how sedges are classified. The taxonomic treatment includes an illustrated key to genera and brief descriptions of tribes and genera. Species descriptions follow the same format found in the *Grasses* text. The appendix that follows clearly details additions and nomenclature changes to the Illinois flora. Many species of *Scirpus*, for example, have been transferred to segregate genera, including *Isolepis*, *Bulboschoenus* and *Schoenoplectus*.

The new *Flowering Plants* edition includes taxa from the Chenopodiales: Phytolaccaceae,

Nyctaginaceae, Molluginaceae, Cactaceae, Portulacaceae, Chenopodiaceae, Amaranthaceae and Caryophyllaceae. Polygonaceae, a family included in this order, is treated in a previous volume. The *Flowering Plants* volume does not include a key to the families at the beginning of the taxonomic treatment, but it would have been useful. Instead, readers are encouraged to use Mohlenbrock's companion book *Guide to the Vascular Flora of Illinois*. After a five page introduction, the *Flowering Plants* volume delves into the Chenopodiales. Species descriptions are provided in an identical structure as the other volumes. Moreover, the author provides other useful tidbits such as a key to sterile or immature specimens of genera in the Chenopodiaceae and a table that details the differences between *Chenopodium lanceolatum* and *C. album*. The illustrations in this volume are truly lovely and I found myself admiring them as I paged through the text. Never have I seen such weedy species presented in such a lovely fashion.

The information included in these three texts is an invaluable addition to the knowledge of the flora of North America. In particular, those interested in the Midwest United States should consider making this series a part of their library.—*Amy Trauth Nare, Botanical Research Institute of Texas, Fort Worth, TX 76102-4060, U.S.A. amy trauth@yahoo.com*

JOHN A. PARROTTA. 2002. **Healing Plants of Peninsular India.** (ISBN 0-85199 501-2, hbk.). CABI Publishing, 10 East 40th Street, Suite 3203, New York, NY 10016, U.S.A. (Orders: 212-481-7018, 212-686-7993 fax, cabi-nao@cabi.org). $140.00, 944 pp, numerous color photos, 7" × 9 1/2".

Healing Plants of Peninsula India is an important addition to the therapeutic plant knowledge base. This work compiles valuable information on 545 species of therapeutic plants used in traditional Indian medicine. This is NOT a flora or identification guide, as there are no keys to species. There are, however, superb descriptions and color photographs for all species. "Species are organized alphabetically, by family, genus, and species", and all species are listed, under the appropriate family, in the table of contents.

The introductory material consists of a general introduction that addresses ecological and conservation issues, and the importance of this book in introducing readers to the medicinally useful floristic wealth of central and southern India. It is the author's hope that "...this work will contribute to the recognition and appreciation of the knowledge of plants and their therapeutic uses accumulated and preserved over the centuries across India's varied cultural landscape, and encourage efforts to conserve the diversity of natural ecosystems that are India's traditional pharmacy." There is a short section on the cultural and historical roots of traditional Indian medicine, highlighting Ayurvedic and Siddha medical concepts, and the importance of traditional medicine to the cultures of the region. There is an interesting section of only a few paragraphs called: *Botanical identification of traditional plant drug sources: current challenges*. This section describes a major problem facing Indian traditional medicine generated by a lack of precise botanical descriptions in the traditional texts and general lack of expertise in plant identification among the majority of traders, pharmacists, and Ayurvedic practitioners. A section on the *forest wealth of peninsular India* is the largest section of the introduction, and describes the region in detail, with specific information on vegetation zones. The species descriptions start soon after a brief section on *preparation and organization of the book*.

Each of the 545 species descriptions contains at least one color photograph. Descriptions are arranged as follows: The *scientific name* is followed by a listing of *synonyms* and *authorities*. *Common names* are listed in the appropriate languages of the region. Some common languages seen are: Bengali, Hindi, Sanskrit, Tamil, Kannada, and English. This feature makes this volume useful for Indian traditional healers and botanists alike, as the common names known by the locals can be used

to help find a good botanical description, with correct scientific nomenclature. *Botanical descriptions* are thorough, as is information on *distribution* and *habitat*. Of course the real importance of a work like this is best revealed under the subheading *medicinal properties and uses*. Here, one can find information on the part of the plant used in preparation of a traditional drug, historical information on which cultural groups used the plant, and the chemically active components, if they are identified. Each description also has a short list of *references*.

An extensive 186 pages of end matter follows the descriptions. A *Bibliography* is followed by a *Glossary of Medical Terms* and a *Glossary of Botanical Terms*. A very well done and complete *Common Name Index* comes next, separated into the languages of the region. Also included are a *Scientific Name Index* and an *Index of Medicinal Uses*.

This is certainly one of the most extensive and well-designed medicinal plant books to date. Hopefully its vast information and intuitive organization will set a standard for other regional medicinal plant books. This volume should help awaken readers to the vast unexplored areas of study in medicinal plants. Many of the species described in this work have not been studied scientifically, and could be of great pharmaceutical value. Finally, this book makes one fully aware of the importance of conserving all biologically diverse areas, especially those containing useful and potentially revolutionary healing plants.—*Cole Weatherby, Dept. of Biology, Austin College, Sherman, TX 75090, and Botanical Research Institute of Texas, Fort Worth, TX 76102, U.S.A., wweatherby@austinc.edu*

STEPHEN FOSTER and CHRISTOPHER HOBBS. 2002. **Peterson Field Guide to Western Medicinal Plants and Herbs.** (ISBN 0-395-83806-1, Flexi, ISBN 0-395-83807-X, hbk.). Houghton Mifflin Company, 222 Berkeley Street, Boston, MA 02116-3764, U.S.A. (Orders: 617-351-3243, gracie_doyle@hmco.com, www.houghtonmifflinbooks.com). $22.00 (Flexi), $30.00 (hbk). 448 pp, 530 + color photos, 4 1/2" × 7 1/4".

This Peterson field guide to medicinal plants is the second by author Stephen Foster. The *Peterson Field Guide to Medicinal Plants and Herbs of Eastern and Central North America*, released in 2000, marked a sort of revolution in plant field guides. Not only did this guide allow for the identification of many plant species, using the "Peterson System", but it also provided important information on both contemporary and historical medicinal uses and toxicity. Having used field guides extensively, I have often found myself wanting more information than the descriptions had to offer. This usually meant a trip home to look the species up in my local flora and, often, another trip to the library to search for articles in the scientific literature. While I usually enjoy doing this kind of detective work, I found it fascinating to have more information available right there in the field, with the plant staring me in the face.

Initially this durably bound and covered book resembles any other field-worthy guide. I was a bit surprised to find thick glossy pages, each usually presenting at least one color photograph. This book places photographs immediately adjacent to the individual species descriptions, as other Peterson guides have done. This is a very nice feature, as it can often be frustrating flipping back and forth between descriptions and photographs. The identification system is decent. As in most Peterson botanical field guides, the species are separated into six flower color sections, followed by shrubs, trees, woody vines, ferns and fern allies, and grasses and grass-like plants. In the color-separated sections, things are also grouped by various key flower characteristics. This system requires one to thumb through practically every page until they find the section they are looking for. A table of contents at the beginning of each flower color section showing the sub-sections would be very useful, and speed

up identification. I'm sure that my copy will soon be cluttered with self-adhesive notes sticking out of my favorite sections, so this problem is fixable with a little work.

The biggest surprise came when I started reading the excellent descriptions this book offers. Each species has a short botanical description, followed by range, uses, and related species and warnings when applicable. The "uses" section is, of course, the most significant thing this book has to offer. This usually presents information on how the plant was used historically, and how the plant was and is prepared. It is interesting to see so much preparation information. Although it states plainly in the introduction that this "...book is not intended to be prescriptive or to take the place of a healthcare provider...", there is certainly enough information here on preparation and indications for use to allow one to actually use these plants. Co-author Christopher Hobbs is a licensed acupuncturist, herbalist, and consultant to the dietary supplement industry whose expertise on preparing these plants for actual use is apparent upon reading these sections. Dosage information is rarely listed in the *Uses* section, which seems potentially hazardous. This work provides readers with the necessary information to make use of these plants by containing detailed preparation instructions, and then neglects to give any dosage information, not even warnings about over-dose. It is likely that it would have been difficult to compile this information, and liability issues may have also prevented the inclusion of dosages. It would also be helpful to provide references for the specific historical information presented in the text. However, there is a nice list of references in the back, which seems to compensate for this.

Icons are used throughout this book to indicate poisonous plants, plants that are known to cause allergic reactions or contact dermatitis, and those used in modern medicine. The end matter includes a checklist of plant species, with blanks to write observed flowering or fruiting dates, and two indices: an index of plant species by common and scientific name, and another of medicinal topics. The medicinal topics index is excellent, providing page numbers of plant descriptions organized by their usefulness in treating specific medical conditions.

This guide is an incomparable field companion for anyone with an interest in medicinal plants. The extensive color photographs are good to spectacular, and it is obvious that great amounts of time were invested in finding some of the best photographs available. The book's identification material, detailed information on plant uses, and brilliant color photographs make it especially deserving of a spot in your backpack.—*Cole Weatherby, Dept. of Biology, Austin College, Sherman, TX 75090, and Botanical Research Institute of Texas, Fort Worth, TX 76102, U.S.A., wweatherby@austinc.edu*

Annotations and comments by the Editor

Timber Press' Gardener's Guide to Growing

Michael Jefferson-Brown and Harris Howland. 2002. **Gardener's Guide to Growing Lilies.** (ISBN 0-88192-537-3, pbk.; 0-88192-315-X, hbk.). Timber Press, Inc., 133 S.W. Second Avenue, Suite 450, Portland, OR 97204-3527, U.S.A. (Orders: www.timberpress.com, 800-327-5680, 503-227-2878, 503-227-3070 fax). $29.95 (hbk, 1995), $19.95 (pbk, 2002), 160 pp., 70 color photos, 40 b/w line drawings, 7" × 9 1/2".

Key Words: Lilies, *Lilium*, related plants, gardening, identification.

Diana Grenfell. 2002. **The Gardener's guide to Growing Daylilies.** (ISBN 0-88192-536-5, pbk.; 0-88192-461-X, hbk.). Timber Press, Inc., 133 S.W. Second Avenue, Suite 450, Portland, OR 97204-3527, U.S.A. (Orders: www.timberpress.com, 800-327-5680, 503-227-2878, 503-227-3070 fax). $29.95 (hbk, 1998), $19.95 (pbk, 2002), 160 pp., 74 color photos, 5 line drawings, 7" × 9 1/2".

Key Words: Daylilies, *Hemerocallis*, gardening, horticulture, identification.

Martin Page. 2002. **The Gardener's Guide to Growing Peonies.** (ISBN 0-88192-535-7, pbk.; 0-88192-408-3, hbk.). Timber Press, Inc., 133 S.W. Second Avenue, Suite 450, Portland, OR 97204-3527, U.S.A. (Orders: www.timberpress.com, 800-327-5680, 503-227-2878, 503-227-3070 fax). $29.95 (hbk, 1997), $19.95 (pbk, 2002), 160 pp., 76 color photos, 18 b/w line drawings, 7" × 9 1/2".

Key Words: Peonies, gardening, horticulture, identification, 600 species and cultivars.

Graham Rice and Elizabeth Strangman. 2001. **The Gardener's Guide to Growing Hellebores.** (ISBN 0-88192-517-9, pbk.; 0-88192-266-8, hbk.). Timber Press, Inc., 133 S.W. Second Avenue, Suite 450, Portland, OR 97204-3527, U.S.A. (Orders: www.timberpress.com, 800-327-5680, 503-227-2878, 503-227-3070 fax). $29.95 (hbk, 1993), $19.95 (pbk, 2001), 160 pp., 74 color photos, 20 line drawings, 7" × 9 1/2".

Key Words: Hellebores, gardening, horticulture, identification.

Geoff Stebbings. 2001. **The Gardener's Guide to Growing Irises.** (ISBN 0-88192-519-5, pbk.; 0-88192-388-5, hbk.). Timber Press, Inc., 133 S.W. Second Avenue, Suite 450, Portland, OR 97204-3527, U.S.A. (Orders: www.timber

press.com, 800-327-5680, 503-227-2878, 503-227-3070 fax). $29.95 (hbk, 1997), $19.95 (pbk, 2001), 160 pp., 74 color photos, 3 line drawings, 7" × 9 1/2".

KEY WORDS: Irises, gardening, horticulture, identification, cultivars.

DIANA GRENFELL. 2001. **The Gardener's Guide to Growing Hostas.** (ISBN 0-88192-518-7, pbk.; 0-88192-355-9, hbk.). Timber Press, Inc., 133 S.W. Second Avenue, Suite 450, Portland, OR 97204-3527, U.S.A. (Orders: www.timberpress.com, 800-327-5680, 503-227-2878, 503-227-3070 fax). $29.95 (hbk, 1996), $19.95 (pbk, 2001), 160 pp., 74 color photos, 5 line drawings, 7" × 9 1/2".

KEY WORDS: Hostas, gardening, horticulture, identification, cultivars, propagation, over 400 cultivars and forms.

Ecology/Conservation/Landscape Ecology

ROBERT H. ROBICHAUX and DAVID A. YETMAN (eds.). 2000. **The Tropical Deciduous Forest of Alamos: Biodiversity of a Threatened Ecosystem in Mexico.** (ISBN 0-8165-1922-6, hbk.). The University of Arizona Press, 355 S. Euclid, Ste. 103, Tucson, AZ 85719, U.S.A. (Orders: 520-621-1441, 520-621-8899 fax). $50.00 (hbk), 259 pp., numerous b/w photos, 6" × 9".

KEY WORDS: Mexico, Sonora, Biological diversity, tropical deciduous forest, vegetation, flora, checklist of Rio Cuchujaqui plants, trees in southern Sonora, trees of the Mayo Region, ethnobotanically useful trees, columnar cacti, Mayo people, crop diversity, amphibians and reptiles, birds.

BARBARA TELLMAN (ed.). 2002. **Invasive Exotic Species in the Sonoran Region .** (ISBN 0-8165-2178-6, hbk.). The University of Arizona Press, 355 S. Euclid, Ste. 103, Tucson, AZ 85719, U.S.A. (Orders: 520-621-1441, 520-621-8899 fax). $75.00 (hbk), 460 pp., 37 illustrations, 6 1/8" × 9 1/4".

KEY WORDS: Invasive plants, exotics, amphibians, mammals, insects, fish, birds, 500 naturalized exotic species, Sonoran Desert, adjacent grasslands, riparian areas, native landscapes, Mexico, U.S.A., environmental concerns.

RODNEY W. BOVEY. **Woody Plants and Woody Plant Management: Ecology, Safety, and Environmental Impact.** (ISBN 0-8247-0438-, hbk.). Marcel Dekker, Inc., 270 Madison Avenue, New York, NY 10016, U.S.A. (Orders: 212-696-9000, 212-685-4540 fax, www.deeker.com). Marcel Dekker AG, Hutgasse 4, Postfach 812, CH-4001 Basel, Switzerland (Orders: 41-61-261-8482, 41-61-261-8896 fax) $195.00, 564 pp., 6" × 9".

KEY WORDS: Woody plants, woody plant management.

From the back cover: "Consolidating an extensive breadth of resources on woody plants, this reference/text on the historical significance and botanical nature of woody plants details strategies for managing woody plants and using research data to select the most appropriate control methods—analyzing the responses of over 370 North American woody plants to commercially available herbicides."

Ethnobotanical/Economic/Medicinal/Useful Plants/Toxic

MARLA R. EMERY and REBECCA J. MCLAIN (eds.). 2001. **Non-timber Forest Products: Medicinal Herbs, Fungi, Edible Fruits and Nuts, and Other Natural Products from the Forest.** (ISBN 1-56022-089-9, pbk.). Food Products Press, 10 Alice Street, Binghamton, NY 13904-1580 U.S.A. (Orders: 607-722-5857, 607-722-1424 fax, getinfo@haworthpressinc.com). Price not listed, 176 pp., 6" × 8 1/4".

KEY WORDS: Non-timber forest products, North America, review, history, sustainable uses.

NARAYAN P. MANANDHAR. 2002. **Plants and People of Nepal.** (ISBN 0-88192-527-6). Timber Press, Inc., 133 S.W. Second Avenue, Suite 450, Portland, OR 97204-3527, U.S.A. (Orders: www.timberpress.com, 800-327-5680, 503-227-2878, 503-227-3070 fax). $69.95, 636 pp., 48 color photos, 3 tables, 834 line drawings, 2 maps, 8 1/2" × 11".

Key Words: Plants, Nepalese people, flora, ethnobotany, descriptions, common names.

This is quite a book with fantastic color photos of plants and Nepalese people. There are no keys so the drawings, although not sophisticated, are excellent aids in identification. What a great reference with several useful appendices.

Science/Society/Economy

DOROTHY SCHWIEDER, THOMAS MORAIN, and LYNN NIELSEN. 2002. **Iowa Past to Present: The people and the Prairie. Third edition.** (ISBN 0-8138-2998-4, hbk.). Iowa State Press, 2121 State Avenue, Ames, IA 50014, U.S.A. (Orders: 1-800-862-6657, 1-515-292-3348 fax; www.iowastatepress.com). $32.99, 312 pp., numerous b/w photos and other illustrations, 7" × 10".

KEY WORDS: Iowa, history, juvenile literature, American Indians, pioneers, prairies, settlers, frontier, farms.

STUART MCCOOK. 2002. **States of Nature. Science, Agriculture, and Environment in the Spanish Caribbean.** (ISBN 0-292-75256-3, hbk.; 0-292-75257-1, pbk.). University of Texas Press, P.O. Box 7819, Austin, TX 78713-7819, U.S.A. (Orders: 800-252-3206 fax; 512-471-4032). $50.00 (hbk), $22.95 (pbk), 201 pp., 6 photos, 1 map, 6" × 9".

KEY WORDS: Science, history, Latin America, Caribbean, Venezuela, Puerto Rico, Colombia, Costa Rica, environment, nature, economy, agriculture, botanical science.

GERHARD SONNERT (with assistance of Gerald Holton). 2002. **Ivory Bridges: Connecting Science and Society.** (ISBN 0-262-19471-6, hbk.). The MIT Press, 5 Cambridge Center, Cambridge, MA 02142-1493, U.S.A. (Orders: 800-405-1619, mitpress-orders@mit.edu, mitpress.mit.edu). $30.00 (hbk), 227 pp., 6" × 9".

KEY WORDS: Science, society, governmental science policy, scientists' voluntary public-interest associations, "pure" science, research in the national interest, activities of citizen scientists

Botany/Molecular/Physiology

THOMAS J. GIVNISH and KENNETH J. SYTSMA. 1997. **Molecular Evolution and Adaptive Radiation.** (ISBN 1-521-57329-7, hbk.). Cambridge University Press, The Edinburgh Building, Cambridge CB2 2RU, UK; 40 West 20th Street, New York, NY 10011-4211, U.S.A. $39.95, 621 pp., b/w photos, figures, 7" × 10".

KEY WORDS: Evolution, adaptive radiation, convergence, reproductive strategies, macroevolutionary patterns.

There were forty authors who contributed to the book's seven chapters: **1)** Introduction; **2)** Integrative Studies; **3)** Convergence; **4)** Rapid Radiations; **5)** Reproductive Strategies; **6)** Character Divergence and Community Assembly; and **7)** Macroevolutionary Patterns.

R.S. SINGH. 2000. **Diseases of Fruit Crops.** (ISBN 1-57808-159-9, pbk.; 1-57808-149-1, hbk.). Science Publishers, Inc., P.O. Box 699, Enfield, NH 03748, U.S.A. (Orders: sales@scipub.net; www.scipub.net, or info@scipub.net). $49.50 (pbk), 310 pp., 31 b/w photos, 6" × 9 1/2".

KEY WORDS: Fruit diseases, fruit pests, citrus, pome and stone fruits, mango, banana, grapevines and grapes, guava, strawberry, coconut palm, pineapp.le, pomegranate, litchi, loquat, cashewnut, sapodilla plum.

GEORGE G. KHACHATOURIANS, ALAN MCHUGEN, RALPH SCORZA, WAI-KIT NIP, and Y.H. HUI (eds.). 2001. **Transgenic Plants and Crops.** (ISBN 0-8247-0545-9, hbk.). Marcel Dekker, Inc., 270 Madison Avenue, New York, NY 10016, U.S.A. (Orders: 212-696-9000, 212-685-4540 fax, www.deeker.com). Marcel Dekker AG, Hutgasse 4, Postfach 812, CH-4001 Basel, Switzerland (Orders: 41-61-261-8482, 41-61 261-8896 fax) $225.00, 876 pp., b/w photos, 7" × 10".

KEY WORDS: Transgenic plants, crops, transgenic techniques, agriculture, molecular biology, food plant biotechnology, genetics, social, political, legal aspects of genetic plant manipulation.

YOAV WAISEL, AMRAM ESHEL, and UZI KAFKAFI (eds.). 2002. **Plant Roots. The Hidden Half. Third Edition.** (ISBN 0-8247-0631-5, hbk.). Marcel Dekker, Inc., 270 Madison Avenue, New York, NY 10016, U.S.A. (Orders: 212-696-9000, 212-685-4540 fax, www.deeker.com). Marcel Dekker AG, Hutgasse 4, Postfach 812, CH-4001 Basel, Switzerland (Orders: 41-61-261-8482, 41-61-261-8896 fax) $250.00, 1120 pp., color and b/w photos, line drawings, 8 1/2" × 11".

KEY WORDS: Roots, characteristics of roots, root system, root structure, development, root genetics, regulation of root growth, physiological aspects of root systems, roots under stress, roots of various ecological groups, roots of economic value, roots with medicinal activity

This is quite a book on the subject of roots. There are some 99 individuals listed as contributing to this incredible and massive compilation. The references follow each of the 59 chapters rather than at the end. The editors are to be congratulated.

ANDRÉ O. BAREL, MARC POAYE, and HOWARD I. MAIBACH (eds). **Handbook of Cosmetic Science and Technology.** (ISBN 0-8247-0292-1, hbk.). Marcel Dekker, Inc., 270 Madison Avenue, New York, NY 10016, U.S.A. (Orders: 212-696-9000, 212-685-4540 fax, www.deeker.com). Marcel Dekker AG, Hutgasse 4, Postfach 812, CH-4001 Basel, Switzerland (Orders: 41-61-261-8482, 41-61-261-8896 fax) $235.00, 886 pp., b/w photos, and other figures, 7" × 10".

KEY WORDS: Cosmetics, cosmetic ingredients, finished products, target organs, delivery systems, current technology in safety, toxicology, dermatological testing.

This appears to be an up-to-date reference on the cosmetic industry. **Part 1)** Introduction; **Part 2)** Target Organs for Cosmetic Products; **Part 3)** Safety Considerations; **Part 4)** Vehicles of Cosmetic Products; **Part 5)** Cosmetic Ingredients; **Part 6)** Cosmetic Products; **Part 7)** Legislation and Regulations Worldwide; **Part 8)** Testing Cosmetic Products; and **Part 9)** Cosmetic Claims. Contributions from some 92 expert scientists from academic dermatology and dermato-cosmetics, the cosmetics industry, ingredients and raw materials producers, to regulatory agencies, helped the editors to achieve their goal.

MOHAMMAD PESSARAKLI (ed). **Handbook of Plant and Crop Physiology.** (ISBN 0-8247-0546-7, hbk.). Marcel Dekker, Inc., 270 Madison Avenue, New York, NY 10016, U.S.A. (Orders: 212-696-9000, 212-685-4540 fax, www.deeker.com). Marcel Dekker AG, Hutgasse 4, Postfach 812, CH-4001 Basel, Switzerland (Orders: 41-61-261-8482, 41-61-261-8896 fax) $225.00, 973 pp., b/w photos, graphs, and other figures, 7" × 10".

KEY WORDS: Plant crops, physiology, environmental factors, climatic changes, developmental states, growth regulators.

This is a comprehensive, up to-date reference on plant and crop physiology. **Part 1)** Plants/Crops Growth Responses to Environmental Factors and Climactic Changes; **Part 2)** Physiology of Plant/Crop Growth and Developmental Stages; **Part 3)** Cellular and Molecular Aspects of Plant/Crop Physiology; **Part 4)** Plant/Crop Physiology and Physiological Aspects of Plant/Crop Production Processes; **Part 5)** Plant Growth Regulators: The Natural Hormones (Growth Promoters and Inhibitors) and Plant Genes; **Part 6)** Physiological Responses of Plants/Crops Under Stressful (Salt, Drought, and Other Environmental Stresses) Conditions; **Part 7)** Physiological Responses of Plants/Crops to Heavy Metal Concentration and Agrichemicals; **Part 8)** Physiological Relationships Between Lower and Higher Plants; **Part 9)** Physiology of Lower-Plant Genetics and Development; **Part 10)** Physiology of Higher-Plant/Crop Genetics and Development; **Part 11)** Using Computer Modeling in Plant Physiology; and **Part 12)** Plant/Crop Physiology Under Controlled Conditions, in Space, and on Other Planets. There were some 76 specialists contributing to this volume.

Biographical

WILFRID BLUNT (Introduction by William T. Stearn). 2001. **Linnaeus: The Compleat Naturalist.** (ISBN 0-691-09636-8, pbk.). Princeton University Press, 41 William Street, Pinceton, NJ 08540, U.S.A. (Orders: California Princeton Fulfillment Services, 1445 Lower Ferry Road, Ewing, NJ 08618, U.S.A., 609-883-1759, 609-883-7413 fax, www.pup.princeton.edu). $35.00, 264 pp., color photos, 7 3/4" × 9 3/4".

KEY WORDS: Linnaeus, biography, taxonomy, systematic botany, history.

Journals

Acta Botanica Hungarica. (ISSN 0236-6495). Akadémiai Kiadó, Budapest, H-1519 Budapest, P.O. Box 245, HUNGARY. (Subscriptions: 36-1-464-8221, email: kiss.s@akkrt.hu). $192.00, 4 issues/year, 6 1/2" × 9 1/2".

CONTENTS FOR 43(3-4) 2001: **1)** In honour of the seventy-year-old Gábor Fekete. **2)** Jaraine Komlodi Magda is seventy-years old. **3)** Les componantes de la balance hydrique des deux type des maïs différents dans les deux périodes de végétation successives. **4)** Anatomical investigation of 4,000-years old *Cedrus libani* wood remains from Egypt. **5)** Revisión taxonómica del género *Stevensia* Poit. **6)** Total soluble protein amount in vegetative buds and needles of Norway spruce during the burst ing time. **7)** Melitopalynological and antimicrobial properties of honeys from Elazi_ (E Turkey). **8)** Effect of chemical and biological insecticides on growth, pigmentation, photosynthetic activity and yield productivity of *Vicia faba* plants. **8)** Coenological data on temperate semidesert sandy grass lands in Hungary. **9)** Soil seed bank and vegetation composition of two fen-meadow stands in the Netherlands. **10)** The effects of low temperature on the growth and total protein amount of chickpea (*Cicer arietinum*) seedlings. **11)** Cambial activity and development of xylem in *Tamarindus indica* L. growing in different forests of Gujarat state. **12)** Morpho-histogenic studies of the fruit wall of *Argemone mexicana* L. (Papaveraceae). **13)** Effect of industrial effluents polluting the river Nile on growth, metabolism and productivity of *Triticum aestivum* and *Vicia faba* plants. **14)** Floral anatomy of *Actinomeris squarosa* and *Bidens biternata* (Asteraceae).

"You don't have to be a botanist to use it! All the tools you need to teach plant taxonomy, family characters, classification, etc. Excellent introductory materials on the history and geology of North Central Texas. Great for identifying indigenous plants in an ecosystem! Essential for student wildflower collection projects! Use this one book instead of five, it has it all."

—*Sharon Foster*, 7th grade teacher,
Fort Worth Country Day School

"The best available, user-friendly source of information about our native and naturalized plants. This book should be in the library of every gardener, landscape architect, horticulturist, urban planner, farmer, rancher, and wildflower enthusiast."

—*Howard Garrett, The Dirt Doctor*

"INCREDIBLE, FANTASTIC, WONDERFUL, BEAUTIFUL, ETC. WOW! To be more specific: COMPREHENSIVE, ENCYCLOPEDIC, INNOVATIVE. With every species illustrated - it's a new departure in Texas floras, a breath of fresh air."

—*Marshall Johnston*, Co-author,
Manual of the Vascular Plants of Texas

"The *Illustrated Flora on North Central Texas* is a magnificent work. This abundantly illustrated volume will not only be of use to those people wanting to identify Texan plants, it will be a model of how a local flora should be prepared."

—*Sir Ghillean Prance* FRS
Director, Royal Botanic Gardens, Kew

PAPUA NEW GUINEA

ABSTRACT

A general account is provided of the orchid gatherings from the 1994 Conservation International survey of southern New Ireland, an area identified by environmental assessment as one of Papua New Guinea's major terrestrial unknown regions. One new species (*Dendrobium archipelagense*) and one new variety (*Dendrobium vexillarius* J.J. Sm. var. *hansmeyerense*) are described and illustrated. Several distributional records are reported. Illustrations are provided for most of the cited taxa.

KEY WORDS: Botanical survey, *Dendrobium*, New Ireland, Orchidaceae, Papua New Guinea

JAPANESE ABSTRACT

パプアニューギニアの中でも最も生態的調査が遅れている地域といわれる、ニューアイルランド島南部において、1994年にコンザベーションインターナショナルによる調査が行われた。この調査において採集された蘭に関する報告を行う。*Dendrobium archipelagense* と *D. vexillarius* J.J. Sm. var. *hansmeyerense* の2つの新種の蘭の形態に関して記述と図説を行い、幾つかの分布地域に関しても報告する。

INTRODUCTION

Originally a part of the German Territory of New Guinea, the Bismarck Archipelago consists primarily of New Britain, New Ireland, and Manus. These islands are now separate provinces of the sovereign state of Papua New Guinea (PNG). The Archipelago is collectively designated as the 'Islands Region' by national administrators, and also includes several minor islets scattered outboard of New Ireland, as for example, the St. Matthias group, Lihir, and Tabar (Fig. 1).

The Bismarck Archipelago represents one of PNG's most poorly documented floristic regions (Takeuchi & Golman 2001). It is unfortunately the most intensively logged territory in the country: 50% of the archipelagic land area is currently under timber concessional development (ibid.). Because of the paucity of biodiversity information, the forested tracts in southern New Ireland are ranked among PNG's 16 terrestrial unknowns and are also included in the country portfolio of high-priority sites for conservation action (Johns 1993: 25; Sekhran & Miller 1995: 113–15).

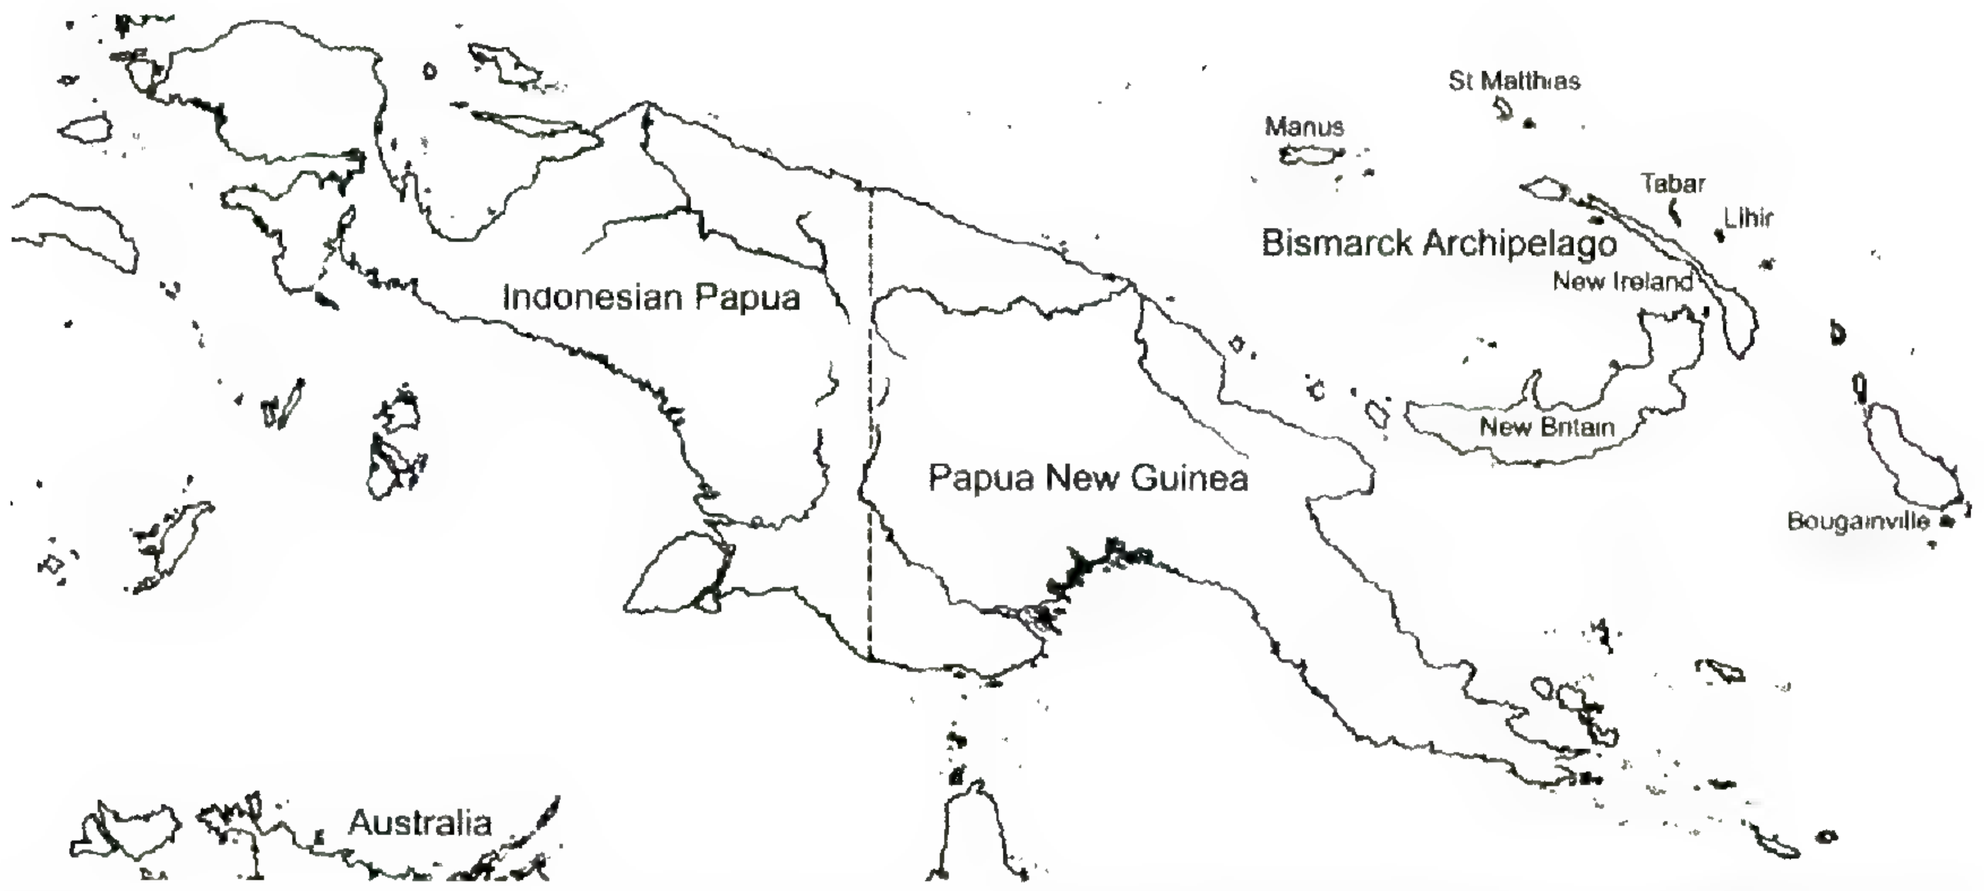

FIG. 1. Island of New Guinea, and the Bismarck Archipelago.

In order to assess the status of its environments, from January 14 to February 16, 1994, a 13-member team conducted an elevation-sequenced survey in the Weitin Valley and Hans Meyer Range of southern New Ireland. Although the survey's collective findings have been recently published (Beehler & Alonso 2001), the orchid vouchers were treated in a separate checklist (Howcroft 1994). In the following discussion, the orchids from the 1994 survey are given further consideration. Occurrence notes from other areas within the Archipelago have also been added when appropriate.

DESCRIPTIONS OF NEW TAXA

Dendrobium vexillarius J.J. Sm. var. **hansmeyerense** Howcroft & Takeuchi, var. nov. (**Fig. 2**). TYPE: PAPUA NEW GUINEA. NEW IRELAND PROVINCE: Hans Meyer Range, Angil Mountain, expedition camp 4 in pristine subcloud forest, 4°25.2' S, 152°56.8' E, 1800 m, 6 Feb 1994 (fl, fr, spirit), *W. Takeuchi & J. Wiakabu* 9453 (HOLOTYPE: LAE).

A var. *vexillarius* sepalis latioribusque abaxialis cristatus differt.

Distribution and ecology.—Known thus far only from the type locality, in mossy montane forest at 1800 m.

Etymology.—The new variety is named after the type locality.

Dendrobium vexillarius was previously represented by six varieties separated primarily by the color of the perianth (Reeve & Woods 1989: 250). A prominent abaxial crest on the lateral sepals distinguishes var. *hansmeyerense* from other infraspecific taxa.

The new variety was collected earlier during the 1975 Kew expedition to New Ireland (i.e., *Sands et al. 1985, 2349, 2374, 2399*). Reeve and Woods (1990) had tentatively assigned these specimens to variety *uncinatum*. However that variety is not prominently crested on the abaxial side of the lateral sepals as with var. *hansmeyerense*. Keels are sometimes present among the varieties of *D.*

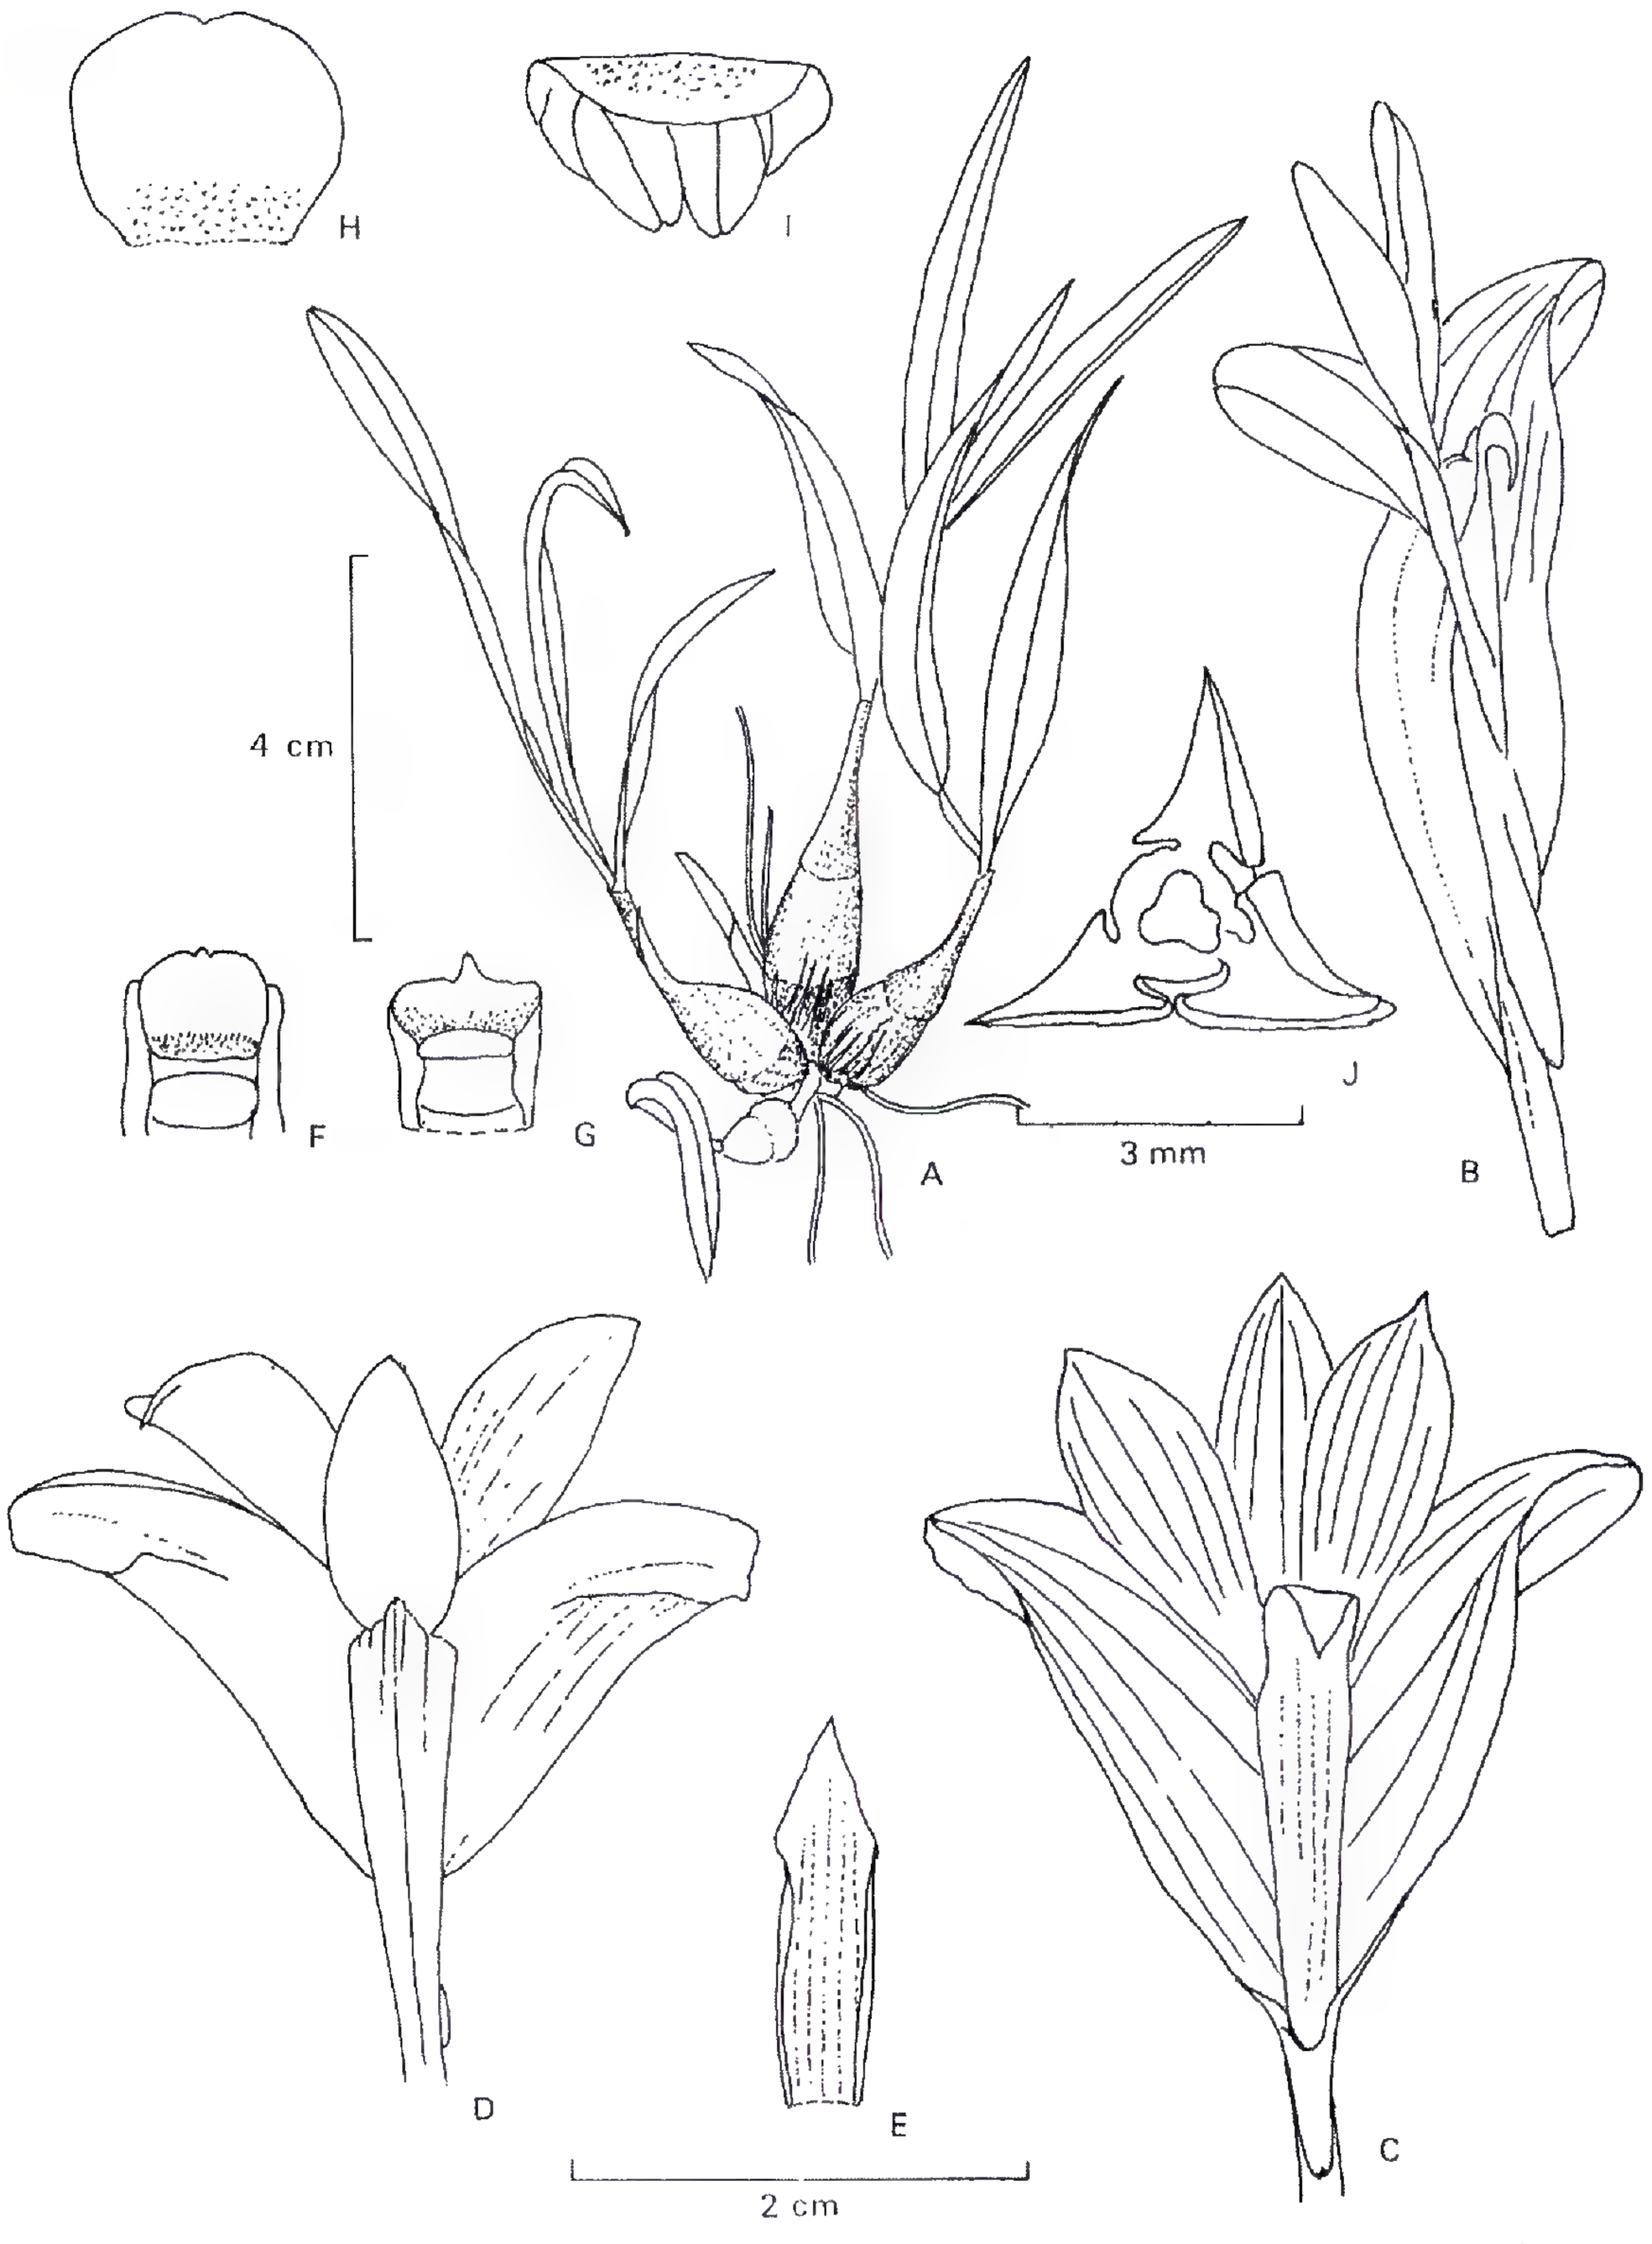

FIG. 2. *Dendrobium vexillarius* J.J. Sm. var. *hansmeyerense* Howcroft & Takeuchi. **A.** Habit. **B.** Flower, side view. **C.** Flower, from below. **D.** Flower, from above. **E.** Labellum, midsection to apex. **F–G.** Column apex with and (**G**) without anther. **H.** Anther, front view. **I.** Anther with pollen, oblique rear (or anterior) view. **J.** Ovary in cross-section. Scale bars: A, 4 cm; B–E, 2 cm; F–G, 3mm; H–I (enlarged 30×); J, 3mm. Drawn from the type by N.H.S. Howcroft.

vexillarius but they are not prominent. The only other taxon in this section with a prominent abaxial keel is *D. brevicaule* Rolfe ssp. *pentagonum* (Kraenzlin) Reeve & Woods, with an otherwise very differently shaped ovary in cross-sectional view.

Dendrobium archipelagense Howcroft & Takeuchi, sp. nov. (**Fig. 3**). TYPE: PAPUA NEW GUINEA. NEW IRELAND PROVINCE: junction of Niagara and Weitin rivers, expedition camp 2, lowland rainforest, 4°30.210' S, 152°56.242' E, 240 m, Jan 1994 (fl, spirit), *W. Takeuchi & J. Wiakabu 9979* (HOLOTYPE: LAE; ISOTYPE: A)

Dendrobio strepsiceroti J.J.Smith, *Dendrobio antennato* Lindley affinis sed differt forma ac amplitudine labelli, lobis lateralibus oblongi-ellipticis (non quadrati ellipticis) apicibus rotundatis superpositis basim midlobi, et lamella triangulari carenti in parte distali midlobo.

Tufted epiphyte. **Rhizomes** short. **Pseudobulbs** swollen at the base, fusiform in the lower part, distally more slender, subcylindrical, with persistent nodal sheaths shorter than the internodes, leafy, to 50 by 1.0–2.0 cm. **Leaves** distichous, lanceolate-ovate, 7.5–9.5 by 2.0–3.0 cm, asymmetrically emarginate, adaxially slightly concave, abaxially convex, thick, coriaceous, green to yellow-green. **Inflorescence** racemose, one or several per pseudobulb, inserted at the apex or slightly below, erect, rachis to 40 cm by 2 3 mm; peduncle to 9 cm long, peduncular and floral bracts tubular; pedicel glabrous, ca. 2.2 cm long. **Flowers** 5–10 per raceme, usually wide-opening, 4.0–5.5 by 3.5 cm, pale green to yellow-green. **Dorsal sepal** recurved, twisted through one turn, oblong-lanceolate, 2.0–2.6 by 0.6–0.7 cm, acuminate. **Lateral sepals** recurved, oblong-lanceolate, 2.5–3.3 by 0.9 cm at the base, apex acute or acuminate. **Mentum** narrowly conical, 0.9–1.0 cm long, apex straight or slightly decurved. **Petals** linear, acute, 3.0–4.5 by 0.25–0.4 cm, twisted through one or two turns, spreading. **Labellum** porrect, 3-lobed, 2.0–2.3 by 1.0–1.5 cm, similar in color to sepals and petals but with some purple venation; lateral lobes oblong-elliptic, 1.15 by 1.5 cm, over-lapping base of the midlobe, apex rounded; midlobe ovate, 1.0 by 1.0 cm, acute to apiculate, not recurved; callus of 5 keels, the lateral ones not extending past the base of the midlobe, the median keel extending to the apex of the midlobe, slightly raised, not lamellate or crested. **Column** 0.5 cm long, apex laterally bilobed, foot at 10° to column. **Ovary** glabrous, 0.9 cm long.

Distribution and ecology.—Widely distributed throughout the Bismarck Archipelago, frequently on trees near the coast but also from inland areas. The type locality is lowland rainforest at 240 m.

The new species seems to flower mainly during the first half of each year. In addition to the type specimen (flowering in Jan), cultivated plants have produced flowers continuously from May to Jul. Seeds from the previous year's set, are released simultaneously with the production of new flowers.

Etymology.—The epithet reflects the distributional restriction to the Bismarck Archipelago.

Within section *Spatulata* Lindl., the novelty's closest relative appears to be

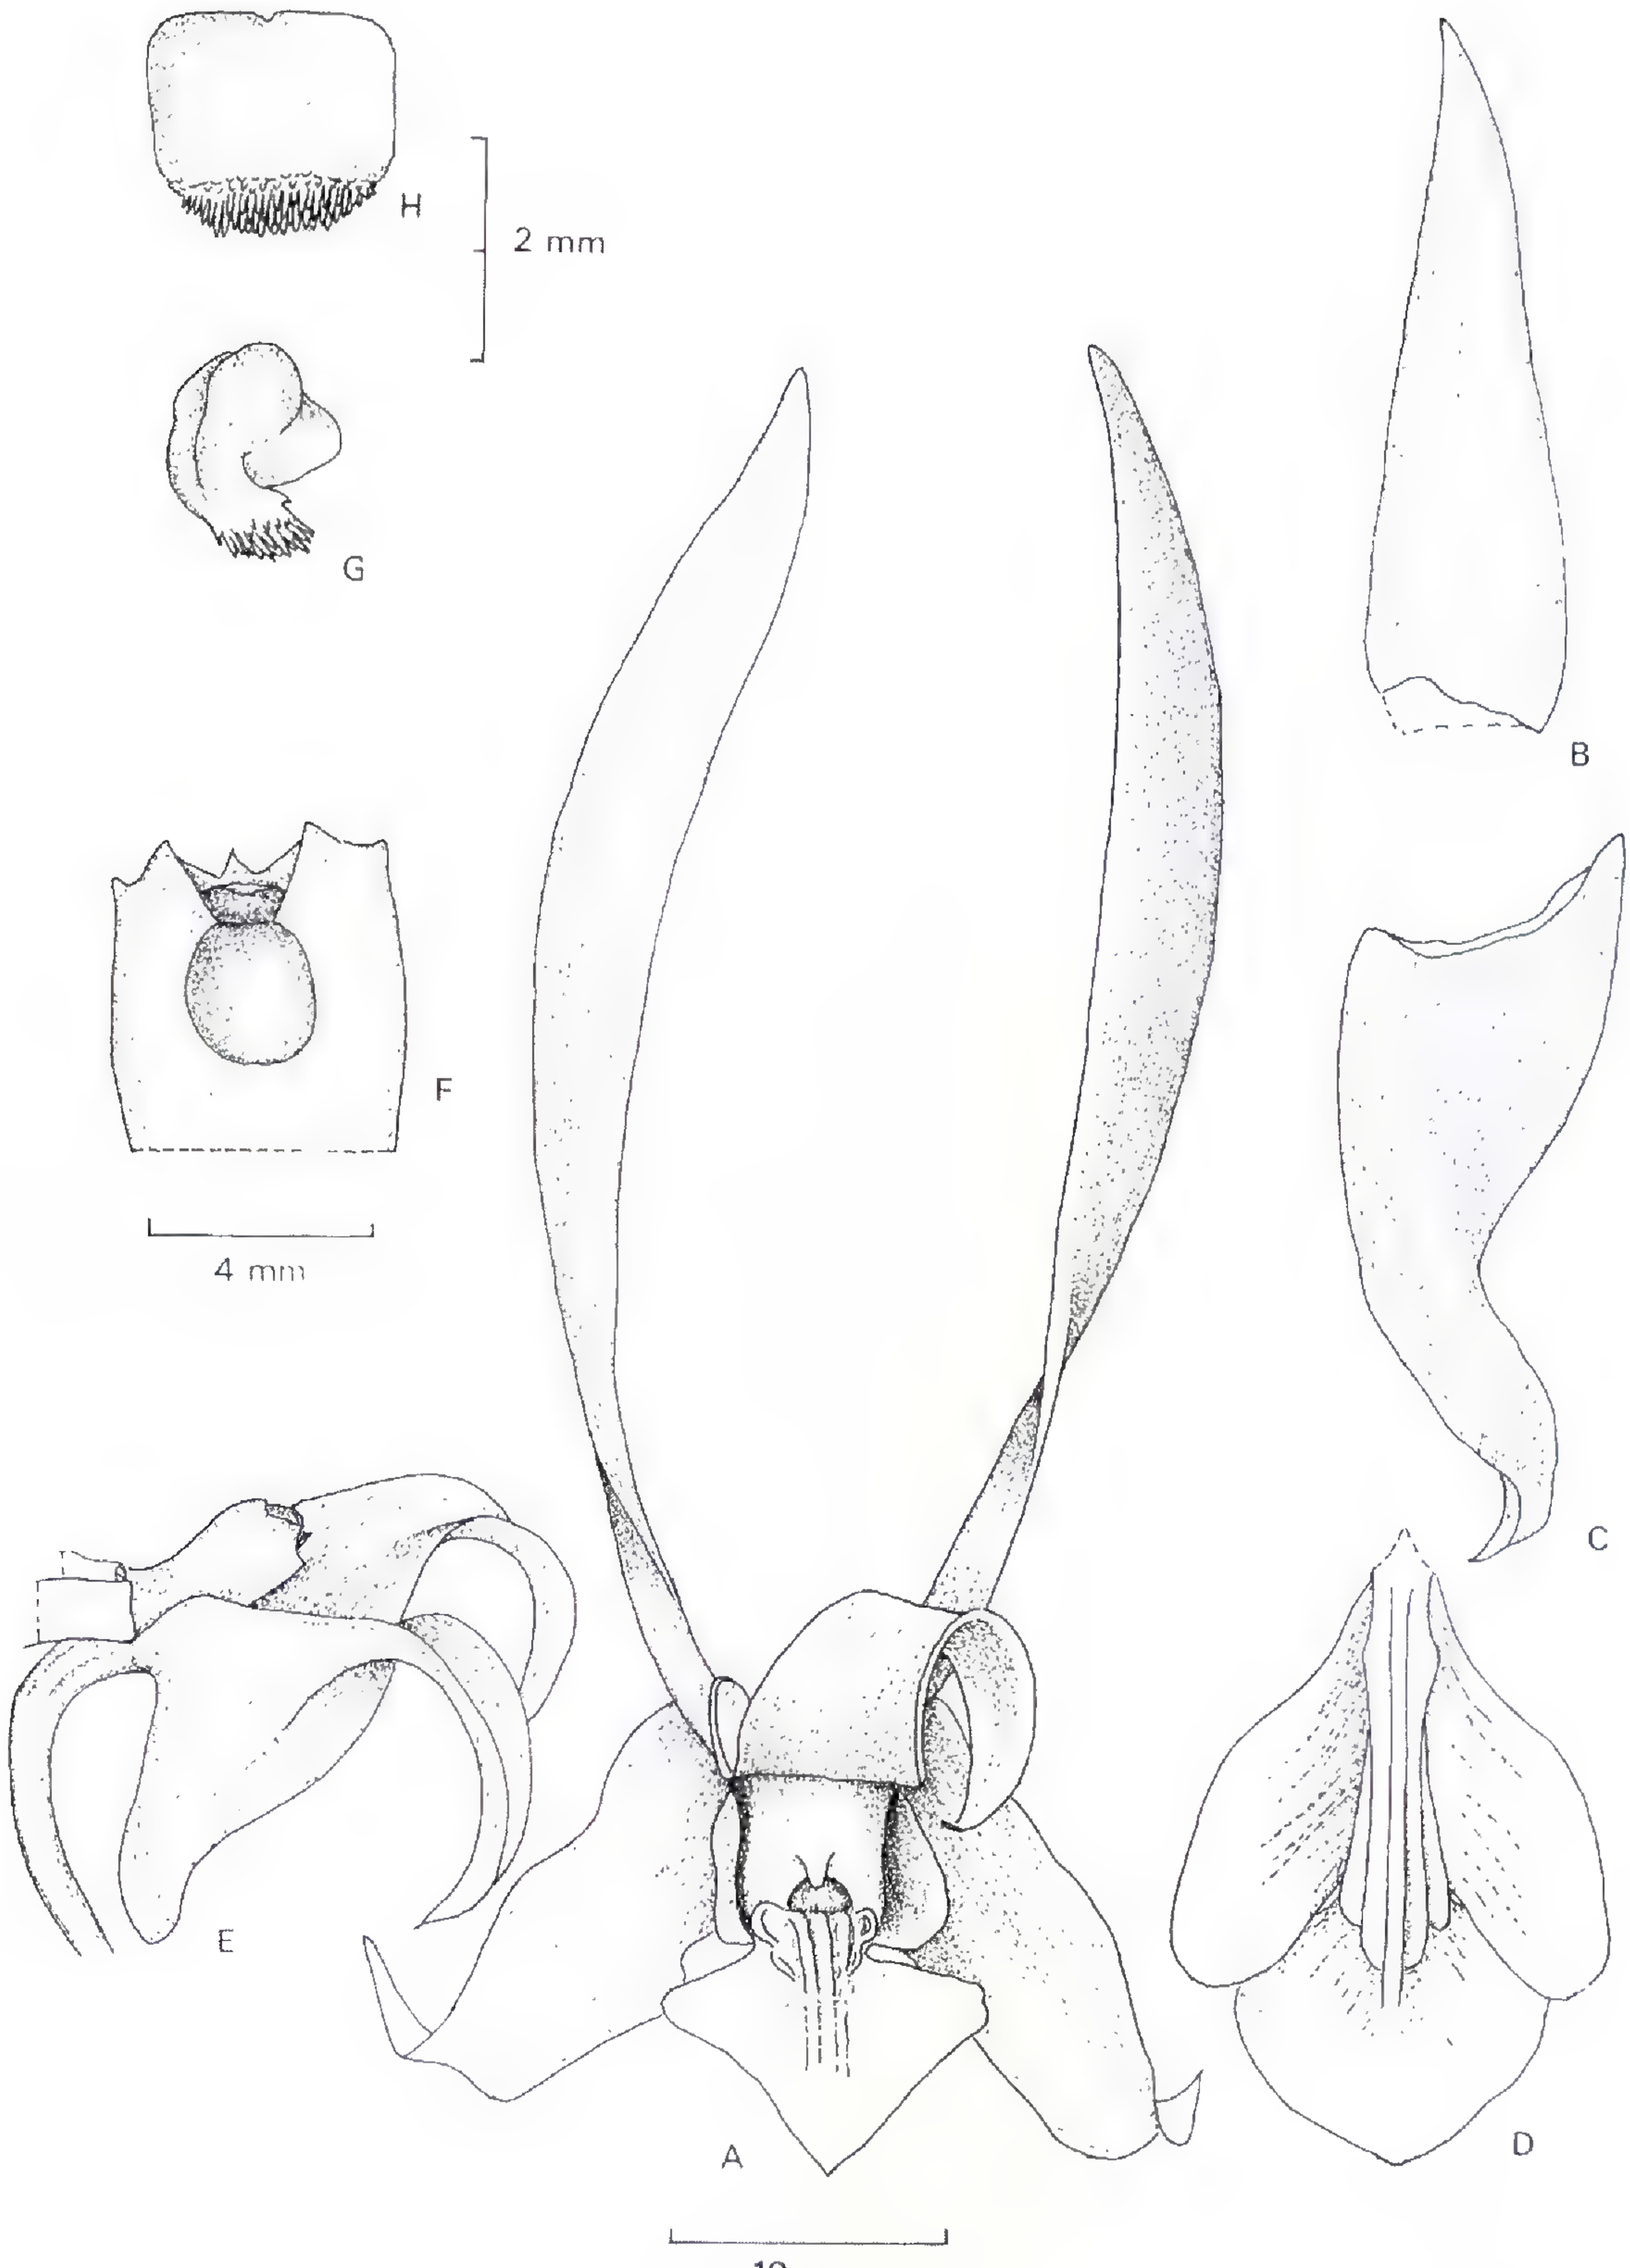

FIG. 3. *Dendrobium archipelagense* Howcroft & Takeuchi. **A.** Flower, aspect. **B.** Dorsal sepal. **C.** Lateral sepal. **D.** Labellum. **E.** Spur, with lateral sepals and column. **F.** Column apex with stigma, from below. **G.** Anther, lateral view. **H.** Anther, frontal view. Scale bars: A–E, 10 mm; F, 4 mm; G–H, 2 mm. Drawn from the type by N.H.S. Howcroft.

Dendrobium antennatum Lindl. In his treatment of this section, Cribb (1986: 618) recognized several species groups, among them the *antennatum* group with 9 species. The new species was formerly placed in *D. strepsiceros* J.J. Sm. by Cribb (ibid.: 637), O'Byrne (1994: 236), and Lavarack et al. (2000: 262).

Smith's illustration of *D. strepsiceros* (1913: Fig. 4, B1, B2) shows that its labellum differs from the corresponding characters in the new species. In *D. strepsiceros* the labellum midlobe is larger than the lateral lobes, and the apices of the latter do not overlap the base of the midlobe as it does in live specimens of *D. archipelagense* (Fig. 3). This distinction can be lost in the preparation of dried specimens so the relationship between the lobes is best seen with spirit material. Apart from the difference in shape and extension of the lateral lobes, *D. archipelagense* has a shorter labellum compared to *D. strepsiceros* and is more similar to *D. antennatum* on that feature.

Compared to its closest congeners, the lateral lobes of the new species are proportionately larger in relation to the length of the labellum. In *D. archipelagense*, the lateral lobe is 70–80% of the labellum length, in *D. antennatum* 55–70%, and in *D. strepsiceros* 50–58% (Fig. 4).

There are five ridges on the callus of the labellum in all of the preceding species. The mid-callus ridge for *D. archipelagense* extends towards the apex of the midlobe, but is not raised to a triangular lamella as described for *D. strepsiceros*. This character may have been overlooked by other authors.

The new species has long petals which make the flower appear larger than typical *D. antennatum*. As many as ten flowers can be produced by one inflorescence. The color of the perianth is initially light green but turns yellow-green with age. In most individuals, the ridges of the labellum are bordered with violet, and there are also violet reticulations up to the median, and sometimes the distal portion of the midlobe. The perianth is persistent on the fruit, a characteristic shared by other species in the *antennatum* group.

No significant color differences have been seen between specimens from West New Britain, East New Britain, and New Ireland. However in terms of flower size, the type collection represents one of the largest and most attractive forms seen by the senior author.

DISTRIBUTIONAL RECORDS

Arachnis beccarii Reichb. f. var. **imthurnii** (Rolfe) Tan, Selbyana 1:1–15. 1975; 1:365–373. 1976. (**Fig. 5**).

Specimen examined: **PAPUA NEW GUINEA. New Ireland Province:** junction of Niagara and Weitin rivers, expedition camp 2, lowland rainforest, 4°30.210' S, 152°56.242' E, 240 m, Jan 1994 (fl, spirit), *W. Takeuchi & J. Wiakabu 9968* (LAE).

The genus *Arachnis* is represented by two species in New Guinea, of which only *A. beccarii* occurs in the Bismarck Archipelago.

Variety *imthurnii* had been previously recorded from Bougainville,

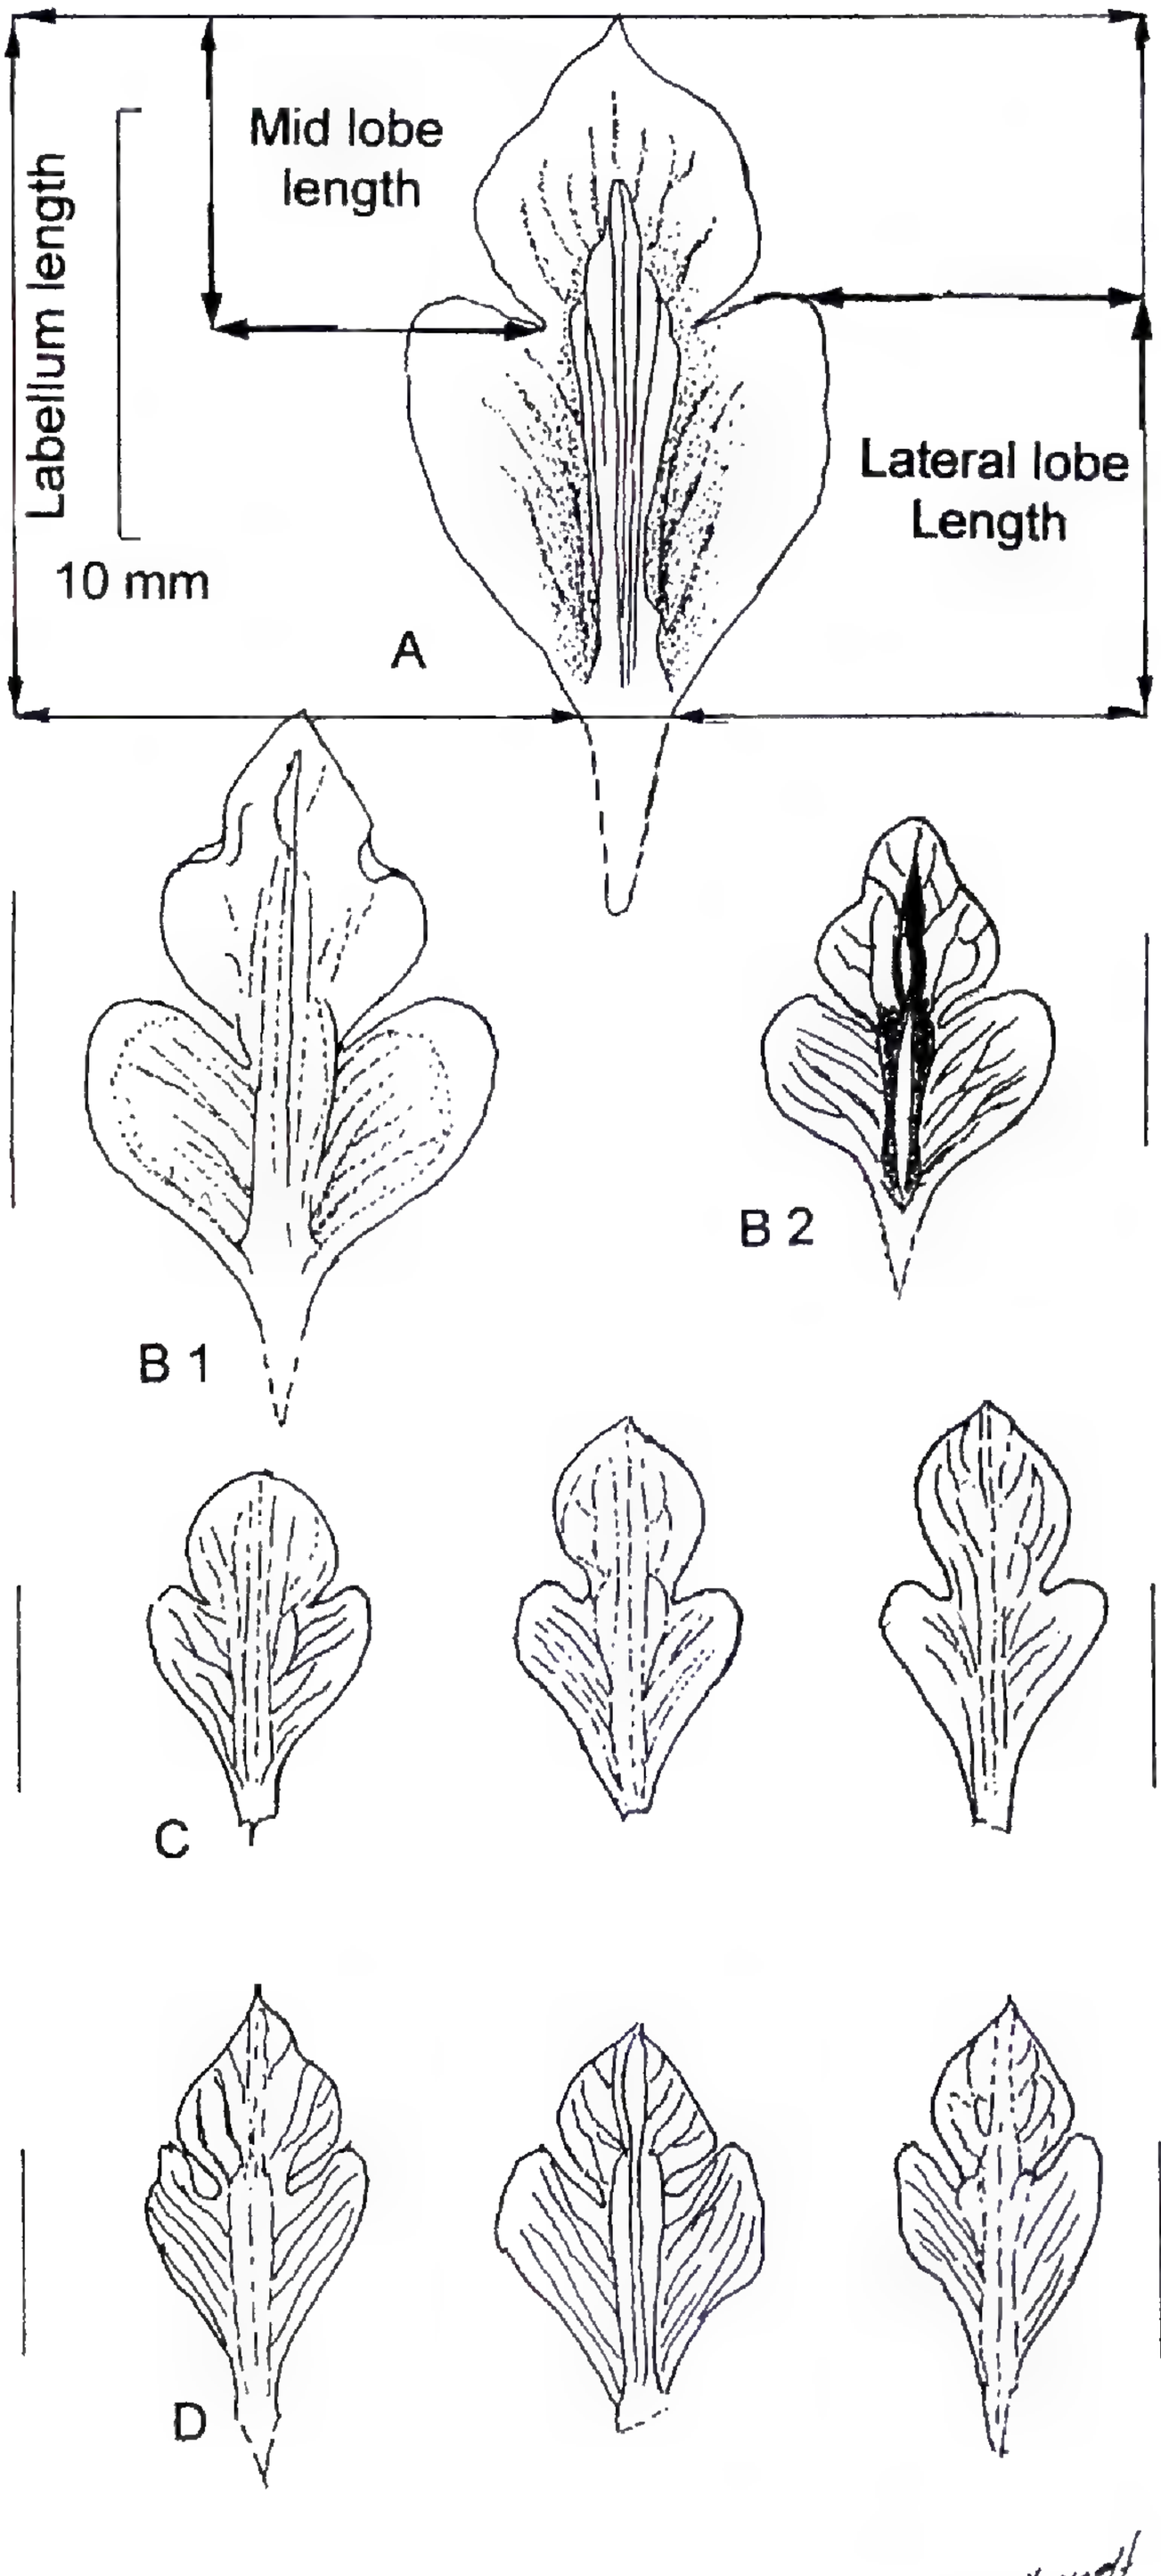

FIG. 4. **A.** Labellum structure. **B1.** *Dendrobium strepsiceros* J.J. Sm., from Smith (1913). **B2.** *D. strepsiceros*, from Cribb (1986). **C.** *D. antennatum* Lindl. **D.** *D. archipelagense* Howcroft & Takeuchi. All scale bars: 10 mm.

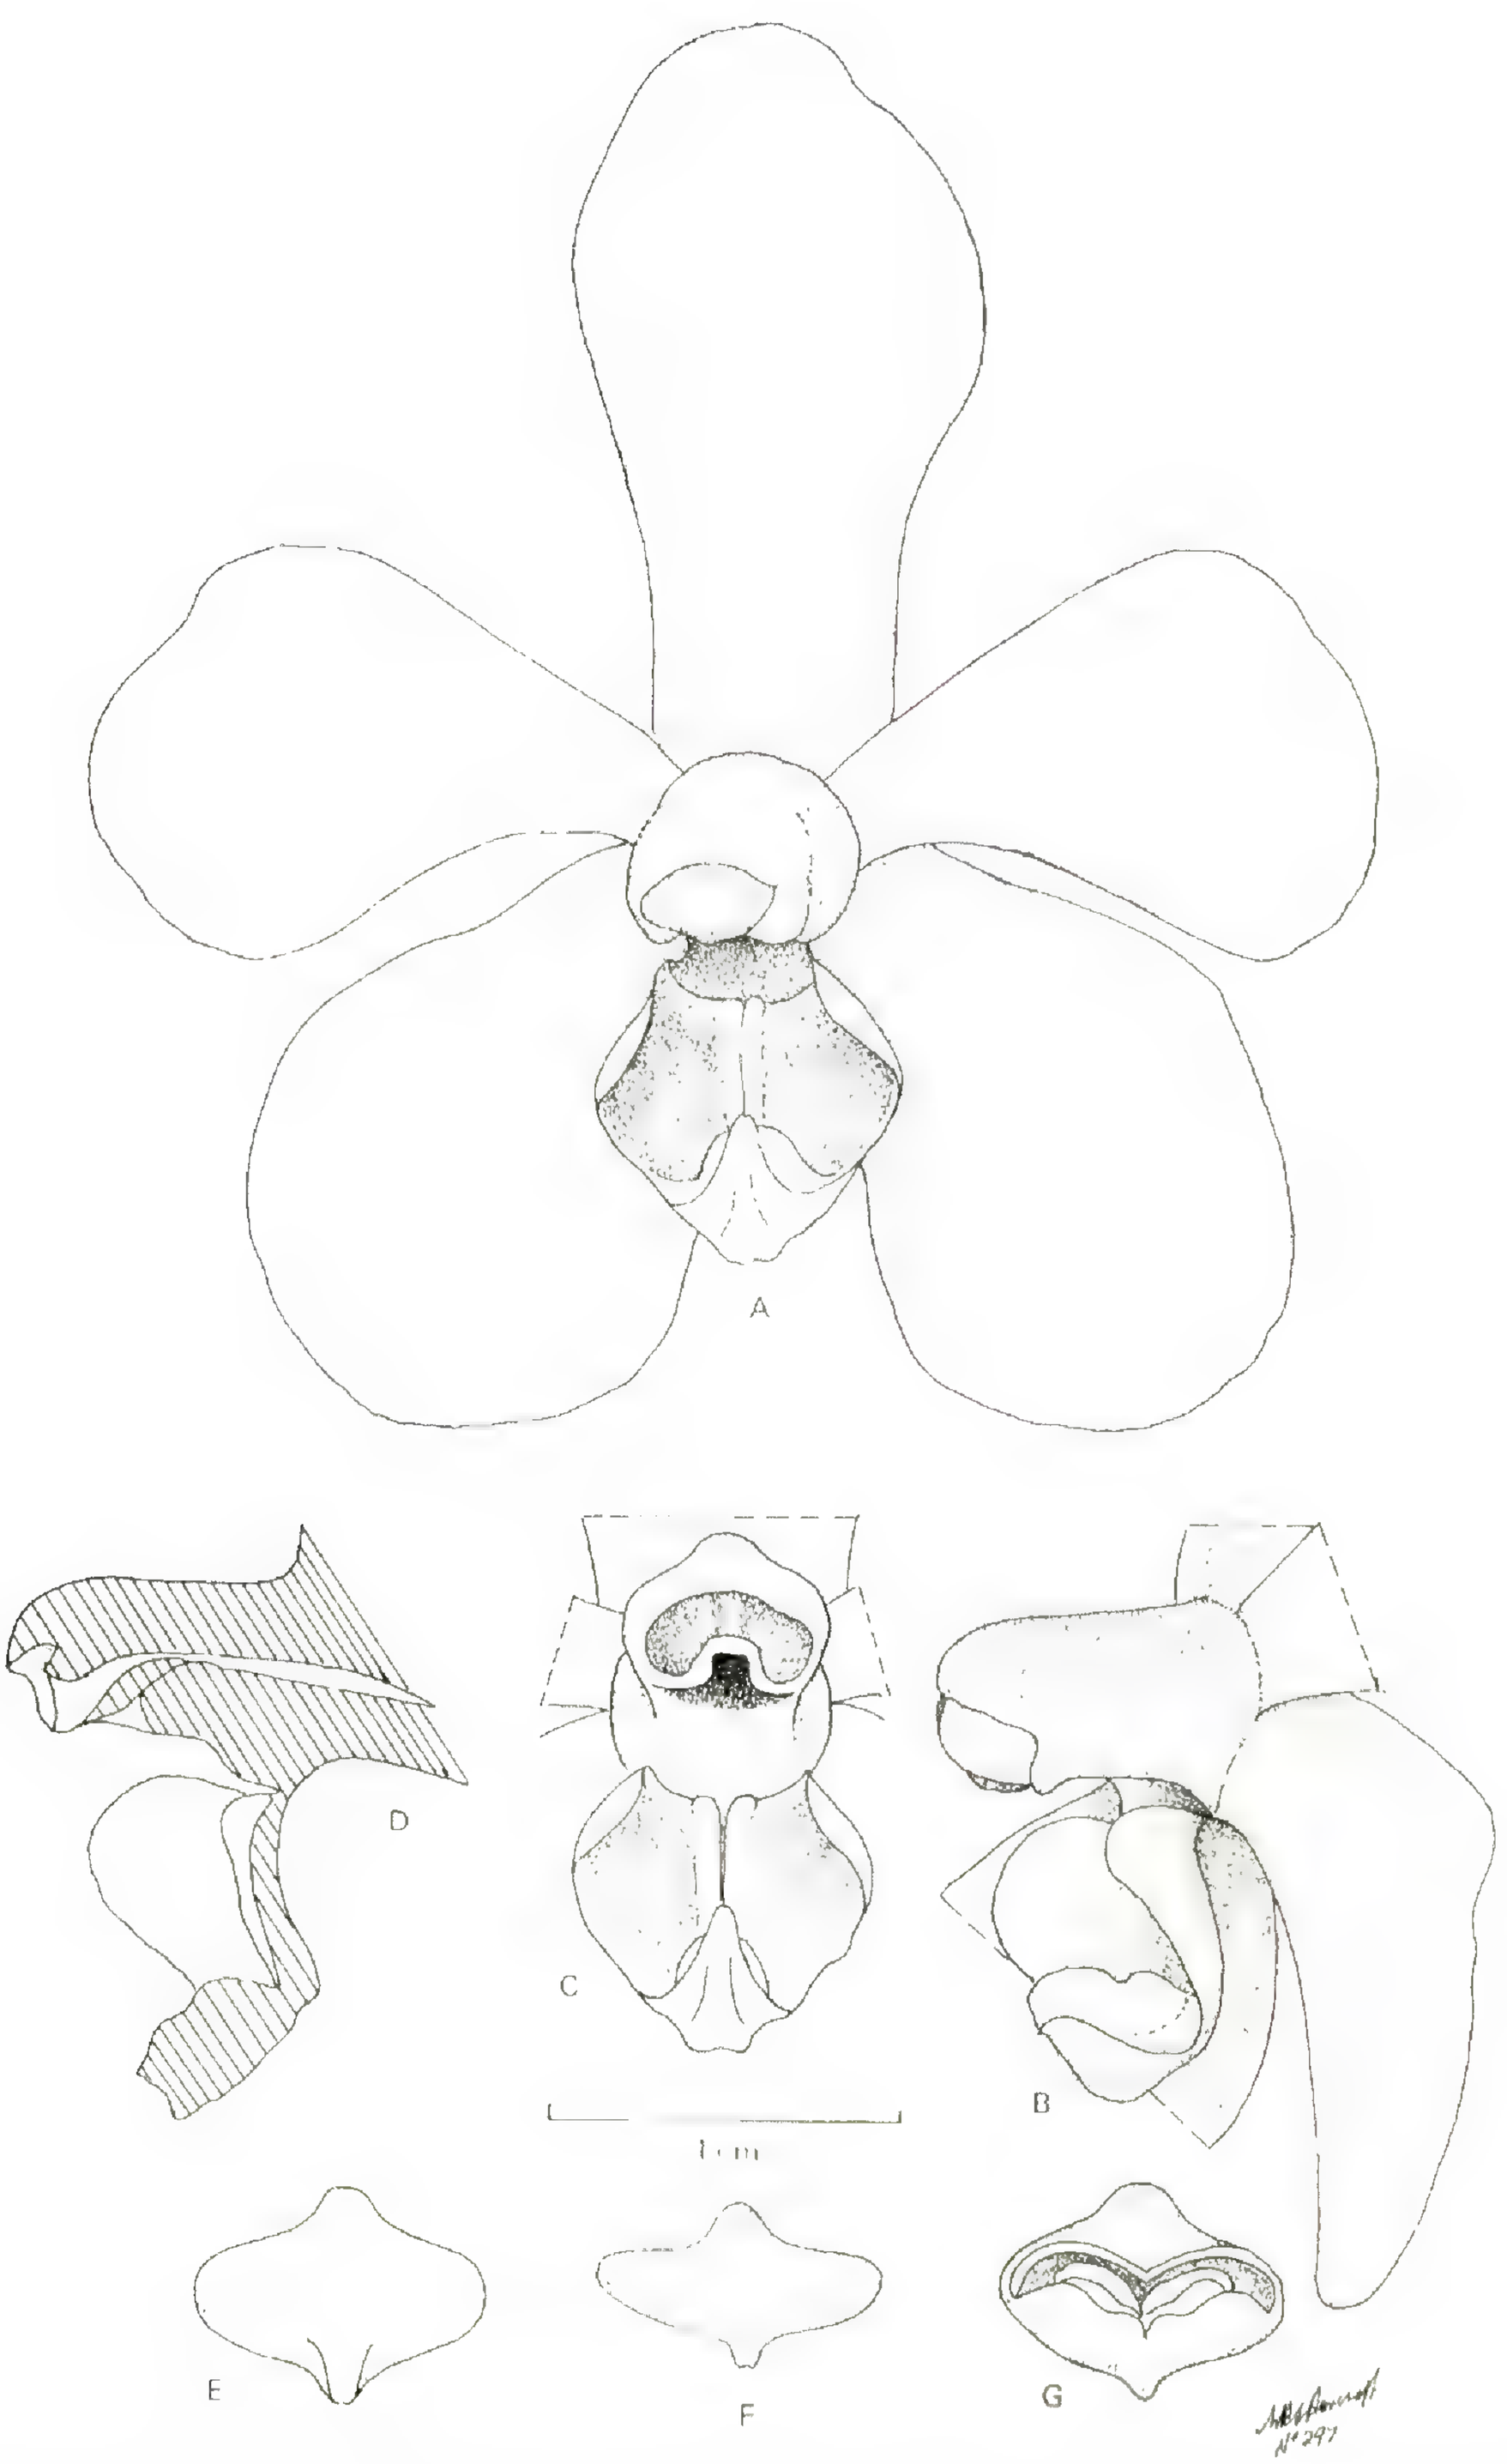

FIG. 5. *Arachnis beccarii* Reichb. f. var. *imthurnii* (Rolfe) Tan. **A.** Flower, frontal aspect. **B.** Labellum and column, side view. **C.** Labellum and column, frontal view. **D.** Labellum and column, cross-section. **E.** Anther, frontal view. **F.** Anther, from above. **G.** Anther, from back, showing pollen. Scale bars: A–G, 1 cm. Drawn from *W. Takeuchi & J. Wiakabu 9968* by N.H.S. Howcroft.

Guadalcanal, Malaita, and Santa Isabel (Lewis & Cribb 1991). It was also seen by the senior author on the Toriu River side of the Kanak Range in East New Britain. The New Ireland specimen is a distributional record for the island.

Although var. *imthurnii* is reported as having an entirely white perianth (ibid.), the New Ireland provenance is marked by large brown spots. Cultivated plants in the National Botanical Gardens at Lae have also produced flowers with color markings different from mainland and archipelagic provenances. The distinctions can be used to justify eventual reinstatement of this variety to specific rank.

Corybas epiphyticus (J.J. Sm.) Schltr., Feddes Repert. Spec. Nov. Regni Veg. 19:21. 1923. (**Fig. 6**).

Specimen examined: **PAPUA NEW GUINEA. New Ireland Province:** Hans Meyer Range, Angil Mountain, expedition camp 4, pristine subcloud forest dominated by bryophytic and ferny growth, 4°25.2' S, 152°56.8' E, 1800 m, 6 Feb 1994 (fl, spirit), *W. Takeuchi & J. Wiakabu 9461* (LAE).

Previously known only from Indonesian Papua (van Royen 1983). The collection from New Ireland represents a significant eastward extension of the species range. *Corybas epiphyticus* is still unrecorded from the PNG mainland.

Dendrobium gnomus Ames, J. Arnold Arbor. 14:106–107. 1933. (**Fig. 7**).

Specimen examined: **PAPUA NEW GUINEA. New Ireland Province:** Hans Meyer Range, ridge adjacent to the Weitin River, expedition camp 3, mossy montane forest, 4°27.205' S, 152°56.489' E, 1175 m, 27 Jan 1994 (fl, spirit), *W. Takeuchi & J. Wiakabu 9597* (LAE).

This species was initially mistaken for *Dendrobium erosum* (Bl.) Lindl. because of the spathulate shape of the labellum and its finely erose margins (Fig. 7F). However the leaf apex is unequally bilobed as with *D. gnomus* (Fig. 7A), whereas in *D. erosum* the apex is acute. The cucullate labellum apex on the New Ireland specimen is probably an artefact of drying. The shape of the sepals and petals, and the mentum being appressed to the ovary and pedicel rather than diverging, are also consistent with the redetermination (Figs. 7B–E).

The species had not been previously recorded for New Ireland.

Pedilochilus longipes Schltr., Feddes Repert. Spec. Nov. Regni Veg. Beih. 1:691. 1912. (**Fig. 8**).

Specimen examined: **PAPUA NEW GUINEA. New Ireland Province:** Hans Meyer Range, Angil Mountain, expedition camp 4, pristine subcloud forest dominated by bryophytic and ferny growth, 4°25.2' S, 152°56.8' E, 1800 m, 4 Feb 1994 (fl), *W. Takeuchi & J. Wiakabu 9380* (LAE).

Previously known with certainty only from mainland New Guinea. The New Ireland specimen represents a distributional record.

Phaius amboinensis Bl., Mus. Bot. Lugd.-Bat. 2:180. 1856. (**Fig. 9**).

Specimen examined: **PAPUA NEW GUINEA. New Ireland Province:** junction of Niagara and Weitin rivers, expedition camp 2, lowland rainforest, 4°30.210' S, 152°56.242' E, 240–300 m, 13 Feb 1994 (fl, fr, spirit), *W. Takeuchi & J. Wiakabu 9780* (A, LAE).

FIG. 6. *Corybas epiphyticus* (J.J. Sm.) Schltr. **A.** Flower and leaf, side view. **B.** Dorsal sepal. **C.** Labellum, frontal view. **D.** Labellum, with parts flattened and spread out. **E.** Column, showing ovary and one spur. **F.** Column with labellum removed and showing two lateral spurs. Scale bars: A–D, 1 cm; E–F, 5 mm. Drawn from *W. Takeuchi & J. Wiakabu 9461* by N.H.S. Howcroft.

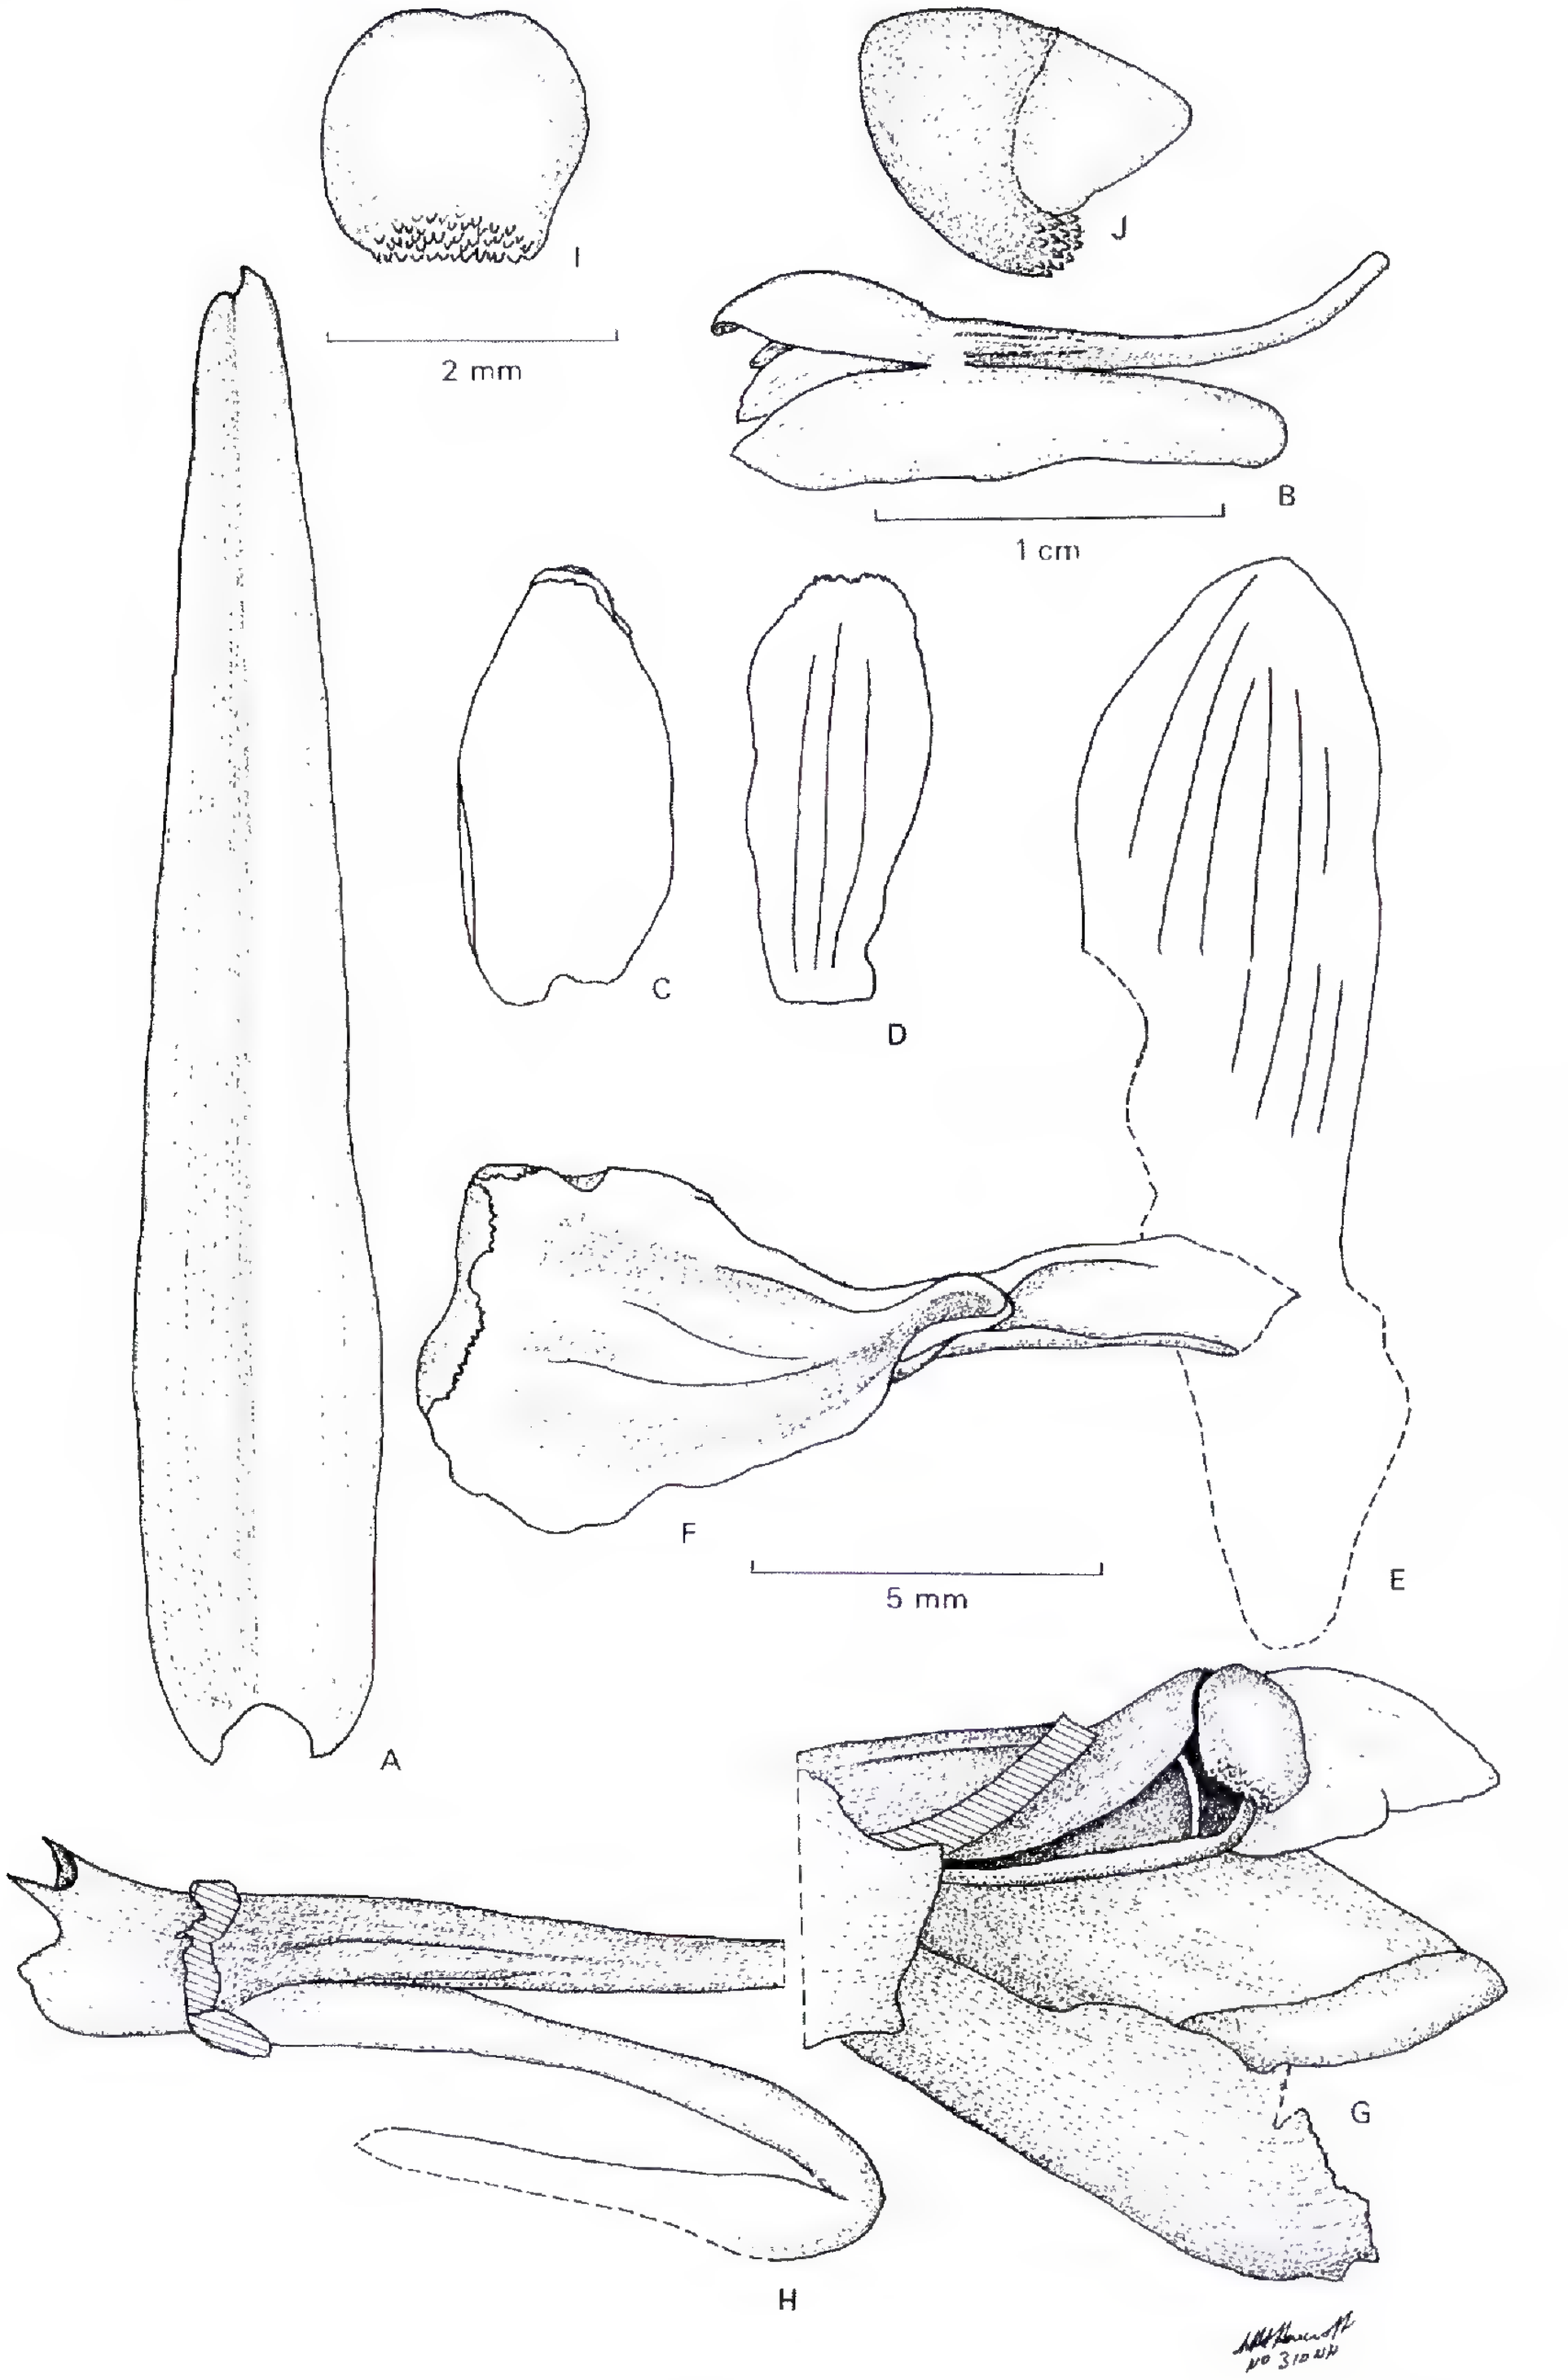

FIG. 7. *Dendrobium gnomus* Ames. **A.** Leaf. **B.** Flower, side view. **C.** Dorsal sepal. **D.** Petal. **E.** Lateral sepal. **F.** Labellum. **G.** Column, oblique side view. **H.** Column, ovary, and spur. **I.** Anther from front. **J.** Anther from side. Scale bars: A–B, 1 cm; C–H, 5 mm; I–J, 2 mm. Drawn from *W. Takeuchi & J. Wiakabu 9597* by N.H.S. Howcroft.

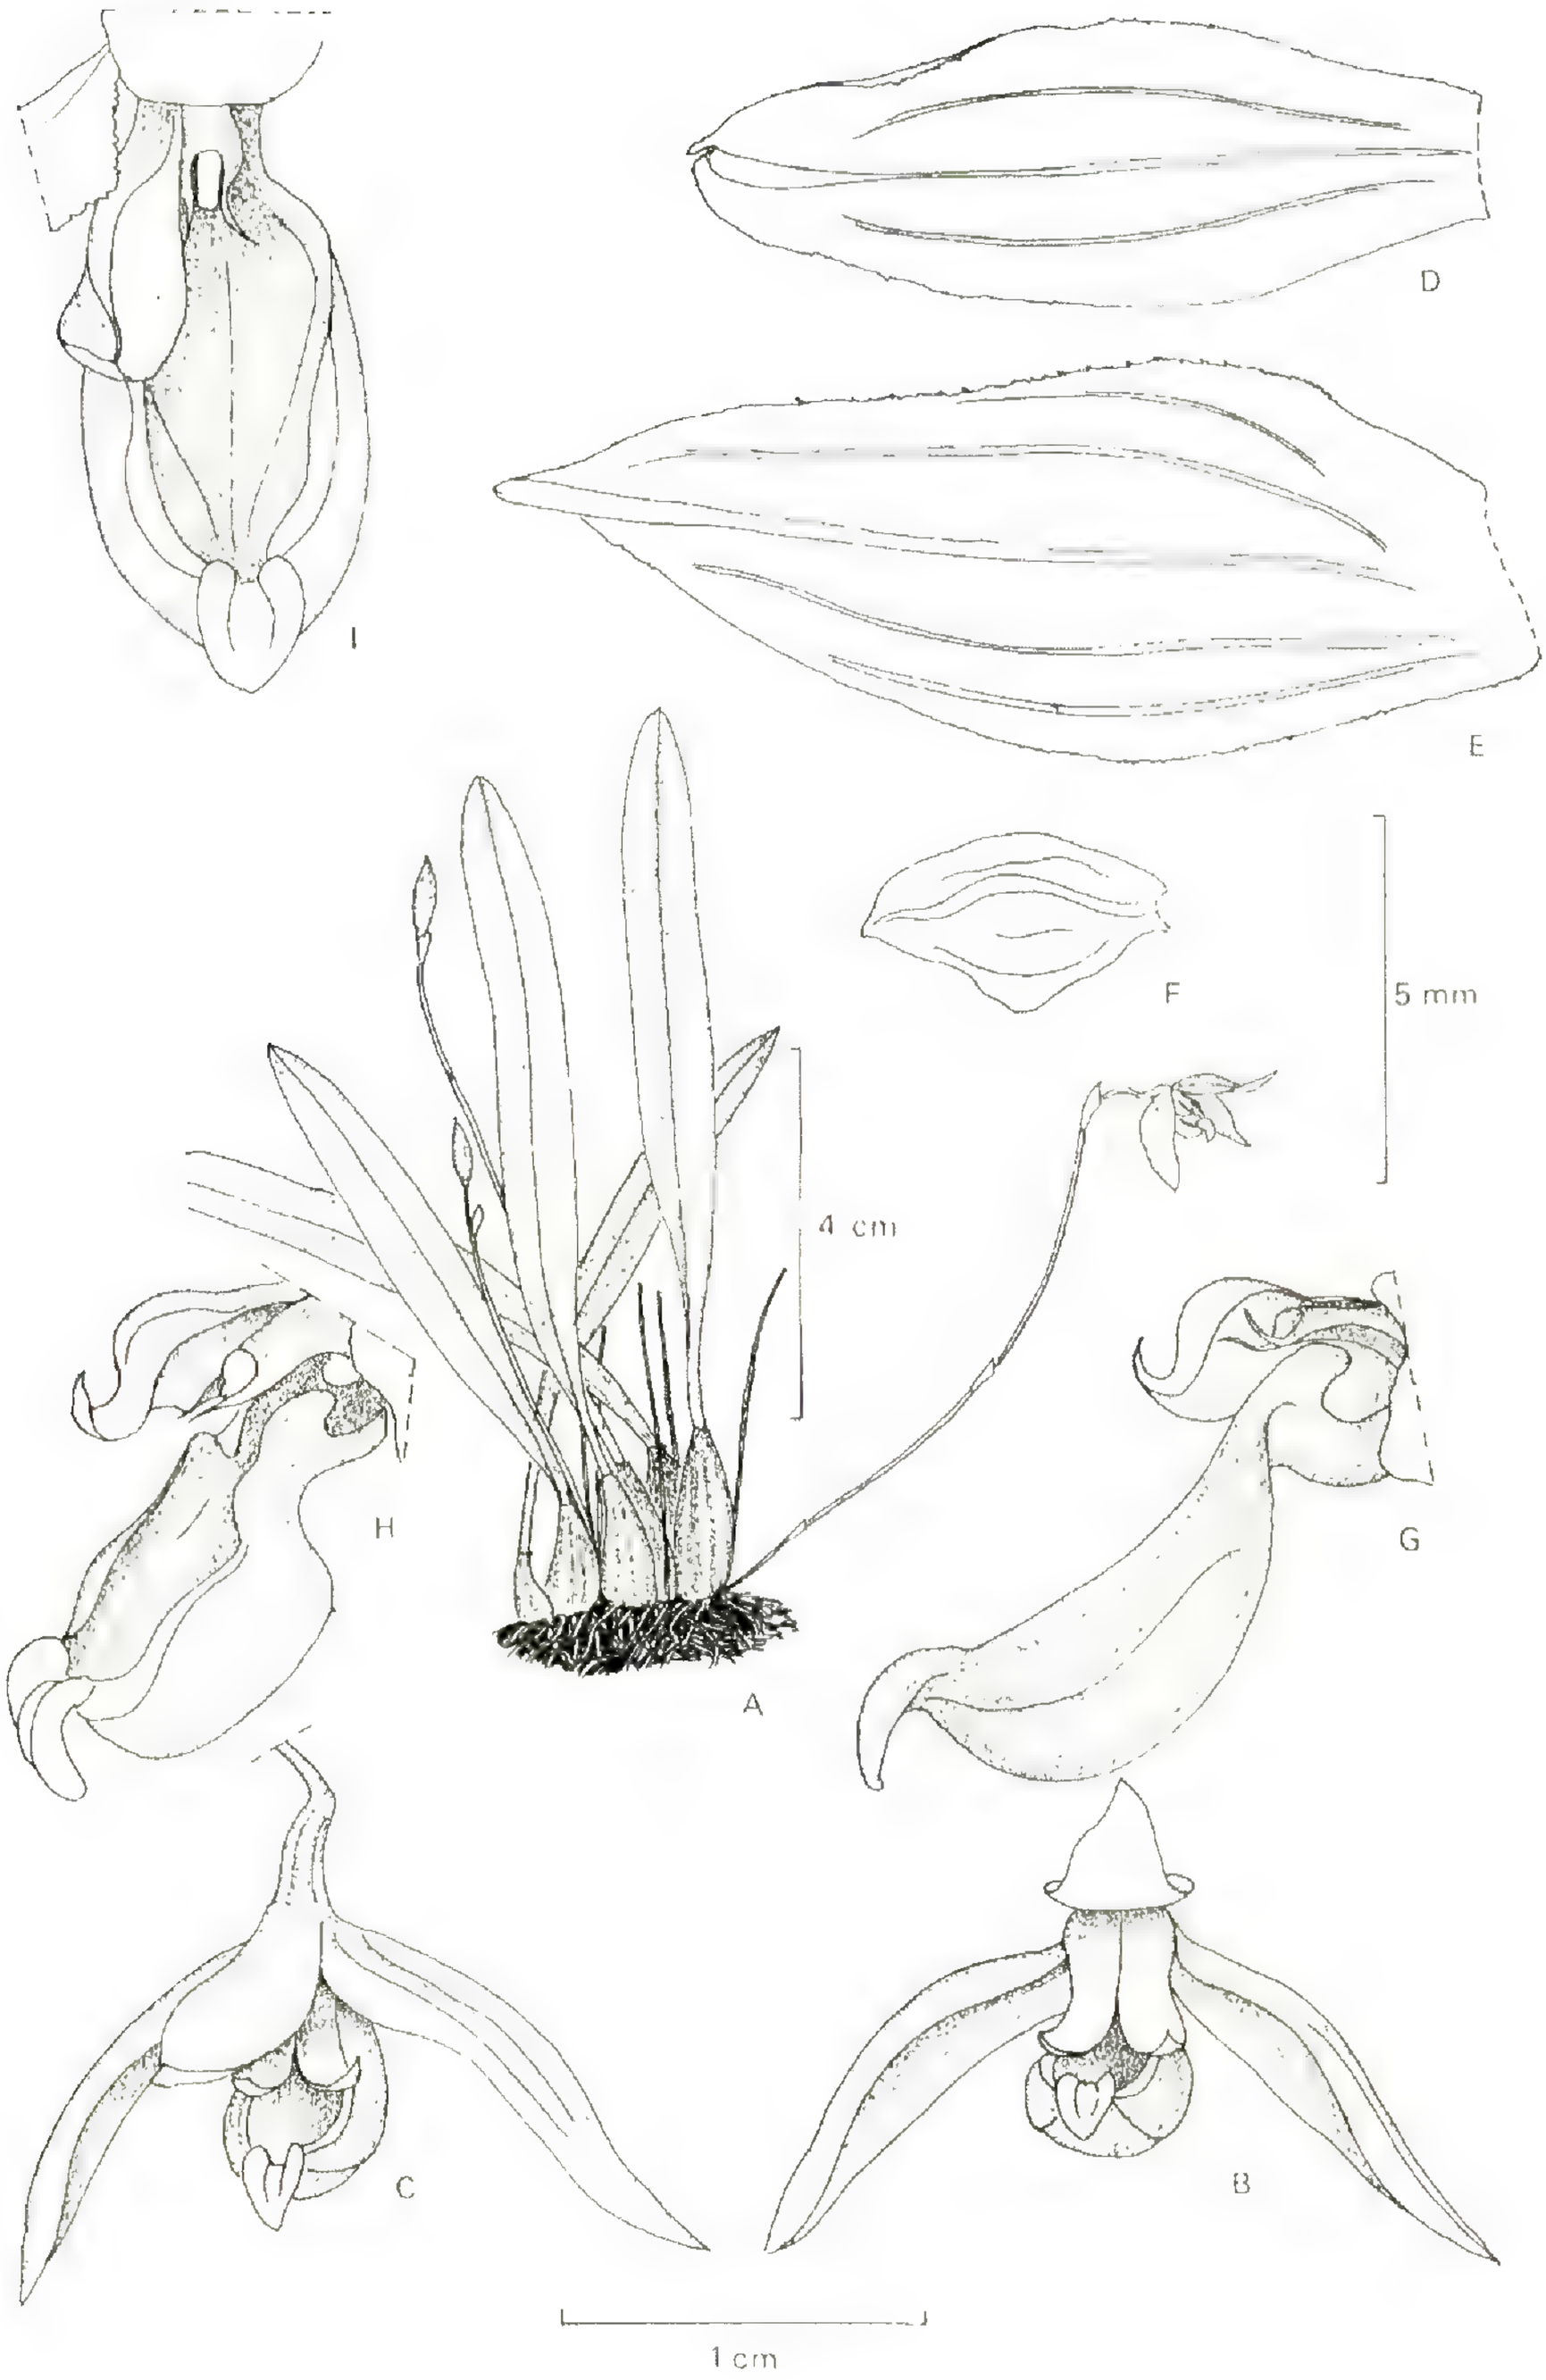

FIG. 8. *Pedilochilus longipes* Schltr. **A.** Habit, whole plants. **B.**–**C.** Flower, aspect. **D.** Dorsal sepal. **E.** Lateral sepal. **F.** Petal. **G.** Labellum with column and one petal, side view. **H.** ditto, oblique view. **I.** ditto, from above. Scale bars: A, 4 cm; B–C, 1 cm; D–I, 5 mm. Drawn from *W. Takeuchi & J. Wiakabu 9380* by N.H.S. Howcroft.

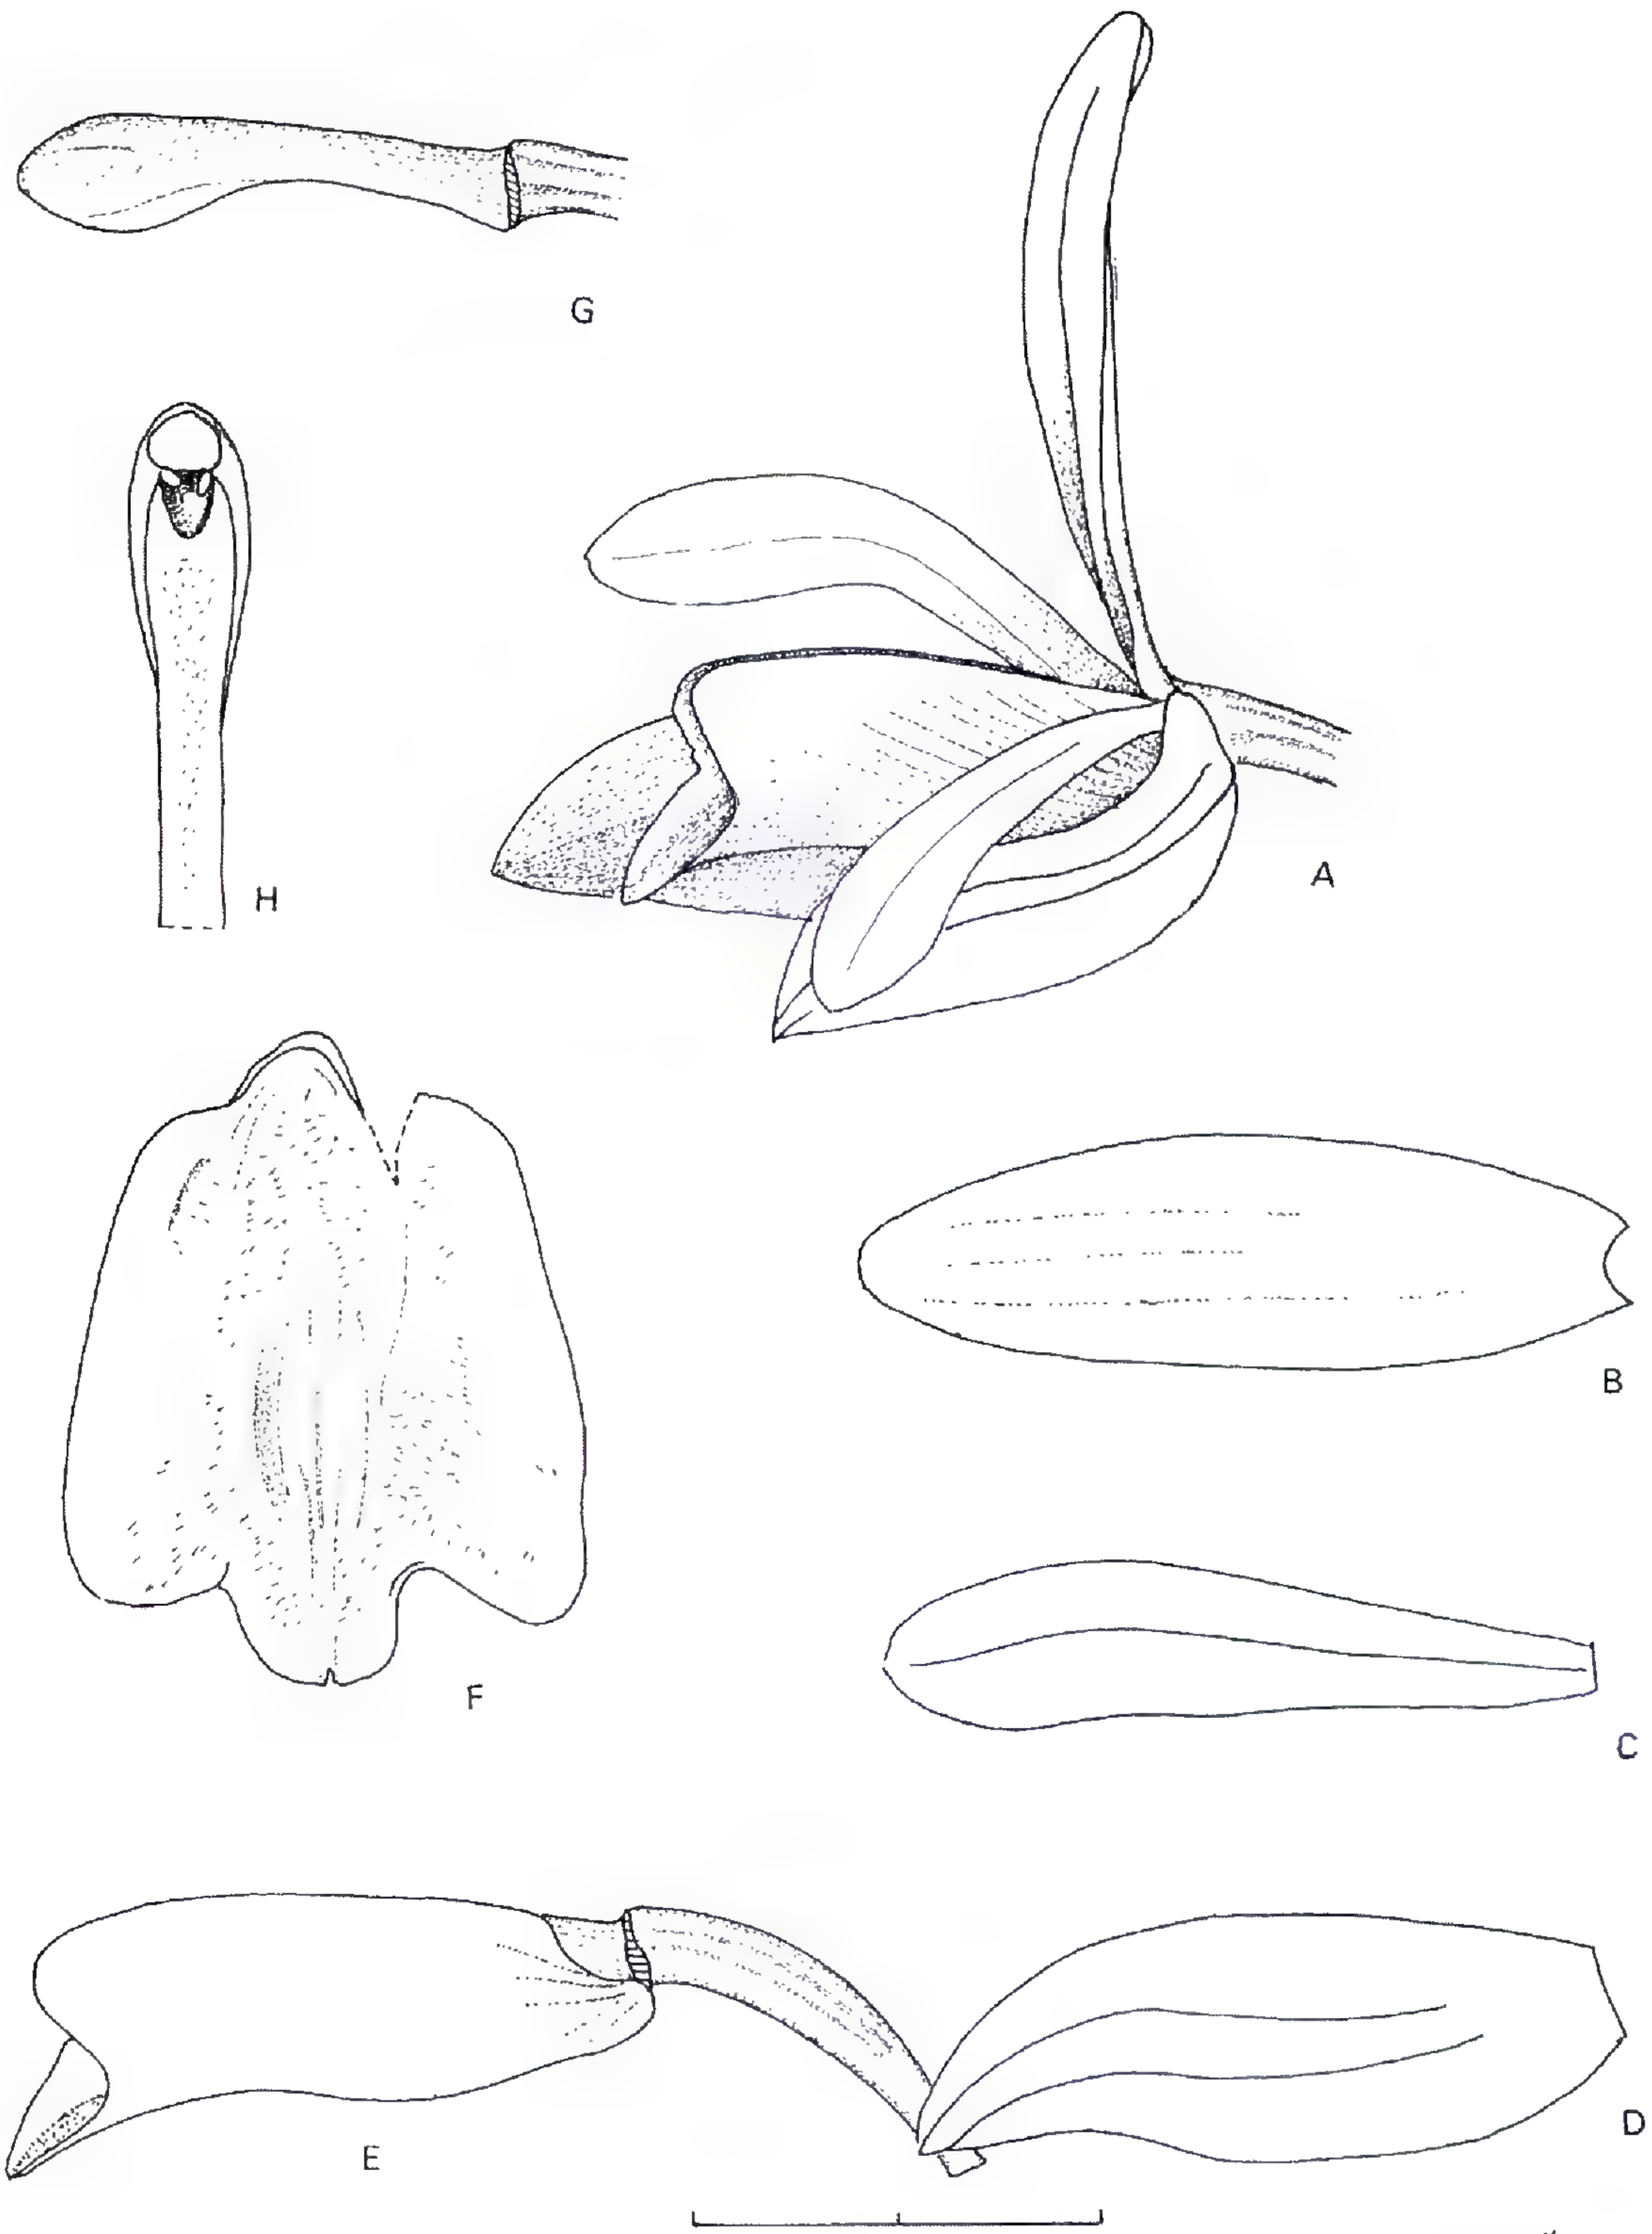

FIG. 9. *Phaius amboinensis* Bl. **A.** Flower, side aspect. **B.** Dorsal sepal. **C.** Petal. **D.** Lateral sepal. **E.** Labellum, side view. **F.** Labellum, flattened, view from above. **G.** Column, from side. **H.** Column, from below. Scale bars: A–H, 2 cm. Drawn from *W. Takeuchi & J. Wiakabu 9780* by N.H.S. Howcroft.

A widespread orchid found on many islands in the Bismarck Archipelago, but not previously recorded from New Ireland. The species distribution includes Vanuatu, Fiji, Samoa, and Tahiti in the east. Also occurring in Java, the southern Philippines (Sulu Archipelago), Sulawesi, and the Moluccas.

Phreatia loriae Schltr., Feddes Repert. Spec. Nov. Regni Veg. 3:318. 1907.

Specimen examined: **PAPUA NEW GUINEA. New Ireland Province:** junction of Niagara and Weitin rivers, expedition camp 2, lowland rainforest, 4°30.210' S, 152°56.242' E, 240 m, 21 Jan 1994 (fl, spirit), *W. Takeuchi & J. Wiakabu 9885A* (LAE).

The species was previously known only from the southern PNG mainland.

Pristiglottis montana (Schltr.) Cretz. & J.J. Sm., Acta Fauna Fl. Univ. Bucur. ser. 2, Bot. 1, 14:4. 1934. (**Fig. 10**).

Specimen examined: **PAPUA NEW GUINEA. New Ireland Province:** Hans Meyer Range, Angil Mountain, expedition camp 4, pristine subcloud forest dominated by bryophytic and ferny growth, 4°25.2' S, 152°56.8' E, 1800 m, 4 Feb 1994 (fl, spirit), *W. Takeuchi & J. Wiakabu 9394* (LAE).

The labellum of this specimen compares well with the illustration by Halle (1977). The new occurrence represents a significant disjunction from the previously known stations in Vanuatu and New Caledonia.

OTHER ILLUSTRATED COLLECTIONS

Bulbophyllum pachyglossum Schltr., Feddes Repert. Spec. Nov. Regni Veg. 16: 125. 1920. (**Fig. 11**).

Specimen examined: **PAPUA NEW GUINEA. New Ireland Province:** Hans Meyer Range, Angil Mountain, expedition camp 4, pristine subcloud forest dominated by bryophytic and ferny growth, 4°25.2' S, 152°56.8' E, 1800 m, 3 Feb 1994 (fl), *W. Takeuchi & J. Wiakabu 9375* (LAE).

Bulbophyllum pachyglossum is a member of section *Brachyostele*, within which 3 species have been described for New Guinea. Of these, only *B. pachyglossum* has been recorded from the Bismarck Archipelago. The species is also known from the Solomon Islands (Lewis & Cribb 1991).

Cadetia echinocarpa Schltr., Feddes Repert. Spec. Nov. Regni Veg. Beih. 1:439. 1912. (**Fig. 12**).

Specimen examined: **PAPUA NEW GUINEA. New Ireland Province:** junction of Niagara and Weitin rivers, expedition camp 2, lowland rainforest, 4°30.210' S, 152°56.242' E, 240 m, 21 Jan 1994 (fl), *W. Takeuchi & J. Wiakabu 9884* (LAE).

Possibly synonymous with the later name *C. homochroma* (J.J. Sm.) Schltr.

Calanthe triplicata (Willemet) Ames, Philip. J. Sci. Bot. 2:325. 1907. (**Fig. 13**).

Specimen examined: **PAPUA NEW GUINEA. New Ireland Province:** junction of Niagara and Weitin rivers, expedition camp 2, lowland rainforest, 4°30.210' S, 152°56.242' E, 240 m, Jan 1994 (fl, spirit), *W. Takeuchi & J. Wiakabu 9976* (A, K, L, LAE).

Widespread in New Guinea, the Bismarck Archipelago, and Southeast Asia.

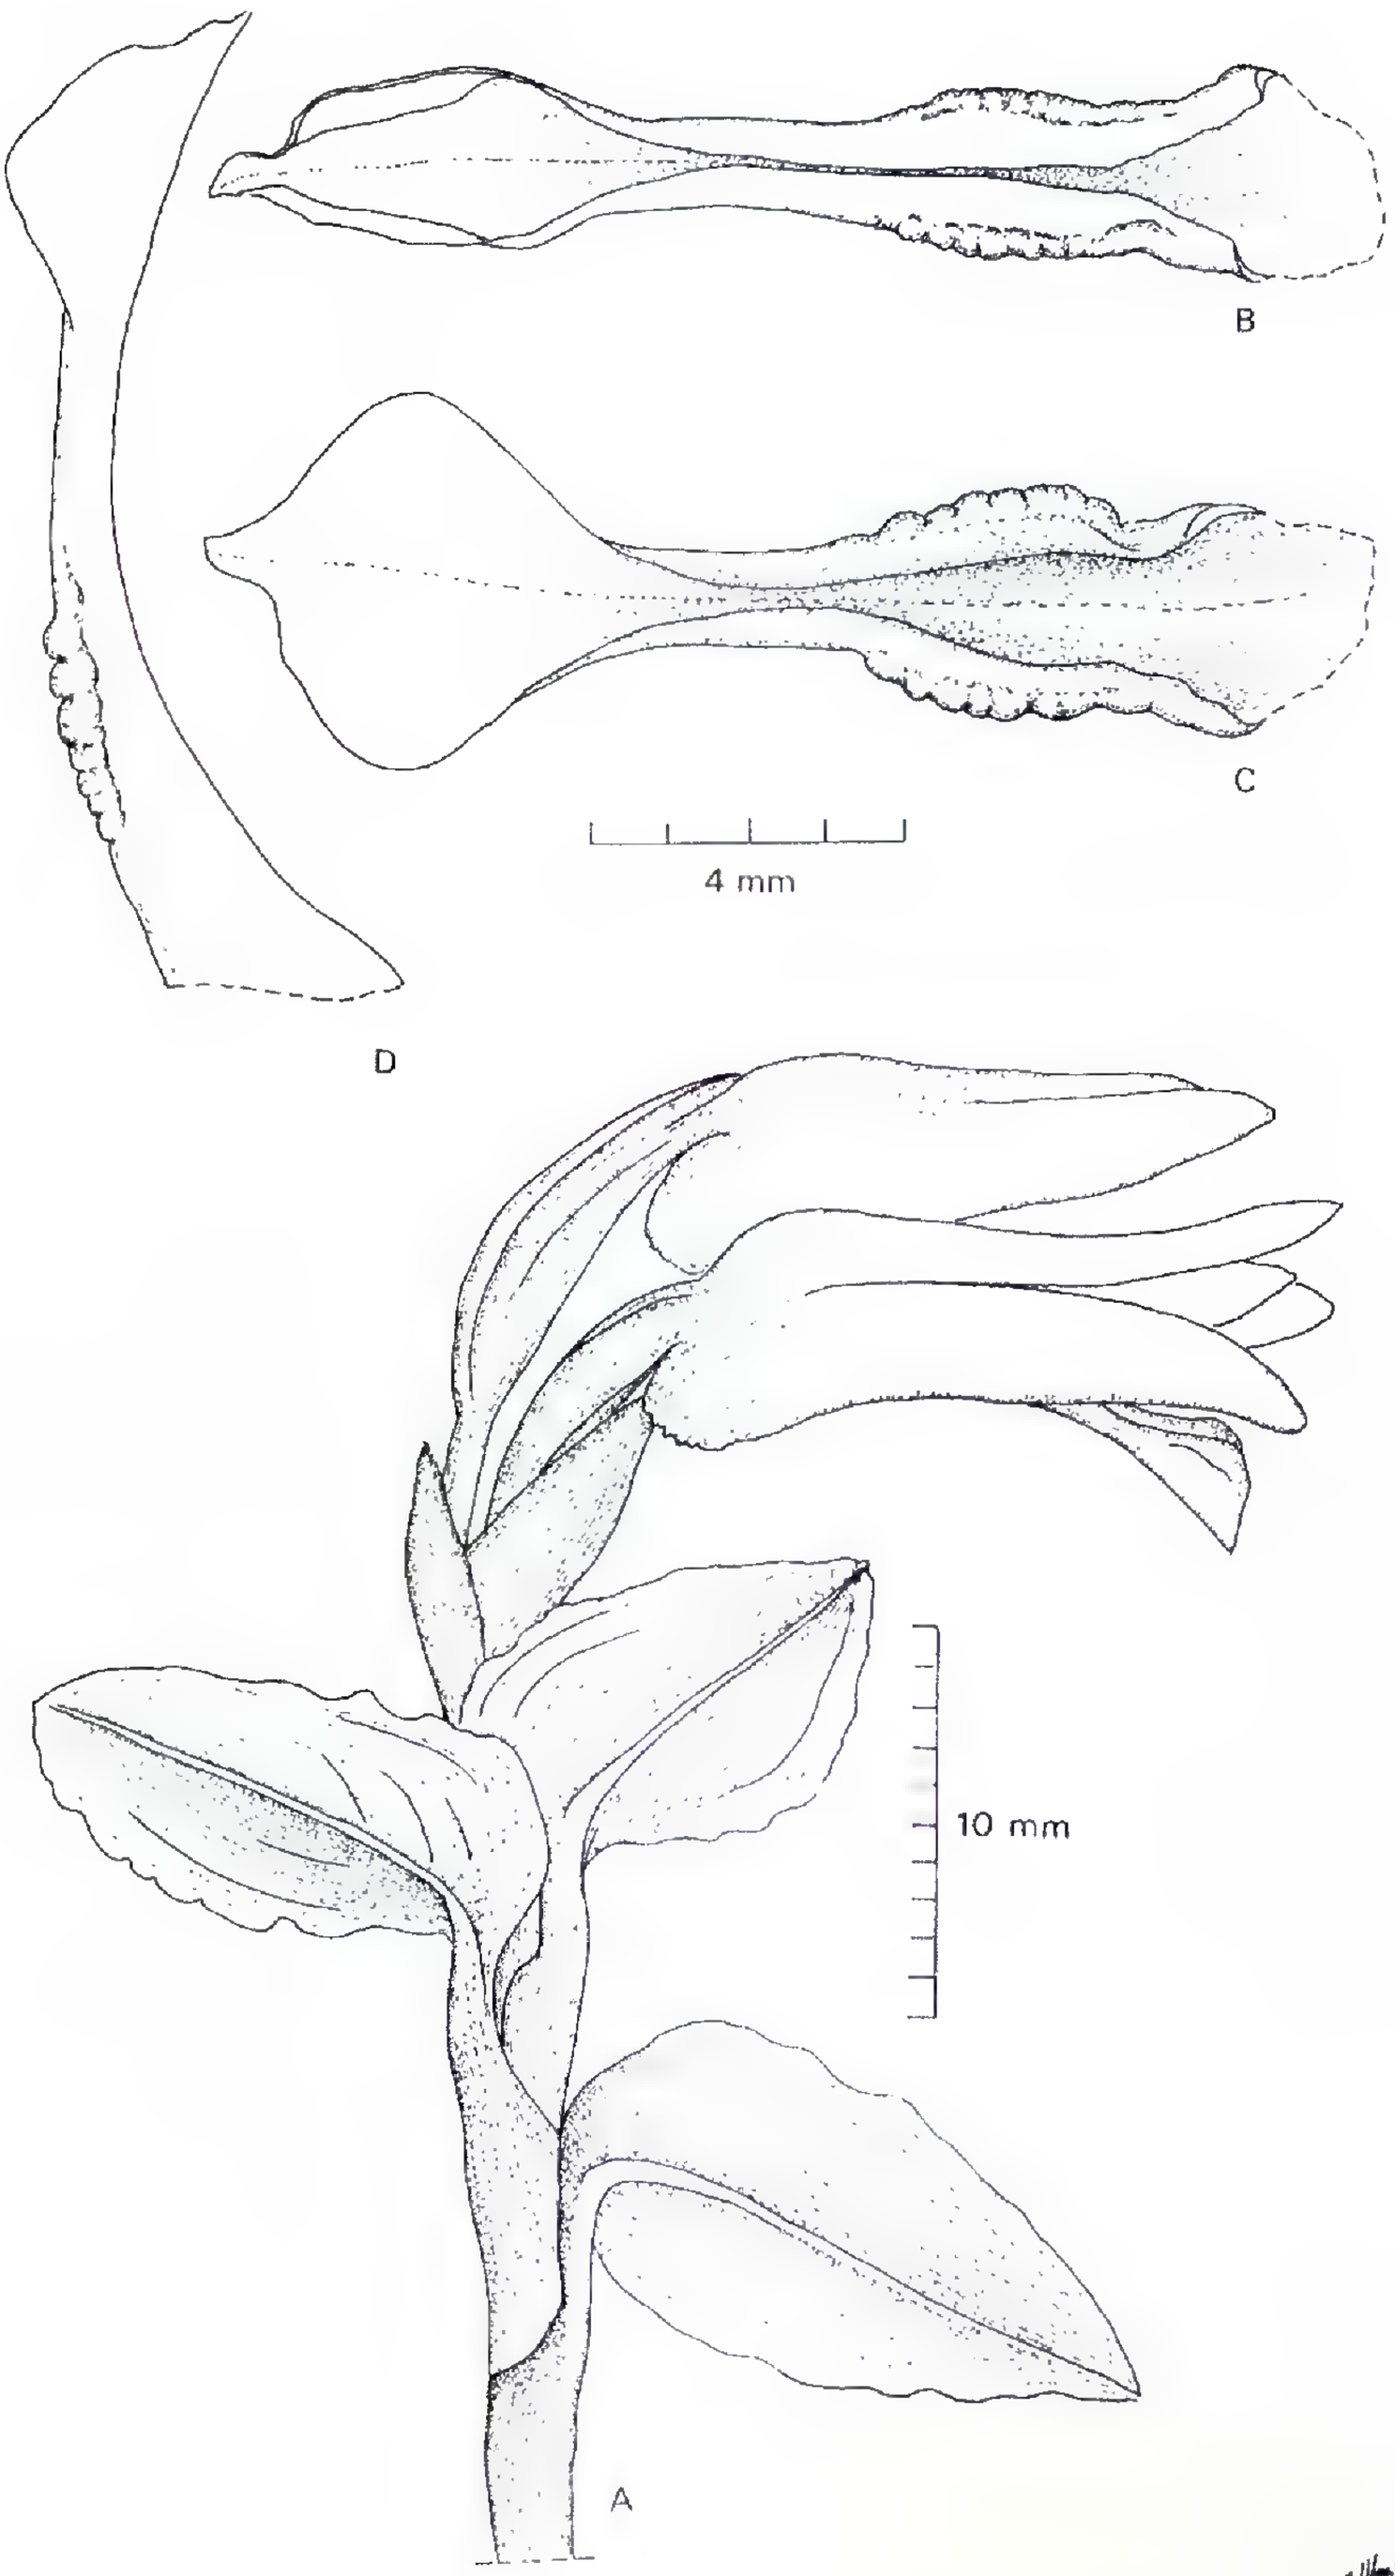

FIG. 10. *Pristiglottis montana* (Schltr.) Cretz. & J.J. Sm. **A.** Flowering habit. **B.** Labellum from above. **C.** ditto, with parts flattened. **D.** Labellum, from side. Scale bars: A, 10 mm; B–D, 4 mm. Drawn from *W. Takeuchi & J. Wiakabu 9394* by N.H.S. Howcroft.

FIG. 11. *Bulbophyllum pachyglossum* Schltr. **A.** Flowering habit. **B.** Flower, from side. **C.** Dorsal sepal. **D–E.** Petals. **F.** Lateral sepal. **G.** Labellum and column, side view. **H.** Labellum, side view. **I.** Labellum frontal view (material distorted). Scale bars: A, 5 cm; B–G, 10 mm; H–I, ×12. Drawn from *W. Takeuchi & J. Wiakabu 9375* by N.H.S. Howcroft.

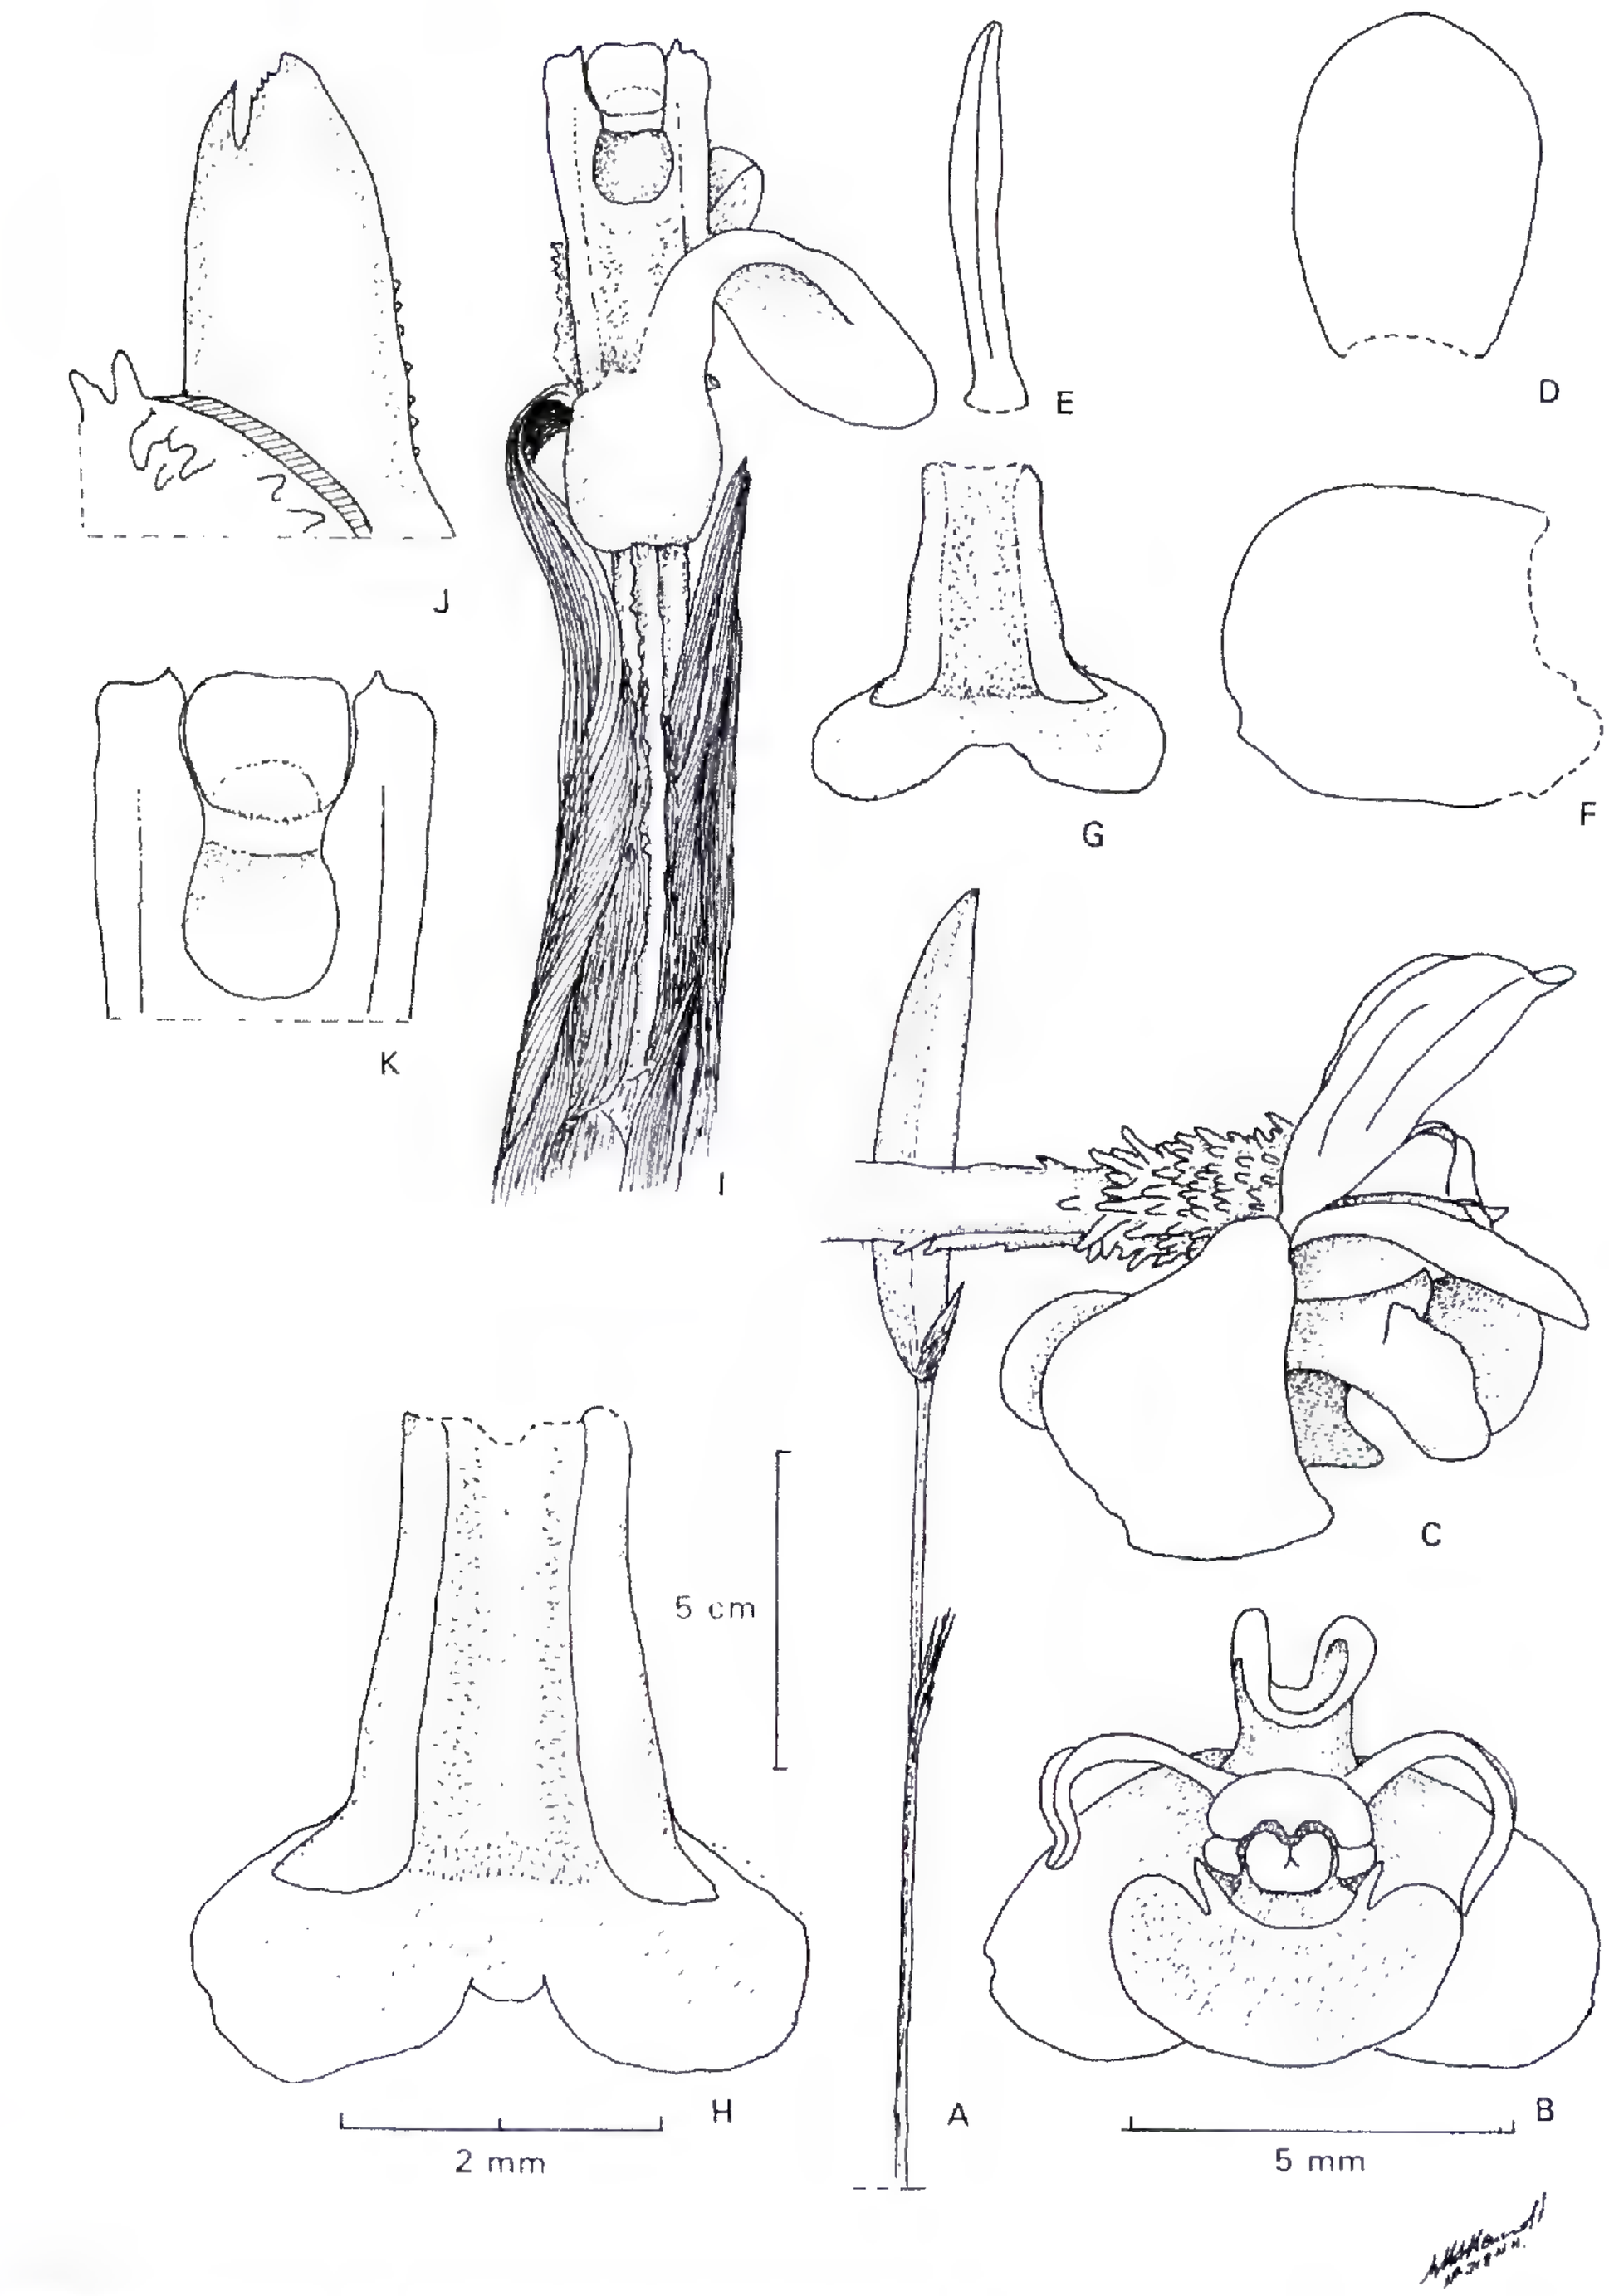

FIG. 12. *Cadetia echinocarpa* Schltr. **A.** Stem and leaf. **B.** Flower, frontal view. **C.** Flower and ovary, side view. **D.** Dorsal sepal. **E.** Petal. **F.** Lateral sepal. **G.** Labellum, from above. **H.** ditto. **I.** Partly dissected flower, showing anther, column, stigma, spur, and sheaths. **J.** Column, side view, without anther. **K.** Column apex from below, showing anther and stigma. Scale bars: A, 5 cm; B–G, 5 mm; H, 2 mm; I, 5 mm; J–K, 2 mm. Drawn from *W. Takeuchi & J. Wiakabu 9884* by N.H.S. Howcroft.

Dendrobium cuthbertsonii F. Muell., Trans. Roy. Soc. Victoria 24:175. 1888. (**Fig. 14**).

Specimens examined: **PAPUA NEW GUINEA. New Ireland Province:** Hans Meyer Range, Angil Mountain, expedition camp 4, pristine subcloud forest dominated by bryophytic and ferny growth, 4°25.2' S, 152°56.8' E, 1800 m, 3 Feb 1994 (fl, spirit), *W. Takeuchi & J. Wiakabu 9341* (LAE); ibid., 4 Feb 1994 (fl), *W. Takeuchi & J. Wiakabu 9400* (LAE); ibid., 6 Feb 1994 (fl, spirit), *W. Takeuchi & J. Wiakabu 9452* (A, LAE).

The surface of the leaves is not verrucose, as in most mainland provenances.

Dendrobium masarangense Schltr. ssp. **masarangense**, Repert. Spec. Nov. Regni Veg. 10:78. 1911. (**Fig. 15**).

Specimen examined: **PAPUA NEW GUINEA. New Ireland Province:** Hans Meyer Range, ridge adjacent to the Weitin River, expedition camp 3, mossy montane forest, 4°27.205' S, 152°56.489' E, 1175 m, 26 Jan 1994 (fl, spirit), *W. Takeuchi & J. Wiakabu 9534* (LAE).

The white-flowered ssp. *masarangense*, with a light yellow-tipped labellum, is widespread and common on high islands. Lewis and Cribb (1991: 188) list its distribution as Sulawesi to New Guinea, New Britain, Bougainville, Guadalcanal, Vanuatu, Fiji, and New Caledonia. The senior author has examined this subspecies *in situ* from the Lelet plateau of New Ireland. However much of the habitat there has been recently destroyed by agricultural development and the orchid has now disappeared from that locality.

Dendrobium rhodostictum F. Muell. & Kraenzl., Oest. Bot. Zeit. 44:300. 1894. (**Fig. 16**).

Specimens examined: **PAPUA NEW GUINEA. New Ireland Province:** Hans Meyer Range, ridge adjacent to the Weitin River, expedition camp 3, mossy montane forest, 4°27.205' S, 152°56.489' E, 1175 m, 25 Jan 1994 (fl, spirit), *W. Takeuchi & J. Wiakabu 9514* (LAE); junction of Niagara and Weitin rivers, expedition camp 2, lowland rainforest, 4°30.210' S, 152°56.242' E, 240 m, Jan 1994 (fl), *W. Takeuchi & J. Wiakabu 9974* (LAE).

Previously recorded from New Ireland. The pseudobulbs of these specimens are less clavate than other collections from New Britain, Bougainville, and the mainland, but the perianth segments and callus agree perfectly in shape and size to the species.

Goodyera rubicunda (Bl.) Lindl., Bot. Reg. 25: 61, misc. 92. 1839. (**Fig. 17**). *Neottia rubicunda* Bl., Bijdr. 408. 1825.

Specimen examined: **PAPUA NEW GUINEA. New Ireland Province:** junction of Niagara and Weitin rivers, expedition camp 2, lowland rainforest, 4°30.210' S, 152°56.242' E, 240–300 m, 13 Feb 1994 (fl, spirit), *W. Takeuchi & J. Wiakabu 9808* (A, K, L, LAE).

In the broad sense, *Goodyera rubicunda* is distributed throughout Malesia, from peninsular Malaysia to Samoa.

Spathoglottis plicata Bl., Bijdr. Fl. Ned. Ind. 5: 401. 1825. (**Fig. 18**).

rivers, expedition camp 2, lowland rainforest, 4°30.210' S, 152°56.242' E, 240 m, Jan 1994 (fl, fr, spirit), *W. Takeuchi & J. Wiakabu 9972* (LAE).

The New Ireland specimen undoubtedly belongs to the *S. plicata* complex. However the ligulate lateral lobes on the labellum, with virtually no dilation of the apices, indicate that this is not subspecies *plicata*. The lack of a distinctly arched column is suggestive of cleistogamy.

Spathoglottis taxa are distinguished primarily by the labellum, especially by the shape and angle of the lateral lobes, shape/size of the callus and its vestiture, and by claw length and width. Plant habit and morphology is of value in defining sections and subspecies (Howcroft 1986). Research by the senior author indicates that six subspecies of *S. plicata* are present in the New Guinea region, of which four have been recorded from the Bismarck Archipelago. A formal revision of Malesian *Spathoglottis* will appear in a future publication by the first author.

ACKNOWLEDGMENTS

Flowers of *Dendrobium antennatum* were provided by Wolfgang Bandisch, General Manager of the National Capital Botanical Gardens (NCBG), and by Judith Raka, NCBG Administration Manageress and Scientific Officer. Specimens representing New Ireland provenances were received from Oscar Melepia, of Gaulim in East New Britain, and from Steven Kami of Port Moresby.

The 1994 New Ireland expedition was funded by Conservation International and the U.S. Agency for International Development (through the Biodiversity Support Program). Bruce Beehler (Conservation International) and the Papua New Guinea Department of Environment and Conservation were the principal planners and organizers for the expedition. Hitofumi Abe (Ecosystem Research Group, University of Western Australia) provided the Japanese translation. Guy Nesom (Botanical Research Institute of Texas) wrote the Latin diagnosis for *Dendrobium archipelagense*, and John J. Pipoly III (Fairchild Tropical Garden) wrote the Latin diagnosis for *D. vexillarius* var. *hansmeyerense*. Reviewers Paul Omerod and Andre Schuiteman made many helpful comments on the manuscript.

RESUMEN

Se describe y se propone a *Portulaca rzedowskiana* como especie nueva para la ciencia. De acuerdo con el material examinado, este taxon se encuentra distribuido en sitios con pastizal y matorral subtropical perturbado de la parte norte del estado de Michoacán. Se caracteriza principalmente por ser de hábito perenne con raíz suberosa, por poseer hojas aplanadas a subrollizas, lanceoladas, en ocasiones oblongo-lanceoladas a oblanceoladas y por el opérculo de la cápsula que es de forma campanulada.

PALABRAS CLAVE: *Portulaca*, Portulacaceae, Michoacán, México.

ABSTRACT

Portulaca rzedowskiana is described and proposed as a new species. According to examined material this taxon is found in grasslands and disturbed subtropical scrub in the north part of the Mexican state of Michoacan. It is distinguised mainly by its perennial habit with suberous root, by its flat to subterete lanceolate leaves, sometimes oblong-lanceolate to oblanceolate in shape, as well as by the campanulated operculum of the capsule.

KEY WORDS: *Portulaca*, Portulacaceae, Michoacan, Mexico.

Durante la preparación del fascículo correspondiente a la familia Portulacaceae para la Flora del Bajío y de regiones adyacentes, se encontraron algunos ejemplares de herbario del género *Portulaca*, los cuales fueron colectados en la parte norte del estado de Michoacán (México) y que corresponden a una entidad que se puede ubicar en la subsección *Conocarpae* D. Legrand (subgénero *Portulaca*, sección *Catoclasis* D. Legrand), cuyo único miembro reportado para México es *P. mexicana* P. Wilson. Éstos ejemplares presentan características que no corresponden a ninguna de las especies conocidas en la actualidad, por lo que se propone como:

Portulaca rzedowskiana G. Ocampo, sp. nov. (**Fig. 1**). TIPO: MÉXICO. MICHOACÁN. Municipio de Morelia: Monte Rubio, pastizal, terreno plano, orilla de camino, por la vía del tren, alt. 1900 m, 1 Ago 1991, *J.M. Escobedo 2035* (HOLOTIPO: IEB; ISOTIPOS: por distribuirse).

Herba perennis crassiuscula; radix incrassata, suberosa, 2–6 cm longa, 0.5–3.5 cm lata; caules usque ad 26 cm longi, prostrati vel decumbentes; folia alterna, plana vel subteretia, lanceolata, aliquando

[1]Trabajo realizado con apoyo económico del Instituto de Ecología, A.C. (cuenta 902-03), del Consejo Nacional de Ciencia y Tecnología y de la Comisión Nacional para el Conocimiento y Uso de la Biodiversidad.

oblongo-lanceolata vel oblanceolata, 4–20 mm longa, 1–3(–4.5) mm lata, apice acuta; sepala ovata, rubra, (3–)4.5–6.5 mm longa, 4–5.5(–6.5) mm lata; petala rosea vel purpurea, obovata, (5.5–)6.5–11 mm longa, (3–)3.5–6(–7) mm lata; stamina 22–44; stylus 4.5–6(–8) mm longus, lobis stigmatosis (3–)4–5(–6); capsula 3.5–6 mm longa, operculum campanulatum; semina coracina, 0.6–0.7(–0.8) mm longa, tuberculata, tuberculis basi stellulatis ornata.

Planta herbácea perenne, carnosa. Raíz engrosada, suberosa, de 2–6 cm de largo por 0.5–3.5 cm de ancho, en raras ocasiones surgen de ella raíces cilindráceas de hasta 15 cm de largo por 2–4 mm de ancho. Tallos varios surgiendo de la raíz, de 4–26 cm de largo, postrados a decumbentes. Hojas alternas, aplanadas a subrollizas, carnosas, pelos axilares de 3–5 mm de largo, pecíolo de 1–1.5(–2) mm de largo, lanceoladas, en ocasiones oblongo-lanceoladas a oblanceoladas, de 4–20 mm de largo por 1–3(–4.5) mm de ancho, ápice agudo. Flores terminales, sésiles, agregadas en cabezuelas de (2–)3–8 flores, rodeadas por un verticilo de (6–)8–10(–13) hojas, pelos de hasta 5 mm de largo; sépalos connados en su base, rojizos, ovados, de (3–)4.5–6.5 mm de largo por 4–5.5(–6.5) mm de ancho, desiguales, ápice agudo, margen escarioso, persistentes hasta la madurez de la cápsula; pétalos de color rosa a morado, connados en su base, obovados, de (5.5–)6.5–11 mm de largo por (3–)3.5–6(–7) mm de ancho, obtusos a emarginados, la mayoría de las veces con un pequeño mucrón; estambres 22–44, sus filamentos de (2.5–)3–4(–5) mm de largo, connados en su base formando un anillo estaminal de ±1 mm de largo, anteras de 0.6–0.8(–0.9) mm de largo; estilo de 4.5–6(–8) mm de largo, ramas estigmáticas (3–)4–5(–6), de 1.5–2.5(–3) mm de largo. Cápsula sésil o sobre un pedicelo de hasta 1.5 mm de largo, la cápsula de 3.5–6 mm de largo por 3–4.5(–5) mm de diámetro, con dehiscencia en su tercio inferior o más cercana a la base, opérculo campanulado a semi-campanulado; semillas de color negro-azulado cuando maduras, brillantes, reniformes, de 0.6–0.7(–0.8) mm de largo, tubérculos redondeados con estélulas radiales en su base.

Material adicional examinado: **México. Michoacán. Municipio de Acuitzio del Canje:** Las Peñas, 1 Jul 1986, *H. Díaz 2372* (CHAPA, IEB). **Municipio de Charo:** brecha rumbo a Las Mesas, 22 Jul 1987, *J. Santos 2114* (IEB); ±1.5 km sobre el camino a Las Mesas, a un costado de la cortina del bordo, 22 Ago 2001, *G. Ocampo 1128* (IEB), *1129* (IEB). **Municipio de Erongaricuaro:** Oponguio, 5 Jul 1990, *H Díaz 6205* (CHAPA, EBUM, IEB, MEXU). **Municipio de Morelia:** Puerto de Los Copales, ±8 km de Morelia sobre la carretera a Mil Cumbres, 22 Ago 2001, *G. Ocampo 1124* (IEB); alrededores de San José de las Torres, 14 Sep 1991, *E. García y E. Pérez 3930* (IEB); San José Coapa, 4 Oct 1989, *J.M. Escobedo 1845* (IEB). **Municipio de Purépero:** ±3 km de Villa Mendoza, camino a San Antonio Carupo, 2 Sep 1999, *E. Carranza et al. 5777* (IEB). **Municipio de Puruándiro:** 9 km al SE de Puruándiro, carretera a Cuitzeo, 22 Jun 1985, *H. Díaz 1162* (IEB). **Municipio de Tlazazalca:** 2 km al W de La Yerbabuena, 6 Jul 1990, *E. Pérez y E. García 1367* (IEB); bordo en la desviación a La Yerbabuena, sobre la carretera a Churintzio, 7 Jul 2001, *G. Ocampo y A. Medellín 1053* (IEB).

Portulaca rzedowskiana se ha encontrado en lugares con matorral subtropical perturbado o con pastizal, en terrenos planos o con poca inclinación, entre los 1800 y 2200 m de altitud (5920–7230 ft). Su abundancia local oscila entre escasa

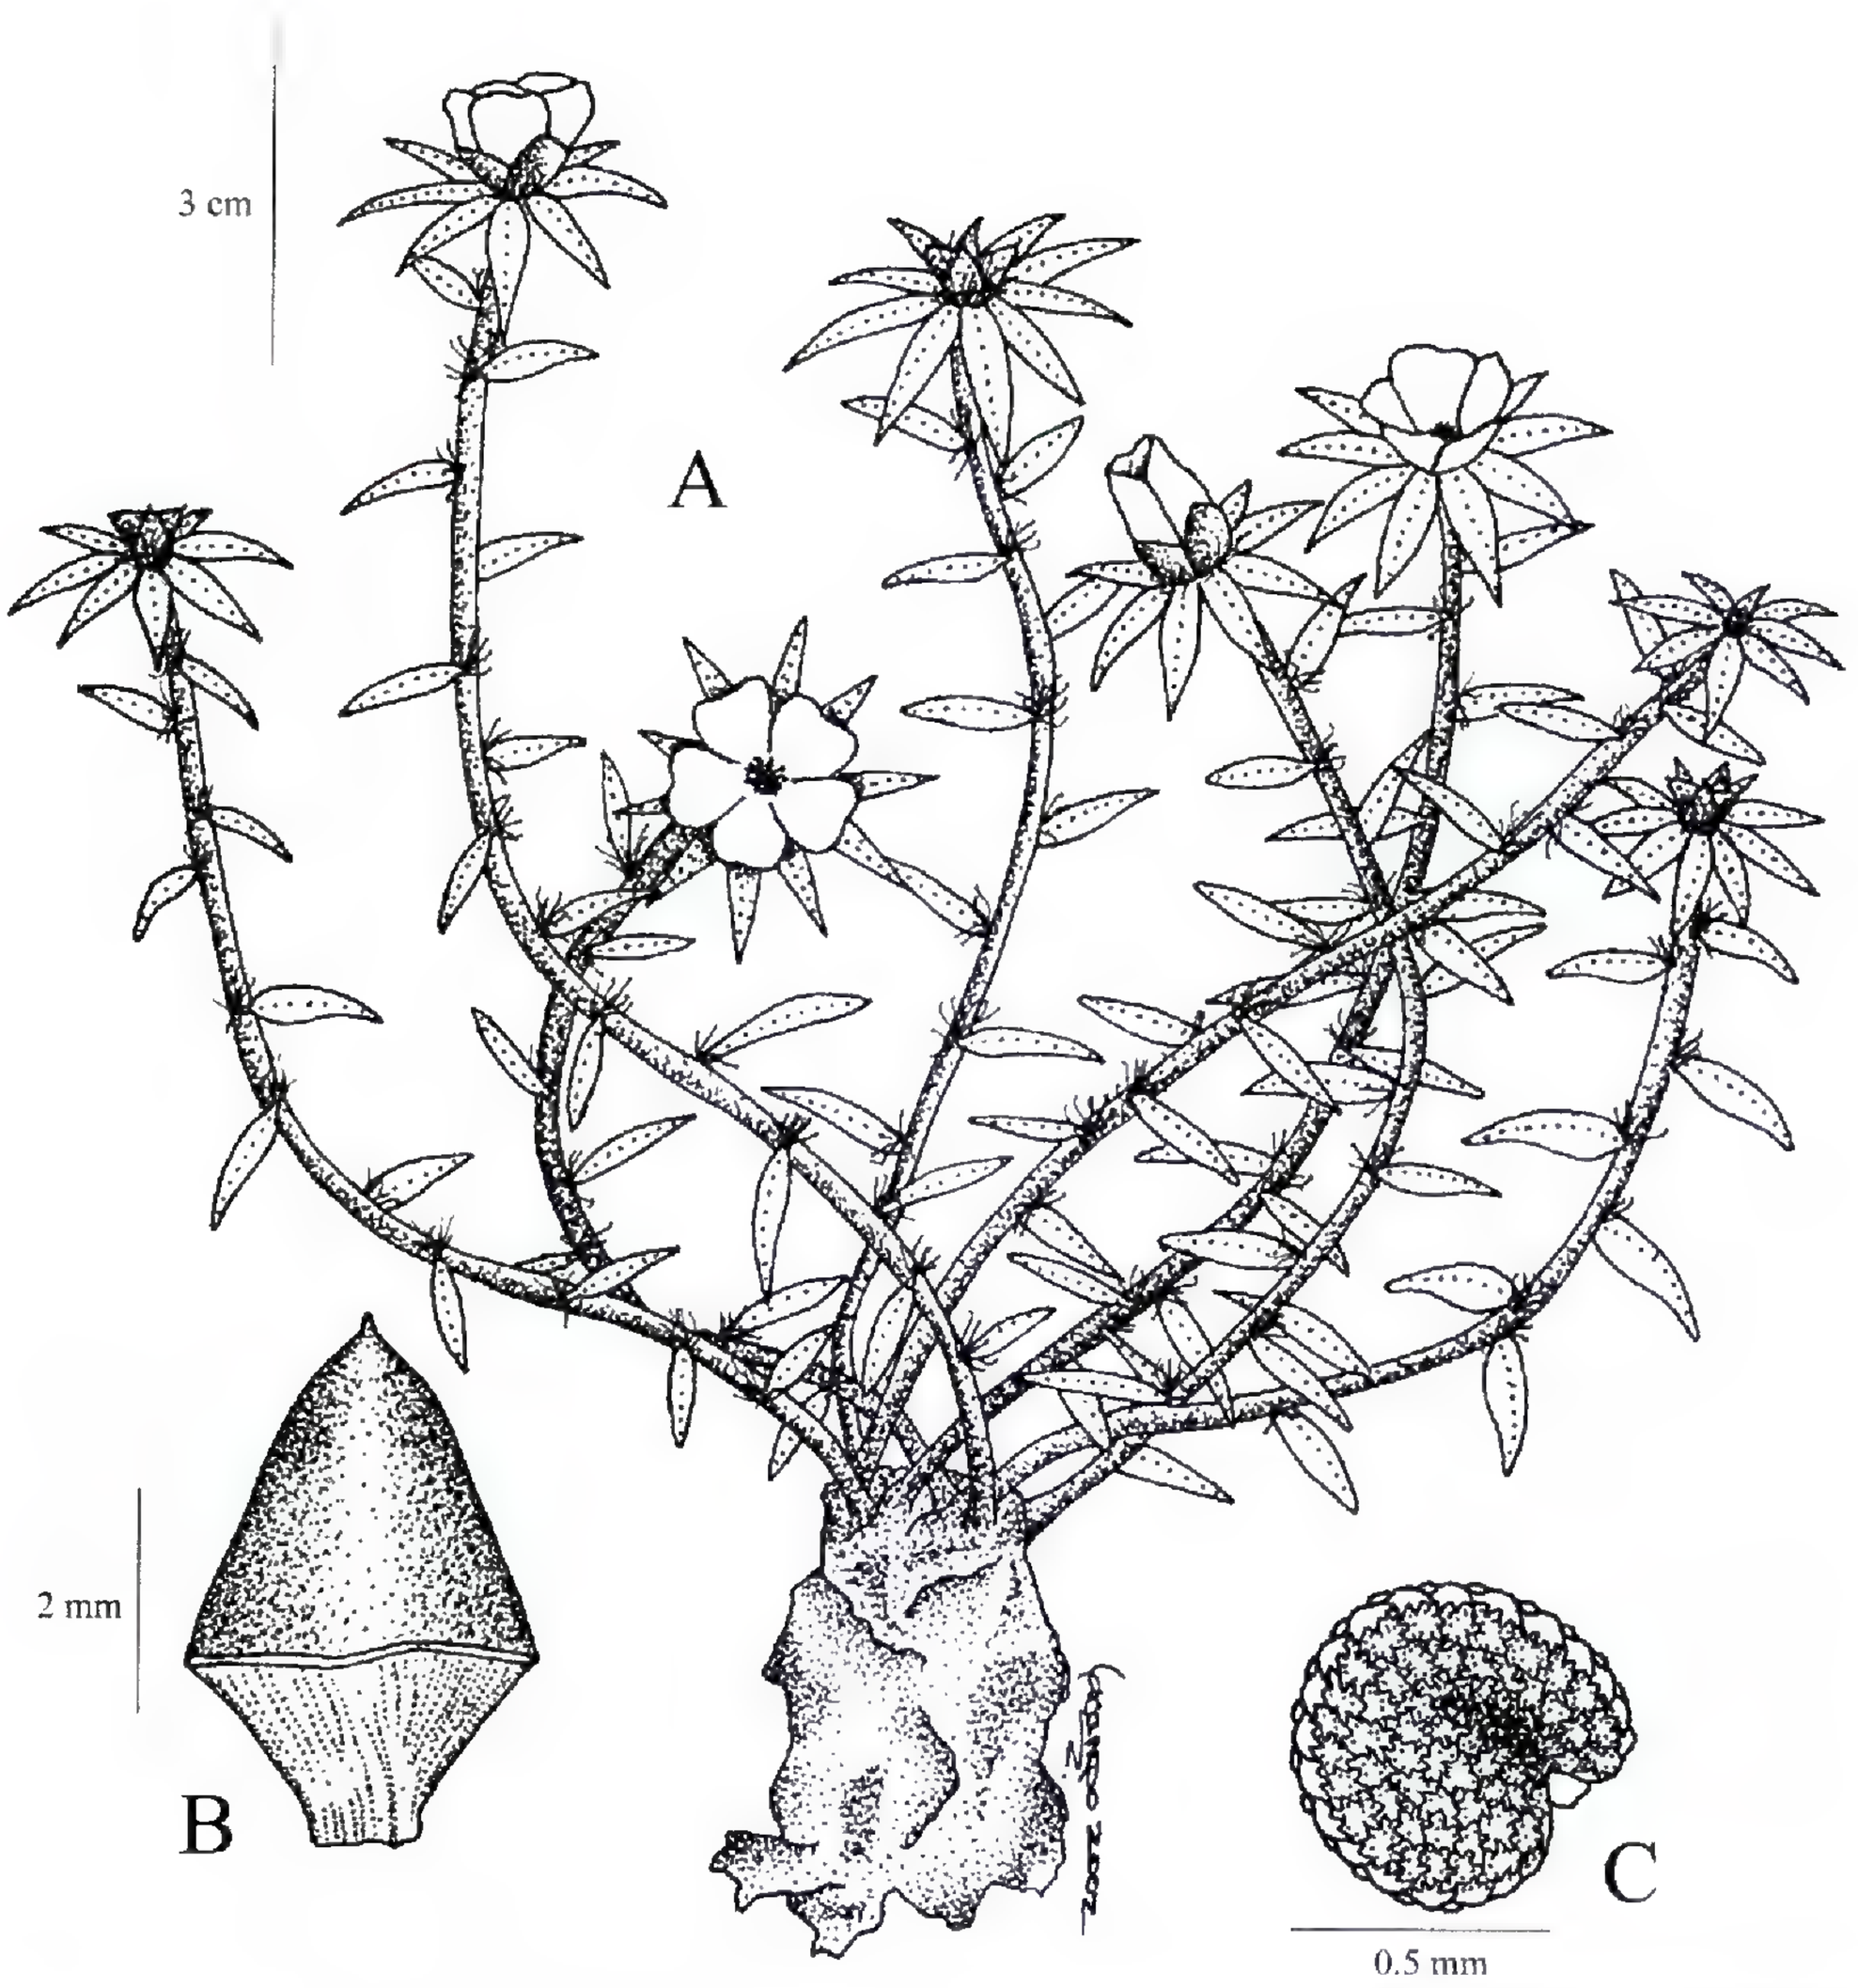

FIG. 1. *Portulaca rzedowskiana*. A. Aspecto general de la planta. B. Cápsula. C. Semilla.

y francamente abundante, por lo que se puede considerar que carece de problemas de supervivencia. Por el momento, únicamente se conoce de la parte norte de Michoacán, pero es de esperarse que esta especie se encuentre en zonas colindantes de los estados de Jalisco y Guanajuato.

Las especies de la subsección *Conocarpae* D. Legrand, muestran cápsulas con dehiscencia en su tercio inferior, el opérculo es campanulado o subconoideo (raramente casi hemiesférico) y sus hojas son rollizas a aplanadas, dispuestas en grupos de 6 a 14 en las inflorescencias (Legrand 1962). *P. rzedowskiana* tiene mayor afinidad con *P. mexicana* P. Wilson, *P. minensis* D. Legrand, *P. perennis* R. E. Fr. y con *P. wedermannii* Poelln., de las cuales se diferencia por una serie de combinación de caracteres (Cuadro 1), siendo los principales el tamaño más

grande que pueden alcanzar sus tallos, así como las mayores dimensiones de sus hojas y de sus cápsulas (*P. rzedowskiana* presenta las cápsulas más grandes de la subsección (D. Legrand, op. cit.), las cuales se conocían de hasta 5 mm de largo), así como por el color negro-azulado de sus semillas. En particular, la nueva entidad se diferencia de *P. mexicana* y *P. perennis* por sus hojas aplanadas, por sus pétalos de hasta 1.1 cm de largo, por presentar mayor número de estambres, así como por tener mayores dimensiones en el tamaño del estilo y el tamaño de la semilla; de *P. minensis* y *P. wedermannii*, especies de distribución sudamericana, se diferencia principalmente por la abundancia regular de la pilosidad axilar y por el menor número en las ramas del estilo.

Martín de Sessé y José Mariano Mociño, en su obra Flora Mexicana, registran a *Portulaca meridiana* L.f. (p. 132, 1891–1897) de las cercanías de Puruándiro (Michoacán), de donde también se ha colectado *P. rzedowskiana*. En la actualidad, se considera que *P. meridiana* L.f. es sinónimo de *P. quadrifida* L., especie distribuida en África, Asia, Oceanía y las Antillas. Por desgracia, de la excursión efectuada por los autores mencionados, no se conocen ejemplares en el herbario del Real Jardín Botánico de Madrid (MA) (McVaugh, p. 446, 2000) ni dibujos en la Colección Torner de la expedición de Sessé y Mociño (Hunt Institute for Botanical Documentation, Pittsburgh, E.U.A.) asociados con la especie aludida. Al revisar la descripción que Sessé y Mociño hacen del material observado, ésta parece coincidir con las características de *P. rzedowskiana*. La descripción de *P. meridiana* que se encuentra en la Flora Mexicana se transcribe a continuación:

Portulaca foliis lineari-subulatis, carnosis, axillis pilosis; floribus polyandris, terminalibus, sessilibus. Fl. Mex.

Portulaca foliis ellipticis, carnosis, planis, articulis pilosis, floribus sessilibus, terminalibus. Herba dodrantalis, caule tereti, glabro, succulento. Folia alterna, lineari-subulata, carnosa, sessilia, glaberrima, pilis fasciculatis, utrinque axillaribus ornata. Flores rubro-purpurei, polyandri, terminales, in capitulum sessiles, verticillum foliorum suffulti. Capsulae ovatae, circumcisae.

Habitat prope Oppidium Puruandirum. Floret Iulio.

Portulaca meridiana es una planta anual, con hojas opuestas, aplanadas, con flores rodeadas por un verticilo de 4 hojas, con pétalos amarillos y con el opérculo de la cápsula de forma campanulado-tubulosa. La disposición opuesta de las hojas, entre otras características, la ubican en el subgénero *Enantiophylla* D. Legrand, por lo que la asignación del nombre de *P. meridiana* que hicieron Sessé y Mociño a los ejemplares que observaron cerca de Puruándiro es incorrecta. La descripción en Flora Mexicana concuerda con las características de la nueva entidad, por lo que muy probablemente se trate de la misma unidad taxonómica.

Etimología.—El epíteto específico está dedicado a la Maestra Graciela

Calderón de Rzedowski y al Dr. Jerzy Rzedowski Rotter por su incansable e invaluable labor en pro del conocimiento botánico de México.

AGRADECIMIENTOS

Deseo expresar mi agradecimiento a Heike Betz (Field Museum) por su apreciable ayuda en la consecución de bibliografía. De igual forma, deseo agradecer a Patricia Mayoral, a Emmanuel Pérez, a Sergio Zamudio (todos ellos del Instituto de Ecología, A.C., Centro Regional del Bajío), así como a James F. Matthews (University of North Carolina at Charlotte) por la revisión crítica del manuscrito.

Angiosperms: Monocotyledons.** (ISBN 0-299-16280-X, hbk.). $90.00, 400 pp, 268 line illus., 1 map, 8 1/2" × 11".

The University of Wisconsin Press, 1930 Monroe Street, 3rd Floor, Madison, WI 53711-2059, U.S.A. (Orders: Customer Service Department, The University of Wisconsin Press, c/o Chicago Distribution Center, 11030 S. Langley Ave., Chicago, IL 60628, U.S.A.; 773-568-1550; fax 800-621-8476, 773-660-2235).

This 2-volume set updates the original 1940 Fassett manual and its successor, the 1957 revision by Eugene Ogden—it is a guide to identification of native or naturalized vascular plants growing in "the region from Newfoundland west along the 50th parallel to southeastern Manitoba and Minnesota, south to Virginia and Missouri. Thus, on the southern edge, our range abuts the range covered by Drs. Godfrey and Wooten in their "*Aquatic and Wetland Plants of the Southeastern United States.*" Volume 1 treats "Pteridophytes, Gymnosperms, and Angiosperms: Dicotyledons"; Volume 2 treats "Angiosperms: Monocotyledons." Species of "salt marshes and tidal waters" and those "which typically occur in saturated peat" are included but "not terrestrial plants which may occur typically on flood plains, in woodland springs, or along vernal woodland or seasonal alpine brooks." The keys, which "utilize vegetative features as much as possible," "treat a total of 1139 species (1186 taxa) representing 295 genera in 109 families." "The 606 plates include figures of 1087 taxa, with 92 percent of the taxa fully or partly illustrated, [and] ... references to the figures are included in the keys." Habitat information and geographical distributions "have been drawn widely from the published literature ... and from herbarium specimens documenting locations not cited in the literature, and from our own field experience." The nicely bound, large-size, easy to-use format of the volumes, spacious plates with black-and-white line drawings, effective keys, and wide taxonomic coverage promise that this contribution will be useful in many contexts.—*Guy L. Nesom, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX, 76102-4060, U.S.A.*

AGAVE OVATIFOLIA (AGAVACEAE), UNA NUEVA ESPECIE DE MAGUEY DEL NORESTE DE MÉXICO

RESUMEN

Una especie de maguey, *Agave ovatifolia* Starr & Villarreal de la Sierra de Lampazos en el norte de Nuevo León es propuesta como nueva. Es ubicada en la sección *Parryanae* de subgénero *Agave* y se discute su relación con *A. havardiana* Trel. y *A.parrasana* Berger. Se presenta una ilustración de la planta y una clave parcial y modificada de la sección *Parryanae* (Gentry 1982:526).

ABSTRACT

A new species, *Agave ovatifolia* Starr & Villarreal from the Sierra de Lampazos in northern Nuevo Leon is described and illustrated. It belongs in the section *Parryanae* of the subgenus *Agave*, and its relationship to *A. havardiana* Trel. and *A. parrasana* Berger is discussed. A partial, modified key to section *Parryanae* (Gentry 1982:526) is provided.

KEY WORDS: Agavaceae, *Agave*, Flora of Mexico

La colecta de material proveniente del norte del estado de Nuevo León proporciona información de una nueva especie de *Agave*.

Agave ovatifolia Starr & Villarreal, sp. nov. (**Figs. 1 y 2**). TIPO: MÉXICO. NUEVO LEÓN: municipio de Bustamente, Sierra de Lampazos, rancho Minas Viejas, 26° 39' N, 100° 24' W, Bosque de *Quercus canbyi, Quercus laceyi, Juniperus, Crataegus, Ribes, Ungnadia, Vitis*, entre otras, 1100–1200 m, 19 Jun 2001, *J.A. Villarreal 9180, M.A. Carranza y J.A. Encina* (HOLOTIPO: MEXU, ISOTIPOS: ANSM, TEX).

Planta multiannuus, acaulis, rosula hemisphaericus, compactus, 80–120 cm diámetro, 60–90 cm alta; foliis 40–50 in 8–10 stratis, ellipticus, 35–45 cm longis, 20 24 cm latus, griseo-azureus, apice acuminatus, spina terminalis 2 cm longa, margine 15–19 paribus dentes separatus 20–25 mm; inflorescentia 3.5–4.0 m alta, ovatus-ellipticus, 13–16 rami floribus 30–50 cm longis; bracteis ellipticus-triangularis, inferiora 20–25 cm longis, 8–10 cm latis, superiora 12–15 cm longis, 7–9 cm latis; pedicelli 4–8 mm longi; flores 67–74 mm longum, flavo-virens, ovarium cylindricus, 30–35 mm longis, perianthii collo 7 mm longo, peranthii tubo 15–20 mm longo, 15 mm lato, tepala 20 mm longa, 5–7 mm lata, fila 50–60 mm longa insertus basis tepalas; capsula cylindricus, 50–60 mm longis, 15–20 mm latis; semina 5–6 mm longa, 3–4 mm lata.

Plantas multianuales; rosetas hemisféricas, algo compactas, 80–120 cm diámetro, 60–90 cm alto; hojas arregladas en 8–10 hileras, 40–50 hojas por planta, elípticas, ligeramente cóncavas a casi planas, 35–45 cm de largo, 20–24 cm de ancho en la parte media, de color glauco-grisáceo, ocasionalmente con 1–2 costillas dorsales, base ensanchada, ápice acuminado con borde de color café,

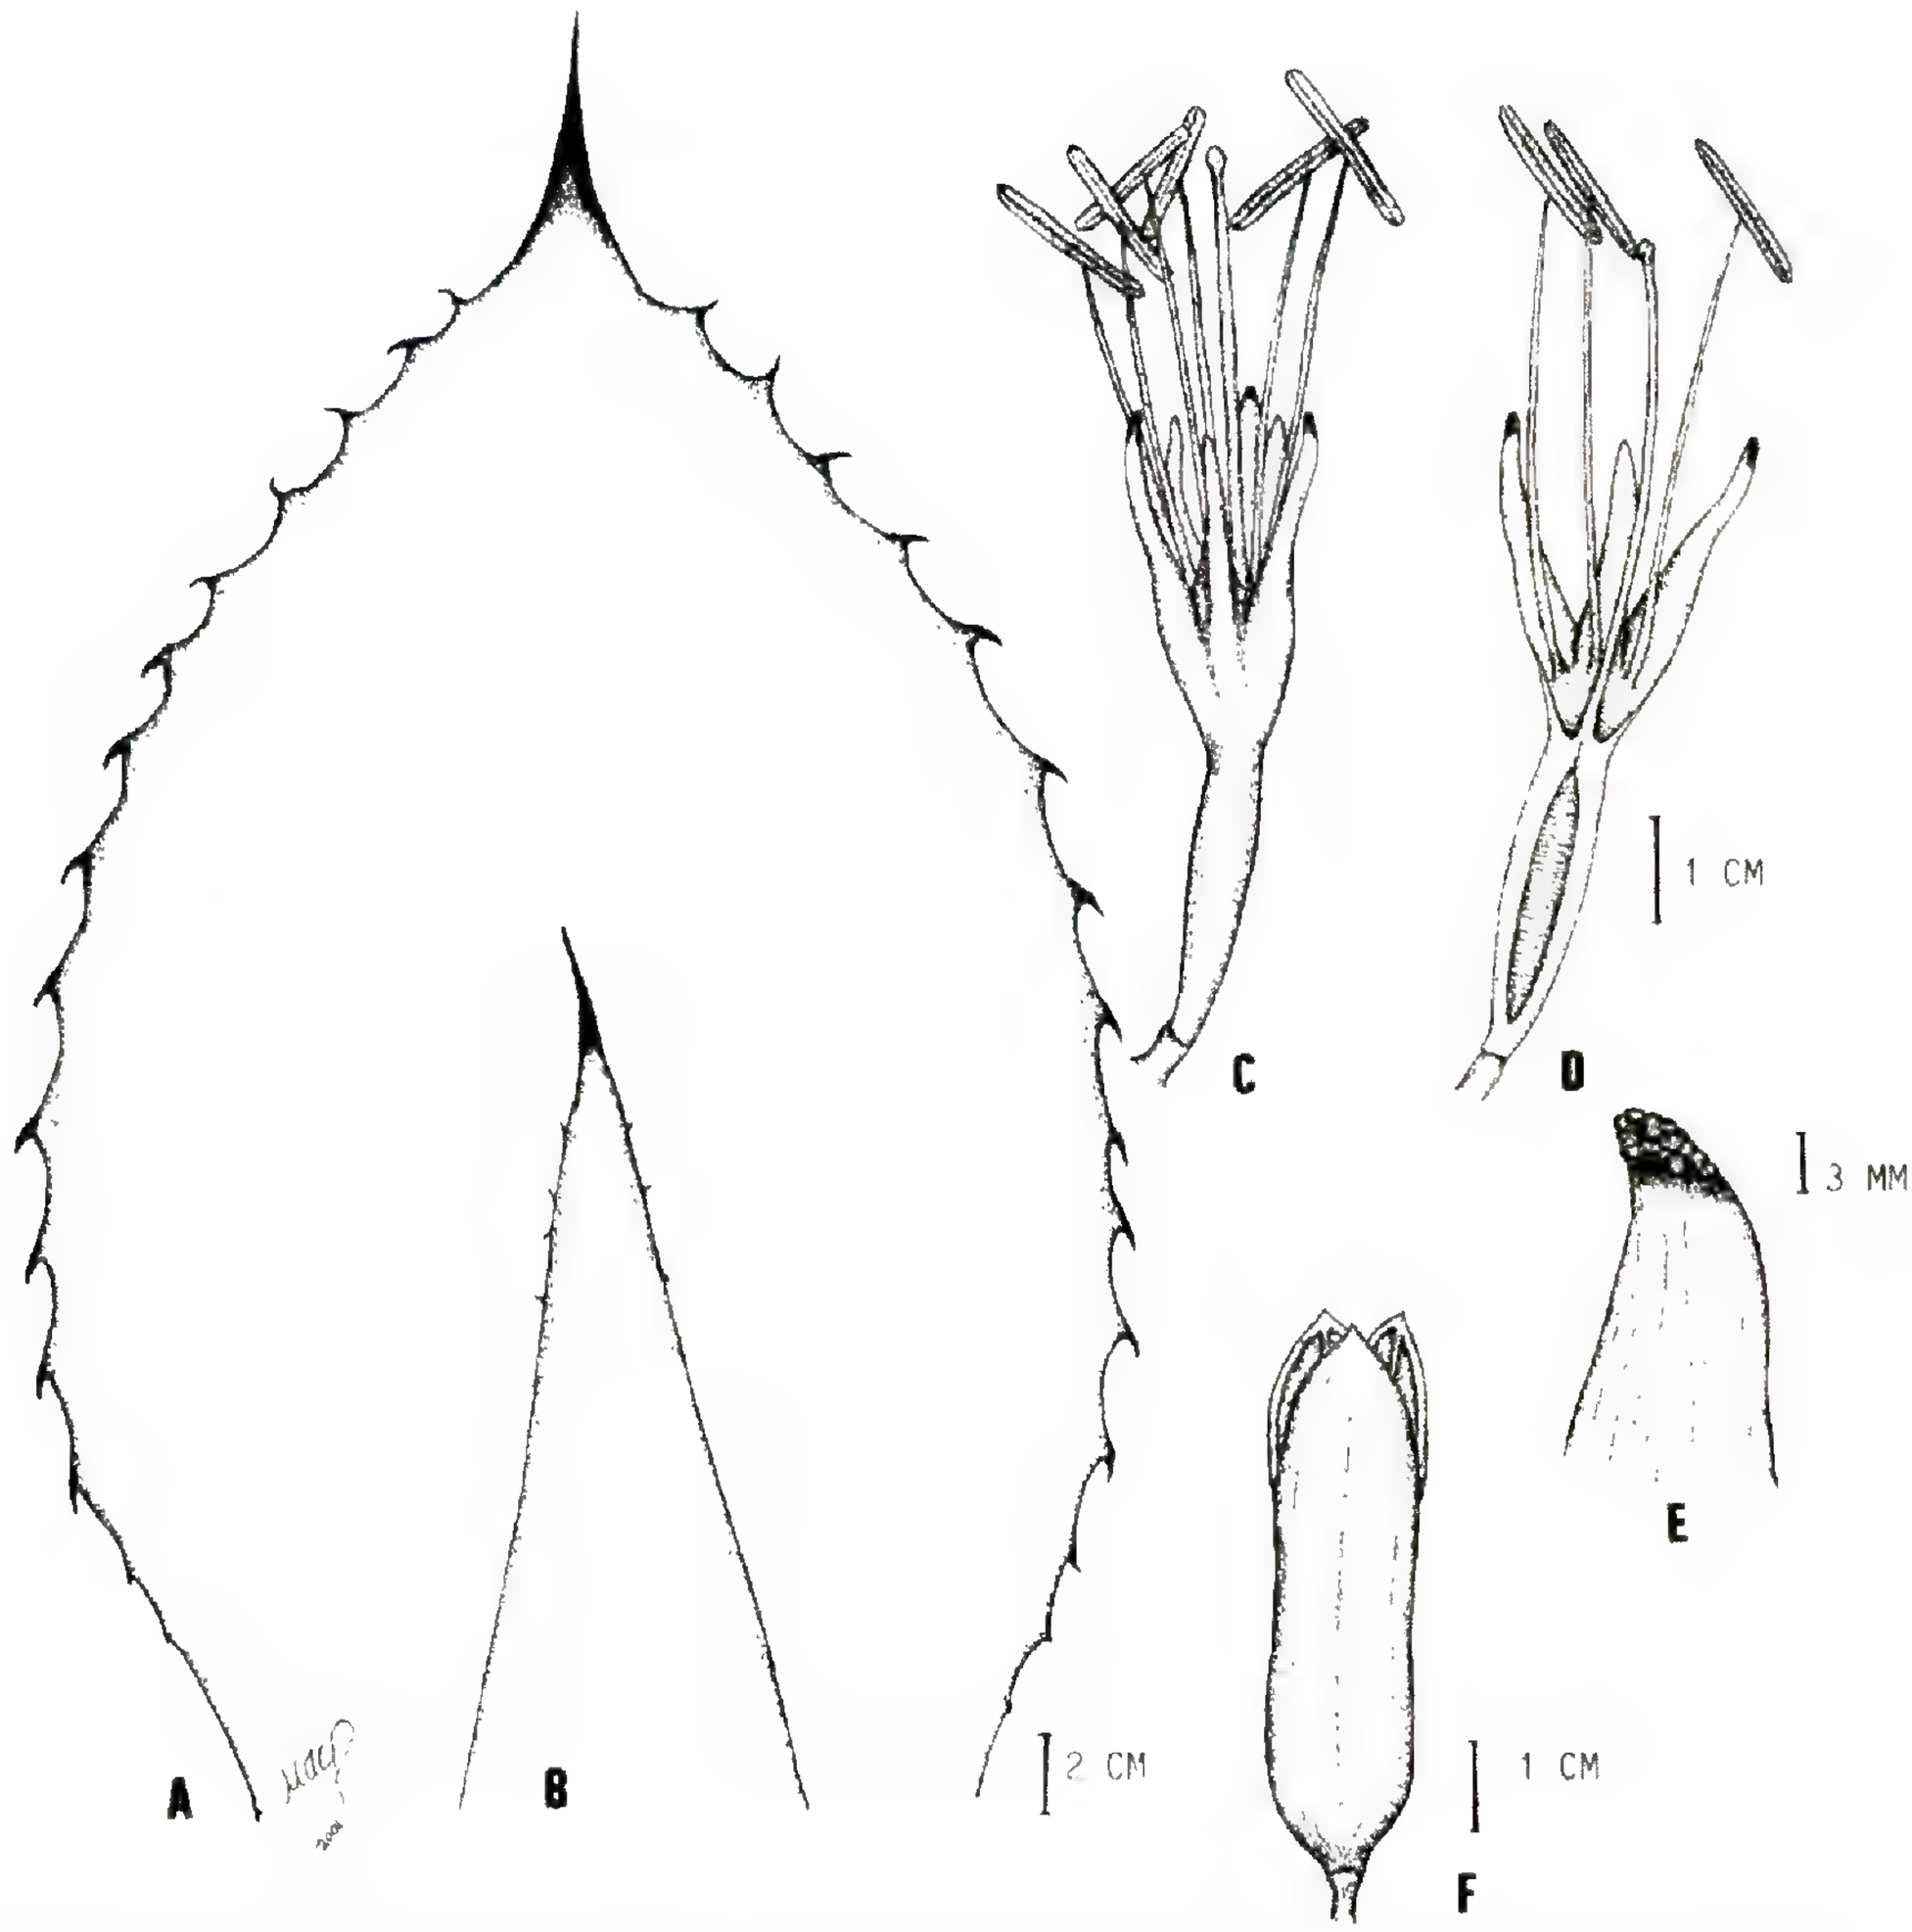

FIG. 1. *Agave ovatifolia*. **A.** hoja. **B.** bráctea. **C.** flor, corte longitudinal. **E.** glándula en el extremo del tépalo. **F.** cápsula.

espina terminal de cerca de 2 cm de largo, margen recto, con 15–19 pares de dientes ligeramente curvados, separados 20–25 mm, más próximos cerca de la base; inflorescencia 3.5–4 m alto, forma elíptica a largamente ovoide, escapo floral 9–11 cm ancho en la base, 6–8 cm en la primer ramificación, raquis algo sigmoideo, 13–16 ramillas florales, de 30–50 cm de largo, ubicadas en la mitad superior del escapo; brácteas elíptico-triangular, esparcidas, las basales 20–25 cm largo, 8–10 cm ancho en la base, las superiores 12–15 cm largo, 7–9 cm ancho en la base, acuminadas con espina terminal, enteras a dentadas, delgadas (papiráceas), glaucas, pronto se deshidratan y cambian a color café-claro, la mayoría erectas; flores en 5–6 umbelas densas, 67–74 mm largo, verde amarillentas; pedicelos 4–8 mm largo, ovario cilíndrico, 30–35 mm largo, cuello del perianto 7 mm largo, tubo del perianto 15–20 mm largo, 15 mm ancho en la parte media, tépalos largamente triangulares, 15–17 mm largo, 5–7 mm ancho

Fig. 2. Planas de *Agave ovatifolia* en su habitat y en floración.

en la base, los tres más externos con evidentes glándulas apicales, filamentos 50–60 mm largo, ligeramente aplanados insertos en la base de los tépalos, verde amarillento, anteras 22–25 mm largo, verdes, estilo 8–9 cm largo; cápsulas cilíndricas 50–60 mm largo, 15–20 mm ancho, color café oscuro; semillas lacrimiformes, 5–6 mm largo, 3–4 mm ancho, color negro brillante.

Crece en laderas y mesetas rocosas entre los 1100–1500 m, tanto en bosque de encino como matorral de *Agave lechuguilla* y arbustos espinosos. Su distribución es restringida en el área antes mencionada con la posibilidad de que se encuentre también en otras sierras aledañas. Las poblaciones son esparcidas, donde no se observan hijuelos ni la formación de colonias. La planta es reportada como buena forrajera para el ganado y las poblaciones son menguadas por jabalíes y otra fauna silvestre. Sólo se observaron plantas maduras y en floración en laderas con fuerte pendiente, donde escapan a la depredación. Localmente se le conoce como "noga" y se le diferencia de las plantas que carecen de hojas con costillas dorsales, las cuales son denominadas "maguey noga."

La especie se ubica en la sección *Parryanae* del trabajo de Gentry (1982) y al parecer esta relacionada morfológicamente con *A. havardiana* Trel. y *A. parrasana* Berger, de las cuales se diferencia por sus hojas proporcionalmente

más anchas, de color gris-azuloso y flores con tamaño intermedio, como se muestra en la siguiente clave modificada. Aunque las dimensiones de las hoja en *A. havardiana* y *A. ovatifolia* se sobreponen, la relación entre el largo y ancho es diferente, la de *A. havardiana* es de 2.0–2.8, mientras que la de *A. ovatifolia* es de 1.5–1.8. La relación entre largo y ancho de la hoja en *A. parrasana* es de 2.0–2.5, pero con hojas consistentemente más cortas. Agave *havardiana* se distribuye en el suroeste de Texas y regiones adyacentes de Chihuahua y Coahuila, *A parrasana* en sierras del centro y sur de Coahuila, mientras que *A. ovatifolia* en la Sierra de Lampazos en el norte de Nuevo León.

Agave ovatifolia es ubicado en la sección Parryanae, y la clave de Gentry (1982:526) puede ser modificada como sigue:

2. Rosettes globose, suckering copiously with long rhizomes forming large, spreading clones; panicles deep with 20 40 umbels; flowers 60–80 mm long ____ **3**
2. Rosettes not globose, more openly flat-topped, with few or no suckers; panicles rather wide and open with 10–20 large umbels; flowers 67–90 mm long ____ **7**
   7. Leaves larger, 30–70 ≤ 15 -25 cm, long acuminate; teeth reflexed along middle and lower leaf margins; tepals about equaling to slightly longer than tube. Big Bend Region and adjacent Mexico ____ **8**
   7. Leaves smaller, 20–30 ≤ 10–12 cm, the apex abruptly acute; teeth not reflexed along margins; tepals about twice as long as tube. Sierras of southern Coahuila. ____ **Agave parrasana** p. 537
      8. Leaves relatively long and narrow, 30–70 × 15–25 cm, the length 2 or more times the width, ovate-acuminate to long-acuminate, leaf tip acute, glaucous gray to light green, spine stouter, 3–5(–10) cm long; flowers 68 88 mm long, tepals 18–24 mm long; Big Bend, east-central Chihuahua and northwestern Coahuila, Mexico ____ **Agave havardiana** p. 531
      8. Leaves relatively short and broad, 35–45 ≤ 20–24 cm, the length less than 2 times the width, elliptic to ovate-el iptic, leaf tip obtuse, silver blue to grayisn sky blue, spine 2 cm long; flowers 67–74 mm long, tepals 15–17 mm long, Nuevo León, Mexico ____ **Agave ovatifolia**

Al parecer *A. ovatifolia* es la misma planta que Mrs. Anna B. Nickels colectó y distribuyó como *A. noah* Nickels a finales del siglo antepasado. La especie de Mrs. Nickels no fue descrita y tampoco fue apropiadamente publicada, a pesar que Trelease (1911) la enlista como sinónimo de *A. wislizeni* Engelm. La taxonomía de *A. wislizeni* ha sido ampliamente discutida por Gentry (1975) y Ullrich (1992). El concepto de Trelease (1911) para *A. wislizeni* acomoda bien con *A. parrasana* pero no para *A. ovatifolia*. Lynn Lowery, renombrado horticultor texano, colectó esta especie de Sierra de Lampazos, a principios de los 1990´s. El epíteto específico hace referencia a las hojas relativamente anchas en relación a su largo.

AGRADECIMIENTOS

Nuestro agradecimiento a el señor Pedro Elizalde Cantú, por permitirnos colectar material botánico en su rancho. A Ron Gass, Miguel A. Carranza y Juan

A. Encina por acompañarnos en las visitas a campo. La ilustración es obra de Miguel A. Carranza.

Book Notice

Laurence J. Dorr, Basil Stergios, Alan R. Smith, and Nidia L. Cuello A. Chief Editor: Laurence J. Dorr. 2000. **Catalogue of the Vascular Plants of Guaracamal National Park, Portuguesa and Trujillo States, Venezuela.** (ISSN 0097-1618, pbk). Contributions form the United States National Herbarium, Volume 20:1–55. Department of Botany, National Museum of Natural History, Smithsonian Institution, Washington, DC 20560-0166, U.S.A. Price not given, 155 pp, 3 figures, 7" × 10".

"Guaracamal National Park, which lies southwest of the city of Boconó, preserves lower montane forest, cloud forest, and paramó in the northeastern-most portion of the venezuelan Andes." It covers 21.5 km2 and ranges between 1600–3100 meters in elevation. "The specimens examined for this catalogue are mostly our own collections. These have been deposited in NY, PORT, UC, and US, and the duplicates have been distributed widely."

The catalogue treats a total of 147 families, 517 genera, and 1227 species—236 species (in 62 genera) of ferns and fern allies, 237 species (in 92 genera) of monocots, 752 species (in 361 genera) of dicots, and 2 species of pines (in 2 genera). The ten most important families in Guaracamal National Park in terms of the number of species are (in order) Orchidaceae -115, Asteraceae–102, Rubiaceae–73, Piperaceae–47, Dryopteridaceae–46, Melastomataceae–44, Solanaceae–35, Poaceae–33, Grammitidaceae–29, and Lauraceae–27. Thirty-three vascular plant taxa have been described (as new to science) from material collected in the park. A brief statement of collection localities, elevational range, exsiccatae, common names and uses, endemic and near-endemic status, and adventive and cultivated species is given for each species, where applicable. Relevant taxonomic references are provided at the end of each family treatment.—*Guy L. Nesom, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX, 76102-4060, U.S.A.*

A NEW SPECIES OF *LITHOSPERMUM* (BORAGINACEAE) FROM NUEVO LEON, MEXICO

B.L. Turner

Plant Resources Center
University of Texas
Austin, TX 78713, U.S.A.

ABSTRACT

Lithospermum hintoniorum is newly described and illustrated. It reportedly occurs in marshy areas of oak woodlands in southern Nuevo Leon, Mexico at elevations of about 1500 meters. It is seemingly most closely related to the widespread *L. calycosum* but is distingished by a number of characters, including both vegetative and floral features.

RESUMEN

Se describe y se ilustra ***Lithospermum hintoniorum***. Se ha localizado en áreas encharcadas de robledales en el sur de Nuevo León, México en elevaciones de unos 1500 metros. Parece ser que su pariente más cercano es el muy frecuente *L. calycosum* del que se diferencia por varios caracteres, tanto vegetativos como florales.

Routine identification of Hinton collections from northeastern Mexico has revealed the following novelity:

Lithospermum hintoniorum B.L. Turner, sp. nov. (**Fig. 1**). TYPE: MEXICO. NUEVO LEON: Mpio. Aramberri, San Juan de Aviles, "Marsh in oak woods," ca. 1480 m, 13 May 1992, *Hinton et al. 21950* (HOLOTYPE: TEX; ISOTYPES: personal collections of the collectors).

Simile *Lithospermo calycosa*, lobos corollarum noncrenulatos, nuculasque majoris (ca. 3 mm altas vice 2 mm) et griseas.

Perennial herbs 12–17 cm high, the stems seemingly recumbent and arising from woody roots which exude a violet-colored dye. Leaves basal at first, but soon developing 20 or more overlapping cauline leaves, these gradually reduced upwards and grading into the floral bracts; blades linear-lanceolate to lanceolate, essentially nonvenose, except for the midribs, the surfaces appressed-strigose, the undersurfaces having finer hairs, the upper surfaces with coarser hairs having attractive flattened basal cells 0.15–0.30 mm across. Inflorescence decidedly scorpioid, having numerous bracteate pale yellow flowers. Sepals 5, linear, mostly 7–9 mm long, moderately pubescent without, glabrous within, weakly glandular at the throat, markedly nodular-annulate at or near the base; lobes 5, ovate, 1.4–1.6 mm long, 1.0–1.2 mm wide. Anthers 5, dorsifixed, ca. 1.7 mm long, inserted in the throat but not exceeding the lobes. Styles ca. 11 mm long, glabrous, minutely bifid at apex. Nutlets 2–4, glossy-gray, not at all ornamented, ca. 2 mm high, 1.5 mm wide, basally attachment ca. 2 mm across.

The relationship of this taxon among Mexican species of *Lithospermum* is

Fig. 1. *Lithospermum hintoniorum*. Freshly dug garden-grown plants from material obtained at the type locality.

moot. Assuming the plants to be consistently homostylous with weakly developed faucal appendages, it will begrudgingly key to *L. calycosum* (Macbride) I.M. Johnst. in Johnston's (1952) treatment of *Lithospermum*, to which it is compared in the above diagnosis. It differs in having much larger, broader, leaves, noncrenulate corolla lobes, and larger (ca. 3 mm high vs 2 mm), glossy-gray nutlets.

It is a pleasure to name this species for the remarkable Hinton family, who first collected the taxon. When first sent to me for identification I recognized it as possibly new but lacked fruiting material for descriptive purposes. George Hinton (son of the living Jaime Hinton, and grandson of the legendary plant collector, George B. Hinton) kindly sent me mature seeds nine years after its initial collection, these obtained from garden grown plants collected at the type locality. I am grateful to him for such diligence.

ACKNOWLEDGMENTS

I am grateful to my wife Gayle Turner for the Latin diagnosis and to Diane M. Ferguson and James S. Miller for helpful comments.

Stanwyn G. Shetler and Sylvia Stone Orli. 2000. **Annotated Checklist of the Vascular Plants of the Washington - Baltimore Area. Part I: Ferns, Fern Allies, Gymnosperms, and Dicotyledons.** (no ISSN or ISBN). Department of Botany, National Museum of Natural History, Smithsonian Institution, Washington, DC 20560-0166, U.S.A. Price not given, 186 pp [duplicated], 1 figure, 8 1/2" × 11".

Stanwyn G. Shetler and Sylvia Stone Orli. 2000. **Annotated Checklist of the Vascular Plants of the Washington - Baltimore Area. Part II: Monocotyledons.** (no ISSN or ISBN). Department of Botany, National Museum of Natural History, Smithsonian Institution, Washington, DC 20560-0166, U.S.A. 95 pp [duplicated], 8 1/2" × 11".

The checklist in this pair of publications treats all native and naturalized species within the "Washington–Baltimore area," which represents a radius of about 50 miles from the Capitol in Washington, D.C. and includes the District of Columbia as well as 23 counties and 5 cities in Maryland and Virginia. "Species were accepted only on the basis of one or more voucher specimens in the D.C. Herbarium or a reliable published record" (the District of Columbia herbarium is a subunit of the US National Herbarium). As summarized in Part II, the documented D.C. flora now includes 1801 native species and 993 introduced species.

A related website (*http://www.nmnh.si.edu/botany/projects/dcflora/*) provides updates on the ongoing D.C. Flora Project and much other excellent information, including a bibliography, color photographs, spring-flowering records, links to useful sites related to the project, and a searchable Checklist database. The Checklist database returns full specimen data accessed by query to family, genus, species, collector, locality, state, or county. For example, an otherwise unrestricted query for Chenopodiaceae returned 148 records; a query for Asteraceae returned 7616 records; a query for Apiaceae in D.C. returned 183 records.—*Guy L. Nesom, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX, 76102-4060, U.S.A.*

A NEW SPECIES OF *SCHISTOCARPHA* (ASTERACEAE: HELIANTHEAE) FROM NORTHWESTERN OAXACA AND CLOSELY ADJACENT GUERRERO, MEXICO

B.L. Turner

Plant Resources Center
The University of Texas
Austin, TX 78713, U.S.A.

ABSTRACT

Schistocarpha calzadana B.L. Turner, sp. nov., is described from south-central Oaxaca (Mpio. Santiago Juxtlahuaca) and south-central Guerrero, Mexico. It is closely similar to *S. bicolor* but can be distinguished by a number of features including those of the leaf, size and congestion of the capitulescence, and number and size of ray florets. A re-evaluation of the Mexican taxa has resulted in the submergence of *S. longiligula* into *S. platyphylla*. A revised key to the Mexican species is provided, along with maps showing their distribution.

KEY WORDS: *Schistocarpha*, Asteraceae, Mexico, Guerrero, Oaxaca

RESUMEN

Se describe ***Schistocarpha calzadana*** B.L. Turner, sp. nov., del centro sur de Oaxaca (Mpio. Santiago Juxtlahuaca) y centro-sur de Guerrero, México. Es muy semejante a *S. bicolor* pero puede diferenciarse por varios caracteres de la hoja, tamaño y aglomeración de la capitulescencia, así como el número y tamaño de las lígulas. Una re-evaluación de los taxa mexicanos ha dado como resultado la inclusión de *S. longiligula* en *S. platyphylla*. Se ofrece una clave revisada par alas especies mexicanas, junto con mapas de su distribución.

Schistocarpha is a mostly Mexican genus of ten closely related species (sensu Turner 1986 and the present paper). These have been variously interpreted (e.g, Rydberg 1927; Robinson 1979; Turner 1996), the most recent appraisal of the Mexican taxa, albeit for the state of Chiapas, being that of Strother (1999). With the exception of *S. eupatorioides* (Fenzl) O. Kuntze and *S. pedicellata* Klatt, Strother placed most of the Mexican species recognized by previous workers under the fabric of *S. bicolor* Less. Because of Strother's treatment I have looked again at the Mexican taxa and have concluded that one can reasonably sink the widespread, highly variable *S. longiligula* Rydb. into the earlier *S. platyphylla* Greenm., but the remainder of Strother's dispositions under a widespread *S. bicolor* is moot. Indeed, having gone over this taxonomic landscape anew I would still recognize six species as occurring in Mexico, including *S. liebmannii* Klatt, *S. matudinae* H. Rob., and the newly described *S. calzadana*, proposed below.

Schistocarpha calzadana B.L. Turner, sp. nov. (**Figs. 1, 2**). TYPE: MEXICO. OAXACA: Mpio. Santiago Juxtlahuaca, 17 km al SW de Santa Rosa sobre la carretera a San Miguel Cuevas

FIG. 1. *Schistocarpha calzadana*; isotype (TEX).

Fig. 2. Distributions of Mexican species of *Schistocarpha*.

y Manzanares (17 13 31.9 N, 98 03 24.4 W), 2150 m, 28 Feb 1995, *J.L. Panero 5524* (con Ismael Calzada) (HOLOTYPE: MEXU; ISOTYPES: TEX, UC).

Similis *S. bicolori* sed petioliis foliorum non articulatis basi, capitulescentia congestiore cum capitulis numerosis, et flosculis radii cum ligulis 1.5–2.5 mm longis (vice 3–6 mm).

Perennial, suffruticose herbs 1.5–2.5 m high. **Stems** moderately to densely pilose, glabrate with age. Larger **leaves** 20–30 cm long, 14–16 cm wide; petioles 6–8 cm long, winged throughout but much tapered below into a distinct petiole; blades broadly subcordate, markedly serrate, their apices rounded or obtuse. **Primary capitulescences** 14–20 cm across, ca. 10 cm high; ultimate peduncles mostly 3–9 mm long, pubescent like the stems. **Involucres** 4–5 mm high and about as wide, having imbricate 3–4 seriate bracts, the inner bracts scarious with mostly rounded ciliate apices. Receptacle plane or somewhat convex, paleate, the pales shorter than the subtended florets. **Ray florets** ca. 13 in a single series; tubes ca. 3 mm long; ligules white, 1.5–2.5(–3.0) mm long, ca. 0.8 mm wide, 2–4 nervate. **Disk florets** 30–40; corollas ca. 4 mm long, tubes ca. 2 mm long, glabrous or nearly so, the lobes 5, ca. 0.5 mm long, hispidulous without. **Achenes** of ray and disk similar, ca. 1.5 mm long, glabrous; pappus of numerous white bristles 3–4 mm long.

Additional collections examined: **MEXICO. GUERRERO:** "Along road between El Paraiso and Puerto del Gallo, 6.0–8.7 mi NE of El Paraiso. Moist tropical evergreen forest," 3500 ft, 9 Mar 1987, *Daniel & Bartholomew 4936* (CAS, TEX). **OAXACA:** Mpio. Santiago Juxtlahuaca, Km 14 de San Miguel Cuavas a El Manzal, desviacion en Santa Rosa (17 13 N, 98 03 W), 2300 m, 18 Feb 1995, *Calzada 19761C* (MEXU, TEX); 0.4 km del poblado El Manzanal, carretera a Infiernillo (17 13 N, 98 03 W), 2185 m, 8 Mar 1996, *Calzada 20784* (MEXU, TEX).

In the account of *Schistocarpha* by Robinson (1979), the present taxon will key to *S. matudae*, a species of southern Chiapas. In my treatment of the genus (Turner 1986), it will key to or near *S. liebmannii*, to which I originally referred the collections from Guerrero. With the newly collected Oaxacan material in hand, it seems likely that the several sheets relate better to *S. bicolor*, the latter from the Gulf Coast sierras, the former from the Pacific sierras. *Schistocarpha calzadana* differs from its more eastern cohort in characters as noted above.

It should be noted that Strother's (1999) treatment of *Schistocarpha* for the Asteraceae of Chiapas would reduce nearly all of the Mexican taxa of that genus (other than *S. eupatorioides* and *S. pedicellata*) to but a single widespread *S. bicolor*, including the present novelty. His comments to justify such reduction, "I have seen intermediate specimens that link all of the named extremes." seem exceedingly strained to me, especially since his examination of a wide range of collections at LL-TEX resulted in no annotations to that effect. I had no great difficulty in placing 'segregate' species names on the holdings at CAS, LL-TEX, and UC, most of which served as the basis for Strother's remarks. I have, however, accepted the likelihood that *S. longiligula* and *S. platyphlla* are synonymous, the two being largely sympatric and separated by relatively trivial features (ligule length and floret number). I also freely admit that *S. matudae*, *S. liebmannii*, and *S. calzadana* might be swept under *S. platyphylla*, as interpreted here (the earliest name for the complex then being *S. liebmannii*), but such tidying should take place only after more detailed field studies of the populations concerned. Regardless, *S. bicolor* (with its markedly winged petioles) does not extend so far south in Mexico so as to include the state of Chiapas.

Etymology.—The species is named for J.T. Calzada, a Mexican botanist who was the second worker to garner the taxon and who participated in all subsequent collections.

I include below a revised key to the Mexican species of *Schistocarpha*, which includes the present novelty. Figures two and three show the distributions of these taxa. The revised key and up-to-date distribution maps should prove helpful to future workers interested in the group.

KEY TO MEXICAN TAXA OF *SCHISTOCARPHA*

1. Pistillate florets (21–)30 80 in 2–4 series _____ **S. eupatorioides** (Fig 2)
1. Pistillate florets (3–)5–21 in a single series.
   2. Petioles conspicuously winged throughout, often expanding at the base and extending across the node; northeastern Mexico _____ **S. bicolor** (Fig 2)

Fig. 3. Distributions of Mexican species of *Schistocarpha*.

2. Petioles not broadly winged throughout, nearly always tapering onto a distinct cylindrical petiole; western and southern Mexico.
   3. Capitulescence lax, containing 8–12 heads on ultimate peduncles 2–5 cm long at maturity _____ **S. pedicellata** (Fig. 4)
   3. Capitulescence strict, congested, containing 30 or more heads on ultimate peduncles mostly 1.5–2.0(–2.5) cm long or less.
      4. Stems glabrate or nearly so at maturity; lower surface of blade (except for veins) glabrous, the upper surface somewhat darker than lower; disk florets 10–12, their corollas sparsely pubescent; montane cloud forests of north central Oaxaca and adjacent Veracruz _____ **S. liebmannii** (Fig. 3)
      4. Plants without the above combination of characters and distribution.
         5. Ray florets 5–12; ligules mostly 4–8 mm long _____ **S. platyphylla** (Fig. 4)
         5. Ray florets 12–21; ligules mostly 1–4 mm long.
            6. Involucral bracts with acute apices; southern Chiapas _____ **S. matudae** (Fig. 3)
            6. Involucral bracts with rounded apices; western Guerrero and Oaxaca _____ **S. calzadana** (Fig. 2)

With the exception of *S. calzadana*, all of the above-keyed taxa are treated in more detail by Turner (1986).

Fig 4. Distributions of Mexican species of *Schistocarpha*.

ACKNOWLEDGMENTS

I am grateful to my wife, Gayle Turner, for the Latin diagnosis and to Jose Panero for calling my attention to the Oaxacan plants concerned. John Strother reviewed an early draft of the manuscript, improving considerably its terseness and readibility. The study is based upon materials from the following herbaria: CAS, LL-TEX, UC, as follows: *Schistocarpha bicolor* CAS (22); LL-TEX (39); UC (7). *Schistocarpha liebmannii* CAS (4); LL-TEX (10); UC (1). *Schistocarpha matudinae* CAS (4); LL-TEX (3); UC (0). *Schistocarpha pedicellata* CAS (9); LL-TEX (15); UC (1). *Schistocarpha platyphylla* CAS (68); LL-TEX (54); UC (8).

SENECIO SPRIBILLEI (ASTERACEAE: SENECIONEAE), A NEW SPECIES FROM MONTANA, U.S.A.

William A. Weber

University of Colorado Museum
Boulder, CO 80309, U.S.A.

ABSTRACT

Senecio spribillei W.A. Weber, a new, putatively narrow endemic species of Asteraceae, is described from a nunatak in the Rocky Mountains of northwestern Montana. It is distinguished from its nearest relative, *Senecio neowebsteri* Blake, by glabrous foliage, broader and shorter leaf laminae, wingless petioles, coarser marginal dentation, smaller, racemose capituli and minute ray flowers.

RESUMEN

Se describe ***Senecio spribillei*** W.A. Weber, una nueva especie endémica de Asteraceae, de un nunatak en las Montañas Rocosas del noroeste de Montana. Se diferencia de su pariente más próximo, *Senecio neowebsteri* Blake, por sus hojas glabras, lámina foliar más ancha y más corta, peciolos sin alas, dientes del margen con dientes más juntos, capítulos racemosos más pequeños y lígulas diminutas.

Senecio spribillei W.A. Weber, sp. nov. (**Fig. 1**). TYPE: U.S.A. MONTANA. Lincoln Co.: Cabinet Mountains, E face of Snowshoe Peak, ca. 150 m below the summit, N48°13'40" W115°40'40"; on sparsely vegetated alpine rock ledges, with *Dryas octopetala* and *Carex albonigra*, 2500 m alt., 25 Aug 2001, *Toby Spribille & M. Arvidson 11264* (HOLOTYPE: MO; ISOTYPE: COLO).

Herba perennis usque ad 2.0 dm alta, tota glabra, caudices brevi-ramosa, folia caulis juvenilis basalibus longepetiolatis 0.5 dm longis, folia basalibus caulis floriferis longepetiolatis 0.5 dm longis induviis, folia caulina 4–5, laminibus late triangulo ovatis vel subrotundis 3–4 × 2.5–3.0 cm longis et latis, truncatis vel ad basi brevissimo-cuneatis, grosse spinuloso-dentatis, petiolis non alatis, 4–5 cm longis, purpureis; capituli 4–6, nutantes, inferiore longe-pedunculata, involucris 8–10 mm altis, discis 5–7 mm diametris, phyllariis glabris lanceolatis obtusis late hyalinis, floribus radii paucis angustissimis.

Perennial from a well-developed, often branched caudex, up to 2 dm tall, totally glabrous; first year shoots 0.5 dm long, consisting of a few basal leaves on long petioles; flowering stem (second season) with withered basal leaves, cauline leaves with lamina broadly triangular-ovate to subrotund, 3.0–4.0 × 2.5–3.0 cm, truncate or very shortly cuneate at the base, coarsely spinulose-dentate, petioles scarcely winged, 4–5 cm long, purple; cauline leaves 4–5, similar to the basal leaves; heads 4–6, nodding, the lower on long, erect peduncles; involucre 8–10 mm high, the disk 5–7 mm diam, with a single row of phyllaries and a few minute basal bracteoles; phyllaries lance-oblong, obtuse or broadly acute, with broad hyaline margins, glabrous; ray flowers few, little exceeding the involucre, the lamina 7 × 2 mm, the veins 4–5, simple, the tube 4 mm long; disk flowers with limb 4 mm, tube 4 mm long; pappi 3 mm long; cypselae linear, strongly ribbed, 3 mm long.

FIG. 1. *Senecio spribillei,* holotype.

This new species is most closely allied with *S. neowebsteri* Blake (*S. websteri* Greenman, non Hook.), an endemic of the Olympic Mountains of Washington (Table 1). It appears to be a narrow endemic of northwestern Montana.

The ray flowers in the new species are so short and so narrow that the collector believed that the plant was rayless. The structural anatomy of the ray flowers differs from that of *Senecio neowebsteri*. In *S. spribillei* the nerves of the ray flowers are simple, unbranched; in *S. neowebsteri* each nerve is forked near the base, the branches continuing closely parallel distally. Baaghoe (1977, 1978) published on the taxonomic application of ligule micro-characters in the

TABLE 1. Comparison of *Senecio spribillei* and *Senecio neowebsteri*.

Senecio spribillei	Senecio neowebsteri
Foliage glabrous	Foliage initially floccose, then glabrate
Leaf lamina almost isodiametric, coarsely dentate, the base truncate	Leaf lamina usually longer than broad, variably dentate, the base cuneate
Petioles not winged	Petioles winged
Heads several, 6–8 mm tall, disk 5–7 mm diam	Heads solitary, 10–15 mm tall, disk 9–12 mm diam
Ligules of ray flowers 7–12 mm, hardly longer than the involucre	Ligules of ray flowers 25–30 × 3–5 mm, much longer than the involucre
Tubes of disk flowers 4 mm, limb 4 mm	Tubes of disk flowers 6 mm, limb 4 mm
Cypselae linear, strongly ribbed, 5 mm long	Cypselae linear. strongly ribbed, 3 mm long
Pappi white, 7 mm long	Pappi white, 3 mm long

Asteraceae but made no mention of venation or possible differences involving venation. Her work dealt with light and electron microscope observations, mostly on epidermal features. The existence of branched and non-branched nerves in *Senecio*, s. lat. deserves attention.

Distribution.—Known only from the type collection. According to the collector, the locality is likely a nunatak north of the southernmost limits of the Pleistocene ice sheets.

Etymology.—Senecio spribillei is dedicated to the young taxonomist and phytosociologist, Toby Spribille, with whom I have been associated for several years. His keen eye and ability to deal with the lichen and bryophyte as well as the phanerogamic flora, his knowledge of phytosociology, and his fine collections, marks him as an important figure in the recent history of the Rocky Mountain flora in Montana.

Book Notices

Charles M. Allen, Dawn Allen Newman, and Harry H. Winters. 2002. **Trees, Shrubs, and Woody Vines of Louisiana.** (ISBN 0-9718625-0-8, pbk). Allen's Native Ventures, LLC, 5070 Hwy 399, Pitkin, LA 70656, U.S.A. (Orders: 337-328-2252, native@camtel.net). Price not given, 333 pp, numerous b/w line drawings, 3 maps, 5 1/2" × 8 1/2".

This book provides information on 414 species that are native and naturalized and, in a number of cases, cultivated and persisting. The entries are listed alphabetically (by scientific name, sans author) by genus and species. A long paragraph on each of the species gives common names, name derivations, morphological features, and medicinal, economic, historical, and wildlife uses. The last sentence of each paragraph notes the distribution in Lousiana: e.g., "It is widely distributed throughout the state but more commonly in sandy soil (FAC) along the coast with reports from 18 parishes" (*Cissus trifoliata*); "In swamps, edges of lakes, ponds and other water bodies (OBL) with current reports from 46 parishes" (*Nyssa aquatica*); "Widely cultivated and escaping and forming dense thickets; this species is a serious pest in many parts of the state (FAC)" (*Ligustrum sinense*); "The current records, mostly from cultivated plants, include seven parishes" (*Photinia serratifolia*); "Planted throughout the state (FACU) as an ornamental with some recent interest in its wood. The current records include 14 parishes" (*Paulownia tomentosa*). Apart from the enumeration of which woody species occur in the state and their reproductive status, perhaps the most useful feature of the book is the line drawing for each species, drawn from a range of previously published sources. Identification keys are not provided but 8 'tables' in the introductory material list genera with distinctive characters such as strong odor, compound leaves, opposite or whorled leaves, etc. This compilation will serve good use as a reference in company with an identification manual and range maps.—*Guy L. Nesom, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX, 76102-4060, U.S.A.*

John Graves, Photos by Wyman Meinzer. 2002. **Texas Rivers.** ISBN 1-885696-38-8, hbk.) University of Texas Press, P.O. Box 7819, Austin, TX 78713-7819, U.S.A. (Orders 800252-3206 512-471-4032, 800-687-6046 fax)) $39.95, 144 pp.80 color photos, 11" × 11".

If *Texas Rivers* were only a picture book it would be an outstanding work. The photographs by Wyman Meinzer are breathtakingly beautiful. Panoramas and close-ups alike are full of radiant color and telling detail. Each captures the essence of the particular area through which the river flows.

The text by John Graves is also complete in itself, a testament to the beauty and diversity and total utility of Texas rivers. He touches on all aspects of riverine territories from their archeology, botany, climate, economy through the alphabet of scientific studies to zoology. It is as if one is taking a leisurely walking tour along the river with a very knowledgeable friend with time to stop to appreciate the great and small wonders of this multifarious land.

Together these two artists have created a very beautiful book, a welcome addition to an library.—*Ruth Ginsburg, Fort Worth, Texas.*

EUCHITON (ASTERACEAE: GNAPHALIEAE) IN NORTH AMERICA AND HAWAII

Guy L. Nesom

Botanical Research Institute of Texas
509 Pecan Street
Fort Worth, TX 76102-4060, U.S.A.

ABSTRACT

Euchiton is treated apart from *Gnaphalium* primarily on the basis of its tendency for stolon production and cypselar surfaces with paired, non-mucilaginous epidermal papillae. Three species of *Euchiton* are recorded in North America: *E. sphaericus* (naturalized in California and Oregon), *E. gymnocephalus* (naturalized in California and Oregon), and *E. involucratus* (apparent waif in California and Massachusetts, the first published report of this species in North America). The first two species also are naturalized in Hawaii. A nomenclatural and ecological summary is presented for each species and a key clarifies their identifications, which have been confused in North America.

RESUMEN

Euchiton Se trata como diferente de *Gnaphalium* primariamente en base a su tendencia a la producción de estolones y superficie de las cipselas con papilas epidérmicas pareadas y no mucilaginosas. Se han citado tres especies de *Euchiton* en Norte América: *E. sphaericus* (naturalizada en California y Oregón), *E. gymnocephalus* (naturalizada en California y Oregón), y *E. involucratus* (aparentemente abandonada en California y Massachusetts, es la primera cita de esta especie en Norte América). Las dos primeras especies están también naturalizadas en Hawaii. Se presenta un resumen nomenclatural y ecológico de cada especie y una clave clarifica sus identificaciones, que han sido confusas en Norte América.

Euchiton is treated apart from *Gnaphalium* primarily on the basis of its tendency for stolon production and cypselar surfaces with paired, non-mucilaginous epidermal papillae (Anderberg 1991). The plants are mostly perennial and produce heads in terminal, capitate clusters immediately subtended by a whorl of leafy bracts. The distinctiveness of the group was emphasized by Drury (1972) and Holub (1974); nomenclatural transfers to *Euchiton* were made by Holub (1974) and completed by Anderberg (1991) and Ward and Breitwieser (1998). The species number about 22 (Drury 1972; Anderberg 1991), including recent additions (Buchanan 1999, Walsh 1999) or 20–30 (Walsh 1993). They are native to Australia and New Zealand and probably to New Guinea and eastern Asia; some species have weedy tendencies and have become widely naturalized.

The following synopsis of *Euchiton* in North America and Hawaii is based on surveys of collections at ARIZ, BRIT-SMU, CAS-DS, GH, HSC, MO, NCU, TEX-LL, UC-JEPS, and WIS.

Euchiton Cass. in F. Cuvier, Dict. Sci. Nat. ed. 2, 56:214. 1828. TYPE SPECIES: *Euchiton pulchellus* Cass.

= *Euchiton involucratus* (G. Forster) Holub

SIDA 20(2): 515 – 521. 2002

Plants perennial or (less commonly) annual, herbaceous, stoloniferous in most species (taprooted in 1), white-tomentose, eglandular. **Leaves** basal and cauline, sometimes in a rosette, lanceolate to linear, entire, sessile or petiolate, bicolored, usually with a close tomentum at least on the abaxial surfaces. **Capitulescences**: heads usually in a terminal cluster subtended by a whorl of leafy bracts, sometimes with axillary clusters below. **Capitula** narrowly campanulate to short-cylindric; phyllaries chartaceous, transparent, inner with larger stereomes. **Pistillate florets** fertile, more numerous than the bisexual florets, corollas purple or purple-tipped. **Bisexual florets** fertile, corollas purple or purple-tipped. **Cypselae** oblong, 0.6–1.5 mm, epidermis minutely papillate (the papillae imbricate and paired, nonmyxogenic); pappus of caducous, separate or weakly basally connate bristles separating in groups. Base chromosome number, $x = 14$.

1. Annual, taprooted; leaves not at all clasping or sheathing; capitula in a globose cluster; bisexual florets 1 per capitulum; capitulescence bracts 4–8. _____ **Euchiton sphaericus**
1. Perennial or biennial, fibrous-rooted; leaves subclasping or sheathing; capitula in a hemispheric cluster; bisexual florets 3–7 per capitulum; capitulescence bracts 2–5.
   2. Stolons commonly present, plants forming colonies; basal leaves present in a rosette at flowering; cauline leaves 2–4(–6), linear to oblanceolate, 0.5–3(–4) cm long, 1–3 mm wide; pistillate florets 40–60; capitulescence bracts 2–3, not exceeding the capitulescence or only slightly so. _____ **Euchiton gymnocephalus**
   2. Stolons usually absent, plants not evidently colonial; basal leaves usually withered or absent at flowering; cauline leaves 6–10, mostly linear, 3–8 cm long, 2–3 mm wide; pistillate florets 80–150; capitulescence bracts 3–5, distinctly longer than the capitulescence. _____ **Euchiton involucratus**

1. Euchiton gymnocephalus (DC.) Holub, Folia Geobot. & Phytotax. 9:271. 1974 [non (DC.) A. Anderberg 1991]. *Gnaphalium gymnocephalum* DC., Prodr. 6:235. 1838. TYPE: AUSTRALIA.

Gnaphalium collinum Labill., Nov. Holl. Pl. 2:44, t. 189. 1806. *Gnaphalium japonicum* var. *collinum* (Labill.) Maiden & Betche, Census New South Wales Pl. 204. 1916. TYPE: AUSTRALIA.

Flowering (late March–)May–October(–November). Grassy hills, margins and openings in woods, roadsides, cutover areas; ca. 100–2500 ft (30–750 m); California and Oregon, Hawaii. Apparently native to Australia and New Zealand. Recorded in Australia as "common and widespread, particularly in cooler parts ..., often colonizing bare ground, stream and track margins etc." (Walsh 1993, p. 823) and "woodland areas near Canberra and also extending to upper slopes of mountains; widespread in many parts of Australia and Tasmania" (Burbidge & Gray 1970). In New Zealand, it occurs in a wide variety of habitats but is "typically associated with forest and scrub communities between sea level and 1,000 (–2,000) ft" (Drury 1972, p. 144).

A handwritten note by J.P. Tracy on the JEPS sheet of *Tracy 14110* notes the following: "My record of this plant [*Euchiton gymnocephalus*, presumably in Humboldt County] extends back to 1900 when it was already well estab." Cita-

tions below indicate that Tracy collected the species repeatedly in Humboldt County from 1904 through 1946 and collections between 1960 and 1989 have continued to document its occurrence in counties of northeastern California and southeastern Oregon.

Collections examined. **UNITED STATES. California. Del Norte Co.:** 3 mi S of Klamath River, grassy hills near coast, 300 ft, 12 May 1929, *Tracy 8588* (CAS, UC). **Humboldt Co.:** near Azalea Reserve State Park, cool woods in partial shade, 100 ft, 15 Jul 1960, *Adams s.n.* (HSC); along Mad River ca. 2 mi S of Blue Lake, 28 Jun 1971, *Anderson* and *Smith J-1230* (HSC); 8 mi W of Berry Summit along US 299, 2500 ft, roadcut on serpentine soil, 15 May 1965, *Bos 254* (HSC); Lord Ellis road near Shingle Mill, 28 Mar 1926, *Kildale 1670* (DS); Lord Ellis road near Blue Lake, 25 Nov 1926, *Kildale 2830* (DS); Trinidad, Camp Twenty One, 600 ft, 30 Jul 1932, *Parks and Tracy 1133* (UC); above dirt road from old 101 to the top of the N bank of the Mad River, grassy hillside in half shade, 22 Jul 1967, *Stevens 61* (HSC); Garberville Quad., old skid road, shady edge of redwood forest and mixed evergreen forest, 850 ft, moss-covered rocky subsoil, 13 Aug 1976, *Sutherland 9.13.8.76* (HSC); Shubrick Peak Quad., Kinsey Ridge above Oat Creek, logged doug fir forest, 24 Apr 1978, *Sutherland 6.24.4.78* (HSC); immediate vicinity of Eureka, small patches in open places in woods, 0–500 ft, 31 Jul 1904, *Tracy 2134* (CAS, DS, GH, UC); Boynton Prairie road, near Carroll place, 1000 ft, 23 Jun 1918, *Tracy 4958* (NCU, UC); near Blue Lake, in woods, spreading by stolons and forming patches, 1000 ft, 1 Apr 1923, *Tracy 6175* (JEPS, UC); near Boynton Prairie, in recently logged area, among "fireweeds," 2000 ft, 28 Aug 1927, *Tracy 8358* (UC); Trinidad, logged-off lands, spreading in mats, 10–200 ft, 13 Aug 1932, *Tracy 10349* (ARIZ, CAS, UC); near Blue Lake, roadside in open woods on Trinity Hwy, spreading and forming mats, 900 ft, 20 Jul 1935, *Tracy 14110* (CAS, JEPS, UC-2 sheets); 4 mi SE of Korbel, near "Angels Ranch," local in grassy moist places, 1000 ft, 22 Mar 1936, *Tracy 14784* (CAS, DS, JEPS, UC-2 sheets); Fickle Hill, 6 mi SE of Arcata, in recently cleared land, 2000 ft, 17 May 1936, *Tracy 14811* (UC); 2 mi NE of Orick, on Bald Hills road, local by roadside, 500 ft, 29 May 1936, *Tracy 14829* (CAS, DS, GH, JEPS, UC); hillsides near Canyon Creek, 6 mi SE of Blue Lake, in logged-over land, 1200 ft, 1 Aug 1936, *Tracy 15058* (UC); Carlotta, in recently logged area, with [*Gamochaeta ustulata*] and [*Euchiton sphaericus*], 100 ft, 23 Aug 1936, *Tracy 15164* (UC); Fickle Hill, 6 mi SE of Arcata, in country recently logged, 2000 ft, 24 Aug 1936, *Tracy 15175* (UC); vicinity of Carlotta, in recently cleared land, ca. 100 ft, 15 Jun 1938, *Tracy 15936* (UC); "Riverside Park" near old Strong's Station District School House (burned down), 30 May 1946, *Tracy 17548* (UC); Kneeland Prairie, Dan McBride's place (SE end of Kneeland), local, in partial shade of open fir woods, 2500 ft, 23 Jun 1946, *Tracy 17596* (UC). **Mendocino Co.:** 15 air mi SW of Garberville, 60 air mi SSE of Eureka, 1/4 mi E of Bear Harbor on Lost Coast Trail, edge of trail bed, California bay riparian forest, 120 ft, 8 Jul 1989, *Bowcutt 1369* (HSC); 3.2 km N of jct with Rte 1, along Usal Rd, openings in second growth redwoods, 305 m, 11 Jun 1981, *Smith 6632* (CAS, HSC). **Siskyou Co.:** Forest Service Road 17NO4, Doe Flat, T17N, R4E, Sec. 35, [no date], *Van Deventer s.n.* (HSC). **HAWAII.** Hawaii, Upper Waiakea Forest Reserve, along Disappointment Trail (Pu'u Maka'ala access rd.) of Stainback Hwy., in *Metrosideros* rainforest, ca. 1100 m, 26 Jul 1983, *Wagner et al. 4842* (US). **OREGON. Curry Co.:** on old segment of Hwy 101 that leads as a dead-end from Harris Beach State Park, just N of Brookings, 10 Jun 1964, *Chambers 2241* (DS, NCU); Brookings, 100 ft, 1 Aug 1937, *Tracy 15606* (UC); moist slope 5 mi N of Brookings, 7 Jul 1939, *Peck 20445* (CAS, UC). **Klamath Co.:** Winema National Forest, Cold Springs Road and State Route 140, T36S R6E, Sec. 18, 14 Oct 1978, *Sawyer 3320* (HSC).

Wagner et al. (1997) recorded *Euchiton gymnocephalus*, identified as *E. japonicus* (Thunb.) Holub, as a new state record for Hawaii. In Australia it was identified as *Gnaphalium japonicum* Thunb. by Burbidge and Gray (1970), but the synonymy of *G. japonicum* with *G. gymnocephalum* was later rejected without specific comment by Cooke (1986) and Walsh (1993). In the present review, plants

from Japan and China appear to be consistently distinct from related ones of Australia and New Zealand, although differences are subtle, and until someone may provide a more detailed study of the complex, the morphological affinity of the North American plants with those of Australia is reinforced by the nomenclature. Differences between the two taxa are outlined in the following couplet.

Basal leaves usually narrowly oblanceolate, attenuate to a distinct petiolar portion, the cauline abruptly differentiated in size and shape from the basal, smaller and linear-lanceolate to linear-oblanceolate; adaxial leaf surfaces quickly glabrescent and shiny-green; stereome thickened and opaque, distinctly narrowed apically and separated from the lamina by a short, completely translucent portion; cypselae ca. 0.7 mm long. ____ **Euchiton gymnocephalus**

Basal and cauline leaves linear lanceolate to linear oblong, without a distinct petiolar portion, the lower cauline slightly reduced in size but similar in shape to the basal; adaxial leaf surfaces persistently arachnoid, appearing dull; stereome thin-translucent, not evidently narrowed apically, more or less directly connected to the lamina; cypselae ca. 1.0 mm long. ____ **Euchiton japonicus**

Plants from Japan, China, and Taiwan (specimens examined), and probably from Ryukyus and Korea are typical *E. japonicus* (see citation below). Collections referable to *E. japonicus* or *E. gymnocephalus* from New Guinea, New Caledonia, and Java need to be studied in order to assess their relationship. Reports of *E. japonicus* from the Philippines evidently refer, at least in part, to *Gnaphalium oblanceolatum* Elmer, which apparently is more closely related to *E. involucratus* (but probably not conspecific with it) than to *E. japonicus*.

Euchiton japonicus (Thunb.) Holub, Folia Geobot. & Phytotax. 9:271. 1974 [non (Thunb.) Anderb. 1991]. *Gnaphalium japonicum* Thunb., Fl. Jap. 311. 1784. TYPE: JAPAN ("prope urbem Nagasaki").

2. Euchiton involucratus (G. Forster) Holub, Folia Geobot. & Phytotax. 9:271. 1974 (non A. Anderberg 1991). *Gnaphalium involucratum* G. Forster, Fl. Ins. Austr., 55. 1786. TYPE: NEW ZEALAND

Flowering July–October. Grassy open places, often moist or wet; ca. 50–600 m; California and Massachusetts. Native to Australia and New Zealand; collections also observed (present study) from New Guinea, New Caledonia, Java, and Taiwan. The species in Australia is recorded as a "weed of gardens and disturbed ground" (Burbidge & Gray 1970); it also is common "particularly in swampy sites, from near sea-level to the higher alps where usually in *Sphagnum* bogs" (Walsh 1993).

Both of the North American collections cited below probably represent waifs, because this species apparently has not been subsequently recorded in floristic summaries from anywhere in the USA. This apparently is the first published report of *E. involucratus* from North America.

Collections examined. **UNITED STATES. California. Humboldt Co.:** S end of Fickle Hill, 6 mi SE of Arcata, ca. 2000 ft, moist ground, among rushes and sedges, spreading by rootstocks, perennial, 26

Sep 1948, *Tracy 18232* (ARIZ, NCU, UC-2 sheets, WIS). **Massachusetts. Hampshire Co.:** Northampton, weed in garden, Sep 1900, *Mrs. E.H. Terry s.n.* (GH).

3. Euchiton sphaericus (Willd.) Holub, Folia Geobot. & Phytotax. 9:271. 1974 (non A. Anderberg 1991). *Gnaphalium sphaericum* Willd., Enum. Hort. Berol. 2:868. 1809. TYPE: AUSTRALIA.

Gnaphalium involucratum G. Forster var. *simplex* DC., Prodr. 6:236. 1838. Based on *G. sphaericum*.
Gnaphalium involucratum G. Forster var. *ramosum* DC., Prodr. 6:236. 1838. TYPE: AUSTRALIA.
Gnaphalium morii Hayata, Ic. Pl. Formos. 8:58. 1919. TYPE: Taiwan ("Formosa").
?Leontopodium japonicum (Thunb.) H. Lév. var. *sandwicense* H. Lév., Fedde Repert. 10:121. 1911. TYPE: HAWAII.
Gnaphalium japonicum sensu various authors, non Thunberg 1784.

Flowering (late June, *Tracy 15974*; July–)August–October. Grassy open places in wooded areas, recent clearings and clearcuts, disturbed soil, especially along roadsides; ca. 100–2000 ft [30–600 m]; California and Oregon, Hawaii (Molokai, Lanai, Maui, and Hawaii, fide Wagner et al. 1999). "Reported from San Joaquin County," California (Ferris 1960; voucher not seen in present study). Native to Australia and New Zealand; also documented from New Guinea, New Caledonia, Java, Philippines, Japan, and Taiwan (Drury 1972). In Australia recorded as "a very common and widespread species, occurring on a wide variety of substrates, e.g., mallee and coastal sands, clayey floodplain area, and often colonizing disturbed ground" (Walsh 1993).

Euchiton sphaericus has long been identified in California, apparently beginning with Howell (1937), as *Gnaphalium japonicum*; it recently was correctly identified by Wagner et al. (1997) and by Peter W. Michael (annotations on specimens at GH). Correct nomenclature was earlier provided by Drury (1972). *Euchiton sphaericus* was established in California at least by 1915, when apparently first collected there. J.P. Tracy collected it repeatedly from that year through 1949; from one locality (*Tracy 14752*) he noted that it was "scarce now, abundant 15 years ago." Tracy also observed (fide label of *Tracy 5097*) that the species was "probably introduced in grass seed sown on logged-over country." Relatively recent collections (1954, 1977, 1992) confirm its persistence in northwestern California.

Euchiton sphaericus was collected in Hawaii, perhaps for the first time, in 1909 (on Maui, *Faurie 928*–BISH, as noted by Wagner et al. 1999). Rock (1914, p. 352) noted that in Hawaii *E. sphaericus* was among several species "imported accidentally during the last 10 or 20 years, by the cattle estates with grass seeds."

Collections examined. **UNITED STATES. California. Del Norte Co.:** Sutton Creek, 2 mi E of the Van Deventer Ranch and 2.5 mi air-line E of Fort Dick, 350 ft, 15 Oct 1954, *Van Deventer 412* (UC). **Humboldt Co.:** Eel River, 16 mi N of Garberville, 29 Aug 1936, *Howell 12888* (GH, LL, WIS); logged redwood flat, 2 mi E of Carlotta, 15 Aug 1936, *Jepson 17,898* (JEPS); mouth of Laribee Creek, common as a weed but local, 200 ft, 12 Sep 1915, *Tracy 4677* (CAS, MO, UC); around Humboldt Bay, Newells Camp on old Kneeland Prairie road, probably introduced in grass seed sown on logged over country, 1500 ft, 1 Sep 1918, *Tracy 5097* (NCU, UC-2 sheets); South Fork of Eel River, 4 mi above the mouth, common road-

side weed, 200 ft, 29 Sep 1918, *Tracy 5103* (TEX, UC); at Eureka, introduced along old road in stump land, 0–200 ft, 6 Oct 1918, *Tracy 5118* (UC); North Fork of Mad River, along newly constructed road, evidently introduced and not yet common there, 1000 ft, 19 Sep 1920, *Tracy 5399* (UC); South Fork of Eel River, near Miranda, 300 ft, 9 Aug 1925, *Tracy 7229* (UC); along Lord-Ellis Road, headwaters of North Fork of Mad River, scarce, 2000 ft, 8 Aug 1931, *Tracy 9608* (UC); near Dyerville, roadside weed, scarce now, abundant 15 years ago, 300 ft, Sep 1935, *Tracy 14752* (UC), Carlotta, locally abundant as a "fireweed" in recently cleared land, 100 ft, 23 Aug 1936, *Tracy 15162* (GH, HSC-2 sheets, MO, TEX, UC-3 sheets, WIS); Fickle Hill, 6 mi SE of Arcata, restricted to land recently cleared and soil disturbed, 2000 ft, 24 Aug 1936, *Tracy 15176* (GH, JEPS, UC); Trinity River Valley, at Willow Creek, weed in garden, not common, 500 ft, 20 Jun 1938, *Tracy 15974* (UC); Trinity River Valley, along new road to Hors Linto Creek, disturbed soil, 800 ft, 4 Sep 1938, *Tracy 16142* (UC); Trinity River Valley, near Raccoon Creek, moist ground disturbed by road work, 500 ft, 11 Aug 1940, *Tracy 16694* (JEPS, LL-2 sheets, UC); Valley of South Yager Creek, recently logged land as a 'fireweed' on the Redwood House Road at old mill site, 1 mi N of Redwood House, 1500 ft, 26 Jul 1942, *Tracy 17299* (UC); Park's place, 10–200 ft, 28 Sep 1947, *Tracy 17933* (UC); Fickle Hill, 6 mi SE of Arcata, recently logged area, scarce, ca. 2000 ft, 26 Sep 1948, *Tracy 18230* (UC); Van Duzen River, near Grizzly Creek, frequent in disturbed soil of recent logging operations, 300 ft, 16 Oct 1949, *Tracy 18591* (UC, WIS); Aikens Campground, T10N R5E, Sec. 30, mixed evergreen forest, 1 Jul 1977, *Sawyer 2990* (HSC). **Lake Co.:** road to Bartlett Mountain, Aug 1930, *Mason 5732* (UC). **Mendocino Co.:** 10 air mi W of Leggett, along and in dirt roadbed of Hotel Gulch Road 5.3 road mi from Usal, S-facing slope, coast redwood/douglas fir forest logged about 15–20 years ago, 21 Jul 1992, *Bowcutt 1571* (HSC), Mendocino Woodlands, 10 Jul 1938, *Eastwood and Howell 6238* (UC). **Trinity Co.:** Sharber Slough on the Trinity River, 3 mi E of the South Fork, along trail, sparsely introduced in moist ground, 6 Sep 1926, *Tracy 7783* (CAS, UC). **HAWAII. Hawaii:** Hawaii National Park, Kilauea Crater, on dry lava, 18 Jul 1931, *van Löben Sels 595* (UC); Waimea Mts., Jun 1910, *Rock 8433* (GH); Hawaii National Park, weed on xeric cinder flats in Kau Desert near Halemaumau, 3600 ft, 18 Jun 1948, *Webster* and *Wilbur 1793* (TEX). **Lanai:** Mts., E end, Jun 1913, *Forbes 276.2* (UC). **Maui:** Koolau Gap, Haleakala, volcanic cinders, 10 Aug 1927, *Degener 18451* (GH); Haleakala, 16 Aug 1927, *Degener 18450* (GH); Olinda, Pipe-Line Trail, 30 Jul 1927, *Topping s.n.* (GH); Haleakala, Aug 1909, *Faurie 928* (BISH, as cited by Rock 1914 and Wagner et al. 1999; not seen). **OREGON. Curry Co.:** dry ground along Chetco River, 3 mi above Harbor, 20 Jul 1919, *Peck 8924* (GH).

ACKNOWLEDGMENTS

I am grateful to the staffs at GH, MO, NCU, and TEX-LL for help during recent visits to those institutions. Loans were studied from ARIZ, CAS, DS, HSC, JEPS, UC, and WIS. Comments by John Strother contributed to the consistency and clarity of presentation.

Book Notice

Dennis Blagg. 2002. **Big Bend Landscapes**. (ISBN 1-58544-202-X, hbk.). Texas A&M University Press. John H. Lindsey Building, Lewis Street, 4354 TAMU, College Station, TX 77843-4354, U.S.A. (Orders: www.tamu.edu/upress, 979-458-3982, 800-826-8911, 979-847-8752 fax). $40.00, 160 pp, 50 color paintings, 15 b/w drawings, 12 1/4" × 9 3/4".

Ron Tyler's introduction to *Big Bend Landscapes* is a succinct history of the region from Indian times to the creation of a public park in a portion of this great wilderness. He also traces the rise of the Romantic movement and the enthusiasm for landscape painting as a result of the awe-inspiring expanses and mountains of the West. The Big Bend country is certainly a manifestation of the 'untarnished handwork of the Creator'.

This essay is a fitting preface to the fifty paintings and nineteen drawings which are reproduced here in beautiful color. The diversity of the country, the effect of light, and the astonishing formations of rocks and clouds are very well portrayed. In the vast panoramic views, the details are astonishing. The short explanations which accompany each picture are interesting and add a personal note. But the paintings speak for themselves. They convey a spirituality and a passion for nature. The artist is a worthy successor of such giants of American landscape painting as Cole, Durand, Church, Kensett, and Bierstadt.—*Ruth Ginsburg, Fort Worth, Texas.*

Wilfrid Blunt with an introduction by William T. Stern. 2001. **Linnaeus. The Compleat Naturalist.** (ISBN 0-691-09636-8, hbk.). Princeton University Press, 41 William Street, Princeton, NJ 08540, U.S.A. (Orders: California Princeton Fulfillment Services, 1445 Lower Ferry Road, Ewing, NJ 08618, U.S.A., 609-883-1759, 609-883-7413 fax, www.pup.princeton.edu). $35.00, 264 pp., color photos, b/w photos, line drawings, maps, 7 5/8" × 9 7/8".

What a beautiful book and what a wonderful way to remember William T. Stearn (1911–2001). The book, originally titled *The Compleat Naturalist: A Life of Linnaeus*, is published in his memory. The following description of the book is an extract from the dust jacket. "This book gives a fascinating and rounded portrait of Linnaeus the man, charting his rise from a poor student at Lund University to Professor of Medicine at Uppsala and a founder of the Royal Academy of Sciences. Wilfrid Blunt's engaging text is interspersed with vivid passages from his subject's own writings—from riveting descriptions of adventures in the wilds of Lapland to a charming account of Sjupp the raccoon. Linnaeus's family life and his relations with pupils are explored alongside his epoch-making scientific achievements. William Stearn's appendix on Linnaean classification provides a concise survey of the basics necessary for understanding Linnaeus's work."

NEW COMBINATION IN *SALIX* (SALICACEAE)

Guy L. Nesom

Botanical Research Institute of Texas
509 Pecan Street
Fort Worth, TX 76102-4060, U.S.A.

Dorn (1998; following Cronquist 1964) has treated *Salix interior* Rowlee at infraspecific rank within *S. exigua* Nutt., observing that a broad region of morphological intergradation exists between the two where their ranges are in contact (see Dorn's Fig. 2, p. 200). This observation is confirmed in field studies relating to a floristic inventory of Lake Meredith National Recreation Area in Hutchinson, Moore, and Potter counties of the north-central Texas panhandle (Nesom & O'Kennon in progress). In this area many populations exist of *S. interior* sensu stricto (colonial shrubs with completely glabrous, linear-lanceolate leaves with widely spaced and elongate teeth) as well as *S. exigua* (similar to *S. interior* but with densely silky-sericeous lower leaf surfaces). Also common are populations with foliar vestiture in varying degrees of intermediacy (e.g., *Nesom & O'Kennon LM359, LM198* – BRIT). *Salix nigra* Marsh and *S. amygdaloides* Anderss. also commonly occur in the area, apparently without intergrades.

Argus (1986) treated *Salix exigua* as including *S. interior* without formal rank, but he noted (p. 91) that the "eastern phase (*S. interior*) differs from the western phase (*S. exigua*) in having leaves less densely sericeous, more distinctly toothed, and more veiny." In my observation (based on BRIT and VDB collections), variability in vestiture is greater in the western phase than in the eastern phase, where the green-glabrous leaves are consistently evident. Sericeous undersurfaces are characteristic of the western phase.

Dorn recognized three varieties within *Salix exigua* subsp. *exigua* but treated *S. interior* only at subspecific rank: *S. exigua* subsp. *interior* (Rowlee) Cronquist. The following combination provides consistent nomenclatural recognition of all infraspecific taxa, following ICBN Article 4.1: "The secondary ranks of taxa in descending sequence are tribe (tribus) between family and genus, section (sectio) and series (series) between genus and species, and variety (varietas) and form (forma) below species" (see commentary in Turner & Nesom, Sida 19:257–262. 2000).

Salix exigua var. **sericans** (Nees) Nesom, comb. nov. BASIONYM: *Salix longifolia* var. *sericans* Nees in Wied-Neuw., Reise Nord-America 2:448. 1841. TYPE: not seen.

This is the oldest available name at varietal rank for plants identified as *Salix interior*. As noted by Dorn (1994, p. 92), the type locality apparently is "in or near the present Cass Co., Nebraska" (eastern Nebraska, well within the range of typical *S. interior* and east of the area of its co-occurrence with *S. exigua* var.

SIDA 20(2): 523 – 524. 2002

exigua, although the epithet implies that the leaves probably were not completely glabrous.

ABSTRACT

The most common weedy *Echinochloa* species in Europe—*E. colona* (L.) Link, *E. crus-galli* (L.) Beauv., *E. hispidula* (Retz.) Nees ex Royle, *E. oryzoides* (Arduino) Fritsch, *E. oryzicola* (Vasing.) Vasing. are for the first time analyzed regarding the micromorphology of lemma and caryopsis, the anatomy of the caryopsis and the size of the starch grains. New potentially valuable characters are the size of the caryopsis, the pattern of surface variation of the caryopsis coat, and the size of the starch grains. A cautionary approach is suggested towards the taxonomic utility of the silica bodies shape. Based on the new characters, the relationships between the species are analyzed. Some nomenclatural issues involving *E. oryzicola*, *E. oryzoides*, and *E. hispidula* are also discussed. For the first time, *E. colona* is recorded from Romania.

RESUMEN

Las especies más comunes de *Echinochloa* en Europa que son *E. colona* (L.) Link, *E. crus-galli* (L.) Beauv, *E. hispidula* (Retz.) Nees ex Royle, *E. oryzoides* (Arduino), Fritsch, *E. oryzicola* (Vasing.) Vasing. han sido analizadas por primera vez mediante micromorfología del lemma y del cariópside, la anatomía del cariópside y por el tamaño de los granos de almidón. Los nuevos caracteres que se pueden considerar de gran valor son el tamaño del cariópside, la variación en el patrón de la superficie de la cubierta del cariópside y el tamaño de los granos de almidón. No se sugiere como herramienta taxonómica la forma de los cuerpos silíceos. Basándose en los nuevos caracteres, se analiza la relación entre las especies. Algunos tópicos de nomenclatura que involucran a *E. oryzicola*, *E. oryzoides* y *E. hispidula* son también discutidos. Por primera vez *E. colona* se cita de Rumania.

INTRODUCTION

Echinochloa is an economically important genus because many of its species are noxious weeds. In Europe, *E. hispidula*, *E. oryzoides* and *E. oryzicola* are most often found as weeds in rice fields while *E. crus-galli* and *E. colona* although present in rice fields, are more often encountered in irrigated fields and amongst vegetable crops (Kossenko 1947; Vasconcellos 1954; Pirola 1965; Chirilă 1984; Tzvelev 1976; Häflinger & Scholz 1980; Carretero 1981; Mosyakin 1996; Ciocarlan 2000). The taxonomy of the genus is controversial due to nomenclatural prob-

[1]Corresponding author

lems and the continuous morphological variation exhibited by the taxa. For the practical purpose of plant identification, the species often lack conspicuous identification characters. Previous treatments and taxonomic studies are often contradictory and, consequently, the limits of the taxa are uncertain and specimens in herbaria are often misidentified. Other important taxonomic treatments of the genus (or part of the genus) are those of Stapf (1899, 1934), Hitchcock (1920), Wiegand (1921), Kossenko (1947), Ohwi (1942, 1962), Martinez Crovetto (1942), Vasconcellos (1954), Bor (1960), Pirola (1965), Chirilă (1967, 1984), Yabuno (1962, 1981), Ali (1968), Gould et al. (1972), Tzvelev (1976), Häflinger & Scholz (1980), Clayton (1980), Carretero (1981), Michael (1983) and Brussoni (1994). A general characterization of the genus can be found in Watson and Dallwitz (1992–onwards). Carretero (1981) provided a summary of the morphologic characters for European weedy species of the genus *Echinochloa*.

The identification of new characters useful in determining taxonomic boundaries have shed light on our understanding of difficult groups such as grasses. The study of lemma micromorphology can provide characters valuable in elucidating the delimitation of taxa, and these characters may reflect systematic relationships. Micromorphological features of glumes and bracts (lemma and palea) have been studied in other genera from *Poaceae* by: Bjorkman (1960), Hsu (1965), Baum (1971), Lucas (1979), Clark and Gould (1975), Thomason (1978a; 1978b, 1980, 1981, 1986), Shaw and Smeins (1979), Terrel and Wergin (1981), Terrel et al. (1983), Webster and Hatch (1983), Barkworth (1983), Peterson (1989), Soderstrom and Zuloaga (1989), Kellogg (1990), Zuloaga and Judziewicz (1991), Valdes-Reyna and Hatch (1991), Molina (1993), Naredo et al. (1993), Ball et al. (1993, 1999) and Snow (1996, 1998).

Caryopsis morphology has received a lot of attention since the beginning of the century; however, most studies have focused on the general morphology and the structure of the embryo. There is comparatively less information available on the anatomy of the caryopsis coat in various other grasses (Netolitzky 1926; Anderson 1927; Avery 1930; Krauss 1933; Hayvard 1938; Akerberg 1943; Bradbury et al. 1956; MacLeod & Palmer 1966; Kowal & Rudnicka-Sternowa 1969; Rost 1973; Jones & Rost 1989; Rost et al. 1990; Ungurean & Costea 1994, 1997). According to our knowledge, micromorphology and anatomy of the caryopsis in *Echinochloa* have not been studied so far.

The purpose of this study is to evaluate the taxonomic usefulness of select floral characters in *Echinochloa*, namely, micro- and macrocharacters of the lemma and caryopsis, the caryopsis coat, and the size of starch grains. Furthermore, the nomenclature, the taxa limits and the interspecific relationships in *Echinochloa* are also discussed.

MATERIAL AND METHODS

Samples were collected and identified from populations in Spain and Romania.

The accessions from Spain were collected and identified by Professor José Luis Carretero from Polytechnic University Valencia, Spain (Table 1). The samples from Romania were collected and identified by the first author (Table 1). Mature spikelets were collected from the median region of the panicles as the spikelets from the upper parts of the inflorescence tend to be smaller. Micromorphological characteristics were assessed on 20 specimens in each population. Voucher specimens for all the taxa are preserved in the VALA, BUAG and BUC Herbaria collections.

Micromorphology of sterile lemmas and caryopses.—Ten mature caryopses for each specimen were examined. Only the adaxial (ventral) face of sterile lemmas and caryopses was observed. Sterile lemmas and caryopses were mounted on aluminium stubs with Avery's spot-o-glue and then coated with 20 nm of gold using Bio-Rad Sputter-Coatter SC-500. Samples were examined with 0° tilt at 5–15 KV on a Hitachi S-4100 Scanning Electron Microscope.

Structure of the caryopsis coat.—Mature caryopses with the glumes and bracts removed were soaked in warm water for 1 hour. Afterwards, they were fixed in FAA (90 ml 95% ethanol, 5 ml formalin and 5 ml glacial acetic acid) for 48 h. Caryopses were transferred to 70% ethanol, dehydrated in tertiary butyl alcohol (TBA), and embedded in Tissuemat. Ten mature caryopses for each specimen were serially sectioned to 5–10 µm, stained with safranin and fast green, mounted in Canada balsam, and examined with standard brightfield optics and with polarized light. A small number of caryopses belonging to each accession were soaked, fixed, embedded and sectioned without removing the glumes and bracts. The anatomy drawings were made using a Reichart camera lucida. The lengths of the largest fifty starch grains located in the mealy endosperm from each caryopsis, from each accession were measured as well.

SPIKELETS AND LEMMATAL MICROMORPHOLOGY

Depending on the environmental conditions, an *Echinochloa* spp. plant can produce 1500–22000 spikelets distributed on 9–25 panicle bearing culms. The spikelets have 2 flowers; the lower floret is sterile consisting only of lemma and palea. Sometimes the lower floret is staminate (especially in *E. colona*). The sterile lemma may be awned; but this character is relatively insignificant. The spikelets of *E. colona* are unawned, those of *E. oryzoides* are always awned, and those of the other species may be awned or not. An important character, emphasised by all authors, is the size of the spikelets. The lower glume is about 1/2 the length of the spikelets in *E. colona*; 1/2–3/4 in *E. crus-galli*, *E. oryzoides* and *E. hispidula*, and 1/2–3/5 in *E. oryzicola*. The lemma (in the species examined) is becoming indurated and difficult to remove. Micromorphological characters of the lemma for *Echinochloa* include: short cells (silica cells), long cells, bicellular microhairs, papillae and microhairs. Stomata may occasionally occur in all species. Cork cells were not observed on the *Echinochloa* sterile lemmas. Silica bodies are

TABLE 1. Description of sample populations.

Species	Source	Accesions
Echinochloa colona	Spain (VALA[a])	c1, c2, c3
	Romania (BUAG[b], BUC[c])	c11, c12
Echinochloa crus-galli	Spain (VALA)	cs501, cs606, cs825, cs820
	Romania (BUAG, BUC)	cs21, cs22, cs23
Echinochloa hispidula	Spain (VALA)	h802, h803, h805, h811.

c–Botanical Garden, University of Bucharest, Romania.

restricted to the intercostal regions. They can be cross-shaped or dumbbell-shaped. Within each category, 2 types can be further recognised.

Cross-shaped type (ratio length:width = 1:1).

C1. Silica bodies with the two endings deeply divided (Fig. 1e).

C2. Endings only slightly bilobed (Fig. 2b).

Dumbbell-shaped type (ratio length:width = 1:2).

D1. The two endings rounded (Fig. 1 a, f).

D2. The two endings emarginated or bilobed (Fig. 1d).

Even if one or two types of silica bodies predominate in one species, one sterile lemma may often contain sporadically the other types as well.

Long cells are easily recognizable by their length and their sinuous margins. Long cells are associated with papillae at their distal ends, especially near the apex of lemmas. Bicellular hairs, 30–60 µm long, are present in all species and belong to the *panicoid type* (Tateoka et al. 1959; Amarasinghe & Watson 1988; Watson & Dallwitz 1992–onwards). All the trichomes observed in *Echinochloa* (bicellular microhairs excepted) are more or less macroscopic. If shorter, they are only an earlier stage in the development of macrohairs. They tend to increase in frequency and length toward the distal parts of the lemmas. The marginal veins usually have the longest hairs. They are somewhat shorter or even missing from the median and lateral veins. Macrohairs are present in the intercostal regions but they are usually shorter compared to those of the marginal veins. In *E. oryzicola*, sterile lemmas often appear glabrous in the intercostal regions. The macrohairs are rigid, pointed and oriented toward the apex of the lemma.

CARYOPSIS

Morphology of caryopsis (Fig. 3, a–e). Caryopsis is the dry, monospermous, indehiscent fruit of grasses in which the layers of pericarp are fused with the seed coat. The adnation between the pericarp and the seed coat starts in the placento-chalazal region and extends toward the rest of the caryopsis (Izaguire de Artucio & Laguardia 1987).

The size of caryopsis varies proportionally with the size of the spikelet and therefore is also an important differential character. The caryopsis is round, ellipsoid to ovate, with the ventral (adaxial) face rounded and the dorsal face (abaxial) more or less flat. The ventral face shows the axis of the embryo. The embryo is large, about 0.5 times the caryopsis length in *E. colona*; almost as long as the caryopsis in *E. oryzicola* and 0.6–0.7 times the caryopsis length in the other examined species. The scutellar region is visible around the embryo axis. The dorsal face features the basal pointed coleorhiza, which is also encircled by a rounded scutellar region. The hilum may or may not project on the outline of the caryopsis. When plants shed their spikelets, they land with the convex face down, in a position that brings the embryo in the most favourable position for germination. The glumes and sterile lemma then absorb the water necessary for germination. When they land in water, the spikelets float until imbibition is completed after which they sink and fall to the bottom of the water (Costea, unpublished). The mature caryopsis coat is shiny and whitish, yellowish or brown. The scutellar region prolonged around the embryo (on the convex, ventral face), is smooth or wrinkled, and may have black spots (*E. oryzicola*).

Micromorphology of caryopsis (Fig. 2, c–f) is not similar in the *Echinochloa* species examined. The epicarp cells are elongated ranging from 60–120 µm in length and 10–20 µm in width. The periclinal walls are flat, except for *E. oryzicola* which has concave periclinal walls (Fig. 2f). The anticlinal walls are protuberant and undulated with the amplitude, the width at the base and the shape of the undulations having diagnostic value. For example, in *E. crus-galli* (Fig. 2d) the anticlinal walls are Ω-undulated (undulations rounded, wider toward the apex and narrower at the base), in *E. orzyoides* and *E. hispidula* they are S-undulated, (Fig. 2c and e) and in *E. oryzicola* they are Z-undulated (Fig. 2f).

Anatomy of the caryopsis coat (Fig. 4, a–c) in the examined species is similar. The differences observed are minute and quantitative. The caryopsis coat consists of adnate layers of pericarp, seed coat and nucellus that surround the endosperm and embryonic axis. If the lemma is not removed, cross-sections reveal its connivence with the caryopsis. The structure of the lemma resembles the structure of the leaf. A homogenous mesophyll consisting of 2–4 cell layers can be observed between the 2 epidermis. During the early stages of development the mesophyll cells contain chloroplasts. These cells are larger than the epidermis cells, with thickened, sclerified cell walls at maturity (Fig 4, 1–c).

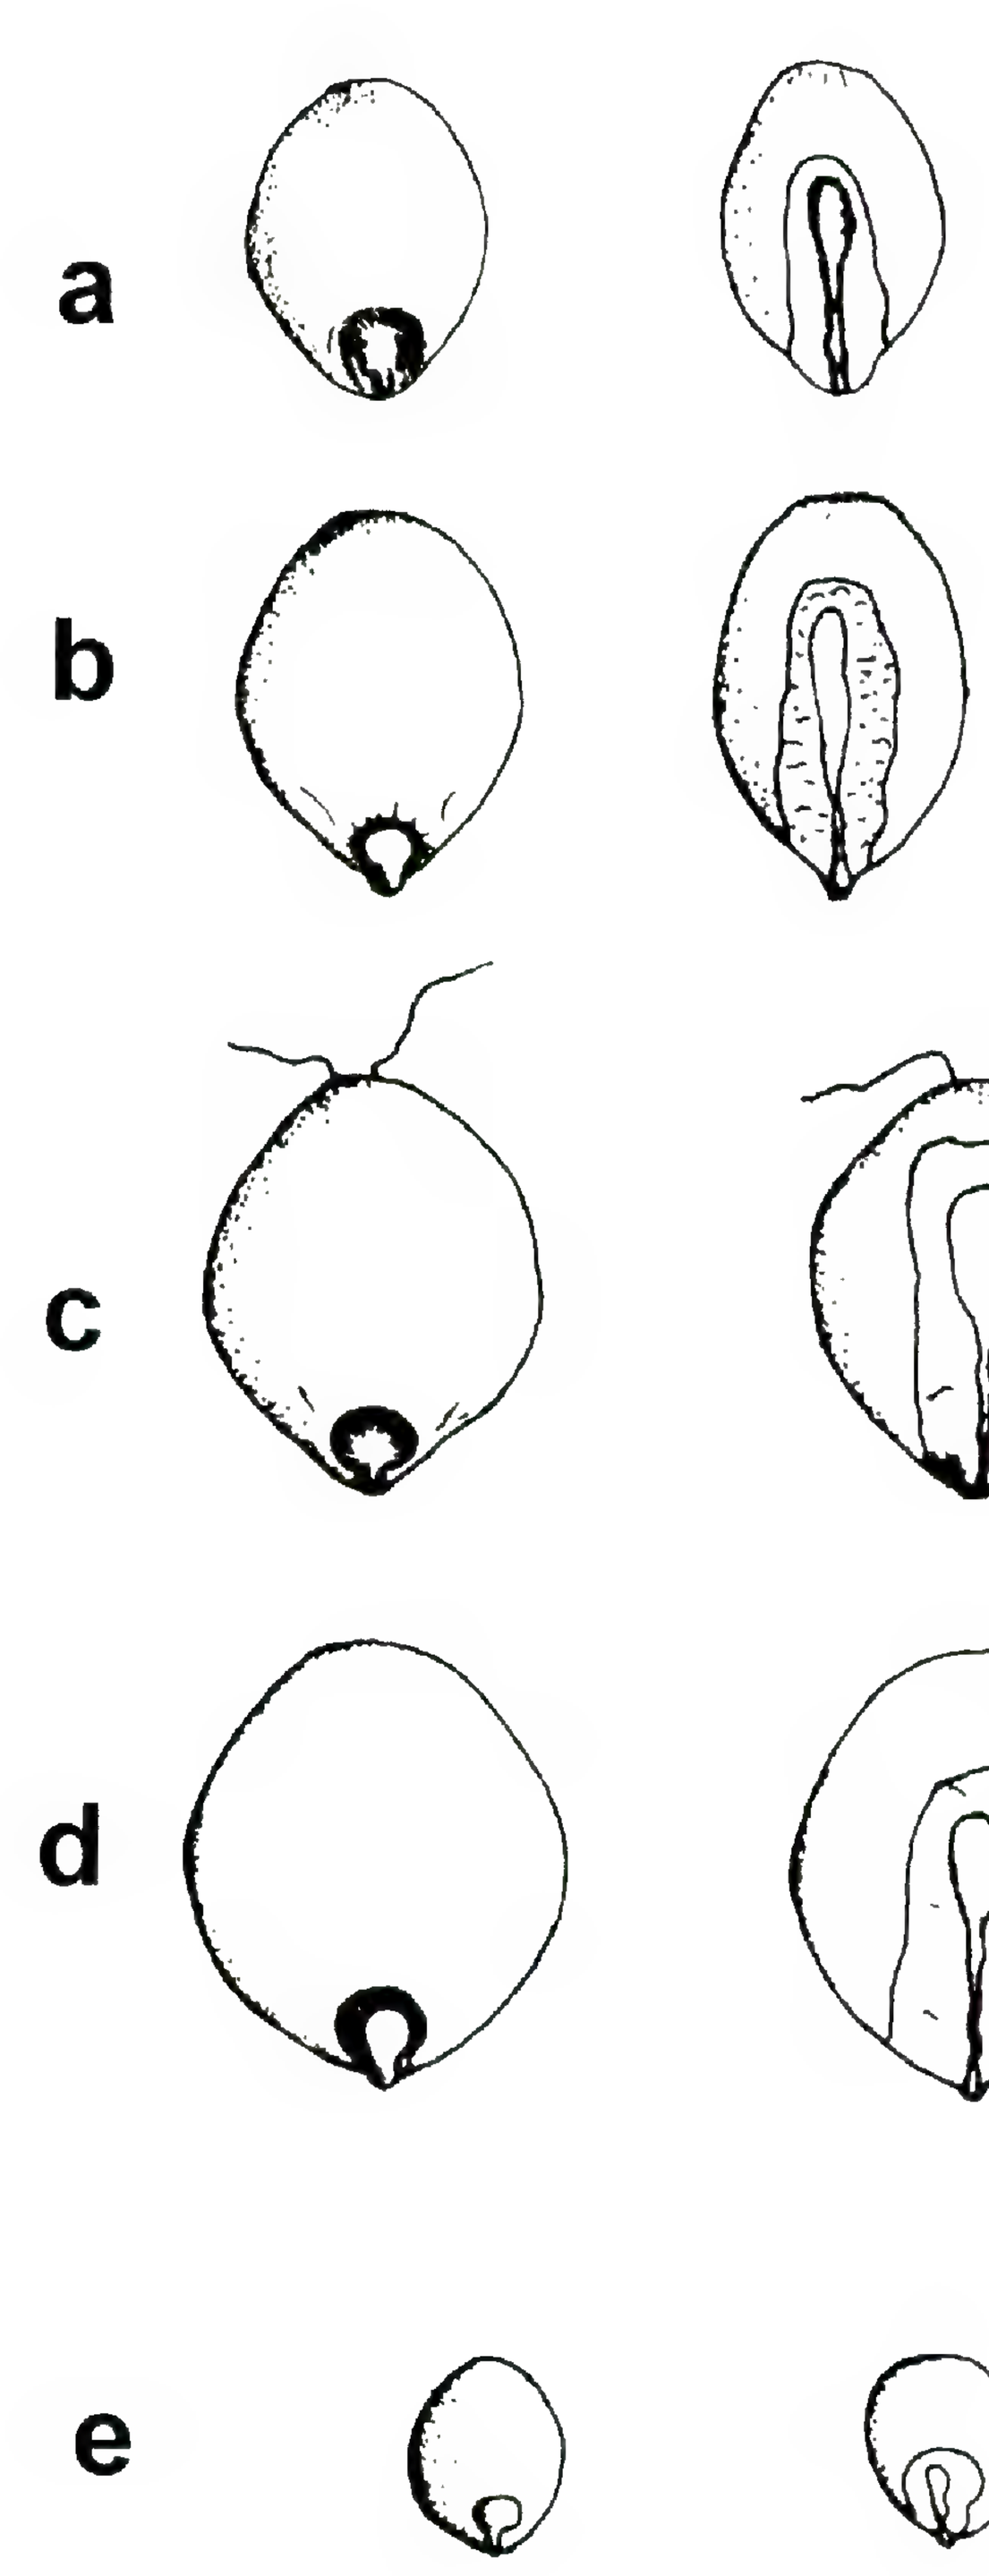

FIG 3. Morphology of caryopsis. **a.** *Echinochloa crus-galli*, **b.** *E. hispidula*, **c.** *E. oryzicola*, **d.** *E. oryzoides*, **e.** *E. colona*. Scale bar 1 mm.

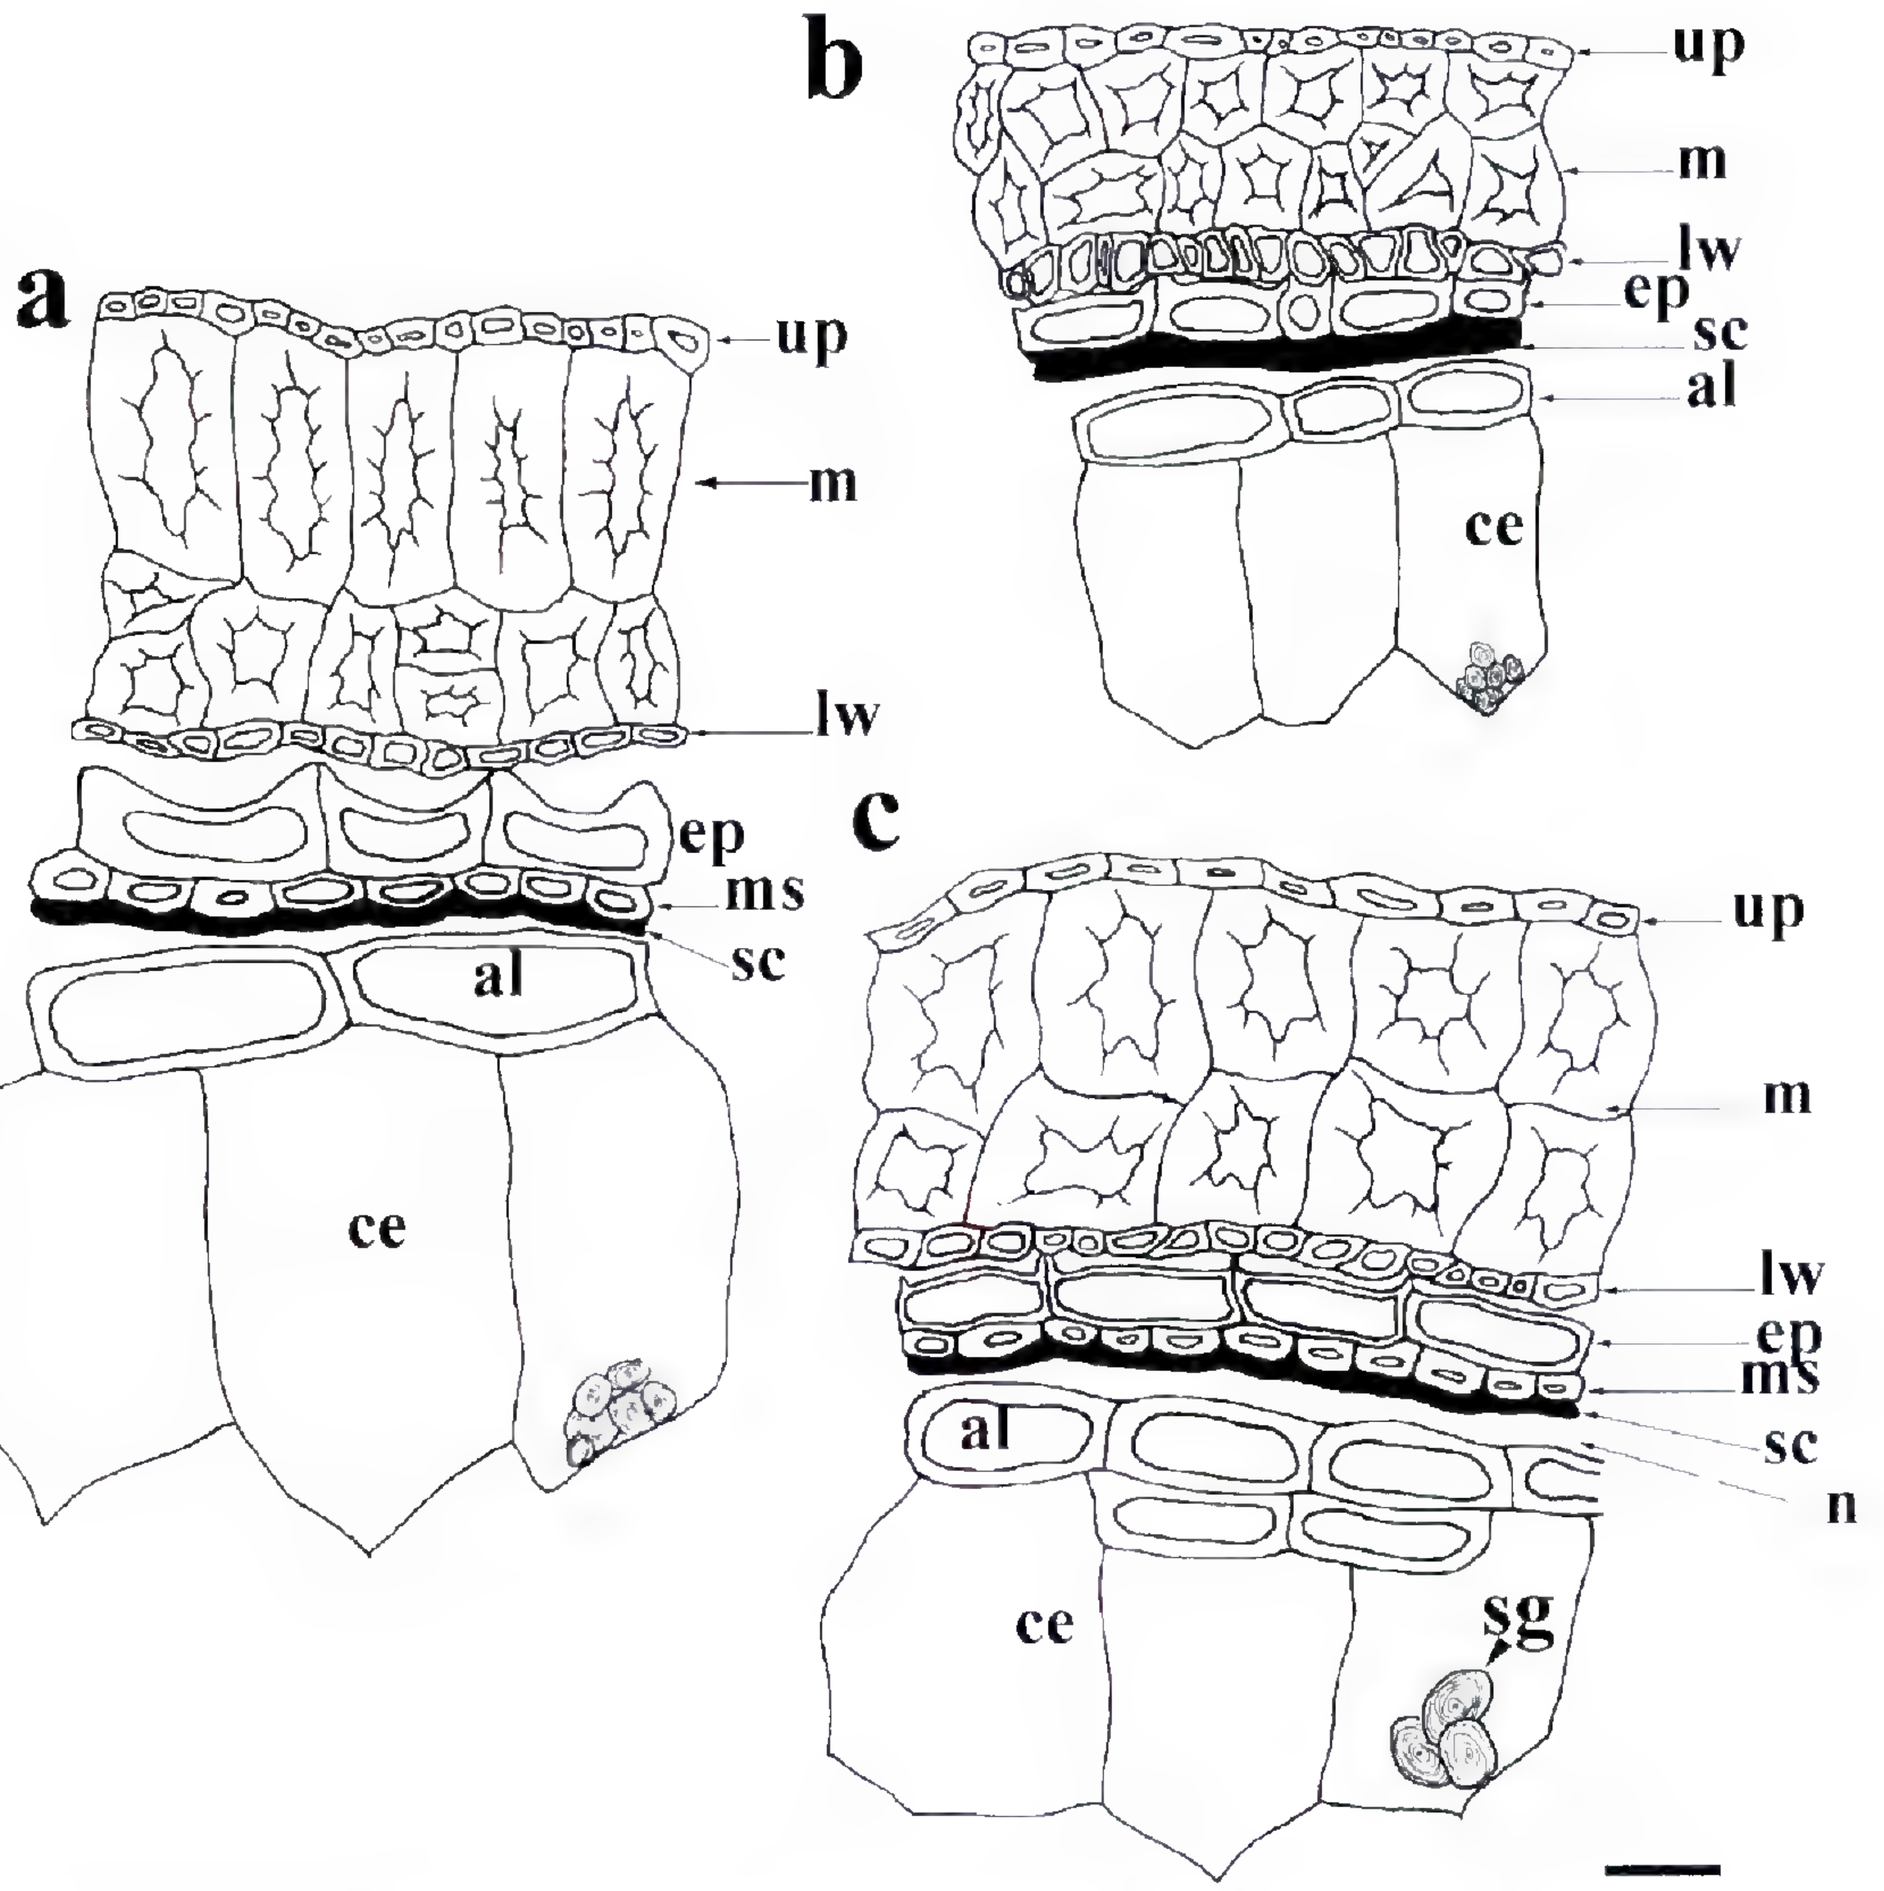

FIG. 4. Anatomy of caryopsis. **a.** *Echinochloa oryzicola*, **b.** *E. crus-galli*, **c.** *E. oryzoides*. **up**—upper epidermis of lemma, **m**-mesophyll of lemma, **lw**-lower epidermis of lemma, **ep**-epicarp, **ms**-mesocarp, **sc**-seed coat, al-alleurone layer, **ce**-central endosperm, **sg**-starch grains. Scale bar 10 μm.

The veins in young lemmas resemble the tertiary veins of the leaves. The caryopsis coat is thin (7–15 μm thick), with a simple structure. It consists of only 2–3 cell layers. The one-layered epicarp is the most representative component of the pericarp. The epicarp cells have thickened walls. The mesocarp is also single-layered with smaller and often crushed cells. At caryopsis maturity the endocarp is usually no longer visible. In younger caryopses it consists of long thin-walled cells ("tube-cells"), parallel to the epicarp cells. The seed coat is fused with the pericarp and it is not structured, visible only as brown line. The nucellus persists as a thin remnant. A single layered alleurone is continuous around the entire endosperm. The alleurone layer can be locally 2-layered in *E. oryzoides* (Fig. 4c). The central endosperm consists of large, irregularly shaped cells that contain simple starch grains. The central endosperm does not have a homogenous

appearance. Around the embryo the endosperm is "mealy" and soft while in the rest of the caryopsis is hard and glassy. In most of the species examined, the glassy endosperm predominates. However, in *E. oryzoides* the mealy endosperm is equaly or better developed than the glassy endosperm. The mealy endosperm contains rounded, isolated starch grains; only rarely they are aggregated (but not compound) in small groups of 2–4 granules. The hard endosperm has polygonal (rarely round) starch grains, closely packed together. This last type corresponds to the *Panicum* type described by Tateoka (1962). The average size of the starch grains is significant and it varies between 5.5 µm and 10.5 µm depending on the species. The embryo has a scutellar tail, without an epiblast.

SPECIES DESCRIPTION AND NOMENCLATURE

Nomenclature.—Most of the nomenclatural problems of *E. oryzicola* are related to the binomial *Panicum phyllopogon* on which *Echinochloa phyllopogon* (Stapf) Stapf ex Koss. is based. Stapf's diagnosis of *Panicum phyllopogon* addresses only the vegetative features of the plants, particularly the presence of hair tufts in the collar region of the leaves. For a long time this feature was erroneously considered to be an exclusive characteristic of only one species—*E. phyllopogon*, thus generating extensive nomenclatural confusion. The individuals of *Echinochloa oryzicola*—a more recent name—are constantly showing this vegetative characteristic. Consequently *E. oryzicola* has almost generally been considered a synonym of *E. phyllopogon* (Pirola 1965; Morariu 1972; Kerguélen 1975, 1993, 2002; Czerepanov 1981; Michael 1983; Chirilă 1984; Ciocarlan 2000). Kossenko (1940) further contributed to this confusion when he subordinated *E. oryzicola* as a subspecies of *E. phyllopogon* (1940). Other authors erroneously considered *E. oryzicola* to be a synonym of *E. hispidula* (Ohwi 1962; Gould et al. 1972) or even of *E. oryzoides* (Clayton 1980).

Stapf's collections of *Panicum phyllopogon* at Kew comprise both vegetative and fertile specimens. Tufts of hairs are obvious in most of the vegetative specimens and in several plants bearing inflorescences. Carretero (1981) noted that tufts of hair might also occur in the leaf collar of *E. hispidula* (1981). After examined Stapf's collection, Carretero (1981) synonymized *E. phyllopogon* with *E. hispidula*. Michael initially regarded Stapf's collection (1975 in herb, 1983) as a mixture of *E. phyllopogon* (the plants showing the vegetative characteristics) and *E. oryzoides*. Later, after examining populations from Spain, Italy and France he observed that individuals of *E. oryzoides* may also have leaves with hair tufts in the collar region and accordingly he synonymized *E. phyllopogon* with *E. oryzoides*. The author selected as a lectotype for *Panicum phyllopogon* the one sheet in which the inflorescence and tufts of hairs are evident on the same specimen (1985, note in the Kew Herbarium on the specimen selected as a lectotye, collected by Jacometti from "Novarra, in rice fields"). We support

Michael's view in that *E. phyllopogon* may be a synonym of *E. oryzoides* and that Stapf's collection is a mixture of *E. oryzicola* and *E. oryzoides* (= *E. phyllopogon*).

Many recent studies on the biology, ecology, herbicide resistance and physiology have been also using the binomial "*Echinochloa phyllopogon*" referring probably to *E. oryzicola* (Fox & Kennedy 1994; Fox et al. 1995; Mujer et al. 1995; Gibson et al. 1999; Fischer et al. 2000; Fischer et al. 2000).

Identification key.—The following key is modified from Carretero (1981) and Michael (1983).

In order to improve chances of correctly identifying the species, a range of individuals from the same population and a range of spikelets and caryopses belonging to the same plant should be collected and examined. Spikelets length measurements do not include the awns. Caryopsis measurements refer to dry caryopses. Starch grains should be observed in the mealy endosperm (around the embryo).

1. Spikelets 2–3 mm long, regularly arranged on the racemes. Caryopses whitish, 0.7–1.2 mm long with the embryo 0.4–0.5 of the caryopsis length ____ **E. colona**
1. Spikelets larger, irregularly arranged on the racemes. Caryopses larger, light-yellow or in different shades of brown, with the embryo 0.6–0.9 of the caryopsis length ____ **2**
   2. Spikelets 3.9–5 mm long; caryopses 2–3 mm long; starch grains 7–10 µm in diameter ____ **3**
   2. Spikelets 2.8–3.7 mm long; caryopses 1.4–1.8 mm long; starch grains 5–5.6 µm in diameter ____ **4**
      3. Coleoptyle red-purplish. Leaves often with a tuft of brown hairs in the collar region. Lower glume 1/2–3/5 the length of the spikelets, with the 3 veins visible only at the base. Sterile lemma often glabrous and shiny, rarely with stiff macrohairs, up to 0.8 mm. Caryopses brownish, 2–2.4 mm long, with the embryo 0.9 of the caryopsis length, and the glassy endosperm equal or more developed than the mealy endosperm ____ **E. oryzicola**
      3. Coleoptyle green. Leaves only rarely with a tuft of hairs in the collar region of the leaves. Lower glume 1/2–1/3 the length of the spikelets, with the 3 veins visible along their entire length. Sterile lemma never glabrous and shiny, provided with dense, stiff hairs up to 1mm long. Caryopsis light-yellow, 2.2–2.8 mm long, with the embryo 0.6–0.7 of the caryopsis length and the mealy endosperm more developed than the glassy endosperm ____ **E. oryzoides**
         4. Weeds of rice fields, occasionally with a tuft of hairs in the collar region of the leaves. The panicle is not pyramidal with branches often whorled. Spikelets ovate-elliptical, 3.3–3.8 mm long. Caryopsis 2–2.2 mm long with the scutellar zone transversely wrinkled ____ **E. hispidula**
         4. Weeds not obligate of rice, but sometimes occurring in rice fields especially on the margins of the ponds. Leaves never with hairs in the collar of the leaves. Panicle pyramidal with the branches never obviously whorled. Spikelets ovate, 2.8–3.4 mm. Caryopsis ovate, 1.4–1.9 mm, with the scutellar zone smooth ____ **E. crus-galli**

1. Echinochloa colona (L.) Link, Hort. Berol. 2:209. 1833. TYPE: "JAMAICA:" Antilles, *Browne* (LINN). *Panicum colonum* L., Syst. Nat., ed. 10, 2:870. 1759. *Echinochloa crus-galli* (L.) Beauv. subsp. *colona* (L.) Honda, Bot. Mag. (Tokyo), 37:22.1923.

= *Panicum zonale* Guss., Fl. Sic. Prod. 1:62. 1827.
= *Echinochloa verticillata* Berhaut, Bull. Soc.Bot. Fr., 1953:11. 1954.

There is still disagreement over how to write the specific epithet, as various authors have used either "*colonum*" or "*colona*" to designate the species The specific epithet is most likely derived from the medieval Latin adjective "*colonus-a-um*," in which case "*Echinochloa colona*" is the correct spelling. Another hypothesis (Carretero 1981) is that the specific epithet results from the contraction of the word "*colonorum*," the plural genitive of "*colonus-i*," although we believe this to be less probable.

Echinochloa colona is the most easily recognised species. It is annual, often rooting at the lower nodes. The leaves may have purplish transversal bands. The inflorescence is usually erect, with short branches (the lower ones are shorter to equalling 3 cm long). The spikelets are regularly arranged on the racemes. Often the lower floret of the spikelets is staminate. The lower lemma is awnless, not exceeding 2 mm long. The spikelets are ovate, 2–3 × 1.2–1.8 mm. The lower glume is 3-veined, about 1/2 as long as the spikelet. The upper glume is 5-veined. The sterile lemma is 7-veined. The median vein may or may not have macrohairs. Longest macrohairs, 1 mm long. Lateral veins are only distally conspicuous. The silica bodies are of type D2. The stigmas are dark-red.

The caryopsis (Fig. 3e) is round to almost so, whitish and translucent, (0.7–) 0.9–1.2 × 0.7–1.1 mm. The embryo is 0.4–0.5 of the caryopsis length. The epicarp cells are 40–65 × 8–12 μm. The periclinal walls are flat. The anticlinal walls are moderately thick (2.1–2.7 μm), undulated; the amplitude of the undulations is 5–10 μm, and their width is 6–12 μm. The undulations are Ω-shaped or S-shaped. Starch grains, 5.6 (± 0.24) μm long. The chromosome number is 2n = 6x = 54 (Carretero 1981; Yabuno 1985; Koul & Gohil 1991; Devesa et al. 1991).

This species is a widespread weed in rice fields in tropical and subtropical areas of the globe. In Europe it has been recorded in the warmest countries (Spain, Portugal, Italy, France, Turkey, Greece), where it grows as a ruderal or segetal weed in irrigated crops (and sometimes also in rice). It seems to be expanding towards typical temperate countries where it usually grows as a ruderal. As an example, we are recording the occurrence of this species for the first time in Romania where we have encountered it since 1996 growing as a ruderal in the Railroad Station in Bucharest.

2. Echinochloa oryzicola (Vasing.) Vasing. in Komarov, Fl. U.R.S.S. 2:33. 1934. TYPE: "Oriente Extremo inter segetes *Oryzae sativae* L." *Panicum oryzicola* Vasing., Bull. Appl. Bot. Pl.-Breed. (Leningrad) 25(4).125. 1931. *Echinochloa phyllopogon* (Stapf) Koss. subsp. *oryzicola* (Vasing.) Koss., Not. Syst. Herb. Acad. U.R.S.S. 8(12):210. 1940. *Echinochloa crus-galli* (L.) Beauv. var. *oryzicola* (Vasing.) Ohwi, Acta Phytotax. Geobot. 11:38. 1942.

= *Echinochloa phyllopogon* auct., non Stapf

Annuals; the European populations with a tuft of brownish hairs in the collar

region of the leaves. The hairs are obvious from the two or four leaf stage. Yabuno (1962, 1981) studying Asian populations found that different forms – notably his C and F forms – do not always exhibit the tuft of hairs in the collar region of the leaves. The inflorescence is normally erect and spreading but occasionally can be horizontal or pendent and may be green to red coloured. Spikelets are ovate-elliptical, awned (awn not exceeding 2 cm in length) or not, measuring 3.9–4.8(–5) × 2.2–2.4 mm. The spikelets persist in the panicle longer than in *E. oryzoides*. The lower glume is about 1/2–3/5 the length of the spikelet, with 3 veins only partially visible. The upper glume is 5–7 veined. The sterile lemma is 4–5 veined. The median veins may or may not have short hairs (0.5–0.6 mm); the laterals veins are conspicuous only toward the apex. The longest macrohairs are up to 0.8 µm long. The sterile lemma can be: a) glabrous and shiny, convex—with the lateral veins visible only along their distal part. In the intercostal regions the macrohairs are rare, short, 0.1–0.4 mm, with a swollen base (Fig. 1, c and d) (C-form of Yabuno 1962, 1981). This is the most common type encountered in Europe. b) more or less flat and coarse, with dense long macrohairs, up to 0.8 mm in the intercostal regions (F-form of Yabuno 1962, 1981). The silica bodies may be type C2 (Fig. 1e) or D2 (Fig. 1d). The stigmas are red. The caryopsis is ellipsoidal to almost round measuring 2–2.4 × 1.8–2.1 mm (Fig. 3c). The embryo is 0.75–0.9 of the caryopsis length. Often the stigmas are persistent. The hilum is prominently visible on the outline of the caryopsis. The colour is brownish-red, brownish-green or brownish-grey. The scutellar zone is irregularly wrinkled often with black spots. The epicarp cells are 100–120 × 15 µm. The periclinal walls are concave (Fig. 4a). The anticlinal walls are moderately thick (2.6–3.2 µm) and undulated; the amplitude of the undulations is 8–10 µm, and their width is 6–7 µm (Fig. 2f). The undulations are Z-shaped (acute and narrow toward the apex) (Fig. 2f). The glassy endosperm predominates or it is as developed as the mealy endosperm. Starch grains are 7.14 (± 0.51) µm in length. The chromosome number is 2n = 4x = 36 (Carretero 1981; Yabuno 1985, 1996).

This species originated in China and SE Asia and is now a weed of rice in Europe, Asia, North and South America. The biology and ecology of a cultivated form of *E. oryzicola* has been recently described by Hirosue et al. (2000).

3. Echinochloa crus-galli (L.) Beauv., Ess. Agrost.:53, 161, tab. 11, fig. 2. 1812. TYPE: "Europae, Virginiae cultis" (LINN). *Panicum crus-galli* L., Sp. Pl., ed. 1:56. 1753. *Milium crus-galli* (L.) Moench, Meth:202. 1794.

The herbarium sheet number 80.18 (LINN) contains a specimen collected by Kalm in Canada, annotated by Linnaeus himself as *Panicum crus-galli*. Several authors (Hitchcock 1920; Baum 1967; Carretero 1981; Michael 1983) observed that this specimen does not belong to *E. crus-galli*. The same situation occurs with the other two sheets labelled *Panicum crus-galli* (80.19 and 80.20) by Linnaeus. According to Carretero, only the specimen 80.17 labelled by Linnaeus as *Panicum crus-corvis* corresponds to *E. crus-galli*. Ali (1968) and Gould et al. (1972) designated a neotype. Michael (1983) designated as a lectotype the specimen 1: 303

from Burser's Herbarium at the University of Uppsala [in order to retain the specific epithet, Baum suggested the same solution but he did not select a lectotype (1967)].

= *Panicum crus-corvi* L., Sp. Pl., ed. 2, 1:84. 1762.

Annuals with erect to spreading or decumbent stems, up to 120 cm. The panicle is often pyramidal with purplish nuances, erect, but sometimes nodding. The inflorescence branches are longer than 3 cm, patent or erect-patent, never obviously whorled. The lower branches are frequently twice branched. The spikelets are irregularly arranged on the racemes and the lower floret is rarely staminate. Spikelets are ovate to broadly-ovate, 2.8–3.4 × 1.6–1.8 mm. The lemma of the lower floret is awnless or awned, the awn not exceeding 5 cm in length. The lower glume is 3-veined and about 1/2–1/3 the length of the spikelet. The upper glume is 5–7 veined. The sterile lemma is 7-veined. The lateral veins are visible along their entire length or only toward the apex. The longest macrohairs are about 1 mm long. The silica bodies belong to types C2 or D2 (Fig. 2b). The stigmas are white or red.

The caryopsis is ovate, 1.4–1.9 × 1.3–1.6 mm, brownish-red or brownish-grey in colour. The embryo is 0.6–0.7 of the caryopsis length (Fig. 3a). The epicarp cells are 60–80 × 10–15 µm. The periclinal walls are flat. The anticlinal walls are thick (2.6–3.2 µm) and undulated; the amplitude of the undulations is 8–10 µm, and their width is 6–7 µm. The undulations are Ω-shaped (Fig. 2d). The glassy endosperm predominates. The starch grains are 5.9 µm (± 0.37) in length. The chromosome number is 2n = 6x = 54 (Carretero 1981).

This species is probably the most widespread of the genus, being a common and noxious weed all over the world, especially in irrigated crops. It is less limited to warm climate compared to *E. colona* and *E. hispidula*. In rice it usually grows on the pond margins, but it may also penetrate the interior of the rice fields.

4. Echinochloa hispidula (Retz.) Nees ex Royle, Ill. Bot. Himal. 11:416, 420. 1840.

TYPE: "India Orientali," König (LD). *Panicum hispidulum* Retz., Obs. Bot. 5:18. 1789. *Echinochloa crus-galli* (L.) Beauv. var. *hispidula* (Retz.) Honda, Bot Mag. (Tokyo) 37:122. 1923. *Echinochloa crus-galli* (L.) Beauv. subsp. *hispidula* (Retz.) Honda, J. Fac. Sci. Tokio Univ., Bot. 3:267. 1930.

= *Echinochloa phylloryzoides* Novelli, Giorn. Risic. 2:306 (1912).

= *Echinochloa erecta* (Pollacci) Pignatti, Arch. Bot. (Italy) 31, ser. III, 15(1):2. 1955. *Echinochloa crus-galli* (L.) Beauv subsp. *erecta* (Pollaci) Ciferri & Giacomini Nomencl. Fl. Ital. 1:20. 1950.

Annuals which may occasionally have tufts of hairs in the collar region of the leaves. The panicle is rarely pyramidal, erect to pendent, green or with purplish nuances. The branches are whorled and more or less erect, except for the lowermost ones. Spikelets are ovate-elliptical of 3.3–3.6(–3.8) × 1.7–1.8 (–2) mm. The lower glume is 3-veined, about 1/2–1/3 of the spikelet length, and the upper glume is 5–7 veined. The sterile lemma is 7-veined resembling *E. crus-galli*. The longest macrohairs are about 0.8 mm long (Fig. 1b). The silica bodies are very

variable, depending on the population – C1 (h802) (Fig. 1b), C1 and D1 (h803, h805), C2 and D2 (h805). The stigmas are white but may occasionally be red.

The caryopsis is larger that of *E. crus-galli*, ovoid to oblong, 2–2.2 × 1.5–1.8 mm and brownish-red or brownish-grey in colour (Fig. 3b). The embryo is 0.6–0.7 the caryopsis length, and the scutellar zone is transversally wrinkled (Fig. 3b). The hilum is projecting on the outline of the caryopsis. The epicarp cells are 65–90 × 10–15 µm. The periclinal walls are flat. The anticlinal walls are thick (2.6–3.2 µm) and S-undulated; the amplitude of the undulations is 8–10 µm and their width is 6–6.5 µm (Fig. 2e). The glassy endosperm predominates. The starch grains are in average 6.3 (± 0.47) µm in length. The chromosome numbers reported are: 2n = 6x = 54 (Devesa et al. 1991) or 2n = 36 (Carretero 1981; Feng & Zhang 1993).

This taxon probably originated in the SE Asia. It is widespread in tropical and temperate areas of Asia, Africa, America and Australia. In Europe it grows only in the warmest regions (Spain, Italy, Portugal and France) as a weed of rice fields.

5. Echinochloa oryzoides (Arduino) Fritsch, Verh. Zool.-Bot. Ges. Wien 41: 742. 1891. TYPE: "Semina hujus Panici inventa a me fuere inter Oryzam" *Panicum oryzoides* Arduino, Animadv. Bot. Spec. Alt. 16, tab. 5. 1764. *Panicum crus-galli* L. var. *oryzoides* (Arduino) Fiori, Nuov. Fl. Anal. Ital. 1:79. 1923.

= *Echinochloa crus-galli* (L.) Beauv. subsp. *oryzoides* Bolos & Masclans, Collect. Bot. 4:420. 1955.
= *Panicum hostii* Bieb., Fl. Taur. Cauc. 3:57. 1819. *Echinochloa crus-galli* (L.) Beauv. subsp. *hostii* (M. Bieb.) K. Richter, Pl. Eur. 1:26. 1890.
= *Panicum phyllopogon* Stapf, Hook, Ic. Plant., ser. 4, plate 2698. 1901. *Echinochloa phyllopogon* (Stapf) Stapf. ex Koss., Not. Syst. Herb. Acad. U.R.S.S. 8 (12):208. 1940.
= *Echinochloa macrocarpa* Vasing. in Komarov, Fl. U.R.S.S. 2:739. 1934. *Echinochloa crus-galli* L. Beauv. var. *macrocarpa* (Vasing.) Morariu in Savulescu, Fl. Rom. 12:86. 1972.
= *Echinochloa coarctata* Koss., Not. Syst. Herb. Acad. U.R.S.S. 9(1):28. 1941.
= *Echinochloa commutata* Schultes in Roemer & Schultes, Syst. Veg., ed. 15, Mant. 2:267. 1824.

Annuals with erect to spreading or decumbent stems, up to 130 cm tall. The seedlings have a reddish coleoptyle. Tufts of hairs in the collar region may be infrequently present. The inflorescence is green, pendent and at maturity hanging almost horizontally, resembling rice in habit. The branches of the panicle are often adpressed to the main rachis. The spikelets are rather persistent, usually awned (awn up to 5 cm long), broadly-ovate to ovate and (3.6–)4.1–5 × 2.2–2.6 µm. The lower glume is about 1/2–1/3 the length of the spikelet, with 3 veins visible across their entire length. The upper glume has 5 veins also entirely visible. The sterile lemma is 7-veined, with the lateral veins usually visible along their entire course. The longest macrohairs are about 1 mm long (Fig. 1a). The silica bodies belong to the type D1 (Fig. 1a). The stigmas are red.

The caryopsis is ovate to almost round, 2.2–2.8 × 1.9–2.3 mm (Fig. 3d) and yellowish. The embryo is 0.6–0.7 the caryopsis length, with the scutellar region

zone smooth (Fig. 3d). The epicarp cells are 100–120 × 10–15 µm. The periclinal walls are flat. The anticlinal walls are moderately thick (2–2.6 µm) and weakly S-undulated (Fig. 2c). The amplitude of the undulations is 1–3 µm, and their width is 8–11 µm. The mealy endosperm predominates. The starch grains are 9.5 µm (± 0.58) in length. The chromosome numbers reported are: 2n = 36 (Carretero 1981) and 2n = 6x = 54 (Yabuno 1984; Feng & Zhang 1993).

The species is a common weed in rice occurring in many countries from Asia, Europe, North America, South America and Australia. It is probably one of the most widespread species after *E. crus-galli* and *E. colona*.

DISCUSSION

Characters

The genus *Echinochloa* does not have qualitative characters which clearly demarcate its species. A good example is the presence of hair tufts in the collar region of the leaves which has been considered an exclusive feature of *E. phyllopogon*. This assumption has subsequently caused a widespread nomenclatural and taxonomic confusion because as we have previously indicated, three species may show this feature (*E. oryzicola* commonly; *E. hispidula* and *E. oryzoides* rarely). Even the most significant qualitative character states overlap between species. When such characters are noted they are always accompanied by the words "often," "usually," "normally," etc. because exceptions are possible. The occurrence of a feature should be understood as a predilection and not as an exclusive characteristic.

Lemmatal micromorphology.—The long cells, microhairs and papillae are the same in all species examined. The pattern of papillae in *Echinochloa* species is similar to the pattern described in the fertile lemmas of some *Panicum* species (Clark & Gould 1975). The macrohairs are more or less similar in the examined taxa. Shorter hairs that could be described as prickles (Metcalfe 1960; Ellis 1979) were observed in all species. However, because these shorter hairs represent a developmental stage, only the macrohairs are recognised in this study as a distinct category (see Snow 1996, 1998 for considerations on homology and ontogeny of hairs in *Poaceae*). Variations in length, distribution and density of macrohairs are minute and there is considerable overlapping among species. The only exception is the short, rare macrohairs, with swollen bases from the intercostal regions of sterile lemmas in *E. oryzicola* (in the "form C" of Yabuno 1962, 1981). These hairs are constant in their morphology and can be considered intermediate to prickles (Metcalfe 1960; Ellis 1979). Silica bodies have previously been considered structures of taxonomic significance in *Poaceae* (Metcalfe 1960; Ellis 1979; Palmer & Tucker 1981; Evoli & Pirola 1971). In *Echinochloa*, silica bodies vary in shape even within a small area of the same lemma. However, in most species there is a tendency toward one or two types. *Echinochloa hispidula* was the most variable of all species examined in this

study. The silica bodies varied from population to population, with all the different types observed. The previous epidermis studies conducted on leaves (Sanchez 1968; Pirola & Evoli 1971; Carretero 1981; Jin et al. 1986) are rather contradictory but they all showed an even greater variation of this character. Even if the results obtained in this study revealed some differences between species (*E. hispidula* excepted), the shape characteristics of the silica bodies should be regarded with caution. More populations need to be examined before a final conclusion is reached. The same cautionary approach towards the taxonomic utility of the silica body shape is suggested by other studies conducted on *Zizania* (Terell & Wergin 1981), *Oryza* (Whang & Kim 1994) and *Leptochloa* (Snow 1996). Ball et al. (1999) showed that silica phytoliths examined individually are taxonomically irrelevant. The authors instead used detailed morphometrics, computer-assisted imagery and statistical analysis to develop a classification key of several *Triticum* and *Hordeum* species. The presence or absence of silica bodies in lemmas can prove useful at higher ranks (genera and above) since their presence is probably symplesiomorphic (Snow 1996).

Caryopsis.—The simple morphology of the caryopsis provides good characters for species identification. The size of caryopsis is important and correlated with the size of the spikelets. The other characters overlap between species but may be useful diagnostics is some cases, eg: caryopsis whitish, translucent (*E. colona*), yellowish (*E. oryzoides*); embryo 0.4–0.5 of the caryopsis length (*E. colona*) or 0.75–0.9 (*E. oryzicola*). Surprisingly, surface patterns of the caryopsis proved to be significant in the differentiation between almost all *Echinochloa* species. However, more populations should be examined before any definite conclusions can be reached.

The anatomy of the caryopsis is of minimal systematic value. The overall organization of the caryopsis coat resembles the structures described in *Setaria* (Rost 1973) or *Melica* (Rost and Izaguire de Artucio 1990). The structural simplicity of the pericarp can be a functional result of the indurated lemma that protects the caryopsis. In those grasses where no coalescence between the caryopsis and lemma occurs, or when the lemma is thin, the pericarp is more complex structurally (as for example in many *Triticoideae*—Netolitzky 1926; Avery 1930; Krauss 1930; Bradbury et al. 1956; Ungurean & Costea 1994). The anatomy of the sterile lemmas in *Echinochloa* species could be more important as a taxonomic character than the structure of the caryopsis coat. The structural features and surface pattern of the lemma indicate its ontogenetic connection with the leaves.

The average size of the starch grains examined in a large number of endosperm cells and caryopses is constant and significant among the species examined and therefore can be considered a diagnostic feature. This character is as significant in the taxonomy of the genus as other quantitatively important characters such as the size of spikelets, and size of caryopses.

Relationships between species

The individuality of *Echinochloa* species as treated in the present study is apparently reinforced by studies of their biology and ecology (Holm et al. 1977, 1997; Szilvássy 1976; Chirilă 1967; Carretero 1981; Yabuno 1983; Norris 1996; Honek & Martinova 1996). The appropriate understanding of *E. oryzicola* was delayed by nomenclature problems since this binomial has been almost generally considered a synonym of *E. phyllopogon* (Pirola 1965; Morariu 1972; Kerguélen 1975, 1993, 2002; Czerepanov 1981; Michael 1983; Chirilă 1984; Ciocarlan 2000). Apart from this nomenclatural confusion *E. oryzicola* is the second species easiest to differentiate (after *E. colona*) even using classic morphologic characters. It has the second largest (after *E. oryzoides*) spikelets, caryopses and starch grains; the micromorphology of the sterile lemma and caryopsis are quite peculiar as well.

Yet apart from *E. colona* and E. oryzicola, which are usually easily recognisable, the other 3 taxa comprise a difficult complex. *Echinochloa hispidula* is extremely variable and shares close affinities with both *E. oryzoides* and *E. crus-galli*. Several current treatments tend to view *E. hispidula* as a subspecies or as a variety of *E. crus-galli* (Michael 1983; Mateo Sanz 1990; Devesa 1991; Janzein 1993; Mateo Sanz & Crespo Villalba 1995; Kerguélen 1993, 2002; Asíns et al. 1999). However, Gonzales-Andres et al. (1996) studying the izoenzyme variation of these species, reached another conclusion: only 3 species—*E. colona*, *E. crus-galli* and *E. oryzicola*—were clearly defined. *Echinochloa hispidula* and *E. oryzoides* clustered together, and the variability between the populations of *E. hispidula* was higher than the variability between both taxa. Therefore, the authors suggested that the most appropriate classification would be *E. hispidula* as a subspecies of *E. oryzoides*. Asíns et al. (1999) studying the morphologic and isozyme patterns of variation of the same species, found only *E. colona* and *E. oryzicola* to be distinct from both morphologic and molecular point of view. Based on their morphology, the populations of *E. crus-galli*, *E. hispidula* and *E. oryzoides* congruently clustered together within each species. However, based on the isozyme variation, there was a considerable overlapping between species suggesting a high degree of genetic variation. Consequently, Asíns et al. (1999) advocated that *E. hispidula* and *E. oryzoides* as infraspecific taxa of *E. crus-galli* would be the most appropriate classification. We consider that in order to reach a final conclusion more populations worldwide should be analysed using combined molecular (such as RAPD, AFLP, ISSR and DNA fingerprints) and morphologic methods, and the data resolved in a cladistic approach involving all characters. The enormous variation observed makes the boundaries between these taxa rather uncertain and in order to avoid an arbitrary classification, we maintained each taxa at specific level. In *Echinochloa* the amplitude of morphologic variation can serve as a basis for taxa differen-

tiation. Each taxon has a distinct morphologic core and the variation—statistically understood—can serve to their delimitation.

ACKNOWLEDGMENTS

I owe many thanks to Jose Luis Carretero for the useful discussions and the material from Spain. I am also very grateful to Julio Iranzo who kindly made possible the SEM study. Our sincere thanks go also to Peter Michael and W.D. Clayton who reviewed an earlier version of the manuscript providing valuable comments and suggestions. Many thanks go also to Cheryl Corbett for the helpful criticism.

ABSTRACT

Seed and fruit morphology of ten species of five American genera of Spermacoceae (*Diodia*, *Ernodea*, *Mitracarpus*, *Richardia*, *Spermacoce*) are described, illustrated, and compared with that in the Hedyotideae. These data support the taxonomic recognition of two distinct tribes.

RESUMEN

La morfología de la semilla y del fruto de diez especies de cinco géneros americanos de Spermacoceae se describe, se ilustra, y se compara con la de Hedyotideae. Estos datos apoyan el reconocimiento taxonómico de dos tribus distintas.

INTRODUCTION

Seed morphology in *Houstonia* L. and related genera in the tribe Hedyotideae Cham. & Schltdl. ex DC. (Rubiaceae) has contributed valuable information, especially when combined with data from chromosome number and pollen structure (Terrell et al. 1986; Terrell 1996). More recent taxonomic studies have continued to emphasize the importance of seed data (Terrell 2001a, 2001b, 2001c).

This study investigates the morphology of the seeds and fruits in selected genera in the tribe Spermacoceae Bercht. & J. Presl. We contrast this information with previously acquired seed data for the Hedyotideae. The two tribes include some superficially similar genera and species (e.g. *Oldenlandia* L. and *Spermacoce* L.), but structure and development of their fruits and seeds are fundamentally different and deserve further study. The Hedyotideae have few to many small seeds per locule, nearly always in subglobose biloculate capsules. In contrast, the fruits of Spermacoceae have one large seed per locule and are generally more structurally complex and vary considerably among the genera. Bremer and Manen (2000) expanded the tribe Spermacoceae to include the Hedyotideae; however, our data from seed and fruit morphology in five genera do not appear to support this inclusion.

Verdcourt (1958) proposed a classification of the Rubiaceae in which he recognized three subfamilies. The Rubioideae, the largest subfamily, contained 17 tribes including the Hedyotideae and Spermacoceae. Bremekamp (1966)

modified Verdcourt's system and recognized eight subfamilies in the family and 19 tribes in the Rubioideae (including the Hedyotideae and Spermacoceae). Verdcourt (1976), still recognizing his original three subfamilies, reduced the number of tribes in the Rubioideae to 12 and maintained Hedyotideae and Spermacoceae. Robbrecht (1988, 1993) recognized four subfamilies and 19 tribes in subfamily Rubioideae. The latter included Hedyotideae and Spermacoceae.

MATERIALS AND METHODS

Scanning electron microscopy was employed in this study of seeds and fruits. The investigation was carried out at the Biology Department, University of South Florida, using a JEOL JSM-35 microscope operating at 15 kilovolts. Ten species in five genera were examined from herbarium material at the University of South Florida (USF) (Table 1). The species examined were those most readily available and representative of species native to tropical America, especially of the Caribbean basin. Tables 1 and 2 provide nomenclatural author's names.

RESULTS

The Spermacoceae is a pantropical tribe that may consist of as many as 19 genera and 450 species. Its generic delimitations are a matter of dispute. Eleven currently recognized genera native to the New World are summarized in Table 2. Morphological characters of the seeds and fruits of five genera of Spermacoceae native to the Americas are described as follows:

Diodia: Ovary 2(3–4)-locular; ovules solitary in each locule, attached to the middle of the septum. Fruit with 2(3–4) indehiscent mericarps, these fleshy or dry capsules. Seed enclosed within the hardened mericarp (accessible only by dissection), oblong, somewhat compressed, the dorsal surface convex, the ventral surface with a slightly sunken, central, longitudinal groove (see comments in Discussion), the testa finely reticulate (Fig. 1A–D).

Ernodea: Ovary 2-locular; ovules solitary in each locule, attached to the middle of the septum. Fruit fleshy, oblong, becoming hardened in drying, not easily separated into indehiscent mericarps (accessible only by dissection). Seeds oblong, somewhat compressed, the dorsal surface convex, the ventral surface with a slightly sunken, central, longitudinal groove, the testa finely reticulate (Fig. 3C,D)

Mitracarpus: Ovary 2(3–4)-locular, ovules solitary in each locule, attached near the middle of the septum. Fruit a thin-walled circumscissile capsule, the distal portion falling away with the calyx limb, the septum usually persistent. Seed oblong to globose, the dorsal surface convex, the ventral face divided into 4 distinct areas by an x-shaped groove, the testa finely reticulate (Fig. 3A,B).

Richardia: Ovary (2–)3–4(–6)-locular, ovules solitary in each locule, attached near the middle of the septum. Fruit dehiscing into dry mericarps, the ventral mericarp face with either a medial keel or narrow groove. Seed filling

TABLE 2. Eleven currently recognized genera of Spermacoceae native to the Americas, the estimated number of species, native distribution, and reference to a recent taxonomic treatment.

Crusea Cham. & Schltdl. 13 spp.	southwestern U.S., Mexico; Anderson 1972.
Diodia L. 5 spp.	North America, Mexico, Central America, West Indies, and South America; Bacigalupo & Cabral 1999.
Emmeorhiza Pohl ex Endl. 1 sp.	Brazil.
Ernodea Sw. 4 spp.	Florida, West Indies, Belize, Honduras, and Guatemala; Negron-Ortiz and Hickey 1997.
Galianthe Griseb. ca. 50 spp.	Central America and South America; Cabral 1991.
Mitracarpus Zucc. ca. 30 spp.	Mexico, Central America, and South America.
Psyllocarpus Mart. & Zucc. 8 spp.	Brazil; Kirkbride 1979.
Richardia L. 15 spp.;	Mexico, Central America, South America; Lewis and Oliver 1974.
Scandentia E.L. Cabral & Bacigalupo. 4 spp.	Brazil; Cabral & Bacigalupo 2001.
Spermacoce L. ca. 150 spp.	North America, Mexico, Central America, West Indies, and South America; [Including *Borreria* G. Mey.; *Hemidiodia* K. Schum.]
Staelia Cham. & Schltdl. 15 spp.	Brazil.

the mericarp tightly (sect. *Richardia*) or slightly smaller than the mericarp (sect. *Asterophyton* (*K.Schum.*) W.H.Lewis & R.L.Oliv.), oblong or broadly ovate, the dorsal surface convex, the ventral surface with a slightly sunken, central, longitudinal groove, the testa finely reticulate (Fig. 3E,F;4A-F)).

Spermacoce: Ovary usually 2-locular, ovule solitary in each locule. Fruit

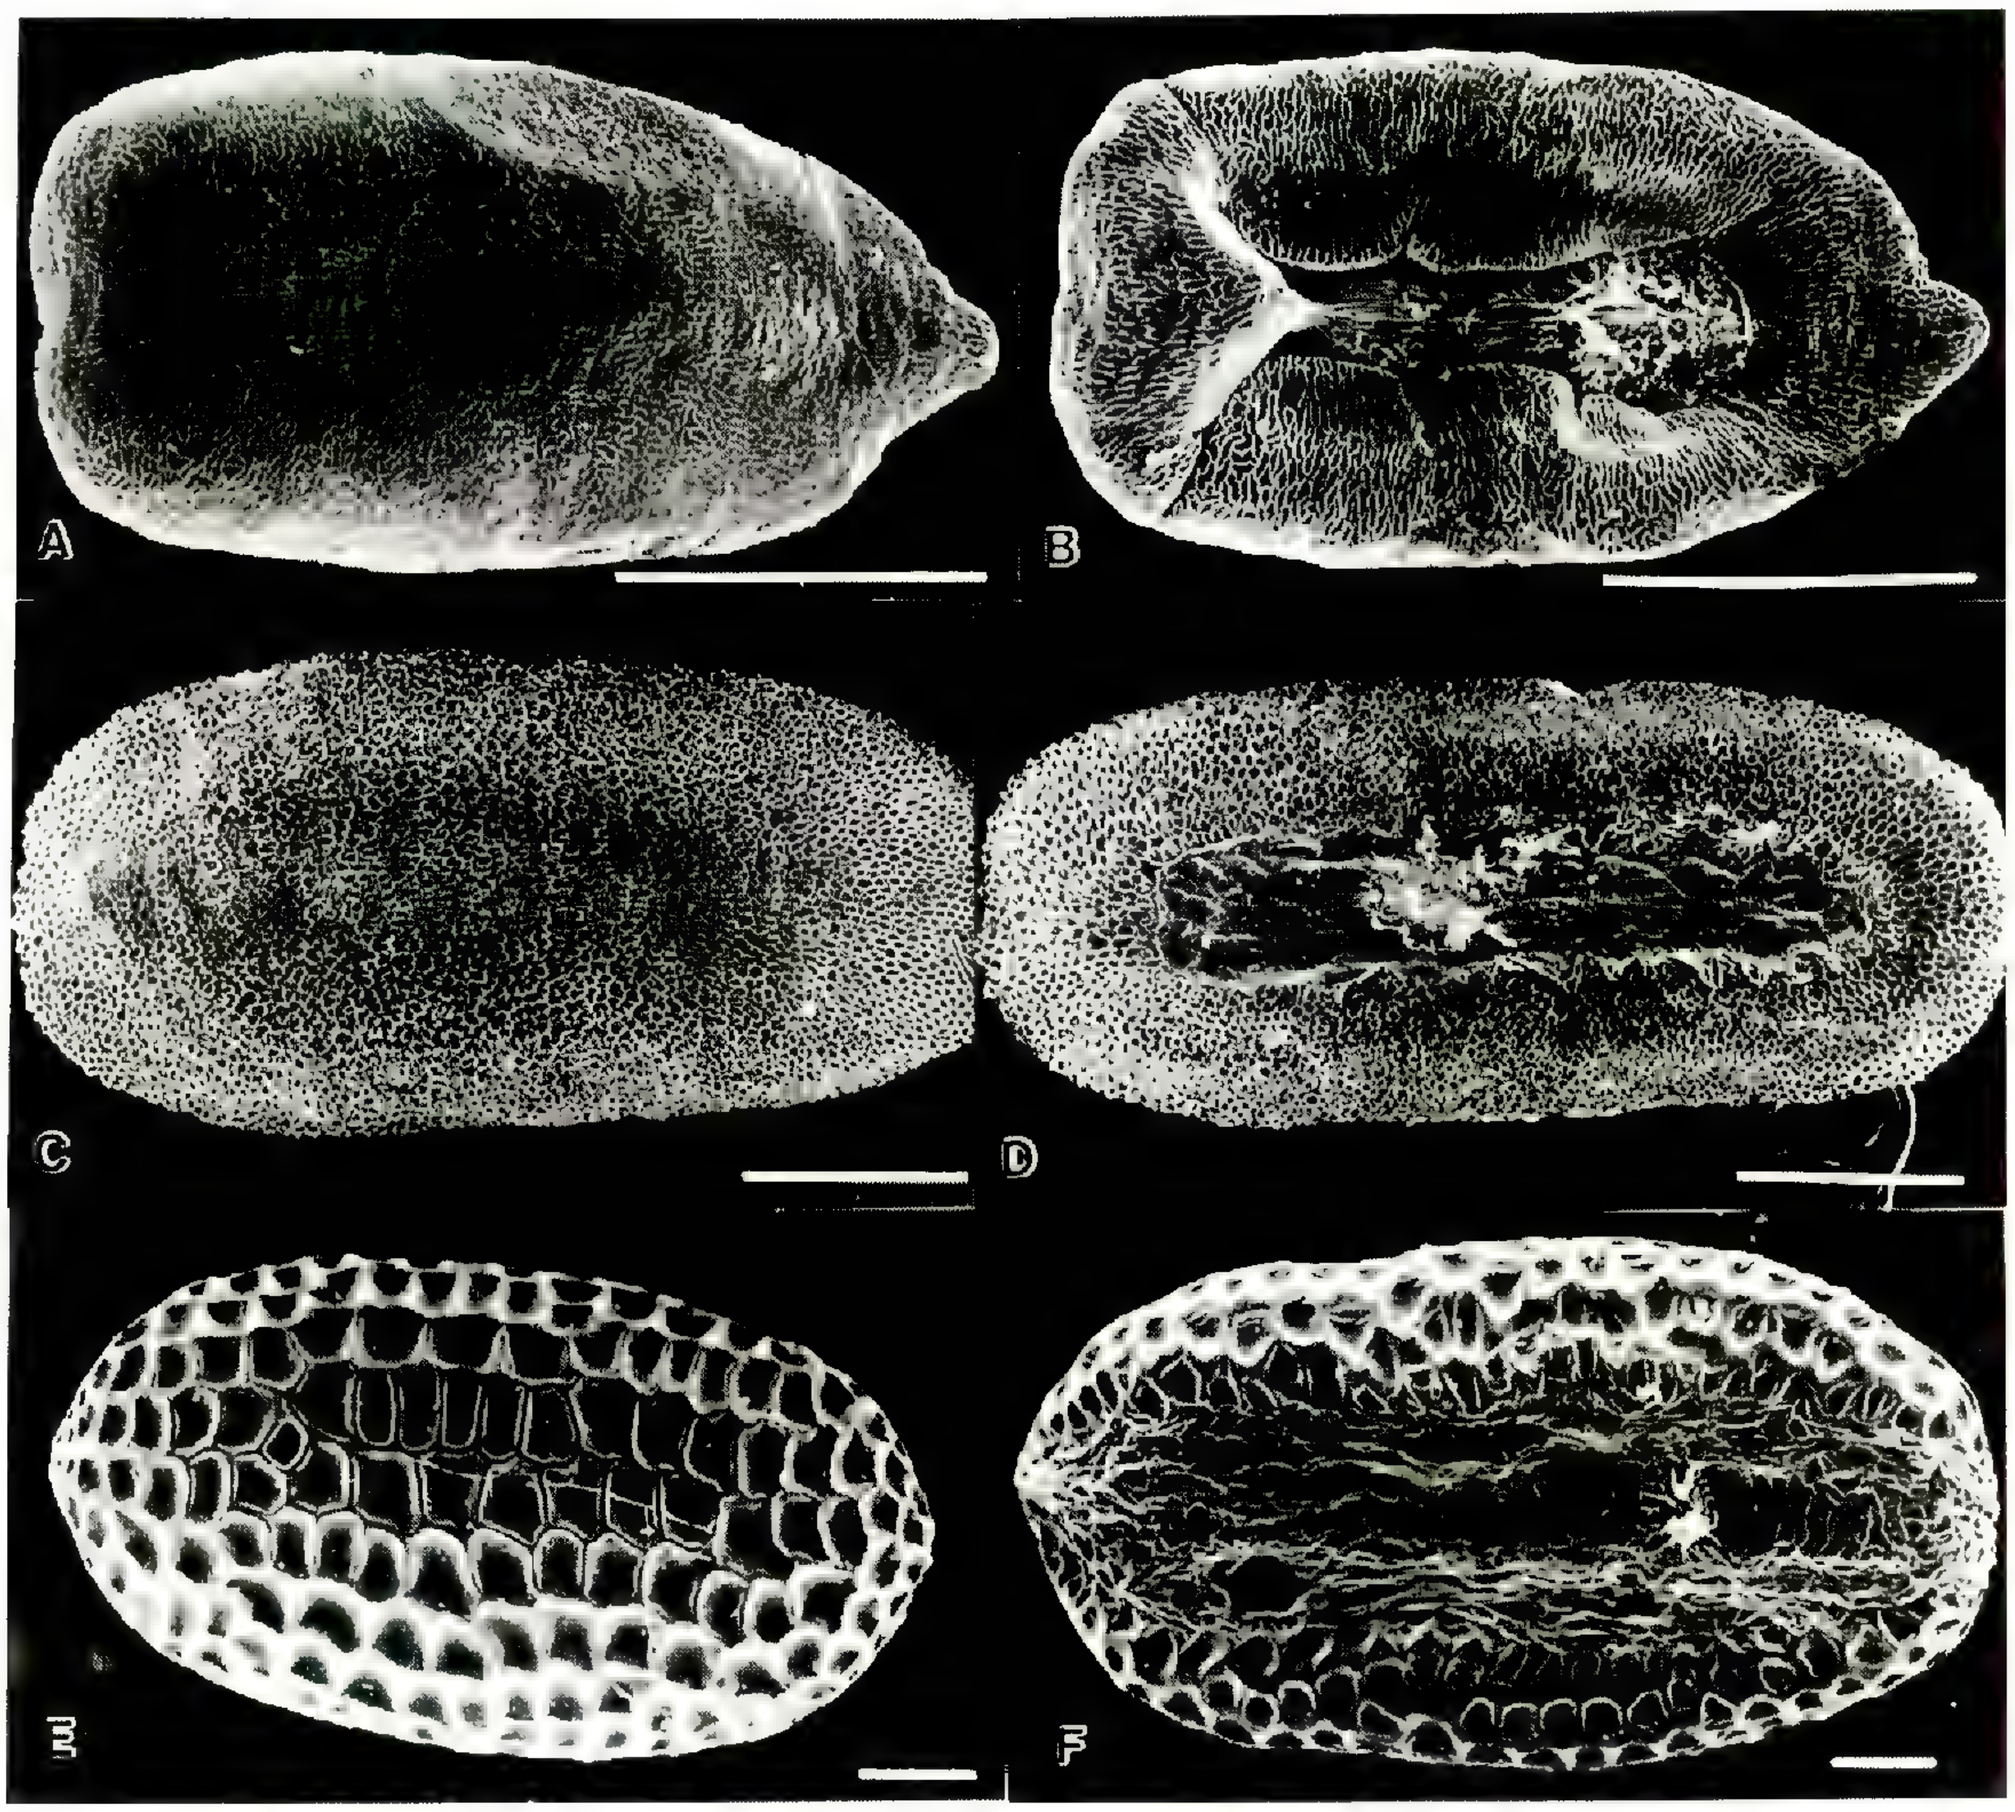

FIG. 1. Dorsal and ventral views of seeds examined by SEM. *Diodia teres* (**A–B**), *D. virginiana* (**C–D**), *Spermacoce prostrata* (**E–F**). Scale bars are 1000 microns (A–B), 100 microns (C–F). Sources of collections listed in Table 1.

dehiscing into 2 mericarps, both opening to release the seed (sect. *Borreria* (G. Mey.) Verdc.) or one mericarp opening to release the seed while the other remains closed by a fragile, easily removable septum (sect. *Spermacoce*). Seeds are ellipsoidal, ovoid, or oblong, the dorsal surface convex, the ventral surface with a slightly sunken, longitudinal groove extending to the ends, this sometimes with small elaiosomes, the testa reticulate (Fig. 1E,F; 2A–F).

DISCUSSION

Some workers continue to treat *Spermacoce* in the broad sense, while others divide it into several genera. *Borreria* is treated either as a separate genus or as a section of *Spermacoce* based on fruit dehiscence (capsule with both carpels opening to release the seeds in *Borreria* or a capsule with 1 carpel opening to release the seed and 1 remaining closed). Based on our study of seed morphology, *Borreria* does not appear to warrant recognition as a genus. Recently,

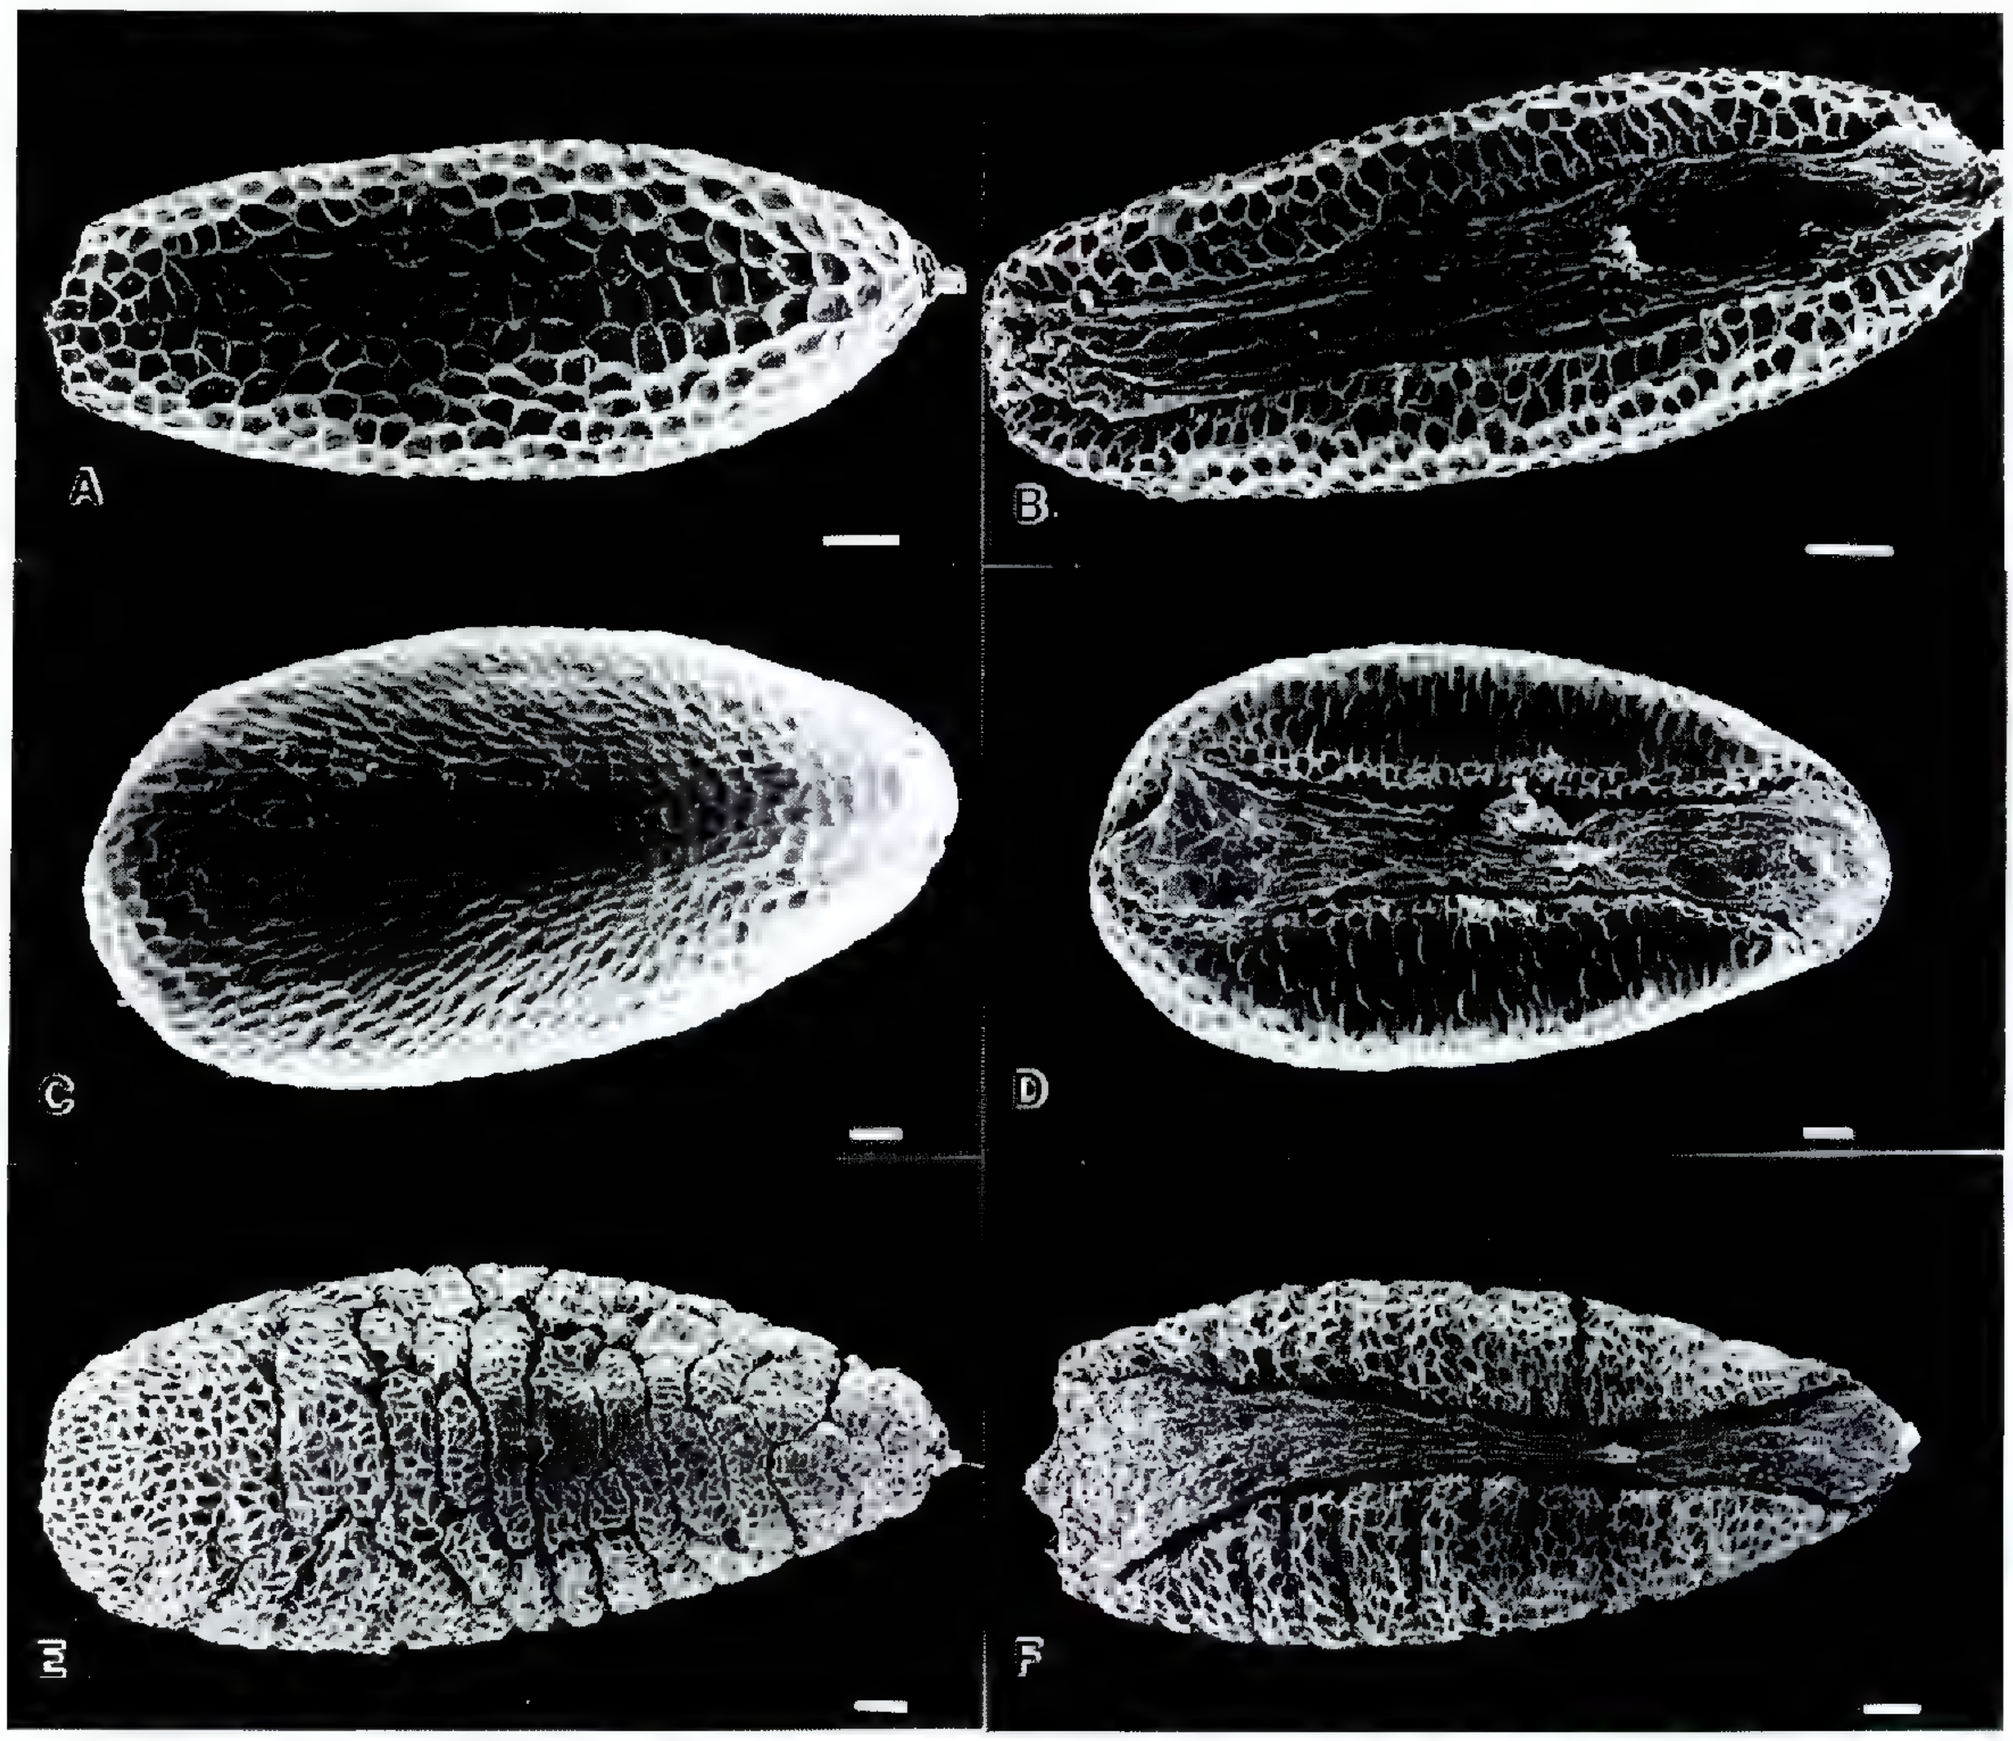

FIG. 2. Dorsal and ventral views of seeds examined by SEM. *Spermacoce verticillata* (**A–B**), *S. tetraquetra* (**C–D**), *S. assurgens* (**E–F**). Scale bars are 100 microns. Sources of collections listed in Table 1.

Galianthe was resurrected as a segregate genus from *Borreria* (Cabral 1991) and *Scandentia* was described (Cabral & Bacigalupo 2001). Both *Galianthe* and *Scandentia* are distinguished from *Borreria* primarily in habit with more or less lax, thyrsoid, apical inflorescences in contrast to the congested, apical and/or axially glomeruliform inflorescences of *Borreria* s. str. *Emmeorhiza*, a monotypic South American genus closely related to *Borreria*, *Galianthe*, and *Scandentia* has an umbelliform inflorescence. The seeds of *Spermacoce assurgens*, *S. prostrata*, and *S. verticillata*, which would be placed in *Borreria* on the basis of fruit dehiscence, do not differ significantly from that of *S. tetraquetra* traditionally placed in *Spermacoce* (Fig. 1E,F; 2A–F). Further work on the *Spermacoce* complex is needed and is underway by various other workers (e.g., E.L. Cabral, N.M. Bacigalupo, and S. Dessein).

Diodia also presents similar problems in circumscription. *Hemidiodia*, a monotypic genus with 2 indehiscent mericarps and long considered closely related to *Diodia*, was transferred to *Borreria* subg. *Dasycephala* (DC.)

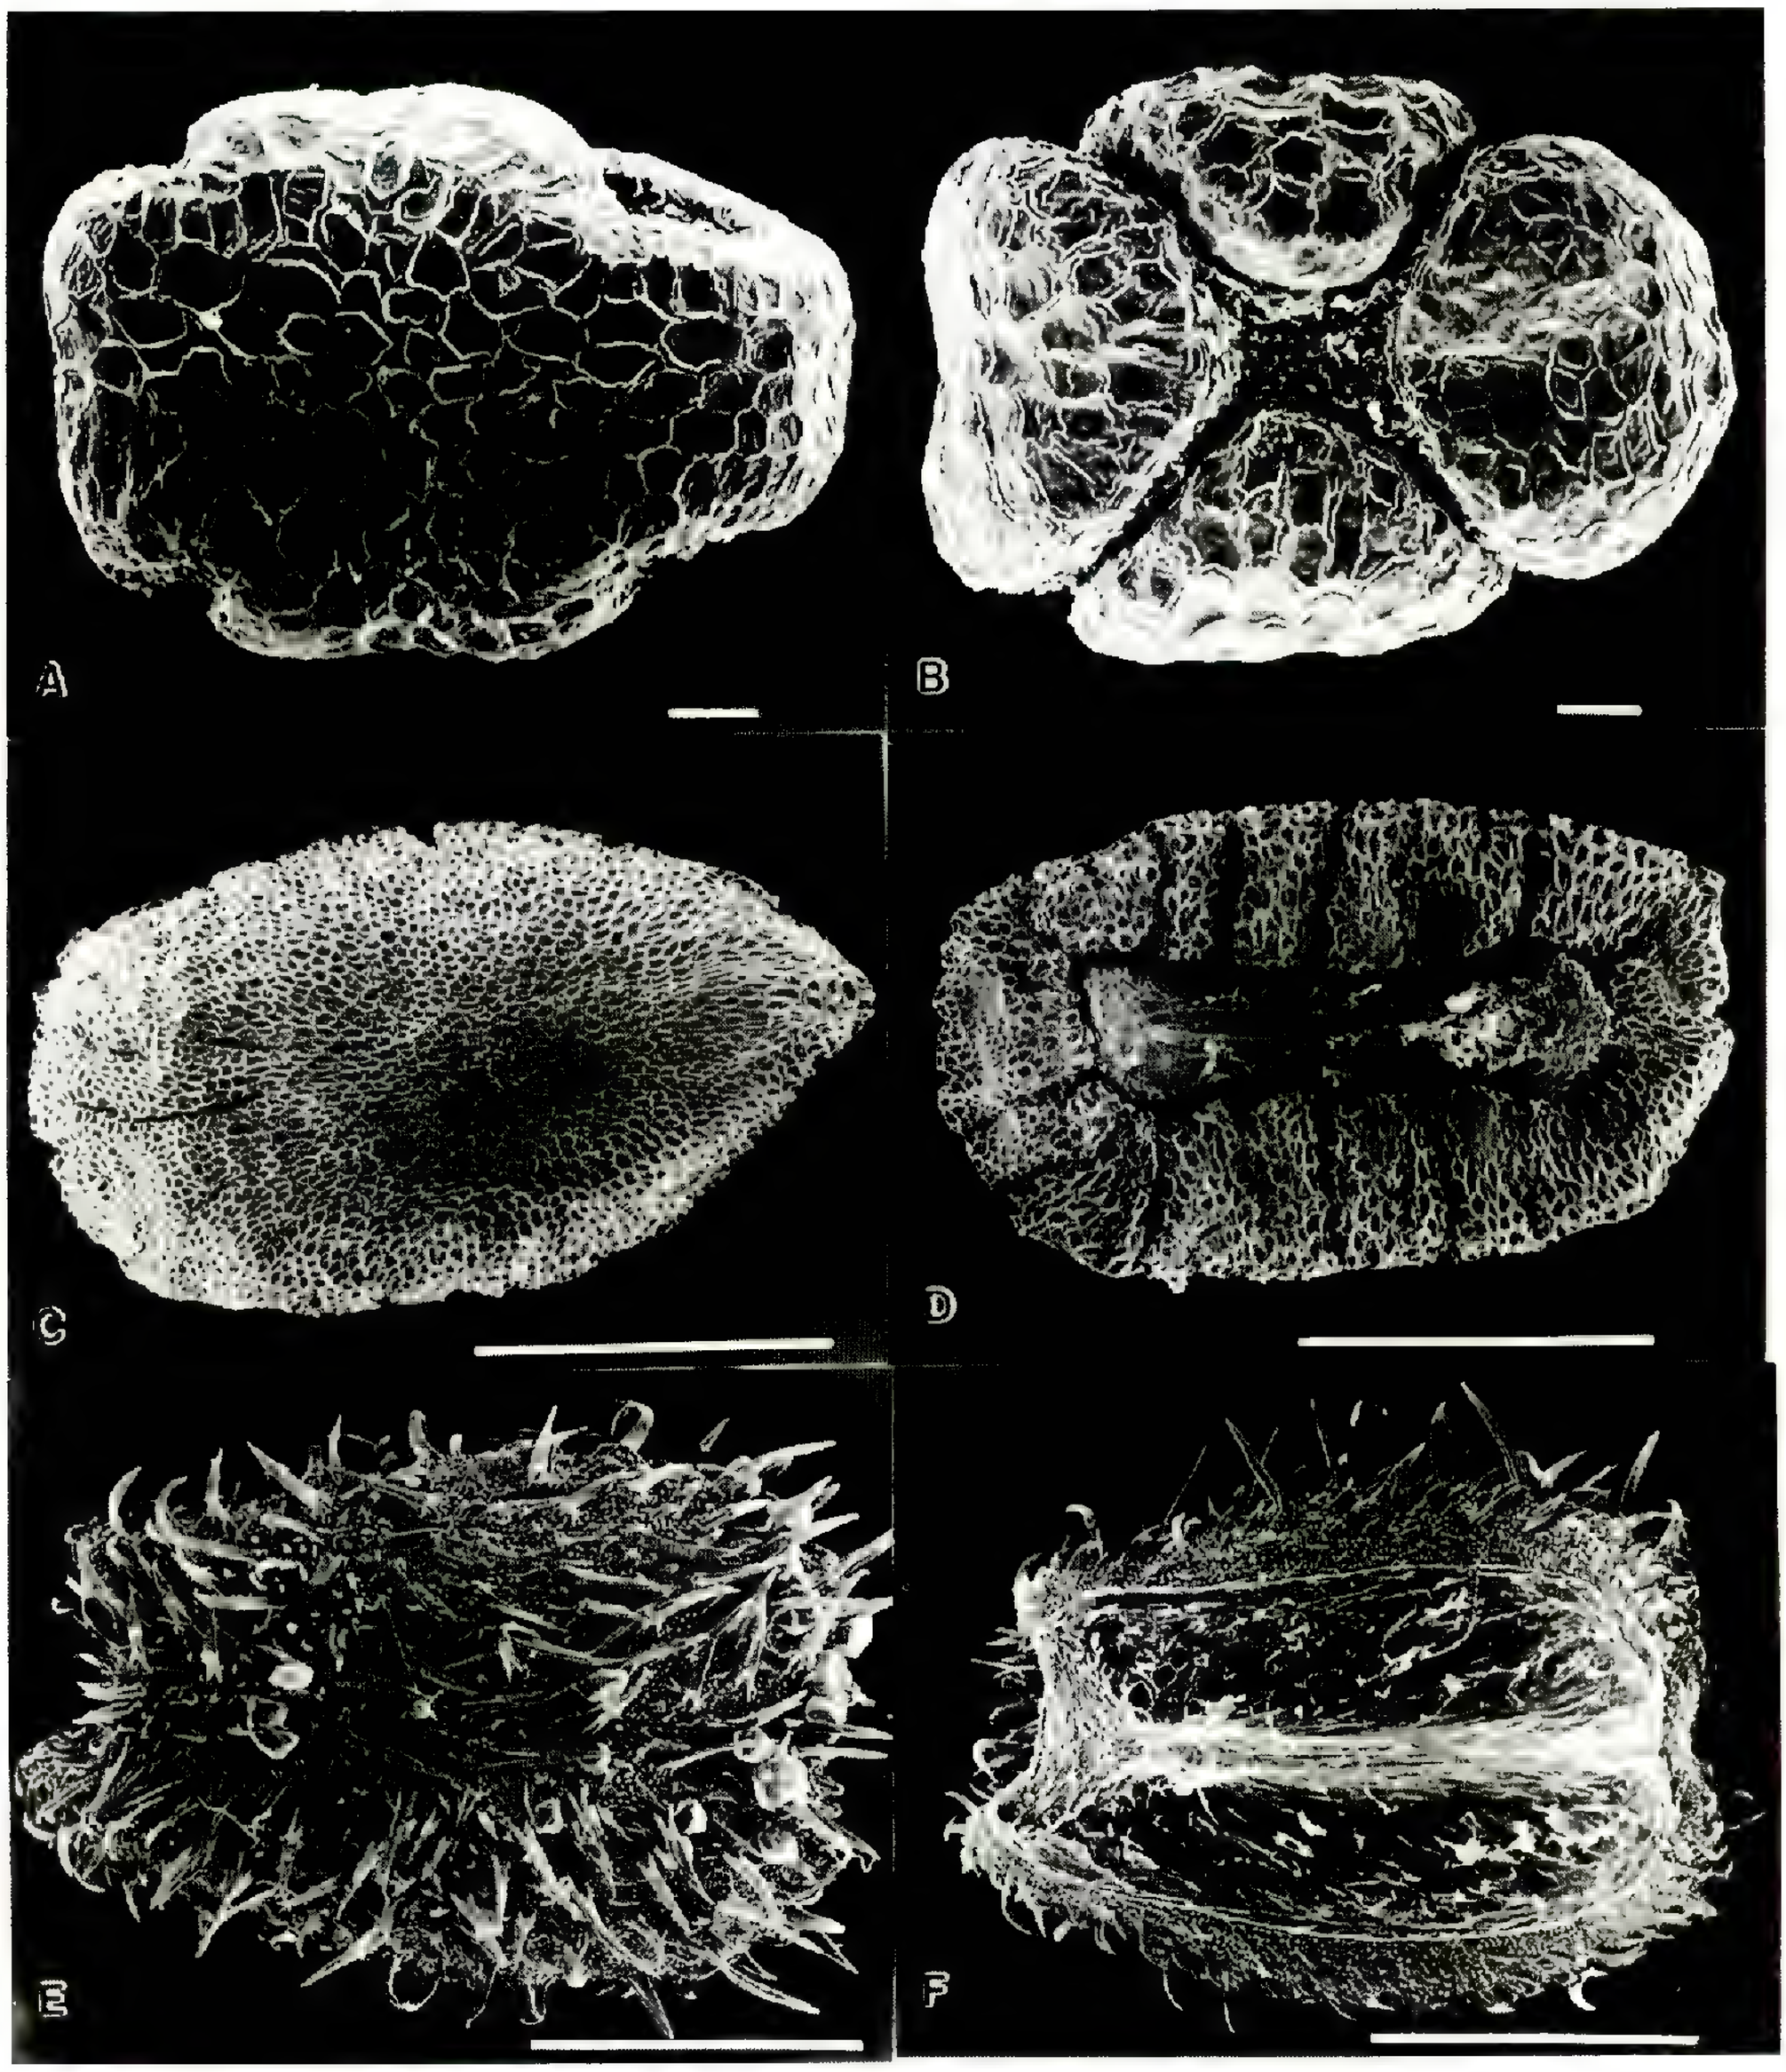

FIG. 3. Dorsal and ventral views of seeds and mericarps examined by SEM. *Mitrocarpus hirtus* seeds (**A–B**), *Ernodea littoralis* seeds (**C–D**), *Richardia brasiliensis* mericarps (**E–F**). Scale bars are 100 microns (A–B), 1000 microns (C–F). Sources of collections listed in Table 1.

Bacigalupo & E.L.Cabral by Bacigalupo and Cabral (1996). Another study by Bacigalupo and Cabral (1999) defined *Diodia* as comprised of only five American species; the other species previously referred to the genus are transferred to *Galianthe* or *Borreria*. These workers exclude *Diodia teres* and related species from *Diodia* s. str. The placement of these species is still under study by Bacigalupo and Cabral. The seed morphology is markedly different between the two southeastern U.S. species, *Diodia virginiana* and *Diodia teres*, exam-

ined in this study (Fig. 1A–D). The seed of *D. virginiana* is oblong with an equally rounded apex and base. The testa has more or less isodiametric cells. In contrast, that of *D. teres* is oblong with an apical projection and a truncate base. On the ventral surface, the base and sides are somewhat enrolled onto the longitudinal groove. The cells of the testa surface are elongate (2–3 times as long as wide). Further study by other workers may prove *D. teres* and related species to be distinct at the generic or subgeneric level.

The seeds of the four *Richardia* species examined are fairly uniform, differ only slightly in size and shape, and the genus appears to be a natural assemblage.

Ernodea seeds and fruits are most similar to those of *Diodia virginiana*.

The seeds of *Mitracarpus* are unique among those examined in this study. The distinct x-shaped groove and the circumscissile dehiscent capsule, both features unique in the tribe, suggest that it may be a distinct subtribe.

The Hedyotideae is much simpler in seed morphology than is the Spermacoceae, but has much more variation in seed shape and size. The seeds are typically in subglobose capsules, each bearing few to many seeds borne on complexly structured placentas. The variation shown by the seeds of the various taxa is very great and each genus, subgenus, or section often has its own particular seed shape. The following are some examples of seed diversity found in the Hedyotideae: (1) *Houstonia* L. has crateriform seeds, each with a ventral subglobose cavity (subg. *Houstonia*) or with a hilar ridge in a ventral shallow depression (subg. *Chamisme* Raf. sect. *Amphiotis* (DC.) Terrell) or with a hilar ridge in a ventral boat- or cup-shaped depression and with other complex structure (subg. *Chamisme* sect. *Ericotis* (Terrell) Terrell) (Terrell et al. 1986, Terrell 1996); (2) *Oldenlandia* L. typically has very small trigonous seeds, 50–100 or more per capsule (Terrell 1996); (3) the *Hedyotis fruticosa* L. group has dorsiventrally compressed seeds with a short to long raised hilar ridge (Terrell 1996); and (4) *Stenotis* Terrell and *Stenaria* (Raf.) Terrell have ellipsoid seeds with a central punctiform hilum (Terrell 2001a, 2001b).

The Spermacoceae, in contrast, have one seed per locule, and the locules develop into varied mericarps. The complexity occurs in the mericarps as well as in the seeds; the seeds examined here do not seem to exhibit much variation, although the *Mitracarpus* seed is an exception. In the Spermacoceae, some mericarps are hardened and indehiscent (e.g., *Diodia*), others are fleshy (*Ernodea*), and some open widely (e.g., *Spermacoce*). Each genus often has its characteristic kind of mericarp, and its structure is important in classification (e.g., *Richardia*, Fig. 4A,B). The mericarps may be more important in classification than the seeds (e.g., our figures show the similarity of seeds among the various genera). The presence of such varied mericarps contrasts with the morphology of the Hedyotideae, which have no such seed covering, just the bare seeds attached to a multi-branched placenta.

An additional seed feature not found in the Hedyotideae is the ventral

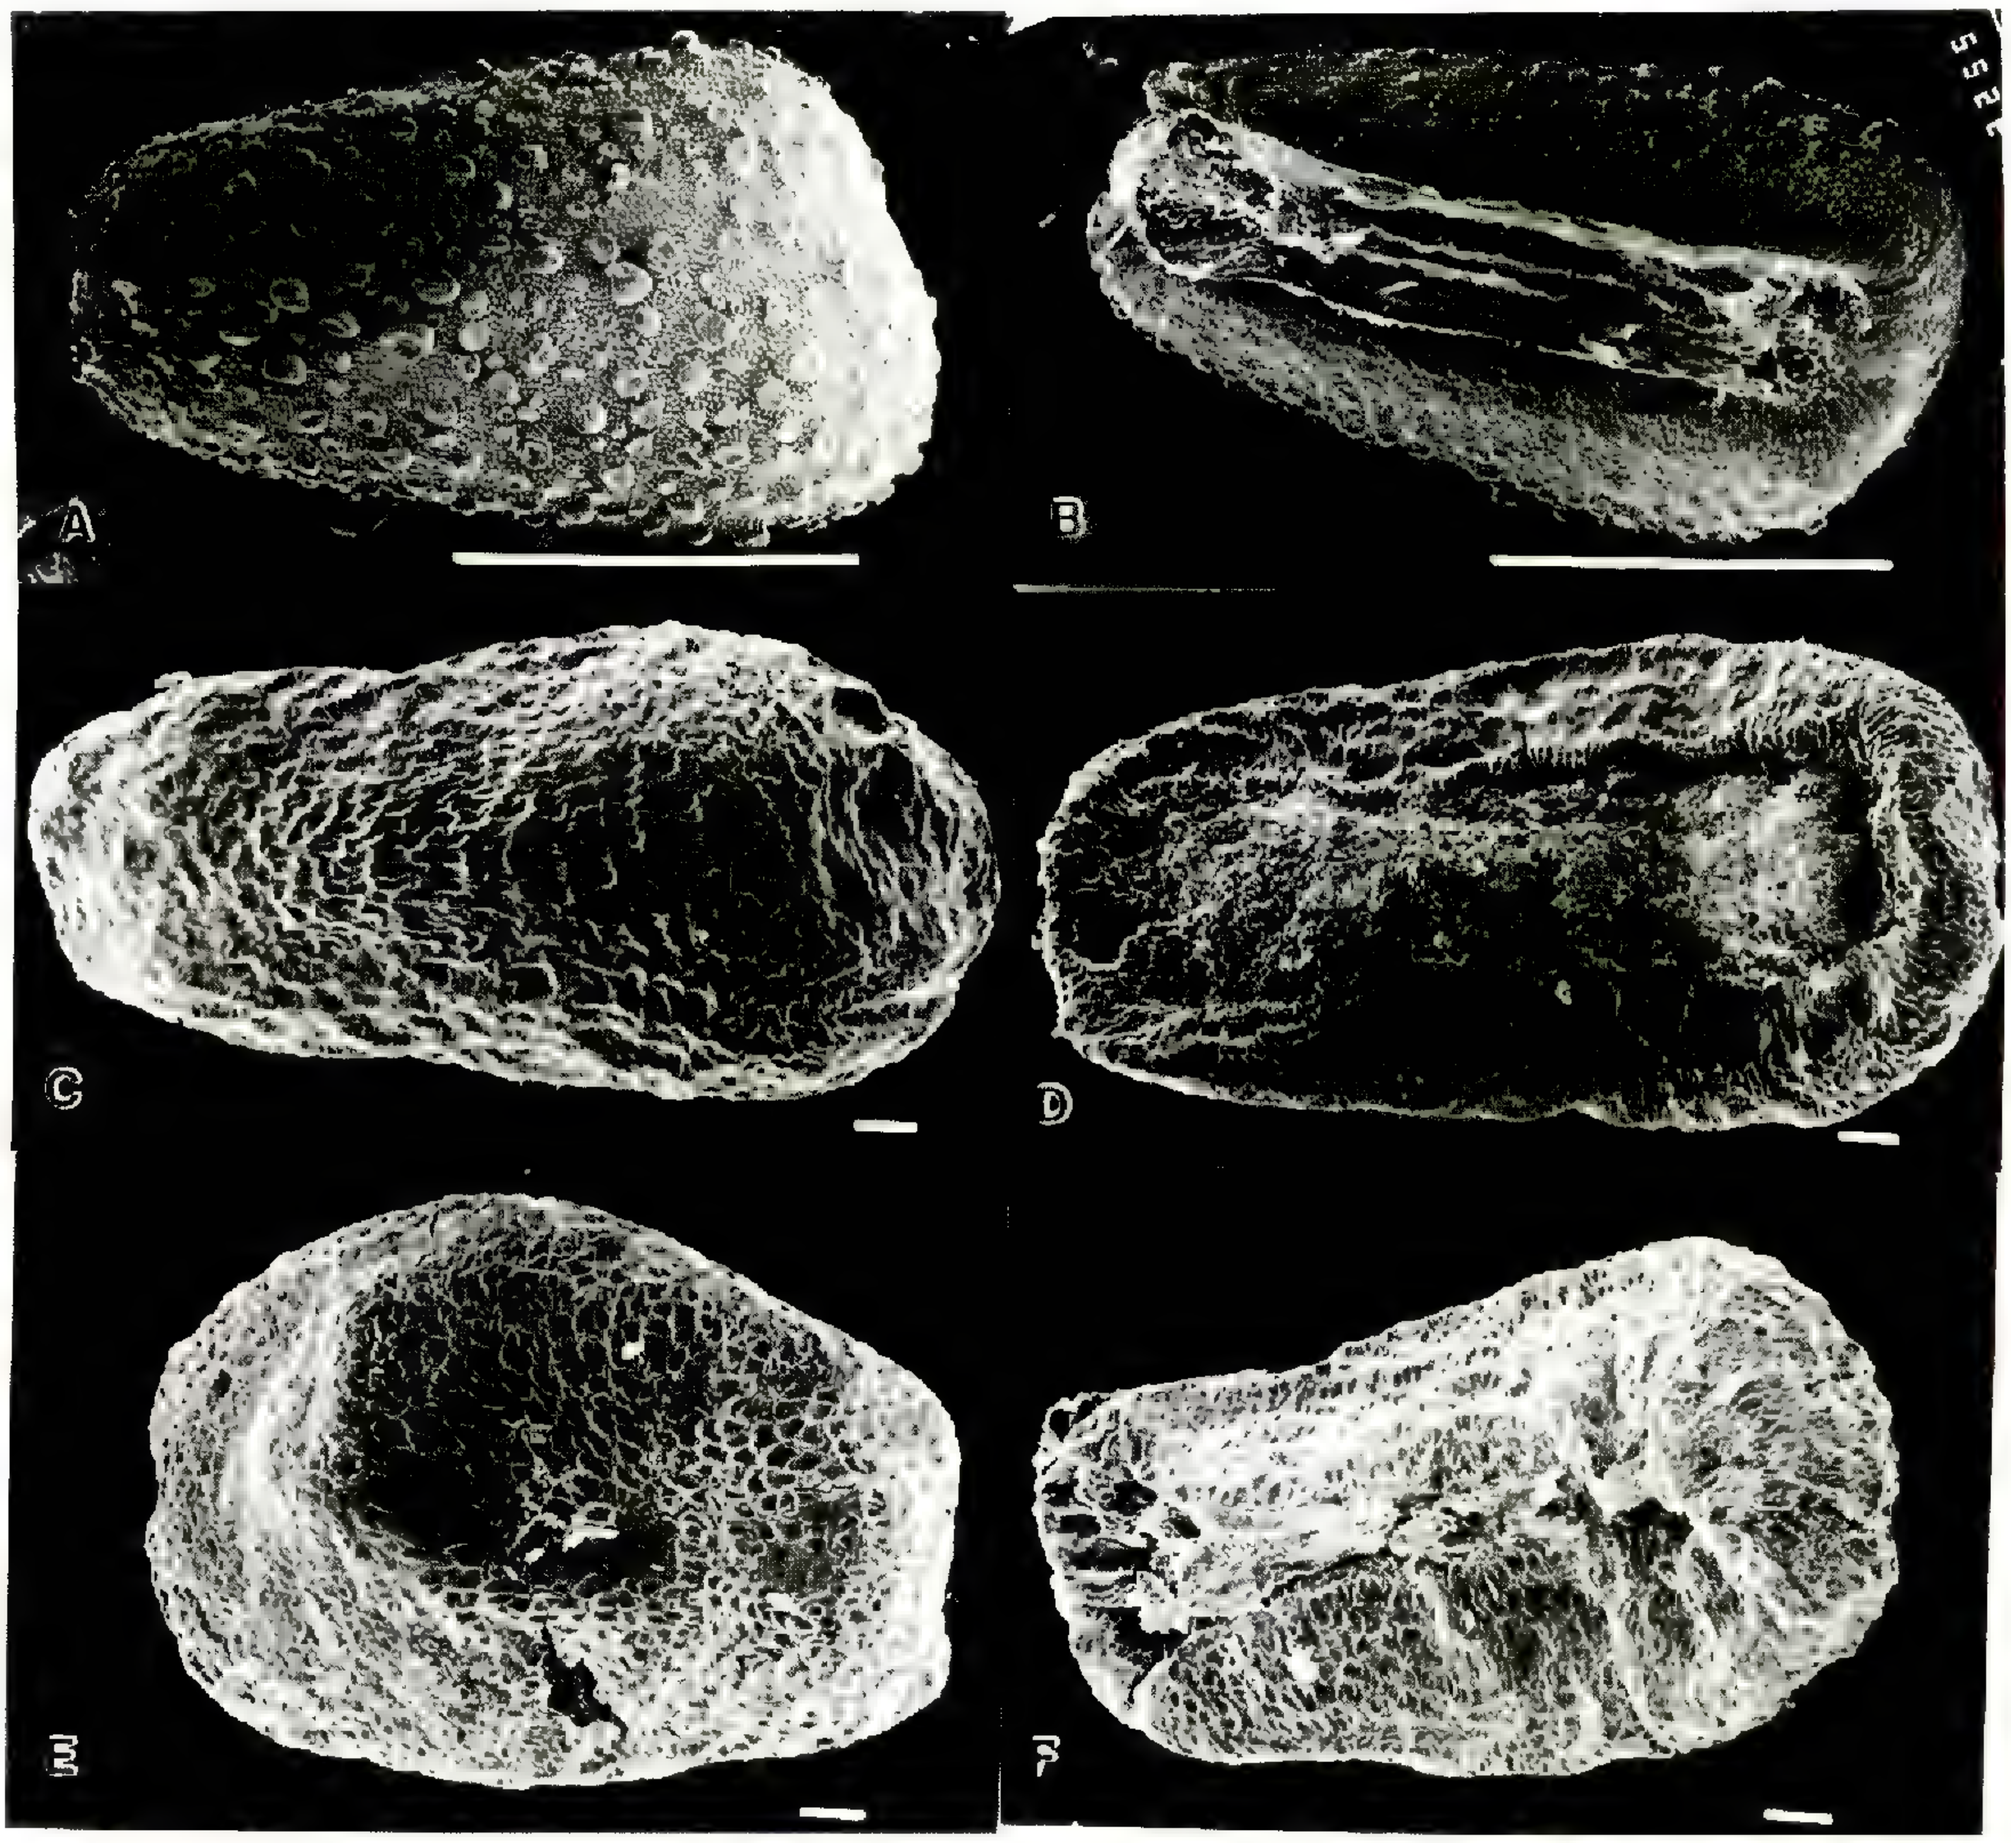

FIG. 4. Dorsal and ventral views of seeds and mericarps examined by SEM. *Richardia scabra* mericarps (**A–B**), *R. humistrata* seeds (**C–D**) and *R. tricocca* seeds (**E–F**). Scale bars are 1000 microns (A–B), 100 microns (C–F). Sources of collections listed in Table 1.

(adaxial) longitudinal groove which resembles a raphe. This structure was designated as a strophiole by Kirkbride (1979), Bacigalupo and Cabral (1996), and other South American botanists. The structure and terminology of this apparent raphe needs further study. It occurs on all seeds of Spermacoceae that we have examined. The Hedyotideae differ in having a so-called hilum, a punctiform scar or a more elongated ridge-top scar on the seed.

Although our evidence from five selected genera represents a limited survey of the possibly 19 genera of Spermacoceae, it is sufficient to lead us to seriously question the union of the Spermacoceae and Hedyotideae.

ACKNOWLEDGMENTS

We thank Betty Loraamm, Electron Microscope Manager, and Clinton J. Dawes, Biology Department, University of South Florida for providing SEM data and

advice on SEM matters. Joseph Kirkbride and John Wiersema contributed valuable reviews. Piero Delprete provided early taxonomic advice. Paul Peterson and Pedro Acevedo contributed the Spanish translation.

Book Notice

J.D. Vertrees. 2001. **Japanese Maples: Momiji and Kaede. Third Edition Revised and Expanded by Peter Gregory.** (ISBN 0-88192-501-2, hbk.). Timber Press, Inc., 133 S.W. Second Avenue, Suite 450, Portland, OR 97204-3527, U.S.A. (Orders: www.timberpress.com, 800-327-5680, 503-227-2878, 503-227-3070 fax). $49.95, 332 pp, 312 color photos, 4 maps, 8 1/2" × 11".

A comprehensive source of information on the culture, identification, and nomenclature of Japanese maples, this newly revised classic best seller describes each of the 320 cultivars of *Acer palmatum* and 60 cultivars of other Japanese maple species, plus briefly mentions 150 promising new plants. The second edition was selected in 1997 by the American Horticultural Society as one of the 75 great American Garden Books.

This fully updated third edition has been revised by Peter Gregory, chairman of the Maple Society, and is even more comprehensive than its predecessors. The most extensive revision occurs within Chapter 2: *Taxonomy and Nomenclature*. It adds approximately 100 important new maple hybrids and selections that have been introduced since the last revision by the late J.D. Vertrees in 1987. A total of some 320 *A. palmatum* cultivars are described, along with 60 cultivars of other Japanese maple species. Nomenclature has been updated to conform to current taxonomic standards. The cultivar descriptions in *Chapter 5: Acer palmatum and Its Cultivars* have been placed in alphabetical order rather than by group to make the information more easily accessible. Many additional new photographs have been included, and Vetrees' original photos are clearer and sharper thanks to current reproduction technology. The meanings of Japanese names have been added to the descriptions where possible. This proved impractical in many cases as the meaning could not be determined accurately. *Appendix B: Guide to Uses and Characteristics* provides a summary to assist in the selection of specific plants for individual situations, taking into consideration their ultimate size, habit, color, suitability for companion plantings, and dramatic effect in the garden. The *Index* has been expanded to include all the Japanese maple cultivar names published in books, journals, and major catalogs of growers. The list contains synonyms and alternative names, misspellings and misprints, and names of cultivars which are thought to be no longer in cultivation. The Index alone should continue to make *Japanese Maples* the foremost dictionary and encyclopedic reference for this cultivar.

Japanese Maples will provide guidance for gardeners, landscapers, nursery owners, and others with an authoritative guide to propagation, cultivation, and horticultural characteristics of this extraordinarily useful group of plants. It will meet the needs of all readers, but especially amateur gardeners, avid plant enthusiasts, and commercial nursery professionals.—*Gary L. Jennings, Botanical Research Institute of Texas, Fort Worth, TX 76102-4060, U.S.A.*

ABSTRACT

Morphology, distribution, ecology and phenology for *Carphephorus odoratissimus* and *C. odoratissimus* var. *subtropicanus* are discussed and compared. *Carphephorus odoratissimus* var. *subtropicanus* is illustrated and evidence supporting varietal status is quantified. It occurs in a fire-maintained pine savanna-flatwoods/dry prairie landscape, where it is a conspicuous, perennial, autumn-flowering forb, endemic to south and central peninsular Florida.

RESUMEN

Se discute y compara la morfología, distribución, ecología y fenología de *Carphephorus odoratissimus* y *C. odoratissimus* var. *subtropicanus*. *Carphephorus odoratissimus* var. *subtropicanus* se ilustra y se cuantifican las evidencias que apoyan su estatus varietal. Se da en una sabana/pradera seca de pinos mantenida mediante fuego, es una hierba perenne, otoñal, endémica del sur y centro de la península de Florida.

INTRODUCTION

Carphephorus sensu lat. (Asteraceae-Eupatorieae-Liatrinae) comprises seven species (Correa & Wilbur 1969), and one recently recognized variety (Wunderlin & Hansen 2001) of *Carphophorus odoratissimus*, all of which are endemic to the southeastern United States. Six of these taxa occur in Florida, of which five [*C. carnosus* (Small) C.W. James, *C. corymbosus* (Nutt.) Torr. & A. Gray, *C. paniculatus* (J.F. Gmelin) H. Hebert, *C. odoratissimus* (J.F. Gmelin) H. Hebert, and *C. odoratissimus* var. *subtropicanus* (DeLaney, N. Bissett & Weidenhamer) Wunderlin & B.F. Hansen] are known from peninsular Florida (DeLaney et al. 1999; Wunderlin 1982; Wunderlin et al. 1996; Wunderlin 1998; Wunderlin & Hansen 2001).

The circumscription of *Carphephorus* has been much debated (Hebert 1968; Correa & Wilbur 1969; Cronquist 1980; Cox 1998). Some authors (Hebert 1968; Correa & Wilbur 1969) include *Trilisa* and *Litrisa* within *Carphephorus*, while others recognize them as distinct genera (Cassini 1823, 1828; Robinson 1913; Gaiser 1954; James 1958; King & Robinson 1987; Bremer 1994). Evidence presented by both Hebert (1968) and Correa & Wilbur (1969) support the inclusion of *Trilisa* within *Carphephorus*. Most recent floristic works have adopted this broad definition of *Carphephorus* (Cronquist 1980; Godfrey & Wooten 1981; Long & Lakela 1971; Wunderlin 1982; Wunderlin et al. 1996; Wunderlin 1998).

SIDA 20(2): 559 – 569. 2002

In the most recent taxonomic study of *Carphephorus* sensu lato (Correa & Wilbur 1969), *Trilisa* and *Litrisa* are included within *Carphephorus*. Since Correa and Wilbur (1969), no new taxa in *Carphephorus* were recognized until DeLaney et al. (1999), described *C. subtropicanus* DeLaney, N. Bissett, & Weidenhamer. Following DeLaney et al. (1999), Wunderlin and Hansen (2001) treated *C. subtropicanus* at varietal rank within *C. odoratissimus*.

Based upon field observations in the fall of 1995, there seemed to be two entities of *C. odoratissimus* within peninsular Florida. *Carphephorus* specimens from flatwoods and prairie habitats of south-central peninsular Florida seemed somewhat morphologically different from *C. odoratissimus*, as known to us from previous fieldwork in southern Alabama, southern Mississippi, southern Georgia, and the Florida panhandle. Subsequent field investigations and critical taxonomic study of *Carphephorus* conducted from 1995–1997 led us to conclude that the *Carphephorus* entity in south-central peninsular Florida was worthy of recognition. Since that time, our on-going (1998–2001) field investigations and taxonomic studies of Florida *Carphephorus*, particularly in the region of range overlap for *C. odoratissimus* and *C. subtropicanus* in central Florida, lead us to conclude that *C. subtropicanus* should be recognized as a variety of *C. odoratissimus*. In this paper we present ecological, geographical, morphological, and phenological evidence to corroborate Wunderlin & Hansen's (2001) recognition of *C. subtropicanus* at varietal rank. All our data on morphological characters are derived from field sampling of randomly chosen individuals in each of ten populations of these varieties scattered in central Florida. Both entities have mainly separate geographic ranges but intergrade where they are contiguous or overlapping; both exhibit slightly divergent but overlapping flowering phenology; and despite quantitative differences in mean values of vegetative morphology and numbers of flowers per head, they lack differences in achene and floral morphology; all these features are indicative of varietal rather than species level recognition. Phenotypically, *C. odoratissimus* var. *subtropicanus* is distinguished from *C. odoratissimus* var. *odoratissimus* by its lack of a coumarin (vanilla-like odor), shorter and narrower basal leaves, strongly clasping and entire stem leaves, broader and more diffuse inflorescence, and more flowers per head. An illustration of *Carphephorus odoratissimus* var. *subtropicanus* is provided in Figure 1.

TAXONOMIC RELATIONSHIPS

Carphephorus odoratissimus var. *subtropicanus* differs from var. *odoratissimus* most notably in leaf character and some inflorescence characters. Small (1933:1337) noted that "extreme forms" of *Trilisa odoratissima* (= *C. odoratissimus*) might represent two entities, "one with a strong coumarin odor, broad, clasping, coarsely toothed upper leaf -blades and slightly viscid involucres [var. *odoratissimus*], the other with only a faint coumarin odor, narrow entire

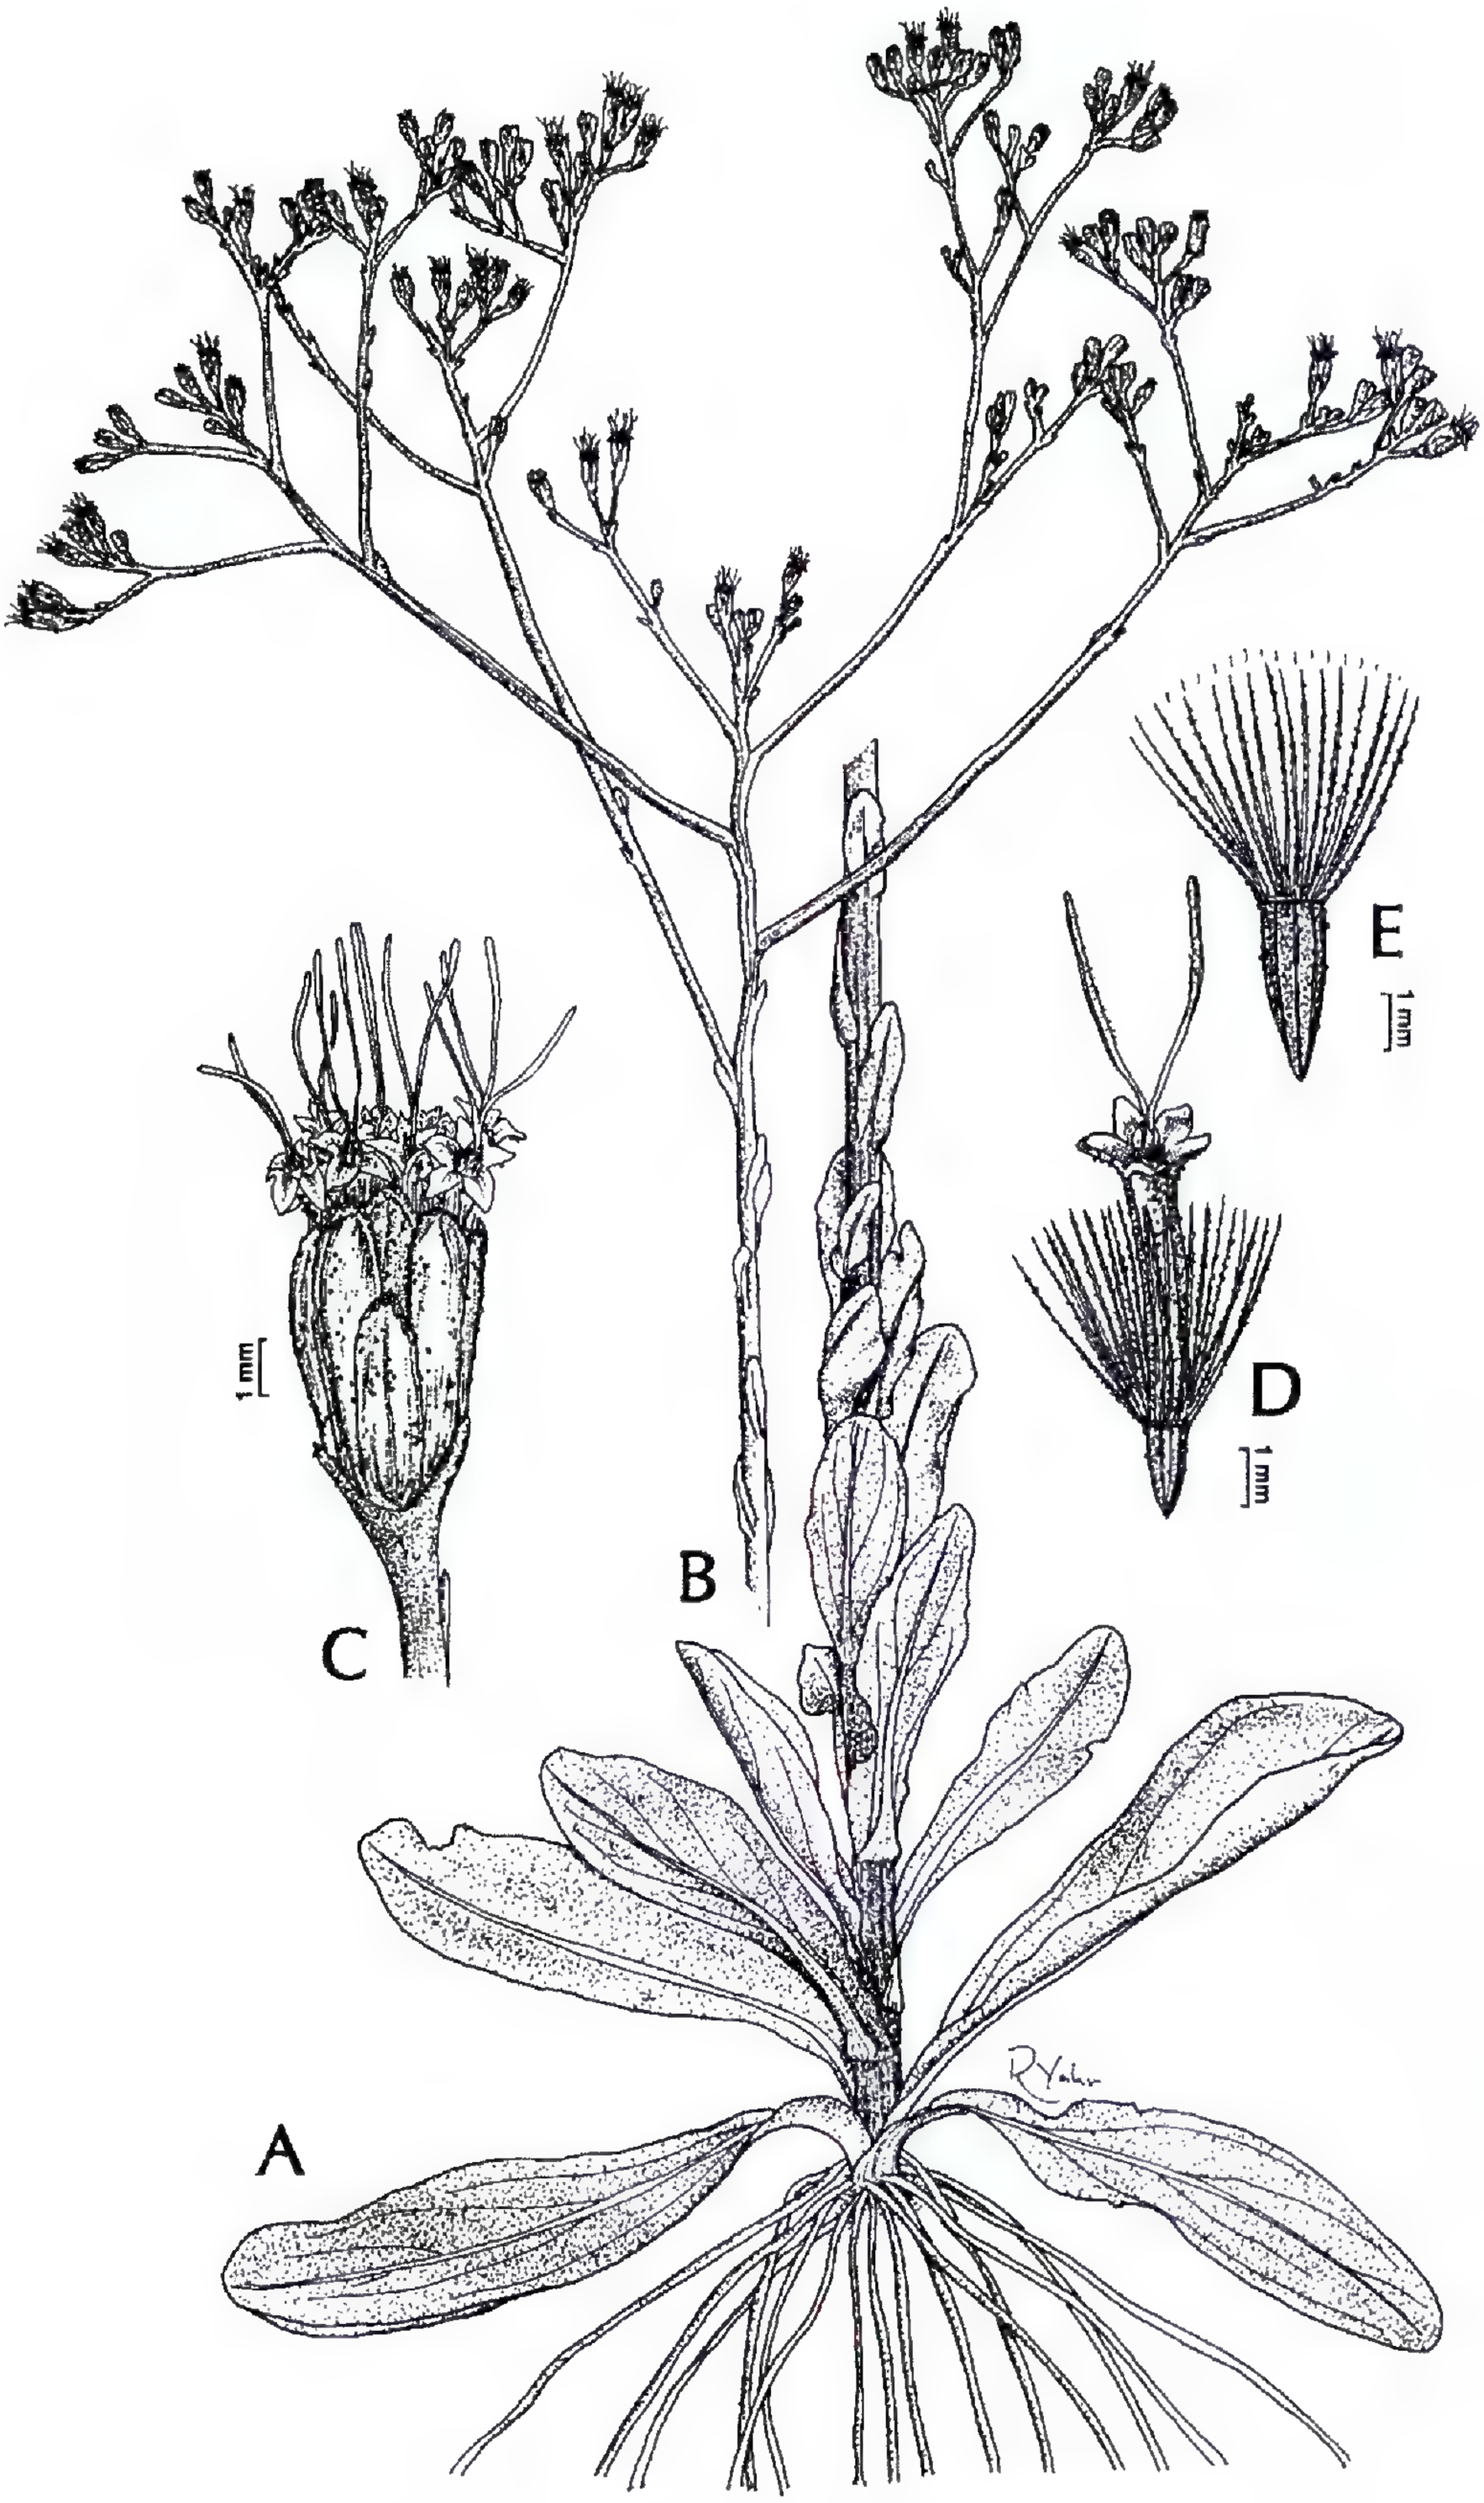

FIG. 1. *Carphephorus odoratissimus* var. *subtropicanus* drawn from *Orzell & Bridges 25,261*. **A.** Habit of base of plant; **B.** Inflorescence; **C.** Single head at anthesis; **D.** Floret at anthesis with pappus and achene; **E.** Mature achene with pappus.

upper leaf blades and very viscid involucres. Small never published the latter as a distinct taxon, and subsequent floristic workers have treated *C. odoratissimus* as a single entity. A revision of the genus (Correa & Wilbur 1969) also failed to account for the two as separate entities. According to Correa and Wilbur (1969), the type of *C. odoratissimus* is "presumably from the outer Coastal Plain of South Carolina ... which was the site of most of the species mentioned in Thomas Walter's *Flora Caroliniana*." Although this type has not been seen by the authors, the collection location is outside the range of *C. odoratissimus* var. *subtropicanus*.

There is considerable character overlap between the two *C. odoratissimus* varieties (Table 1). The presence of numerous quantitative differences in inflorescence and leaf morphology are the most divergent character states. However, the lack of major differences in achene and floral morphology indicates differentiation at the varietal level. One useful character is the average number of inflorescences per clump in well-developed plants. Most plants of *C. odoratissimus* var. *subtropicanus* have one or two flowering stems per clump (mean=1.6, std.=0.8), whereas in central Florida var. *odoratissimus* averages over twice as many inflorescences per clump (mean=4.1, std.=1.9). Several characters of the basal and stem leaves have different mean character states. Although there is wide variation in leaf size and shape between plants within a population in either entity and between lower and upper leaves on individuals, comparison of leaves in the same relative position on plants of the two varieties reveals consistent differences. The basal leaves of *C. odoratissimus* var. *subtropicanus* are both shorter (mean=11 cm) and narrower (mean=3.0 cm) than those of var. *odoratissimus* (mean length=19.8 cm; mean width=5.6 cm). The stem leaves of var. *odoratissimus* are broadly elliptic, and although the base of the leaf clasps the stem, the apex of the leaf is often divergent or flared away from the stem. The margins of the stem leaves in var. *odoratissimus* are often coarsely shallowly toothed. In contrast, the stem leaves of var. *subtropicanus* are narrowly elliptic, clasp the stem for their entire length, and typically have entire margins.

Other characters that differentiate the two varieties involve the size and branching pattern of the inflorescence. The inflorescence of var. *subtropicanus* is much broader than that of var. *odoratissimus*, and on well-developed mature plants it is almost always as broad as tall or broader than tall (height:width ratio mostly from 0.5:1 to 1:1). This difference is mostly attributable to the angle of branching of the primary inflorescence branches from the main axis. The inflorescence branches of var. *subtropicanus* diverge from the main axis at an angle of 30° to 45° and are often arcuate, resulting in a rather open and diffuse inflorescence. In contrast, the main inflorescence branches of var. *odoratissimus* diverge from the main axis at an angle of 10° to 20°, resulting in a narrower, taller, inflorescence that is typically taller than broad (height:width ratio from 1.5:1 to 3:1). This open, diffuse inflorescence, more diffuse than any other species

TABLE 1: Ranges of character states in selected populations of *Carphephorus odoratissimus*.

Character	var. *odoratissimus*	var. *subtropicanus*
Stem height	140–180 cm	50–150 cm
Stems per clump	1–9	1–5
Basal leaf length	17–24 cm	9–14 cm
Basal leaf width	4.5–6.8 cm	2.5–4.0 cm
Inflorescence height:width ratio	1.5:1 to 3:1	0.5:1 to 1:1
Lower stem leaf length	10–15 cm	4–11 cm
Lower stem leaf width	5–7 cm	1.7–4.0 cm
Midstem leaf length	2.2–4.5 cm	1.6–6.0 cm
Midstem leaf width	1.8–3.5 cm	0.8–2.4 cm
Flowers per head	(4–)7–10	(7–)10–14
Involucre height	4–6 mm	7–9 mm
Involucre width	2–3 mm	4–6mm
Achene length	2–2.5 mm	1.9–2.5(–2.8) mm

of *Carphephorus*, is a reliable field character but is often difficult to discern in dried herbarium specimens or plants with an immature inflorescence.

Differences in inflorescence, floral, and achene characters between the two varieties are minor. There is considerable variation even within an individual in the number of florets per head, size of heads, and size of floral parts. *Carphephorus odoratissimus* var. *subtropicanus* tends to have more florets per head (10–13) than is typical for var. *odoratissimus* (7–10). However, this could be attributable to the fact that most var. *subtropicanus* inflorescences consist of only 50–75 heads, in contrast to the hundreds of heads present in some inflorescences of var. *odoratissimus*; therefore a larger proportion of heads fully develop all of their potential florets. We can not find any consistent differences in achene length (1.9–2.5 mm) (–2.8 mm) for *C. odoratissimus* var. *subtropicanus* in comparison to var. *odoratissimus* (2.0–2.5 mm) or other floral characters between the two varieties. DeLaney et al. (1999) also noted overlap in achene length and number of florets per capitulum.

The following key can be used to distinguish the two varieties:

Plants with a strong odor of coumarin or vanilla; basal leaves usually more than 15 cm long and 5 cm wide; midstem leaves broadly elliptic, the apex flared away from the stem, the margins often shallowly toothed; inflorescence taller than broad (height:width ratio of 1.5:1 to 3:1), the primary inflorescence branches diverging from the main axis at a 10° to 20° angle; heads mostly with 7–10 flowers _____ **Carphephorus odoratissimus** var. **odoratissimrus**

Plants with very slight or no odor of coumarin or vanilla; basal leaves less than 15 cm long and 4 cm wide; midstem leaves narrowly elliptic, tightly clasping the stem, the margins entire; inflorescence broader than tall (height:width ratio of 0.5:1 to 1:1), the primary inflorescence branches diverging from the main axis at a 30° to 45° angle; heads mostly with 10–14 flowers _____ **Carphephorus odoratissimus** var. **subtropicanus**

DISTRIBUTION AND ECOLOGY

Carphephorus odoratissimus var. *subtropicanus* is endemic to central and southern peninsular Florida, where it has been collected from 21 counties (Fig. 2), an area encompassing approximately 50,000 sq. km (20,000 sq. mi). It is a conspicuous, autumn-flowering forb of burned pine savanna-flatwoods/dry prairie landscape throughout south-central Florida and is quite frequent in Highlands, Polk, and Okeechobee counties. In the western part of the peninsula, its range extends somewhat further north as compared to the eastern part of its peninsular range. In south Florida, *C. odoratissimus* var. *subtropicanus* is rather infrequent in Collier County, having been collected most frequently in scrubby flatwoods near Immokalee and historically from scrubby flatwoods at Marco Island, the only offshore island location presently known. In southeastern Florida it has been collected from flatwoods and prairies in St. Lucie, Martin, and northern Palm Beach counties. It is not known from the Everglades region of south Florida, presumably due to the absence of acidic pine flatwoods and prairies. There is an historical collection from a sandy low pineland in northern Miami-Dade County, presumably from sandy flatwoods that once occurred on the Atlantic Coastal Ridge.

Carphephorus odoratissimus var. *odoratissimus*, in contrast, is found throughout most of the southeastern United States coastal plain, from southeastern North Carolina south and west to southeastern Louisiana (Correa & Wilbur1969). It is quite common in northern Florida and in southern Georgia and Alabama, where it is typically found in upland longleaf pine (*Pinus palustris* Mill.) dominated woodlands and savannas. Throughout its range var. *odoratissimus* tends to be associated with sandy surface soils that are better drained than those for var. *subtropicanus*. *Carphephorus odoratissimus* var. *odoratissimus* does not occur in South Florida slash pine (*Pinus elliottii* Engelm. var. *densa* Little & K.W. Dorman) dominated flatwoods. However, ranges of both varieties overlap in central Florida. Here *Carphephorus odoratissimus* var. *odoratissimus* seems to reach its southern limit in ecotonal habitats on the lower sideslopes of sandy ridges, both associated with the Central Ridges in extreme northern Polk and Osceola counties and with coastal sand ridges in Brevard, Volusia, Citrus, and Hillsborough counties.

Carphephorus odoratissimus var. *subtropicanus* is characteristic of the pine-savanna flatwoods/dry prairie landscape of the Okeechobee, Osceola, and Desoto Plains (as defined by Cooke 1939; Schmidt 1997) in south-central peninsular Florida. Pine savanna-flatwoods and dry prairie occupy nearly level, inter-drainage flatlands on acidic, low nutrient, poorly drained sandy to sandy clay alfisol or spodosol soils (Abrahamson & Hartnett 1990; Bridges 1997; Orzell & Bridges 1997). Pine savanna-flatwoods are fire-maintained, open-canopied pine stands dominated in south-central Florida either by *Pinus palustris* or *P.*

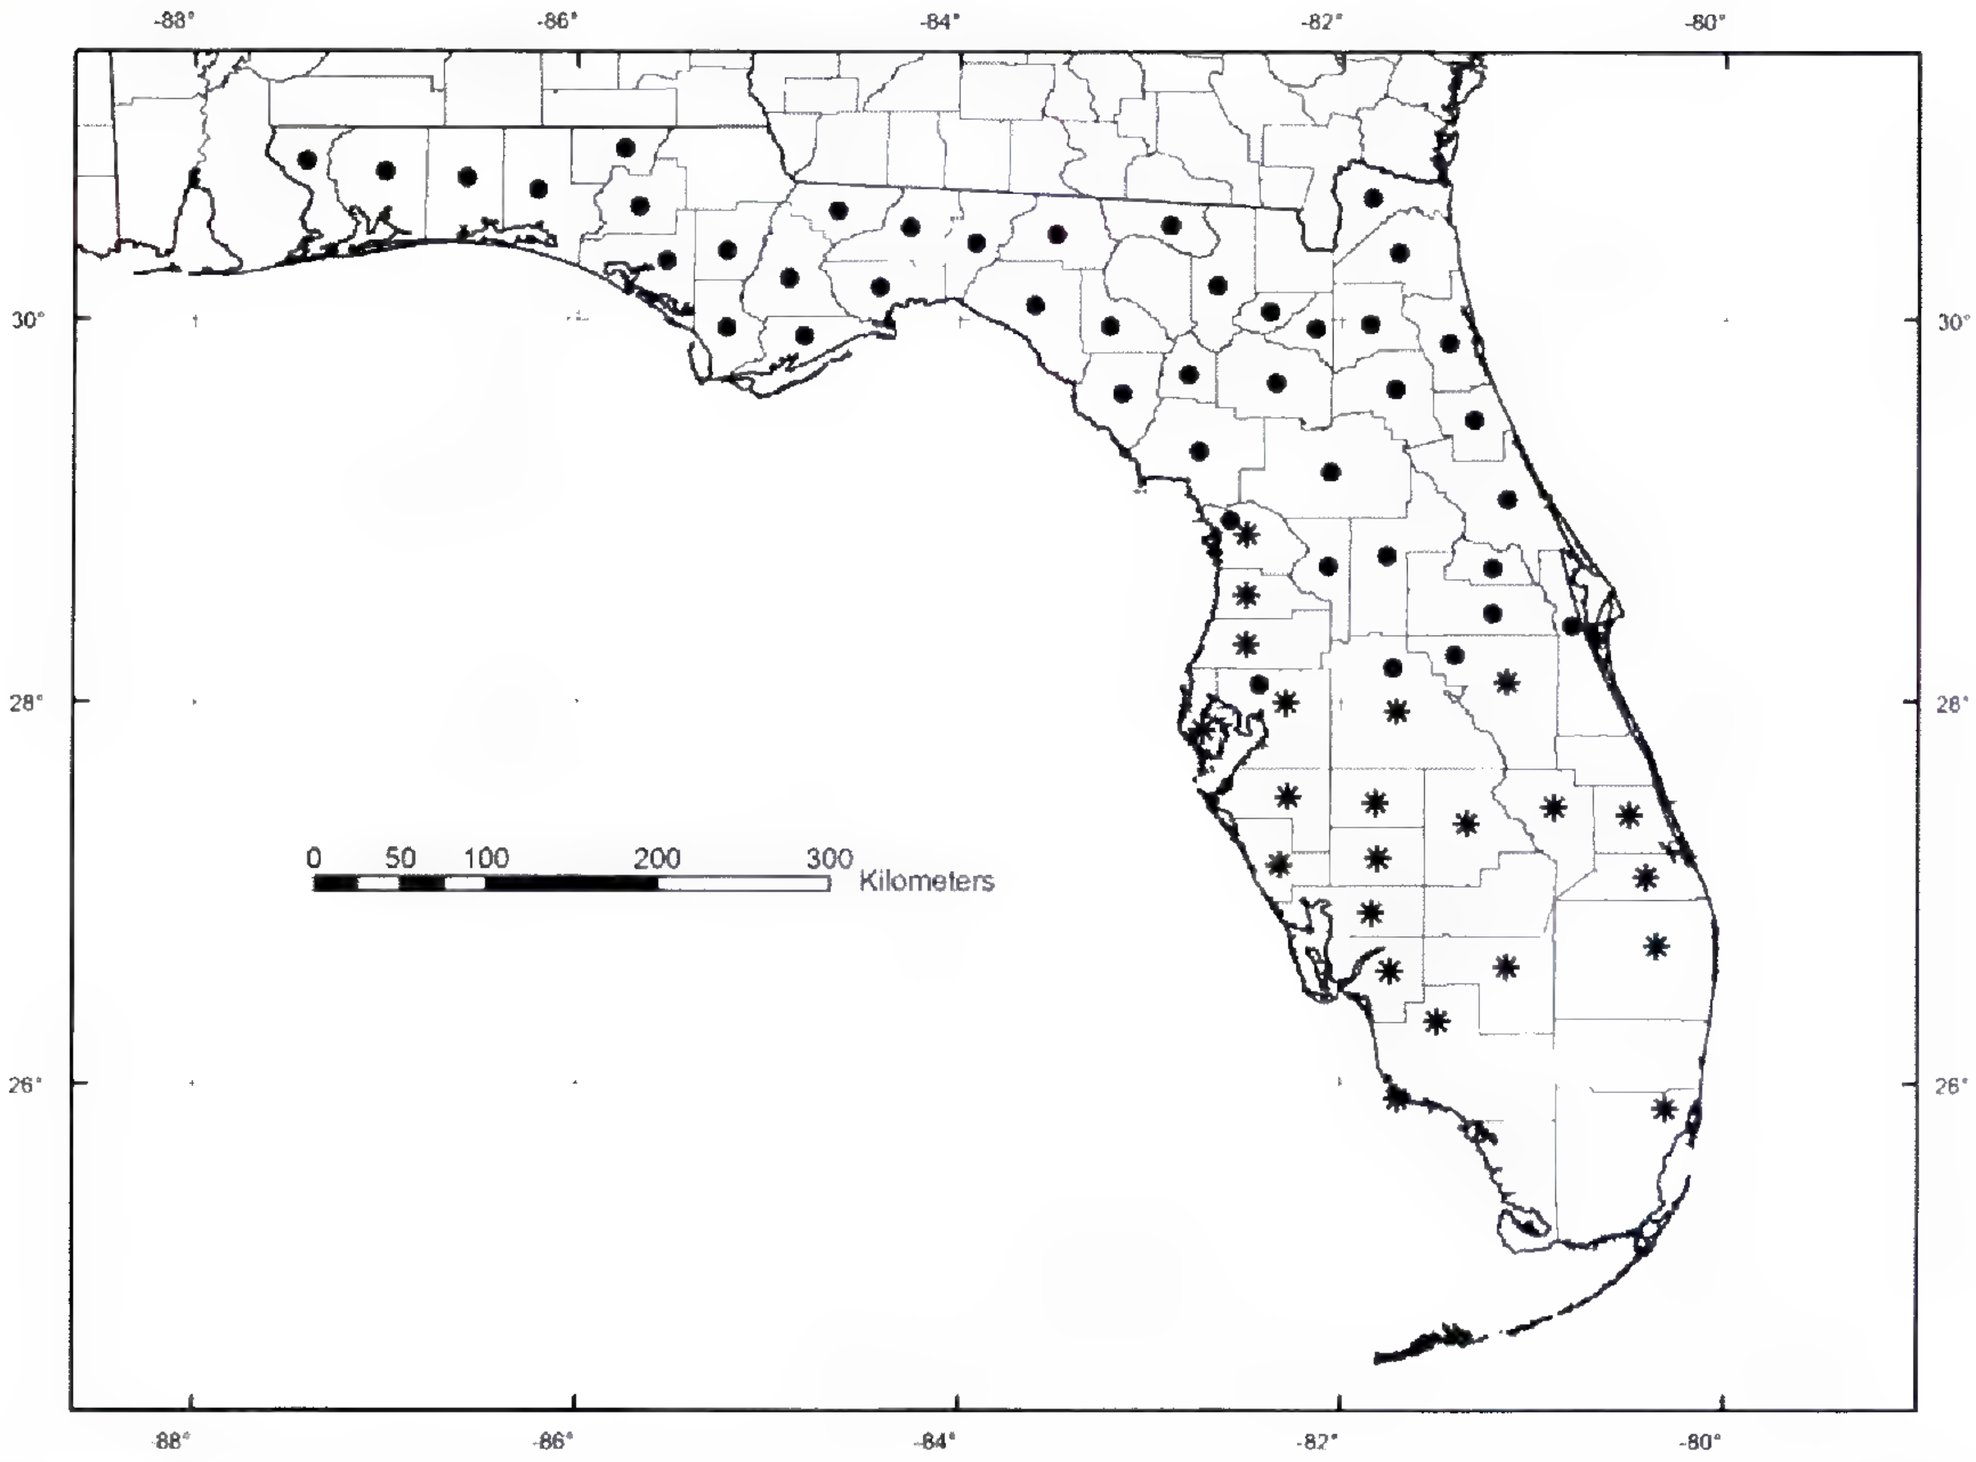

FIG. 2. Florida distribution of *Carphephorus odoratissimus* var. *subtropicanus* (stars) and var. *odoratissimus* (circles). Exact location within county is shown when species is restricted to a single or few locations in a county. For Collier County there are two stars, one for mainland and one for the only known island population on Marco Island. A symbol is placed in center of county when species is widely distributed throughout county. Distribution of *C. odoratissimus* var. *odoratissimus* extends beyond figure north of Florida to North Carolina and west to Louisiana.

elliottii var. *densa*, with *Aristida beyrichiana* Trin. & Rupr., *Serenoa repens* (W. Bartram) Small, and low-growing *Quercus minima* (Sarg.) Small typically dominant in the ground cover as well as numerous regionally endemic species that vary floristically between geographic regions (Orzell & Bridges 1997). Dry prairies are similar in ground cover composition to pine-savanna flatwoods but are naturally treeless. Historically, dry prairies had annual or biennial naturally occurring fires (Harper 1921, 1927; Orzell & Bridges 1999) and are the highest fire-frequented community type in central Florida (Orzell & Bridges 1999). Associated species that are endemic or near-endemic to peninsular Florida include *Asimina reticulata* Shuttlew. ex Chapm., *Polygala setacea* Michx., *Liatris tenuifolia* Nutt. var. *quadriflora* Chapm., *Rhexia nuttallii* C.W. James, *Bejaria racemosa* Vent., *Andropogon brachystachyus* Chapm., *Andropogon ternarius* Michx. var. *cabanisii* (Hack.) Fern. & Griscom, *Gymnopogon chapmanianus* Hitchc., *Phoebanthus grandiflorus* (Torr. & A. Gray) S.F. Blake, and *Polygala rugelii* Shuttlew. ex Chapm.

Carphephorus odoratissimus var. *subtropicanus* can be sympatric with any

of the four other *Carphephorus* species occurring in central Florida. It most often occurs with *C. corymbosus* at drier sites, *C. paniculatus* at mesic sites, and in very rare cases with *C. carnosus* at wet-mesic sites. *Carphephorus* odoratissimus var. subtropicanus is sympatric with var. *odoratissimus* at its northern (Polk and Osceola counties) and northwestern (Citrus and Hillsborough counties) range limits. Plants intermediate between the two are occasionally found in ecotonal and disturbed sites in central Florida where the boundaries of the two overlap. Where the two varieties are sympatric at a site in Osceola County, var. *subtropicanus* grows in dry-mesic poorly drained pine flatwoods, whereas var. *odoratissimus* is found on a somewhat poorly drained slight sandy rise between the pine flatwoods and a wetland depression.

PHENOLOGY

At a disturbed site in Orange County, specimens intermediate in characteristics (leaf morphology, inflorescence, and coumarin odor) between var. *odoratissimus* and var. *subtropicanus* were observed with both flowering in late September 1999. The co-habitation and overlapping flowering at the site of both varieties indicates that ecological separation of the two varieties is incomplete.

In 1997 at an Osceola County site, *C. odoratissimus* var. *odoratissimus* flowered from early September till late October, and *C. odoratissimus* var. *subtropicanus* flowered from late October into November. Elsewhere in central Florida, var. *odoratissimus* generally flowers from early to mid September into late-October and even earlier in north-central Florida (August thru mid-September), whereas var. *subtropicanus* flowers primarily from early to mid October thru early to mid November, with flowering having been noted in September at several locations. Plants flowering in early or late September were also noted by DeLaney et al. (1999). Furthermore, atypical flowering dates for var. *subtropicanus* (usually the result of burning followed by available soil moisture) have been observed. Flowering plants were collected on 2 April 1998 following a 19 August 1997 burn in Osceola County.

APPENDIX 1

Citations here are abbreviated, however full label data is available upon request from the authors, including detailed habitat and location information for the Orzell & Bridges collections.

ACKNOWLEDGMENTS

We thank Paul Ebersbach, Chief of the Environmental Flight at Avon Park Air Force Range (APAFR), for his support of scientific research on the military installation; Rebecca Yahr for the illustration; Scott Penfield (APAFR) for providing funding from the Rangelands Program at APAFR for the illustration; and J. Douglas Ripley formerly of the Environmental Planning Division of the U.S. Air Force in Washington DC., who secured funding for both the illustration and manuscript preparation. Fieldwork was facilitated by Sam VanHook, who conducted prescribed burns of sites for *C. odoratissimus* var. *subtropicanus* at APAFR, and Chris-Ann Kosel formerly of the TNC Disney Wilderness Preserve, who provided access to the preserve. We especially thank Guy Nesom of BRIT, Billie Turner of TEX, and Richard Wunderlin of USF for providing stimulating views and critical edits to earlier drafts of the manuscript.

Book Review

David G. Frodin. 2001. **Guide to Standard Floras of the World. Second Edition.** (ISBN 0-521-9077-0, hbk). Cambridge University Press, Cambridge, U.K. $240.00. 1100 pp, 7 1/2" × 10".

The entire history of botanical exploration of the world can be gleaned from this new edition of Frodin's 1100-page bibliography, which is nearly twice as long as edition one (1984). It is a source of an incredible—almost unbelievable—amount of information. We are here dealing with a landmark in literature on plants. The adjective "monumental," though hackneyed, comes to mind.

Floras exist for every part of the world, no matter how remote. In North America north of Mexico, they are available from county level to state-, country-, or even continent level, e.g., *Flora of North America*. Almost every state has its own flora. Canada has a four-volume *Flora of Canada* plus floras for many provinces and all territories. Some floras take years to complete; work on *Flora Brasiliensis*, for example, extended over 66 years. A few never are finished because of lack of funds or botanists. Frodin includes not only full-fledged floras but also checklists and floristic atlases.

Areas covered by floras are of all sizes and shapes. Here are some examples arranged from small to large, with the number of species in each—A small island: the sub-antarctic Macquarie, 46 species; an island group: the Falklands, 256; part of a country: Michigan, 2465; a country: Canada, 4100; part of a continent: North American Great Plains (extreme southern Prairie Provinces of Canada to the Texas panhandle), 3000; and, finally, continents: Australia, 20,000, and Antarctica, 2 native and 1 introduced species.

Frodin's book is arranged by major geographic area, i.e., North America, Asia, Europe, Africa, etc.; within each area are sub-areas (countries, states, islands, etc.). Coverage is strongly 20th century, with ample representation from the 19th and even earlier. All of the book is good reading, including the 1424 footnotes.

Among the tidbits in the Guide are these about Easter Island. The first floristic account of Easter appeared in 1914, with others in 1920, 1922, 1951, 1958, and 1991. The island has 195 species, mostly introduced (only 46 are native). Badly treated by its inhabitants, it is now virtually treeless. One of the trees, the legume *Sophora toromiro*, is extinct except in cultivation off the island. The last record of the tree from the island was by the Thor Heyerdahl 1955-1956 expedition. The island's sole palm is extinct, too, known only from fossil remains.

More tidbits? Which U.S. state has the most plants? Leading the pack are California, 5800, followed by Texas, 4800, and Florida, 3800. North Dakota is last with about 1000.

The compiler of all this wealth, David Frodin, is a botanist at Kew Gardens in England. He spent many years bringing together in one place an abundance of floristic literature; the user is thus spared this prodigious effort. The myriad titles he lists are testimony to the thousands of dedicated botanical explorers who have worked over the centuries to discover and make known the world's plants.—*John W. Thieret, Northern Kentucky University.*

SIDA 20(2): 570. 2002

RESOURCE ALLOCATION PATTERNS AND PHENOTYPIC VARIATION IN THE ENDANGERED TEXAS WILDRICE (*ZIZANIA TEXANA*, POACEAE)

Paula Power

San Marcos National Fish Hatchery and Technology Center
500 E. McCarty Lane
San Marcos, TX 78666, U.S.A.

ABSTRACT

Zizania texana Hitchc., an endangered macrophyte endemic to the upper 4.9 km of the San Marcos River, Hays County, Texas was Federally listed in 1978 after the species experienced a population decline between about 1940 and 1967. Recent interest in restoration has focused attention on the need for a better understanding of the species' response to a variety of microhabitats. This study documents biomass allocation patterns in three microhabitats over 7 months. Current velocities ranged from 0.0–0.010 m/s in the slow site, 0.038–0.142 m/s in the moderate site, and 0.250–0.369 m/s in the fast site. Plants were harvested from each site, on seven occasions, washed, separated into roots, submersed leaves, and reproductive culms with associated leaves and inflorescences, then dried and weighed. At the end of the study, mean total biomass of plants grown in the fast site was 28.42 gdw vs 4.24 gdw for plants grown in the slow site. Resource allocation patterns differed among sites and two distinct phenotypes were apparent. One phenotype, associated with relatively higher current velocities, had higher net productivity, a well-developed root system, and allocated proportionally more biomass to non-reproductive organs (49.2% gdw root biomass in fast site vs 24.8% gdw root biomass in slow site). A second phenotype, associated with relatively slower flowing water, had lower net productivity and allocated proportionally more biomass to reproductive organs (22.1% gdw reproductive culm in fast site vs. 65.0% gdw reproductive culm in slow site). Because of lower productivity and the potential for loss from herbivory to a significant proportion of the plant in slower flowing water, a microhabitat with relatively low current velocity would not be recommended for restoration purposes.

RESUMEN

Zizania texana Hitchc., un macrófito en peligro, endémico de los 4.9 km superiores del río San Marcos, Hays Co., Texas se incluyó en la lista Federal en 1978 después que la especie experimentase una reducción poblacional entre 1940 y 1967. El interés reciente en la restauración ha prestado atención a la necesidad de una mejor comprensión de la respuesta de la especie a una variedad de microhábitats diferentes. Este estudio documenta los modelos de situación de biomasa en tres microhábitats durante 7 meses. Las velocidades normales variaron entre 0.0–0.010 m/s (el sitio lento), 0.038–0.142 m/s (en el sitio moderado), y 0.250–0.369 m/s (en el sitio rápido). Las plantas se cosecharon de cada microhábitat, en siete ocasiones, se lavaron, separaron las raíces, las hojas sumergidas, y los cúlmenes reproductores con las hojas e inflorescencias asociadas, luego se secaron y pesaron. A final del estudio, la biomasa total media de plantas del sitio rápido fue 28.42 gdw contra 4.24 gdw para plantas del sitio lento. Los modelos de recursos difirieron significativamente entre los diferentes sitios y fueron aparentes dos fenotipos claros eran. Un fenotipo asociado con velocidades actuales relativamente más altas, tenía una productividad neta más alta, un sistema radical bien desarrollado, y colocó proporcionalmente más biomasa en órganos vegetativos (49.2% de peso seco de biomasa de raíz en el sitio rápido contra 24.8% de peso seco de biomasa de raíz en el sitio lento). Un segundo fenotipo,

SIDA 20(2): 571 – 582. 2002

asociado con agua de corriente relativamente más lenta, tuvo una productividad neta más baja y colocó proporcionalmente más biomasa en los órganos de reproductores (22.1% de peso seco de biomasa en cúlmenes reproductores en el sitio rápido contra. 65.0% de peso seco de biomasa en cúlmenes reproductores en el sitio lento). A causa de tasas bajas de productividad y la pérdida potencial debida a los herbívoros en una proporción significativa en el agua de corriente más lenta, este tipo de microhábitat no se debería recomendar para las restauraciones.

INTRODUCTION

Trade-offs between reproductive allocation and vegetative allocation with changes in environmental conditions have been reported by Harper and Ogden (1970); Hickman (1975); van Baalen, et al. (1990); Dunn and Sharitz (1991); Madsen (1991) and Neill (1993). Environmental factors associated with allocation trade-offs include substrate, nutrient availability, and water depth (Idestam-Almquist & Kautsky 1995; Blanch et al. 1999; Lorenzen et al. 2001; Vretare et al. 2001). Little information is available on current velocity and its affect on allocation patterns in macrophytes although numerous studies have identified current velocity as an important factor influencing macrophyte distribution, photosynthesis and growth (Nilssen 1987; Chambers et al. 1991; Madsen & Søndergaard 1983; Power 1996a). The work reported here was undertaken to document resource allocation patterns in the endangered *Zizania texana* Hitchc. over seven months in three different habitat types differing in current velocity and pH.

Zizania texana is an endangered macrophyte endemic to the San Marcos River, Hays County Texas (U.S. Fish & Wildlife Service 1995). It commonly occurs midchannel in swiftly flowing water. Terrell et al. (1978) and Poole and Bowles (1999) provide thorough descriptions of the habitat for *Z. texana*. Threats to the species include reduced spring flow from the source aquifer due to overpumping of ground water for human use, competition and herbivory by nonnative plant and animal species, and absence of sexual reproduction in the wild, along with other human impacts including alteration of historic hydrologic patterns from dams located along the river and within the watershed, and recreational use (U.S. Fish & Wildlife Service 1995).

Under flowing water conditions, *Z. texana* produces long ribbon-like, submersed leaves and emergent culms, each with a terminal, wind pollinated inflorescence; however, sexual reproduction is nearly absent in the wild (U.S. Fish & Wildlife Service 1995). Historical accounts suggest this was not always the case. Photographs depicting fully developed inflorescences and verbal accounts suggest recruitment by seed occurred (Silveus 1933). More recent descriptions of floral structures and floral development by Emery and Guy (1979), and Power (1996b; 1997) indicate that sexual reproduction is most likely limited by environmental factors rather than cytological factors. It is not well understood why fully developed, emergent inflorescences are rare in the wild, although drifting mats of floating vegetation and herbivory play a role (Power 1996b, c). The spe-

cies produces asexual clones (tillers) which form at the nodes of reproductive culms and it is assumed that tiller production is the primary mechanism for recruitment of new individuals in the wild (U.S. Fish & Wildlife Service 1995).

Zizania texana has two distinct phenotypes under wild and cultured conditions. When grown in the wild, *Z. texana* is primarily submersed and tends to be a long lived perennial plant. Under cultivated conditions, *Z. texana* is primarily emergent, reproductive, and short lived (Terrell et al. 1978 and pers. observ.). Information on plant response to environmental conditions, gains importance given the endangered status of the species and the need for restoration of the habitat as outlined in the Recovery Plan for the species (U.S. Fish & Wildlife Service 1995). Adequate restoration protocols cannot be developed without a thorough understanding of the response of *Z. texana* to a variety of conditions found in its historic range.

METHODS AND MATERIALS

This research project was carried out in Spring Lake on the Southwest Texas State University (SWT) campus. Spring Lake is an impoundment formed by a dam and spillway originally constructed across the San Marcos River in 1849. The dam and spillway are approximately 750 m downstream from the San Marcos Springs.

Study plants were obtained by germinating captive grown seed in the lab. Seedlings were then transplanted to 15 cm plastic pots, lined with small plastic bags and filled with sediments collected from one location in the study site in Spring Lake. Pots were placed in an outdoor cement raceway on the SWT campus and seedlings were allowed to grow for about 6 weeks. Water was supplied by an artesian well from the source aquifer for Spring Lake and the San Marcos River. In March 1995, potted plants were transplanted into three sites in Spring Lake and one site in the outdoor raceway on the SWT campus. This was a nested design with plants nested in plots and plots nested in sites. There were three replicate plots at each site. Each replicate plot had 36 potted plants for a total of 432 plants. All plants were protected from herbivores with 1 m^3, floating exclosures constructed of polyvinyl chloride (PVC) pipe and 2.5 cm wire mesh. Initially, four plants were harvested to obtain baseline biomass values for the newly transplanted individuals. The study design called for harvesting four plants from each replicate plot on nine separate occasions. However, during the study period some plants were lost to herbivory and some plants were washed away by the current. As a result, plants were harvested from each replicate plot on six dates, May 3, June 1, June 30, July 27, September 1, and October 16. At each harvest, plants were selected at random. Sediment was washed from plant roots, then plants were divided into vegetative parts, reproductive parts, and roots. Vegetative parts were defined as submersed leaves and reproductive parts were defined as reproductive culms with associated leaves, inflorescences, seeds,

and tillers. Plants were then dried at 65°C for at least 48 hours and weighed to the nearest 0.01 g. Data are reported as means plus-minus standard error.

On nine occasions between May 1995 and October 1995 pH, water depth, and current velocity were recorded in each replicate plot, in each site. Current velocity was measured with a Marsh McBirney Model 201 portable water current meter and calculated as the average velocity at 20%, 60%, and 80% depth. The four sites differed in mean current velocity and were identified as follows: slow (raceway), no flow, moderate and fast.

RESULTS

Plants in the no flow site in Spring Lake were lost to herbivory, probably by crawfish, prior to the second harvest and this site was dropped from the study.

Water depth, current velocity, and pH at the remaining sites were recorded at the study sites eight times between May and October (Table 1). In the slow site, mean water depth was 0.71 m (±0.03) mean current velocity was 0.001 m/s (±0.004), and pH ranged from 7.50 to 7.68. In the moderate site, mean water depth was 0.88 m (±0.06), mean current velocity was 0.090 m/s (±0.048), and pH ranged from 7.23–7.26. In the fast site, mean water depth was 0.85 m (±0.07), mean current velocity was 0.290 m/s (±0.076) and pH ranged from 7.16–7.28.

Plants in all study sites increased in size during the study period (Fig. 1). At each harvest, fast site plants had the greatest root, submersed leaf, and total net biomass, furthermore, data from the September harvest showed mean net total biomass of fast site plants was an order of magnitude greater than mean net total biomass of slow site plants (34.05 g vs. 3.66 g).

Number of submersed leaves increased in all sites during the study period, however fast site plants produced six times as many submersed leaves as slow site plants. At the end of the study period, mean number of submersed leaves in fast site plants was 18.0 (± 1.414) while mean number of submersed leaves in slow site plants was 3.0 (± 0.211).

Reproductive culms were present in every harvest between 1 June 1995 and 16 October 1995. Culm number was greatest during the September harvest in plants grown in the fast site with 2.9 (± 0.380) culms/plant. For plants grown in the slow site, number of culms was greatest in the October harvests with 1.6 (± 0.159) culms/plant. (Fig. 2).

Biomass allocation to plant roots and reproductive culms varied through time and among sites (Fig. 3). The proportion of biomass allocated to roots increased from 27% in March at the beginning of the study to 49% in October in plants grown in the fast site. In contrast, the proportion of biomass allocated to roots decreased from 27% at the beginning for the study to 25% at the end of the study in the slow site.

Plants in all sites produced similar numbers of culms, however biomass allocation varied greatly among sites. In October, culm biomass constituted over

TABLE 1. Means and ranges for environmental factors in two sites (Moderate and Fast) in Spring Lake and one site (Slow) on the SWT campus. Data were collected on nine separate days between May 1995 and October 1995.

	Slow	Moderate	Fast

half of total plant biomass in slow site plants (65%; culm number = 1.6±0.159), in moderate site plants, 48% of total net biomass was culm biomass (culm number = 1.7±0.129 and fast site plants allocated only 22% of total net biomass to reproductive culms (culm number = 2.25±1.591).

The proportion of biomass allocated to submersed leaves was similar among sites even though the number of leaves varied among sites. In October, submersed leaf biomass was 29% of total biomass in the fast site (leaf number = 18±1.414), 15% of total biomass in the moderate site (leaf number = 5.3±1.862), and 28% of total biomass in the slow site (leaf number = 3±0.211).

DISCUSSION

In this study, plants exhibited markedly different growth patterns among study sites. Net total biomass accumulated over the study period was an order of magnitude greater in plants grown in water flowing between 0.146–0.442 m/s compared with plants grown in water flowing between 0–0.01 m/s. Net biomass accumulation in individual plant organs (roots, submersed leaves, and reproductive culms) also was greater in fast flowing water compared with slow flowing water. Submersed leaf biomass was 18 times greater in fast site plants compared with slow site plants and 4.5 times greater compared with moderate site plants. *Zizania texana* exhibited a similar response to flowing water in other studies (Power 1996a, b).

Flowing water has been shown to influence macrophyte photosynthetic rates (Westlake 1967; Smith & Walker 1980; Madsen & Sondergaard 1983), distribution (Fonseca & Kenworthy 1987; Nilssen 1987); and growth (Chambers et al. 1991). Plants occur in a range of current velocities and there is considerable variability in optimum flow rates for macrophytes. Chambers et al. (1991) found an inverse relationship between biomass and current velocity between 0.01–1.0 m/s. Nilssen (1987) found species richness reached a peak at about 0.3

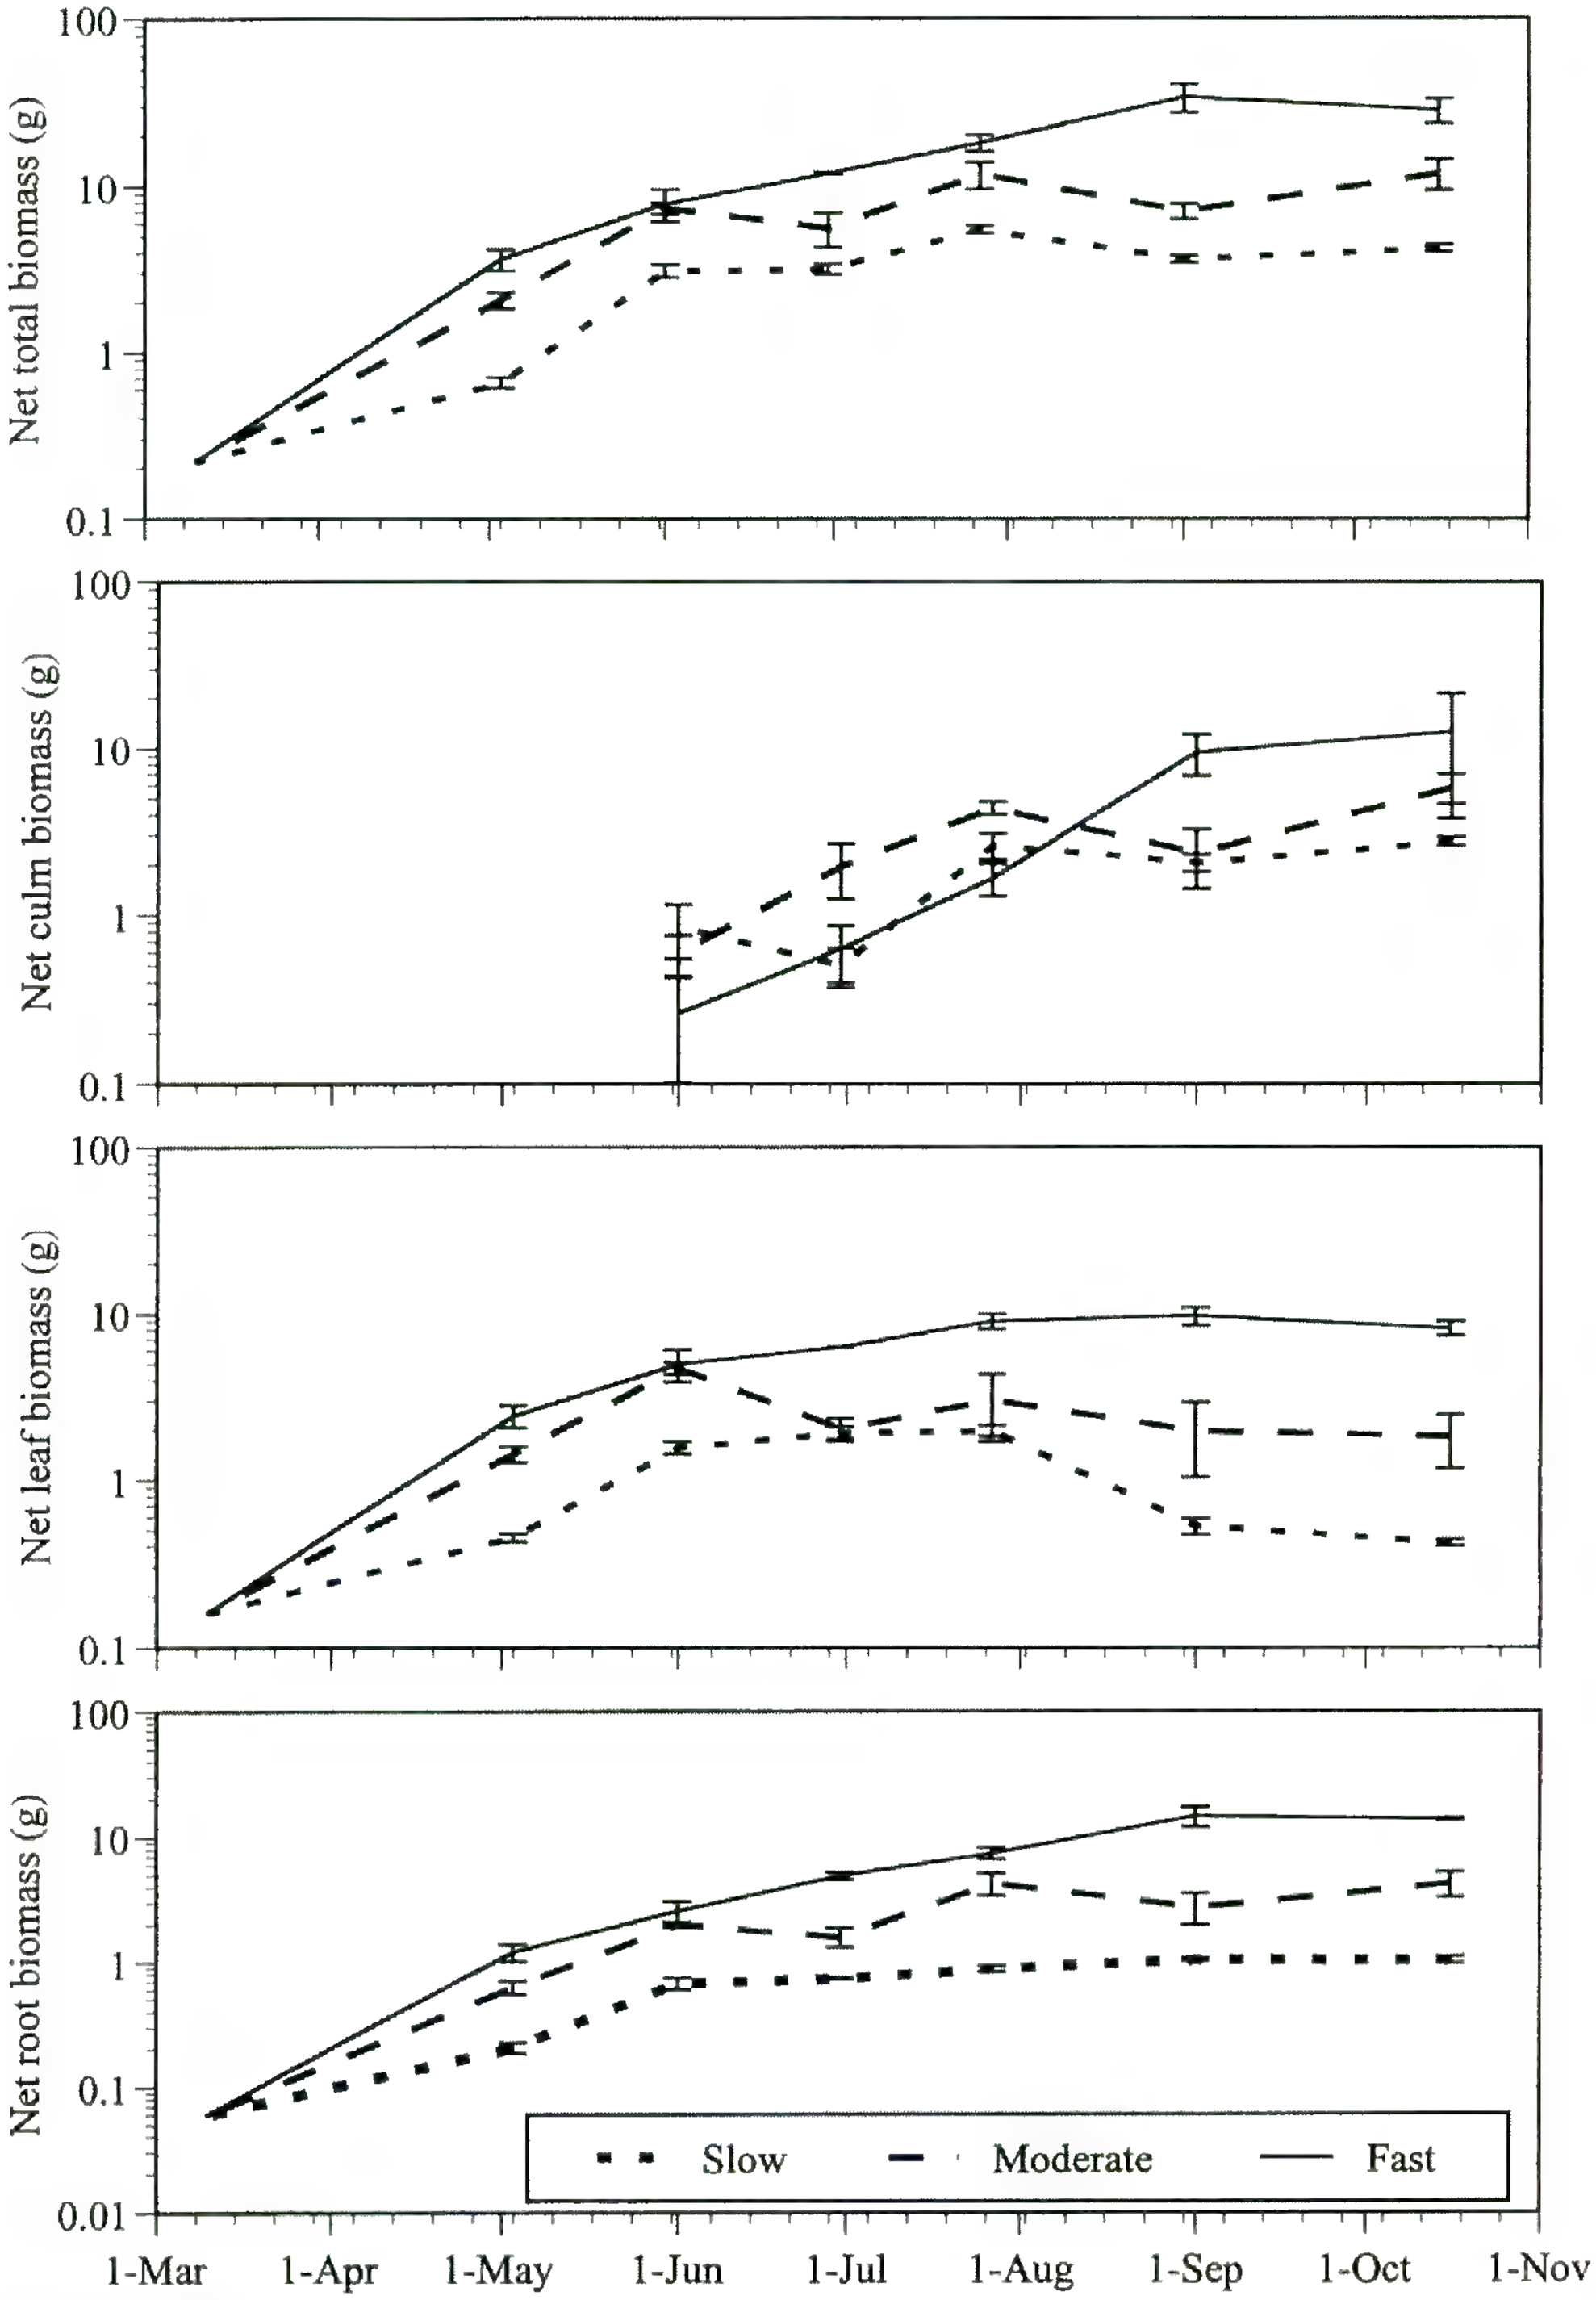

FIG. 1. Growth by potted *Zizania texana* over 7 months from two sites in Spring Lake (fast and moderate sites) and one site at Southwest Texas State University (slow site). After 7 months, plants grown in the fast site had the greatest net root, net leaf, net culm, and net total biomass compared with the other two sites. Points on graph represent the mean ± standard error.

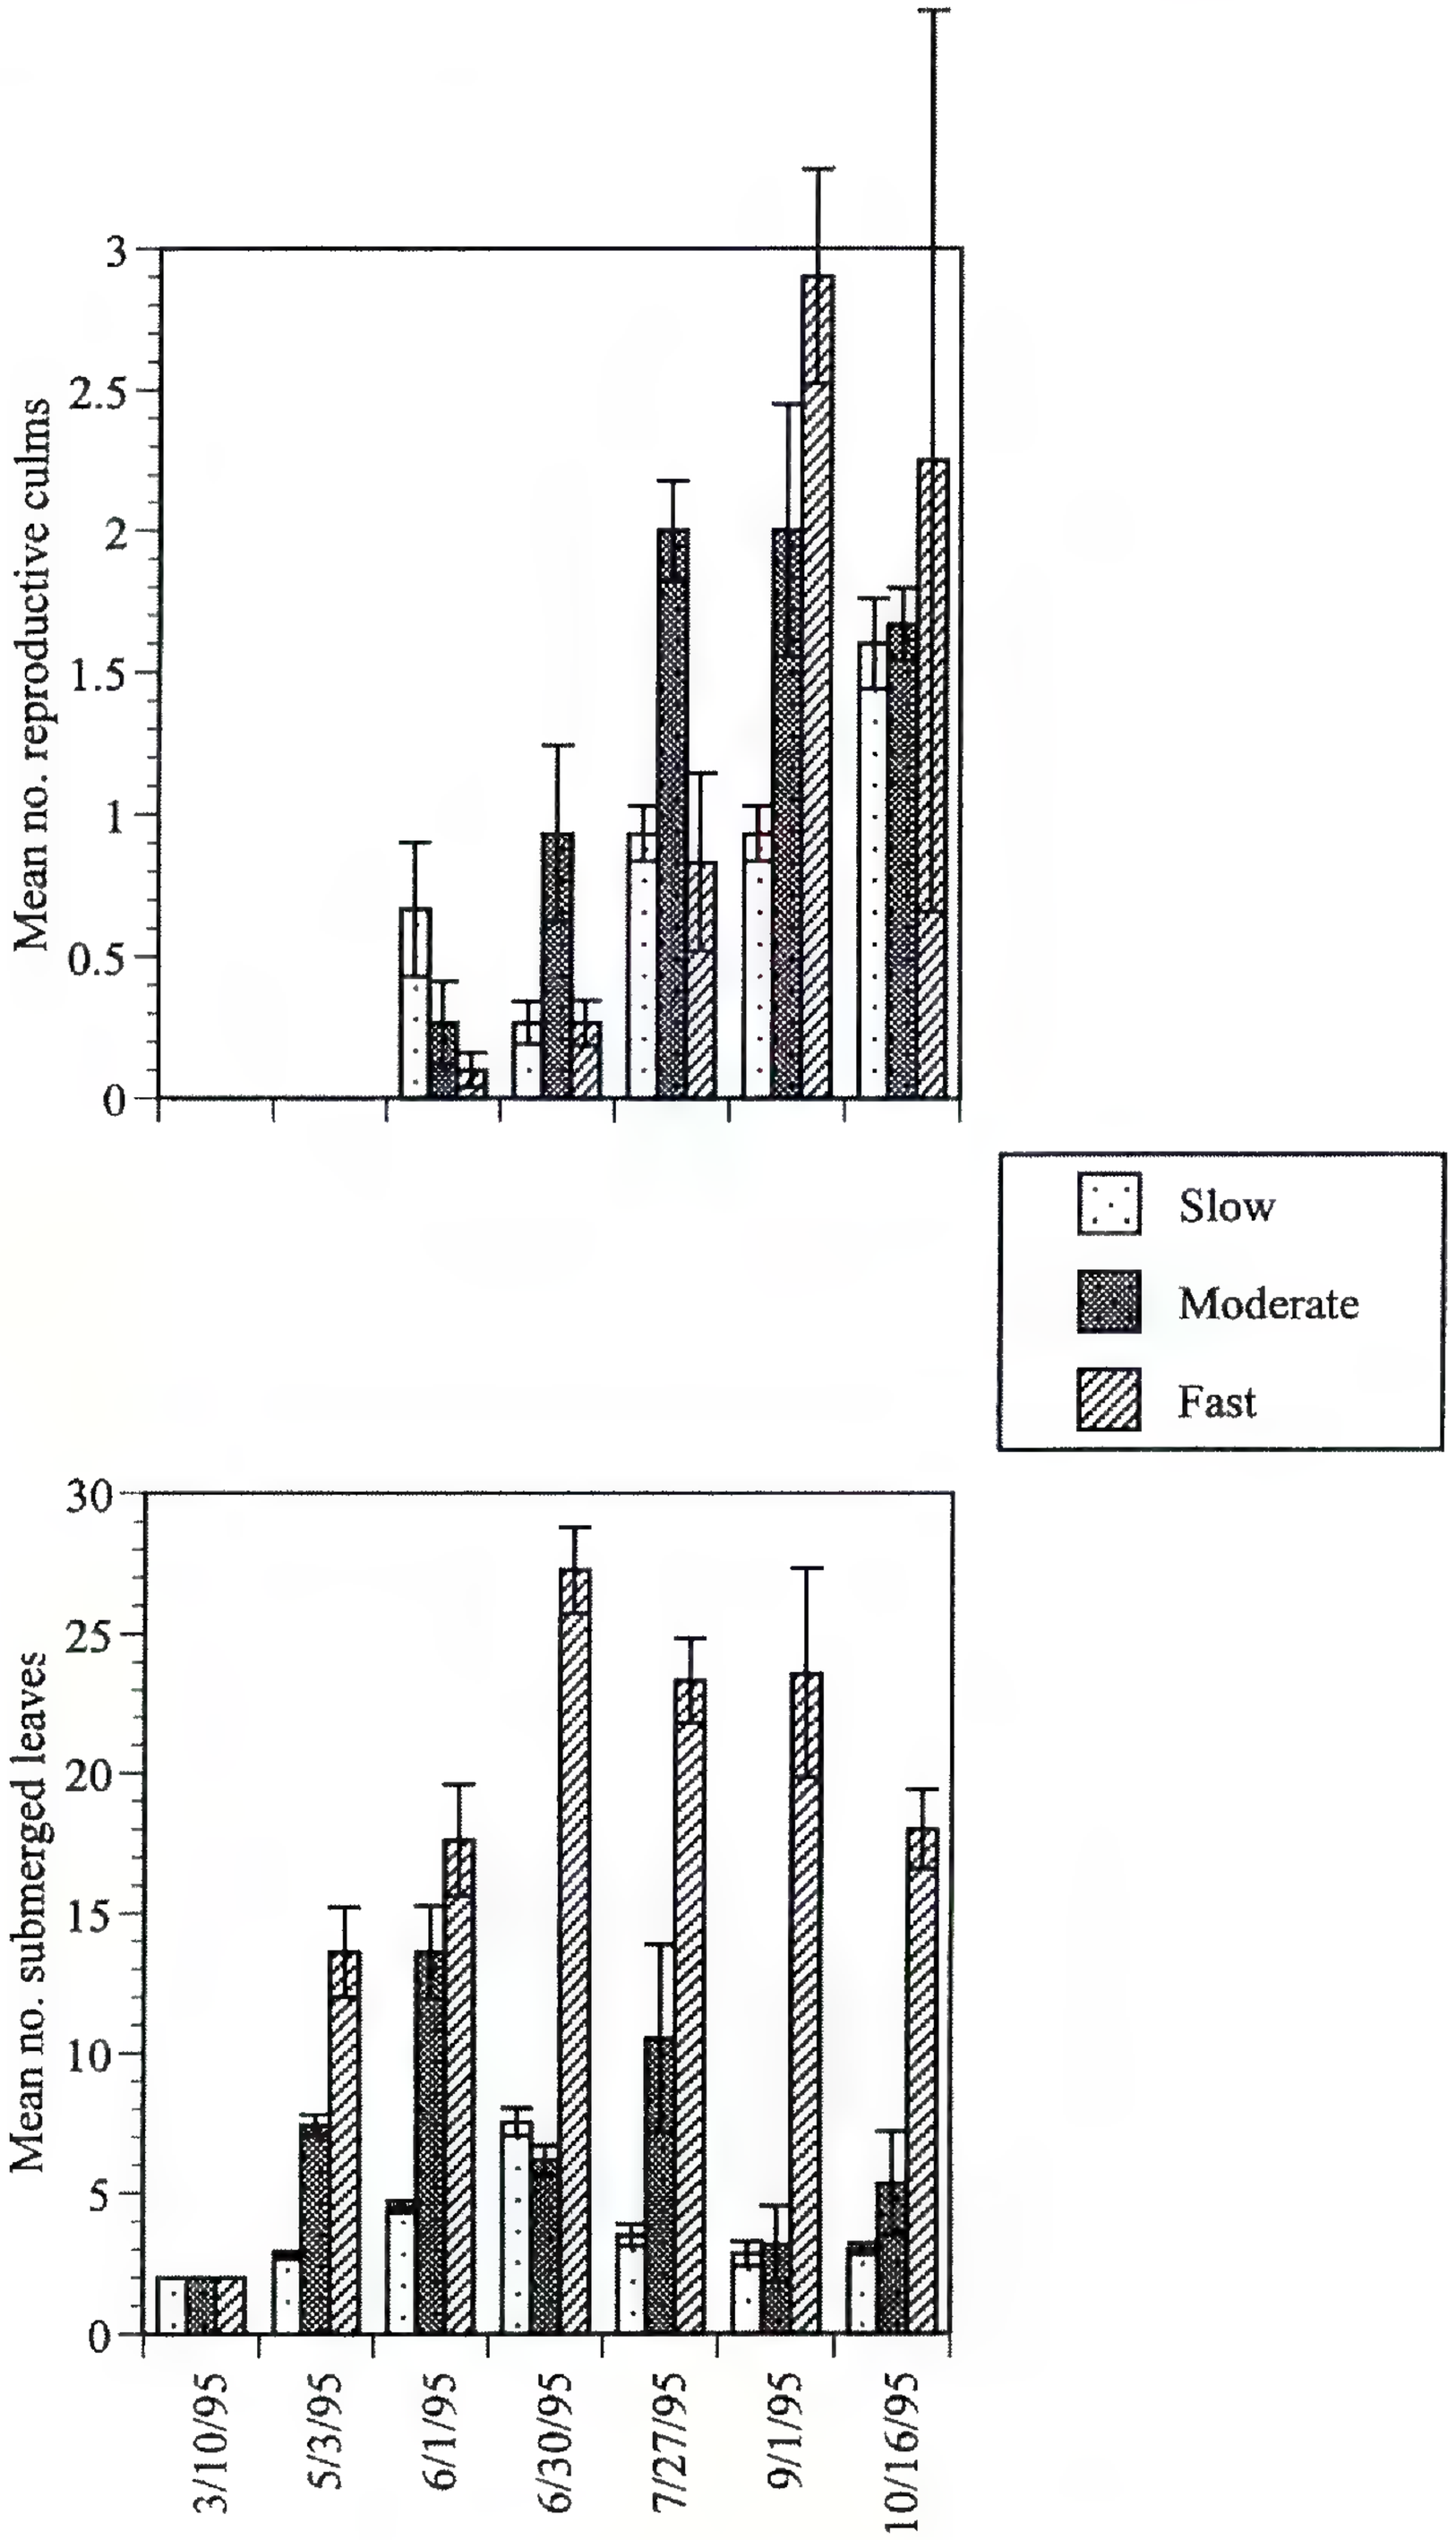

FIG. 2. Number of submersed leaves and reproductive culms from potted *Zizania texana* harvested over 7 months from two sites in Spring Lake and one at Southwest Texas State University. Plants grown in fast flowing water produced more submersed leaves and reproductive culms compared with plants grown in slow flowing water. Vertical bars represent ± standard error.

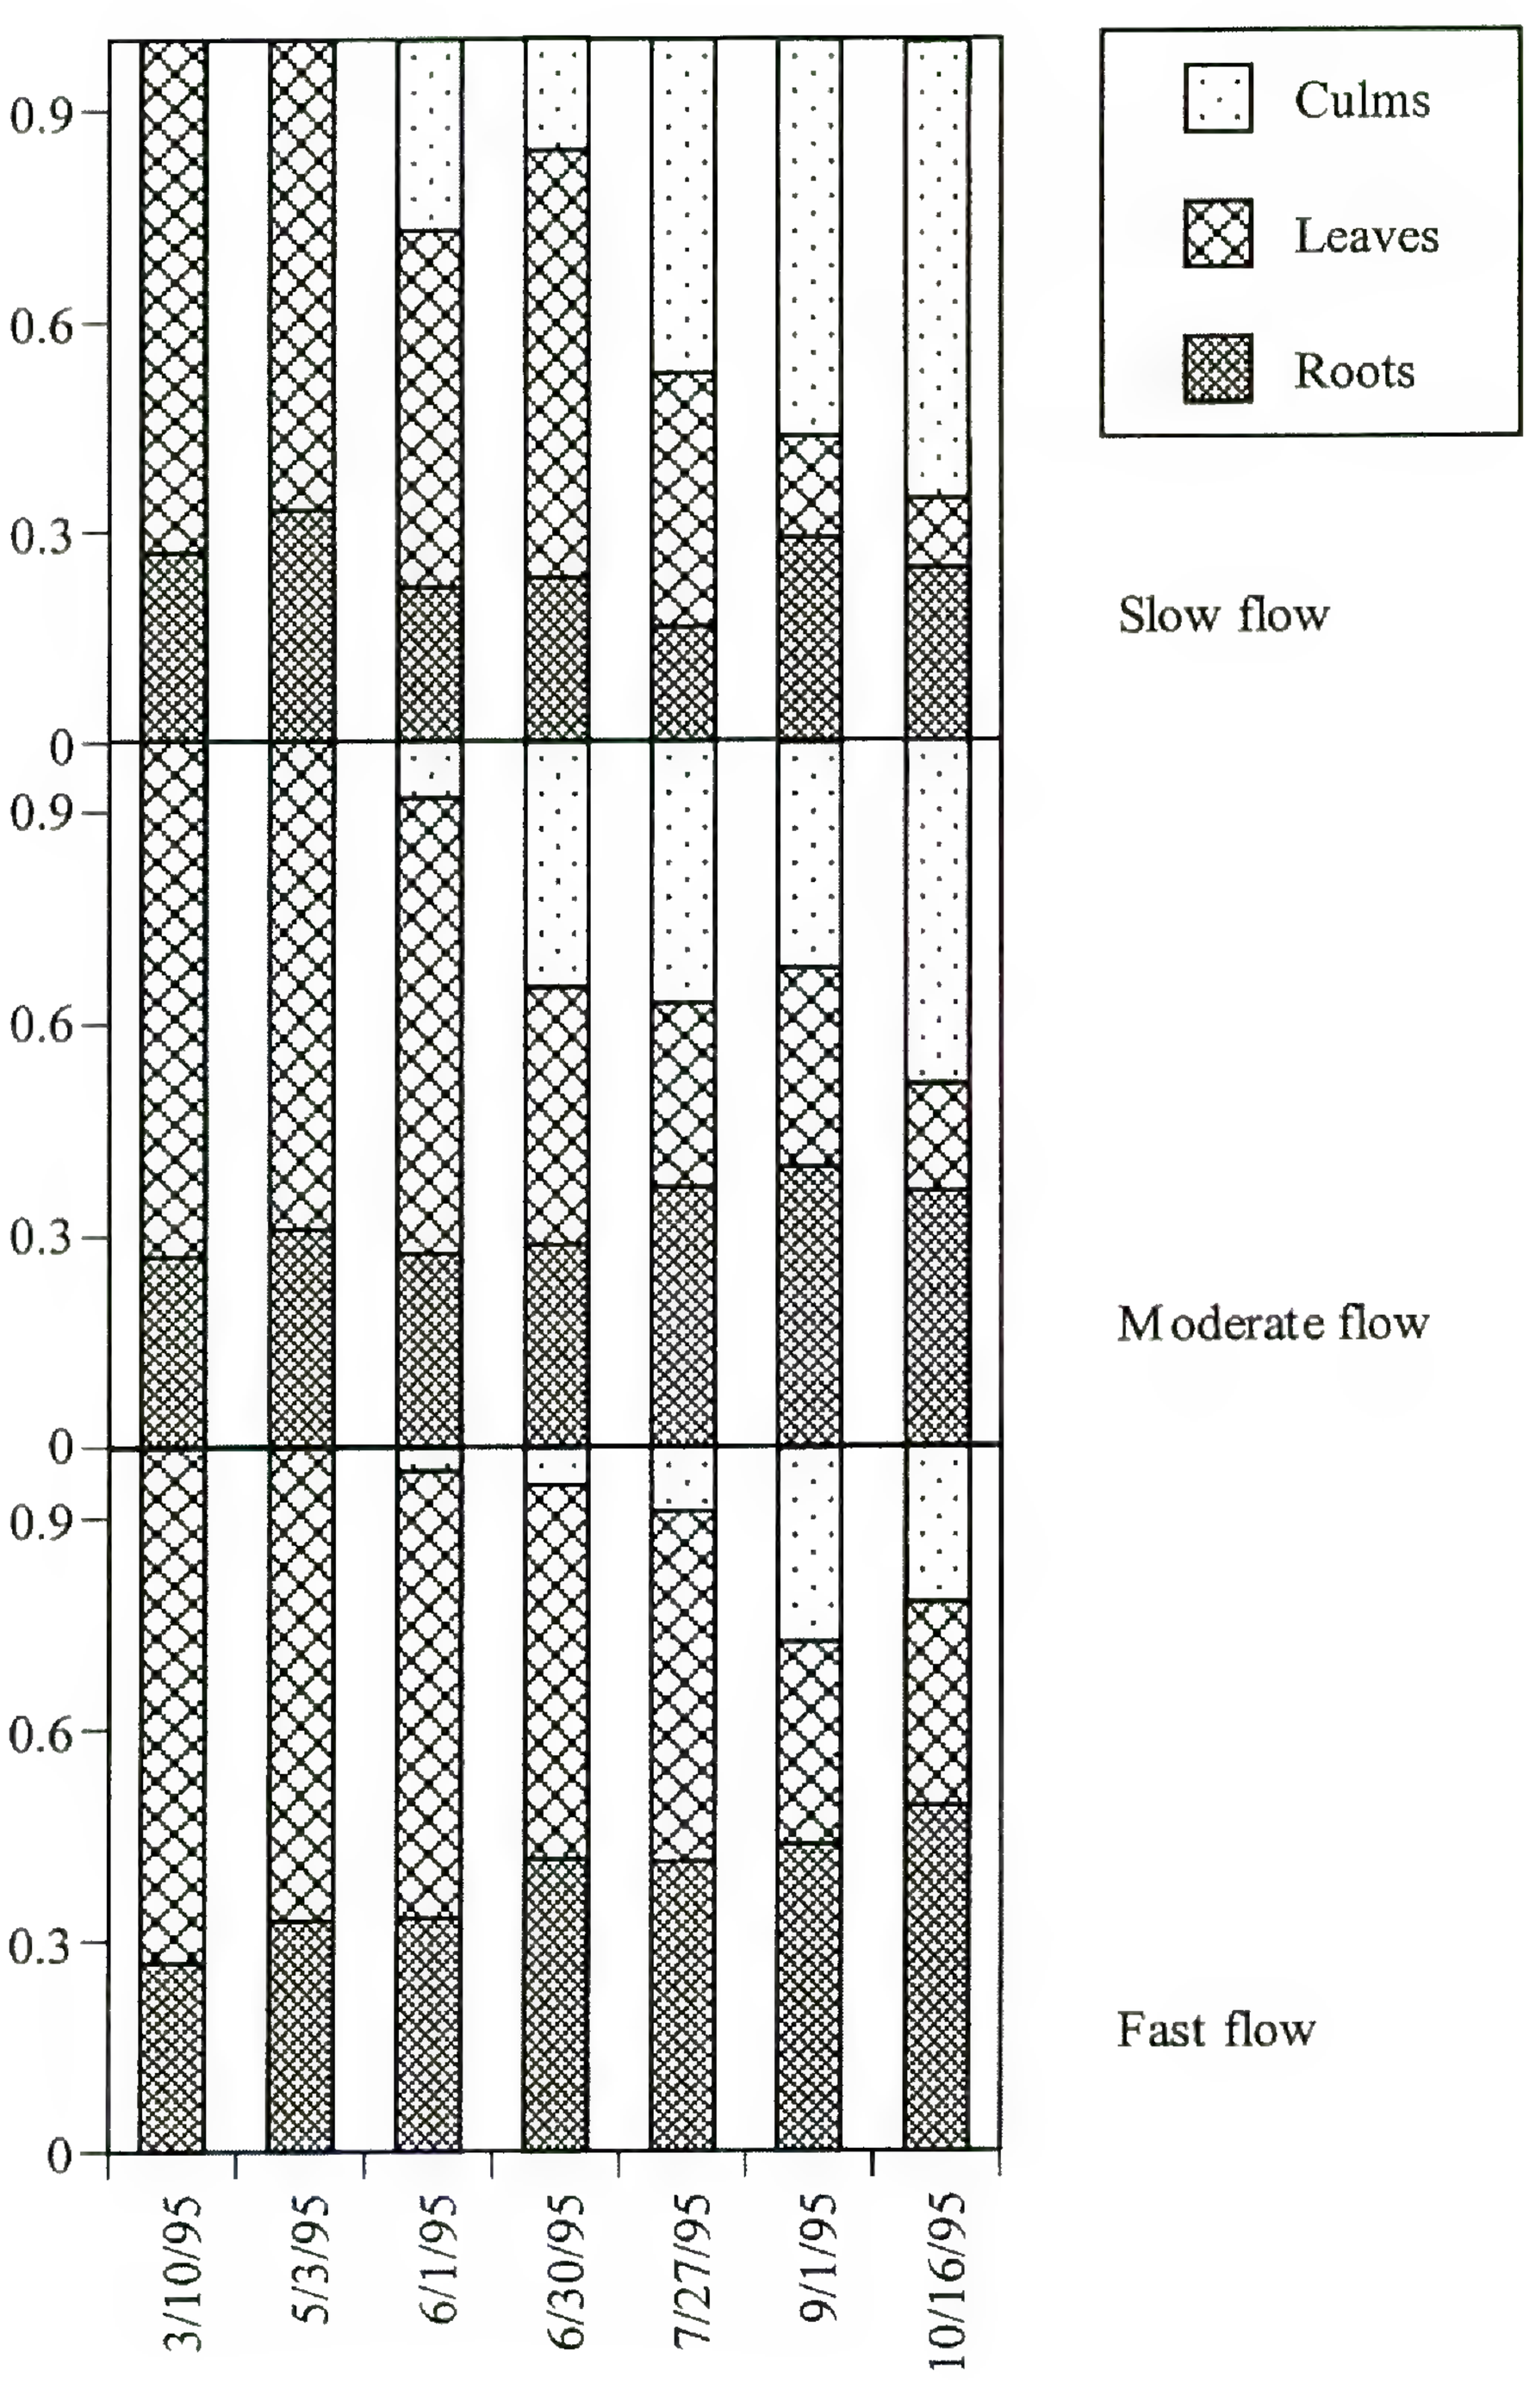

FIG. 3. Proportional allocation of plant mass to roots, leaves, and reproductive culms when grown under three current velocities over 7 months. Biomass allocation to plant roots and reproductive culms varied among sites. There was little difference in the proportion of plant mass allocated to submersed leaves among sites.

m/s along a current gradient from 0.04–1.23 m/s, with some species growing in current velocities greater than 1 m/s. Many species occur in slower current velocities, while fewer species are specialized to withstand the forces of velocities over 0.3 m/s. Apparently, *Z. texana* with smooth, ribbon-like leaves is one of few species able to withstand velocities over 0.3 m/s. Poole and Bowles (1999) found wild *Z. texana* stands primarily in current velocities > 0.46 m/s and the current velocity tolerance range for *Z. texana* exceeds 1.0 m/s; from this study however, it was not possible to identify a maximum or an optimum current velocity for growth.

Zizania texana exhibits phenotypic variation in response to current velocity. One phenotype, associated with relatively higher current velocities, has higher net productivity, a well-developed root system, and allocates proportionally more biomass to nonreproductive organs. A second phenotype, associated with relatively slower flowing water, has lower net productivity and allocates proportionally more biomass to reproductive organs. Plants face a tradeoff between the need for a well-developed root system to anchor plants in potentially unstable sediments, the need for submersed leaves with which to photosynthesize, and the need for emergent stems for reproduction. In this study, the proportional allocation to nonreproductive organs (roots and submersed leaves) decreased with decreasing current velocity as the proportional allocation to reproductive organs increased. Apparently there is a trade-off in favor of submersed organs in faster flowing water.

Other factors directly and indirectly influenced by current velocity may play a role in net biomass accumulation in plant organs. They include herbivory, deposition of debris and sediments on leaves interfering with metabolic processes, colonization of leaves with epiphytes, and the plant's inability to utilize HCO_3^- and its dependence on CO_2 as an inorganic carbon source (unpublished data). Ribbon-like submersed leaves of *Z. texana* are adapted to withstand the forces of flowing water and can reduce carbon limitation by exploiting flowing water habitat where boundary layer surrounding leaves and diffusion distances for CO_2 are reduced, and leaves are continually bathed with carbon rich water. In contrast, in slower flowing water, photosynthesis by submersed leaves of *Z. texana* is carbon limited and few submersed leaves are produced. Emergent reproductive culms with associated emergent leaves most likely are not carbon limited because culms obtain CO_2 from the atmosphere where CO_2 is more readily available owing to the higher diffusion rate and current velocity in air relative to water (Madsen & Sand-Jensen, 1991; Denny 1993).

Increased proportional allocation to emergent reproductive organs in relatively slower flowing water concurs with observations of captive grown *Z. texana* when grown in current velocity ≈0.015 m/s in which plants allocate a greater proportion of biomass to reproductive organs and typically set seed and senesce after one growing season. This is similar to *Z. palustris* and *Z. aquatica*,

annual species which commonly occur in shallow water along the margins of lakes and streams (Ferren & Good 1977; Weir and Dale 1960). The importance of having leaves and flowers above the surface of the water may be due to CO_2 limitation in submersed leaves. In relatively slower flowing water, gas exchange and photosynthesis may be insufficient to support vegetative organs and resources shift to emergent organs where CO_2 is plentiful.

Herbivory is a factor contributing to sexual reproductive failure in *Z. texana* (U.S. Fish & Wildlife Service 1995; Power 1996c). Plants growing in microhabitats with relatively slow flowing water and potentially over 60% of biomass allocated to reproductive parts, are especially vulnerable to herbivory by waterfowl. Microhabitats with conditions which would trigger a low productivity/high reproductive phenotype in the wild include back eddies and protected stream edges, emergent macrophyte beds, impoundments upstream from dams, and potentially, reduced springflows due to drought and overpumping of the source aquifer (the Edwards Aquifer) for human use. These microhabitats would not be recommended as possible *Z. texana* restoration sites.

ACKNOWLEDGMENTS

This research was supported by a Section 6 grant from U.S. Fish and Wildlife Service and Texas Parks and Wildlife. I would like to thank Kathryn Kennedy, Center for Plant Conservation, Robert Doyle, Baylor University for their support and Francis Rose, Southwest Texas State University, for permission to use outdoor raceways and Spring Lake.

NOMENCLATURE OF THE HEART-LEAVED HEDGE-NETTLE, *STACHYS CORDATA* (LAMIACEAE)[1]

James S. Pringle

Royal Botanical Gardens
P.O. Box 399
Hamilton, Ontario, CANADA L8N 3H8
jpringle@rbg.ca

ABSTRACT

Stachys cordata Riddell is the correct name for the species usually called *S. nuttallii* Shuttlew. ex Benth.

RESUMEN

Stachys cordata Riddell es el nombre correcto para la especie usualmente conocida como *S. nuttallii* Shuttlew. ex Benth.

Stachys cordata was described from Ohio by Riddell in 1836. The identity of the species so named was never in question, and the use of this name prevailed during the following 85 years. Riddell's type specimen is extant at US and microfiches are widely accessible.

In 1921, House published the name *Stachys riddellii* in direct substitution for *S. cordata* Riddell, although he inappropriately used the designation "n. sp." Because this was merely a new name for the same species, no new description was provided and no new type was cited. House considered the name *S. cordata* Riddell to be illegitimate, in that it was a homonym of *S. cordata* Gilib. Whether the new plant names in Gilibert's *Flora Lituanica Inchoata* should be considered validly published under the provisions of the *International Code of Botanical Nomenclature* was formerly a matter of doubt. This matter is now settled. *Flora Lituanica Inchoata* and Gilibert's other publications are listed in the *Code* among the "opera utique oppressa," and new names at the rank of species are decreed not to have been validly published in those works.

Immediately upon its being published, the name *Stachys cordata* Gilib. was widely recognized as being taxonomically synonymous with *S. sylvatica* L., the name of a species native to Europe. Consequently, it was not inadvertently validated by subsequently being accepted by any other author. Bentham, in his comprehensive treatment of the genus in 1848, did not note the use of this name by any other authors in the interim, nor did he even cite it in synonymy. Since the provisions of the *International Code of Botanical Nomenclature* pertaining to homonyms apply only to validly published names, the use of the combination

[1]Contribution No. 101 from the Royal Botanical Gardens, Hamilton, Ontario, Canada.

SIDA 20(2): 583 – 584. 2002

by Gilibert no longer constitutes a reason for rejecting the name *S. cordata* Riddell.

Following House's publication of the name *S. riddellii*, that name came into general use for the species, although as late as 1933 the name *S. cordata* was used in Small's *Manual of the Southeastern Flora*. In 1979, Nelson and Fairey noted that the long-misapplied name *S. nuttallii* Shuttlew. ex Benth. (1848), which antedated *S. riddellii* House, was correctly applicable to the same species. The species has usually been called *S. nuttallii* since their paper was published. They rejected the name *S. cordata* Riddell only for the reason given by House. In his monograph on *Stachys* in the southeastern United States, Nelson (1981) included *S. cordata* Riddell in the synonymy of *S. nuttallii* but did not address the question of the legitimacy of the earlier name.

The only post-1981 flora in which the name *S. cordata* Riddell was accepted is that by Gleason and Cronquist (1991). The names *S. riddellii* and *S. nuttallii* were cited in synonymy, without comment. In other standard references, both printed and electronic and including those published since 1991, the name *S. nuttallii* has continued to prevail.

I conclude that there is no basis for the rejection of the name *Stachys cordata* Riddell, and that it is the correct name for the species that has been called *S. riddellii* House and *S. nuttallii* Shuttlew. ex Benth.

ABSTRACT

We investigated a recent report of a disjunct individual of *Cupressus arizonica* (Cupressaceae) collected in the Davis Mountains of Jeff Davis County, Texas. Chloroplast DNA sequences were obtained for the novel disjunct specimen and putative related taxa. Phylogenetic analysis suggests that the Davis Mountains *C. arizonica* specimen consists of vegetative tissue from *Juniperus deppeana*, a common species of the Davis Mountains. Based on this evidence, the present known distribution of *C. arizonica* in Texas remains restricted to the Chisos Mountains of southern Brewster County.

RESUMEN

Hemos investigado un reciente registro de un individuo disyunto de *Cupressus arizonica* (Cupressaceae) colectado en las montañas de Davis del condado de Jeff Davis, Texas. Se obtuvieron secuencias de ADN cloroplastidial del nuevo registro y los supuestos taxa relacionados. El análisis filogenético muestra que el especimen de *C. arizonica* de las montañas de Davis consiste en tejidos vegetativos de *Juniperus deppeana*, una especie común de las montañas de Davis. En base a esta evidencia, la actual distribución de *C. arizonica* en Texas, permanece restringida a las montañas Chisos del condado de Brewster.

INTRODUCTION

Cupressus arizonica, as broadly circumscribed (Wolf & Wagener 1948; Eckenwalder 1993) includes a number of variable, isolated populations in southwestern North America. The recent report of a single individual of *Cupressus arizonica* at Bridge Gap Spring in the Davis Mountains of Jeff Davis County, Texas (Karges & Zech 2001) suggests a more continuous distribution in suitable habitats from California, through the southwestern United States, into Trans-Pecos Texas, and south into Mexico. Previously, *C. arizonica* was known from northern Mexico (Standley 1920; Wolf and Wagener 1948; Little 1978 Correll & Johnston 1979; Rehfeldt 1997) southern Brewster County, Texas (Powell 1988; 1998), and isolated localities in Arizona, California, and New Mexico (Sudworth 1927; Vines 1960; Little 1971; Minnich & Everett 2001). The Davis Mountains specimen led Karges and Zech (2001) to postulate a greater Pleistocene range for *C. arizonica*, represented by an occurrence in this additional Madrean sky island habitat.

The specimen upon which this phytogeographic postulate is based (*Karges & Hedges 2480, SRSC*) may not represent *Cupressus arizonica*, however. This

sheet consists of several short (< 12 cm), separate, yellowed terminal branches, and three small (< 8 mm), detached woody scales. Another voucher of the Bridge Gap putative *Cupressus arizonica* (*Karges s.n., SRSC*) consists of a single branch with green leaves, but no visible reproductive structures. Common members of the Cupressaceae that occur in the Davis Mountains are *Juniperus deppeana* var. *deppeana* and *J. pinchottii* (Powell 1998). Also present in the Davis Mountains, *J. deppeana* var. *sperryi* is an extremely rare endemic known from three individuals (Adams 1973; 1993; Watson & Eckenwalder 1993; Powell 1998). The Bridge Gap specimens could represent one of the above taxa, as concluded by B.L. Turner in an annotation (17 Jan 2001) of *Karges and Hedges 2480* as *Juniperus deppeana*. The distal vegetative growth of *Cupressus arizonica* and the above taxa of *Juniperus* are nearly indistinguishable. This may reflect on the sister relationship between these genera (Brunsfeld et al. 1994; Gadek et al. 2000).

The putative occurrence of *Cupressus arizonica* in the Davis Mountains is of biogeographic importance, and we attempt to address the veracity of the recent report in Jeff Davis Co., Texas, through an alternative means. Cupressaceous taxa that are difficult to identify by conventional means have been accurately identified through chemical analysis (Gough & Welch 1978; Adams 1993; Hsiang & Huang 2000). In order to verify the determination of the two Davis Mountains putative *Cupressus arizonica* specimens, we have gathered and compared chloroplast DNA sequence data from these specimens and specimens of putative related taxa.

METHODS AND MATERIALS

The Davis Mountains specimens were compared to 4 individuals representing *Cupressus arizonica*, 2 other *Cupressus* species, 11 individuals of *Juniperus*, and 1 specimen each of the outgroups *Calocedrus*, *Chamaecyperis*, and *Thuja* (Table 1). This sampling was based on the generic relationships within Cupressaceae suggested by recent studies (Brunsfeld et al. 1994; Gadek et al. 2000). Specimens used for DNA sequencing were either collected during fieldwork in Mexico and the United States in 2001, previously vouchered herbarium specimens, or vouchered live plantings growing at Rancho Santa Ana Botanic Garden (RSABG).

For all specimens collected in 2001, DNA was extracted using 2X CTAB, followed by precipitation in cold isopropanol (Friar et al. 1996). One gram of terminal shoot tissue (including leaves) was used for these extractions. For specimens collected before 2001, a modified small prep for dried leaf tissue was used for extractions (Doyle & Doyle 1987). Amplification of cpDNA templates of the *trnL* intron and *trnL-trnF* intergenic spacer follows the methods outlined by Porter et al. (2000). Purified template amplifications were sequenced directly with four primers, *trnL*c, *trnL*d, *trnL*e, and *trnL*f (Taberlet et al. 1991), using "big

dye" chemistry from Applied Biosystems Incorporated, according to the manufacturer's specifications. All sequences were gathered using an Applied Biosystems Incorporated 3100 automated DNA sequencer.

Chromatograms derived from sequencing were assembled into contigs, and edited using Sequencher v4.1 (Gene Codes Corporation, Inc.). Consensus sequences were manually aligned using Se-Al v2.0a72 (Rambaut 1996). The aligned DNA data matrix is available from the first author upon request. The phylogenetic relationships among these specimens were estimated using Fitch parsimony, in PAUP* v4.0ß8 (Swofford 1998). Estimations of confidence in the clades were obtained through bootstrap analysis (Felsenstein 1985) with 10,000 pseudoreplicates, and through jackknifing (Farris et al. 1996), also with 10,000 pseudoreplicates (63% deletion) as implemented in PAUP*.

RESULTS AND DISCUSSION

The specimens of *Cupressus arizonica* form a well-supported (94% bootstrap, 80% jackknife) monophyletic group with three other *Cupressus* specimens, and

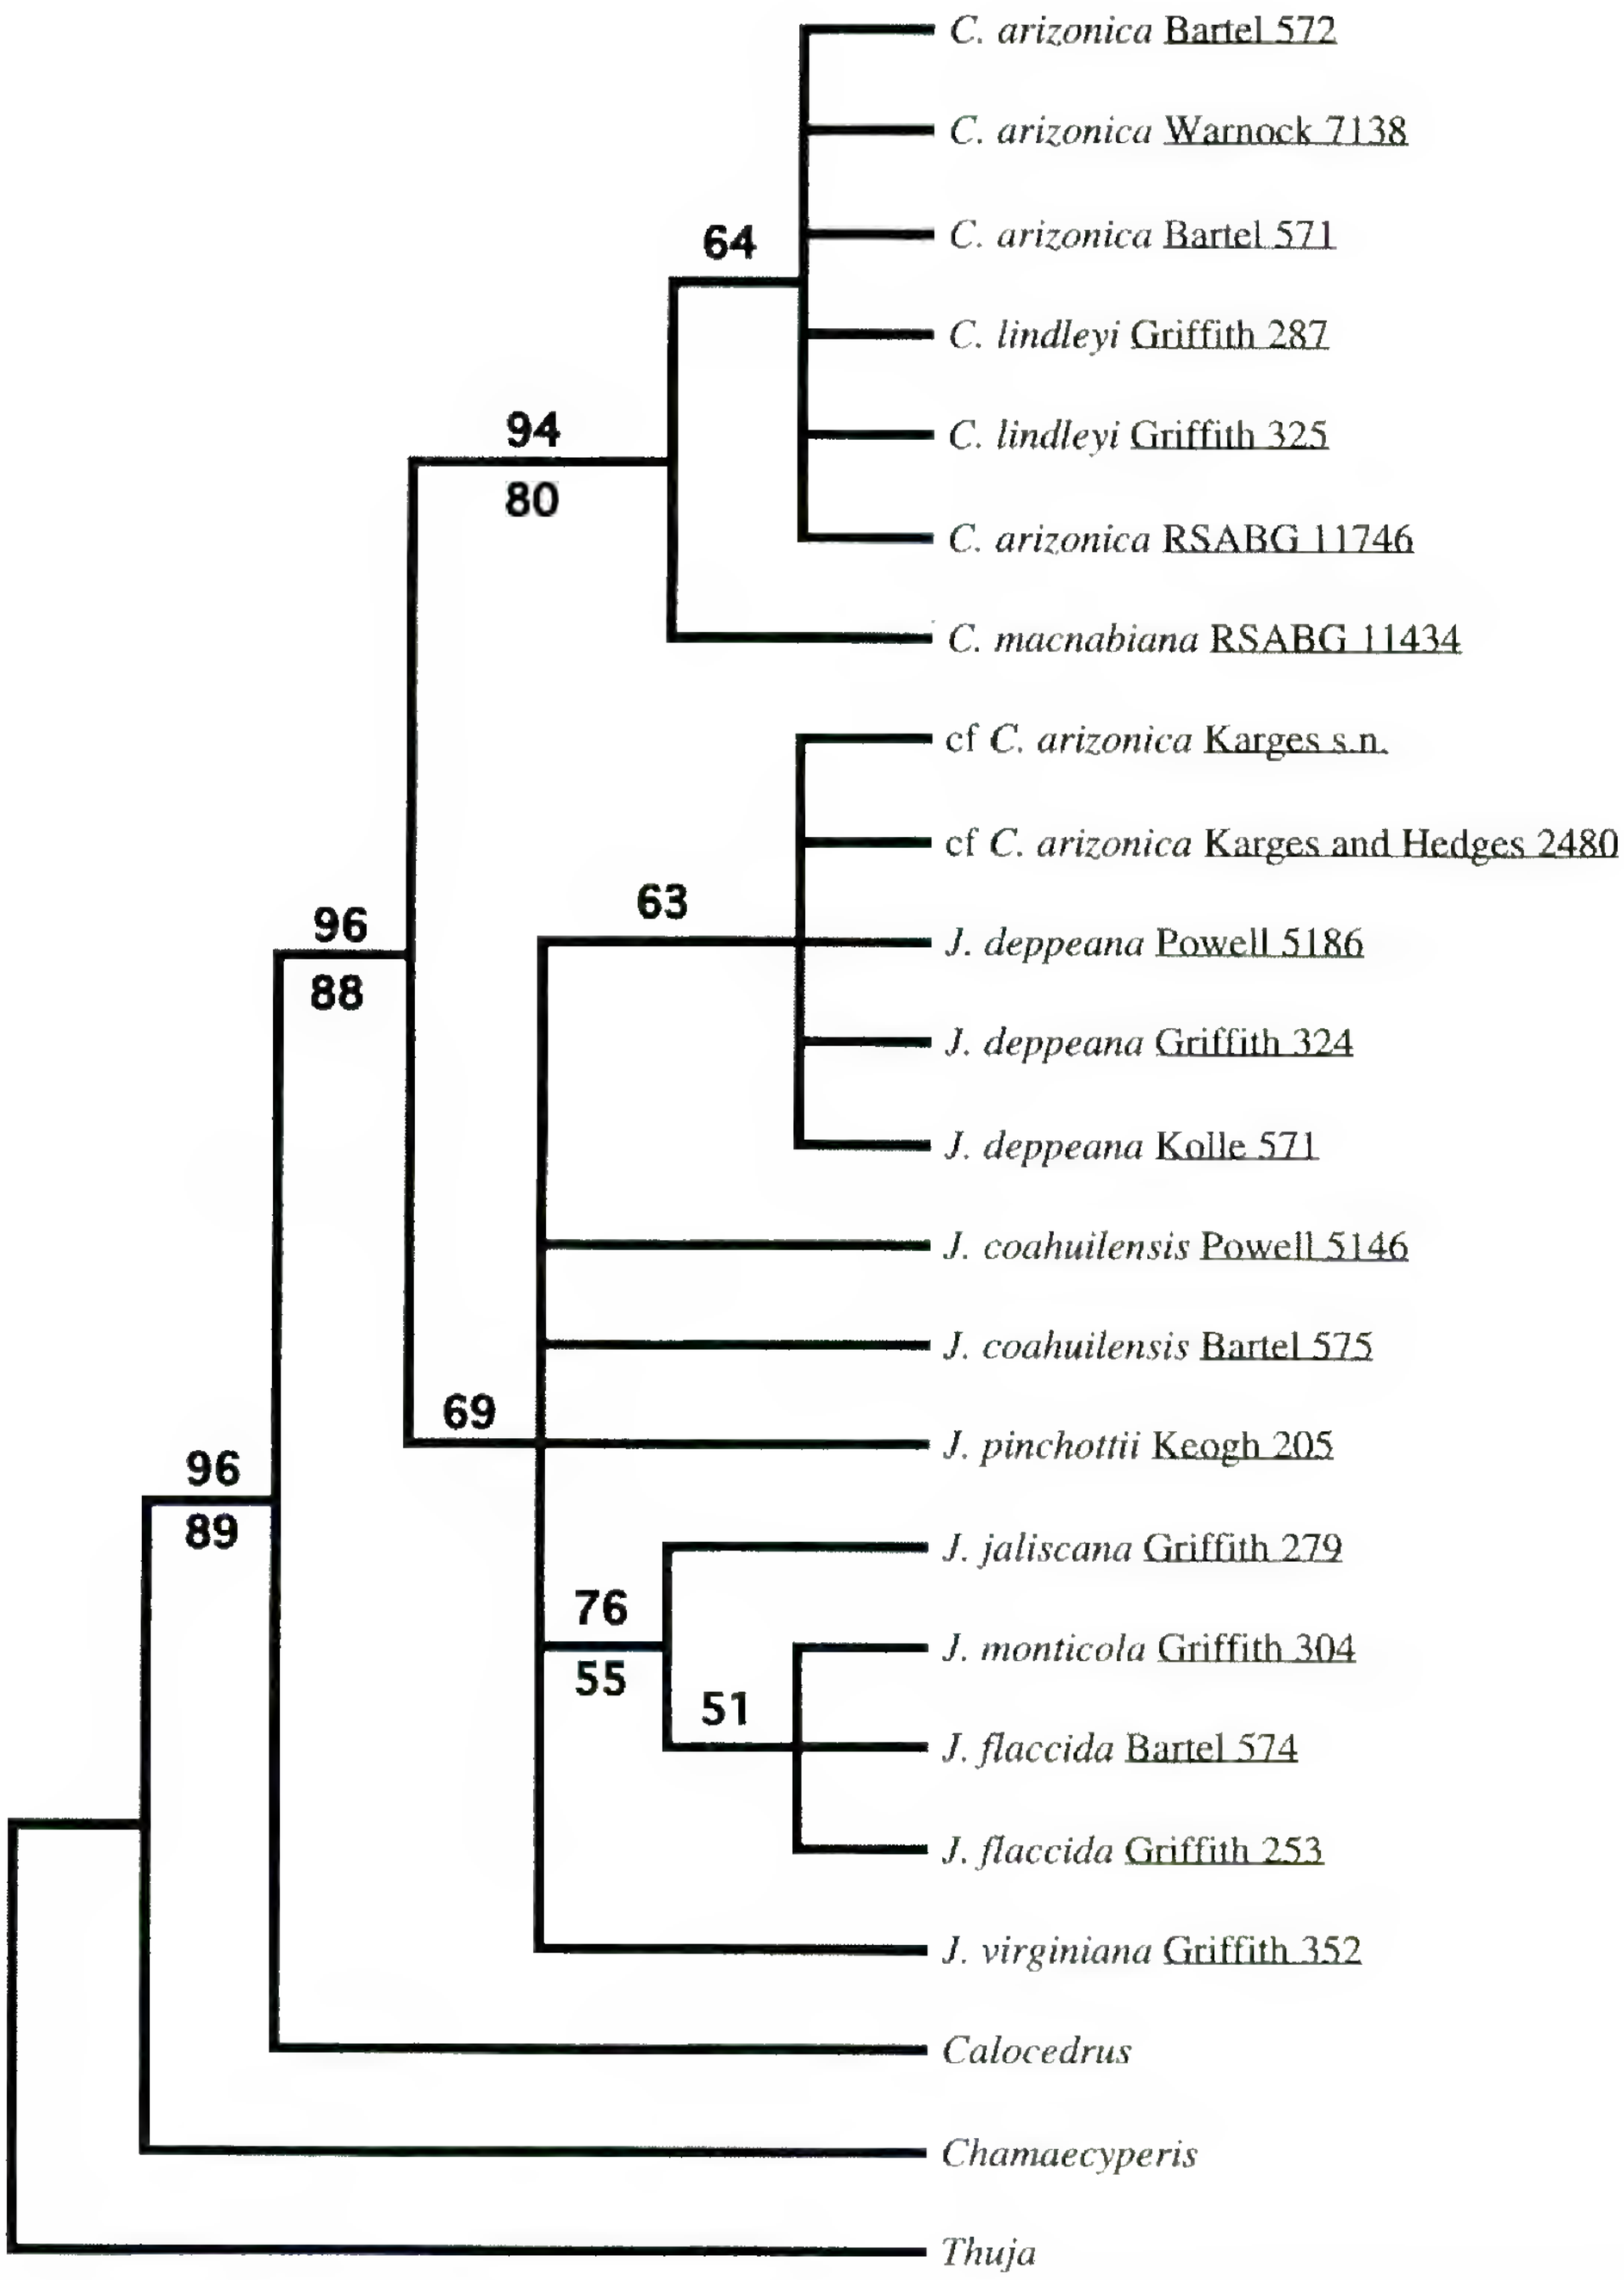

FIG. 1. A phylogenetic analysis of the two putative Davis Mountains *Cupressus arizonica* specimens (*Karges and Hedges 2480* and *Karges s.n.*) and related taxa. Strict consensus tree of 258240 most parsimonious trees from the branch and bound analysis of the *trnL-F* region. With uninformative characters excluded, length = 47; CI = 0.7660; RI = 0.8854; rescaled consistency = 0.6782. Bootstrap percentages above 50% are indicated above the branches, and jackknife support above 50% is indicated below the branches. *C.* = *Cupressus*, *J.* = *Juniperus*.

this clade excludes the two Bridge Gap putative *C. arizonica* specimens (Fig. 1). The three specimens of *Juniperus deppeana* plus the two Bridge Gap specimens form a clade, though lacking strong support (63% bootstrap). *Juniperus deppeana* is a species present at Bridge Gap (Karges & Zech 2001). In context with the known flora of the Davis Mountains, chloroplast DNA data clearly suggest that the two Bridge Gap specimens are not *Cupressus arizonica*, and are most likely *Juniperus deppeana*.

The first author examined the Bridge Gap cypress closely in July 1999 and made the following observations: The specimen's trunk bark is divided into rough squarish plates near the base, characteristic of *Juniperus deppeana* var. *deppeana* (Powell 1988). At a height of about 0.5 m, the gray-brown bark is separated into longitudinal ridges, a key character for *Juniperus deppeana* var. *sperryi* (Adams 1973; Powell 1988). In contrast, the inner bark of *Cupressus arizonica* is often described as reddish (Wolf & Wagener 1948; Powell 1998), maturing often into thin fibrous strips on large trees (Correll & Johnston 1979; Bartel 1993), although the bark of *Cupressus arizonica* sensu lato can be quite variable. Martínez (1963) notes that *J. deppeana* var. *patoniana* forma *obscura* may have the lower bark checkered and the upper bark furrowed.

Although other characters may be of use, in most taxonomic keys the major feature diagnostic between *Juniperus* and *Cupressus* is the presence of fleshy, fused cones (*Juniperus*), versus woody, dehiscent cones (*Cupressus*) (Correll & Johnston 1979; Powell 1988; Bartel 1993, Watson & Eckenwalder 1993). Of the two specimens of the Bridge Gap putative *Cupressus*, one (*Karges s.n.*) is devoid of reproductive features and the other (*Karges & Hedges 2480*) has three separate orbicular-spathulate scales that are 5–7 mm long and 6–8 mm wide. These scales appear to have been sessile at the proximal end rather than peltate. *Cupressus arizonica* has 4–5 partially peltate proximal pentagonal scales approximately 13–15 mm long, 12–14 mm wide, and 2–3(–4) distal oblong, truncate scales 5–8 mm wide and 9–11 mm long, completely peltate and valvate (Table 2). Morphologically, the scales present on *Karges & Hedges 2480* do not appear to be produced by *C. arizonica*.

One of the two putative *Cupressus arizonica* specimens (*Karges s.n.*) may be misdetermined because of a lack of reproductive characters, while the other (*Karges & Hedges 2480*) may have been determined as *C. arizonica* based on the three woody scales collected. Although the location of discovery of these three scales is faithfully recorded, we cannot be certain of their identity. Although unfortunate, this is not the first instance of a mixed collection being mistaken for something more significant (Thomson 1991). Given the above evidence, the present known distribution of *Cupressus arizonica* in Texas remains limited to the Chisos Mountains of southern Brewster County. This may change if a specimen exhibiting clear characters of *C. arizonica* is collected elsewhere in Texas.

TABLE 2. Specimens of *Cupressus arizonica* measured for morphological discussion.

DAHLIA NEGLECTA (ASTERACEAE: COREOPSIDEAE), A NEW SPECIES FROM SIERRA MADRE ORIENTAL, MEXICO

Dayle E. Saar

Department of Biological Sciences
Northern Illinois University
DeKalb, IL 60115-2861, U.S.A.

ABSTRACT

Dahlia neglecta, a new species from the state of Hidalgo, Mexico, is described and illustrated. This species is distinguished by the combination of glaucous stems, tufts of light-colored hairs at the rachis nodes, strongly oblique blade bases, and mucronate ligules.

RESUMEN

Se describe e ilustrada *Dahlia neglecta*, una nueva especie del estado de Hidalgo, México. Esta especie se distingue por la combinación de tallos glaucos y un copete de pelos de colores suaves en los nudos del raquis. Además, las bases de las hojas pequeñas son dominantemente oblicuas, y con lígulas mucronadas. Se ofrece una clave del género.

While collecting material from wild populations of *Dahlia* to expand natural history information and for cytological and molecular analyses of the genus, several undescribed species from Mexico were encountered, one of which is described here.

Dahlia neglecta D.E. Saar, sp. nov. **(Fig. 1)**. TYPE: MEXICO. HIDALGO: ca. 7 km NE of Tulancingo, just below the first pass along Mex 130 to the gulf coast, zone of *Quercus* and arborescent *Opuntia*; SE-facing slopes, among rocks and recent road fill, sunny to mostly sunny locations, elev. 2320 m, 11 Sep 1995, *J.P. Hjerting, D.E. Saar, & P.D. Sørensen 95-86* (HOLOTYPE: MEXU; ISOTYPES: C, DEK, F, IEB, MO, TEX).

Herba perennis 1.1–1.5 m alti. Folia pinnata vel bipinnata. Multiflorus, capitula 10–12.5 cm diam., corollae radii ligulatae lavendulus, squammis exterioribus involucri reflexis sub anthesi. Distinguibilis a caules glaucedine, fasciculati densi ad rachis nodis, obliqus basis laminis, ligulae mucronatusque necnon.

Plants to 1.5 m (type locality) or 1.2 m (paratype population) with 1–3(–5) herbaceous stalks arising from perennial tuberous rootstock; internodes glaucous, hollow, nodes solid. **Median leaves** 19–24 cm long including petiole, bipinnate with stipels frequently at the second (occasionally second and third) rachis node, becoming pinnate without stipels to simple at the base of the flowering portion; petioles solid; rachis with prominent tufts of light-colored hairs at nodes, pinnules opposite on the rachilla, primary pinnae 5–7; leaflets dentate and ciliolate, blade bases strongly oblique, veins lighter-colored, sometimes creating a dusty appearance at first glance. **Capitula** to 12.5 cm in diameter including rays, borne on unbranched peduncles 6–19 cm long and projecting above

the foliage; outer involucral bracts reflexed at anthesis. **Ray florets** sterile; ligules lavender with a spot of yellow at the base, veins darker below, tips mucronate. **Disc florets** hermaphroditic, yellow. Cypselae elliptic-oblong, 8.6 mm wide × 1.2–1.6 mm long; black.

Etymology and distribution.—Flowering commences in August (in 1995). Plants from the type locality grow along and in full view of a busy highway (Mex 105) near the large city of Tulancingo. It is surprising, therefore, that this showy species has not been described previously, hence the specific epithet, *neglecta*. The known distribution for this species is presently limited to the holotype and paratype localities.

PARATYPE: MEXICO. HIDALGO: at K-8, 2 km SW of Mineral del Monte, along route Mex 105, zone of *Cupressus* and scattered shrubby *Quercus*; road cut with dense vegetation on SE-facing slope, elev. 2800 m, 11 Sep 1995, *J.P. Hjerting, D.E. Saar, & P.D. Sørensen* 95-97 (DEK, MEXU).

The combination of glaucous stems, tufts of light-colored hairs at the rachis nodes, strongly oblique blade bases, and mucronate ligules sets this species unmistakably apart from all others. Sørensen's (1969) key would place *Dahlia neglecta* in section *Dahlia*. Within the key for this section, *D. neglecta* pairs with *D. australis* and *D. sherffii* at couplet "N" (page 325) and incorporates some morphological characters from each species. *Dahlia neglecta* is similar to *D. australis* in that the lower leaf surfaces are conspicuously lighter green or silvery green, but the former differs by having flat (not revolute or obscurely so) margins, a smooth (not rugose) upper leaf surface and glaucous (not glabrous or pubescent) canes. The fruit is of similar length but only 1.2–1.6 mm wide versus 1.5–2.6 mm for *D. australis*. The smooth upper leaf surfaces of *D. neglecta* are similar to *D. sherffii*. *Dahlia neglecta* differs from *D. sherffii* by its glaucous (not glabrous) canes, bicolored leaf surfaces, and narrower fruit (*D. sherffii* = 2.2–3 mm). The unique combination of characters mentioned earlier also distinguishes *D. neglecta*. None of these species are sympatric in their distributions.

A molecular study of the genus which utilizes combined molecular sequences from the internal and external transcribed spacer regions (ITS and ETS, respectively) of nuclear ribosomal DNA, shows good support (86% bootstrap value) for placing *Dahlia neglecta* in a pectinate clade ("Variable Root Clade") that includes the "tree dahlias" (sect. *Pseudodendron*: *D. imperialis*, *D. excelsa*, and *D. tenuicaulis*), sect. *Epiphytum* (*D. macdougallii*), two species from sect. *Dahlia* (*D. rudis* and *D. apiculata*), and an unpublished species (Saar et al. in press). Within this clade, *D. neglecta* is most closely allied with *D. apiculata* and *D. tenuicaulis*, but support is minimal (57% bootstrap value). *Dahlia neglecta* is not sympatric with these species and both *D. apiculata* and *D. tenuicaulis* have lignified perennial canes, whereas *D. neglecta* is herbaceous.

The description of *Dahlia neglecta* brings the number of "wild" or naturally-occurring species of *Dahlia* to 35, but does not include the cultivated forms

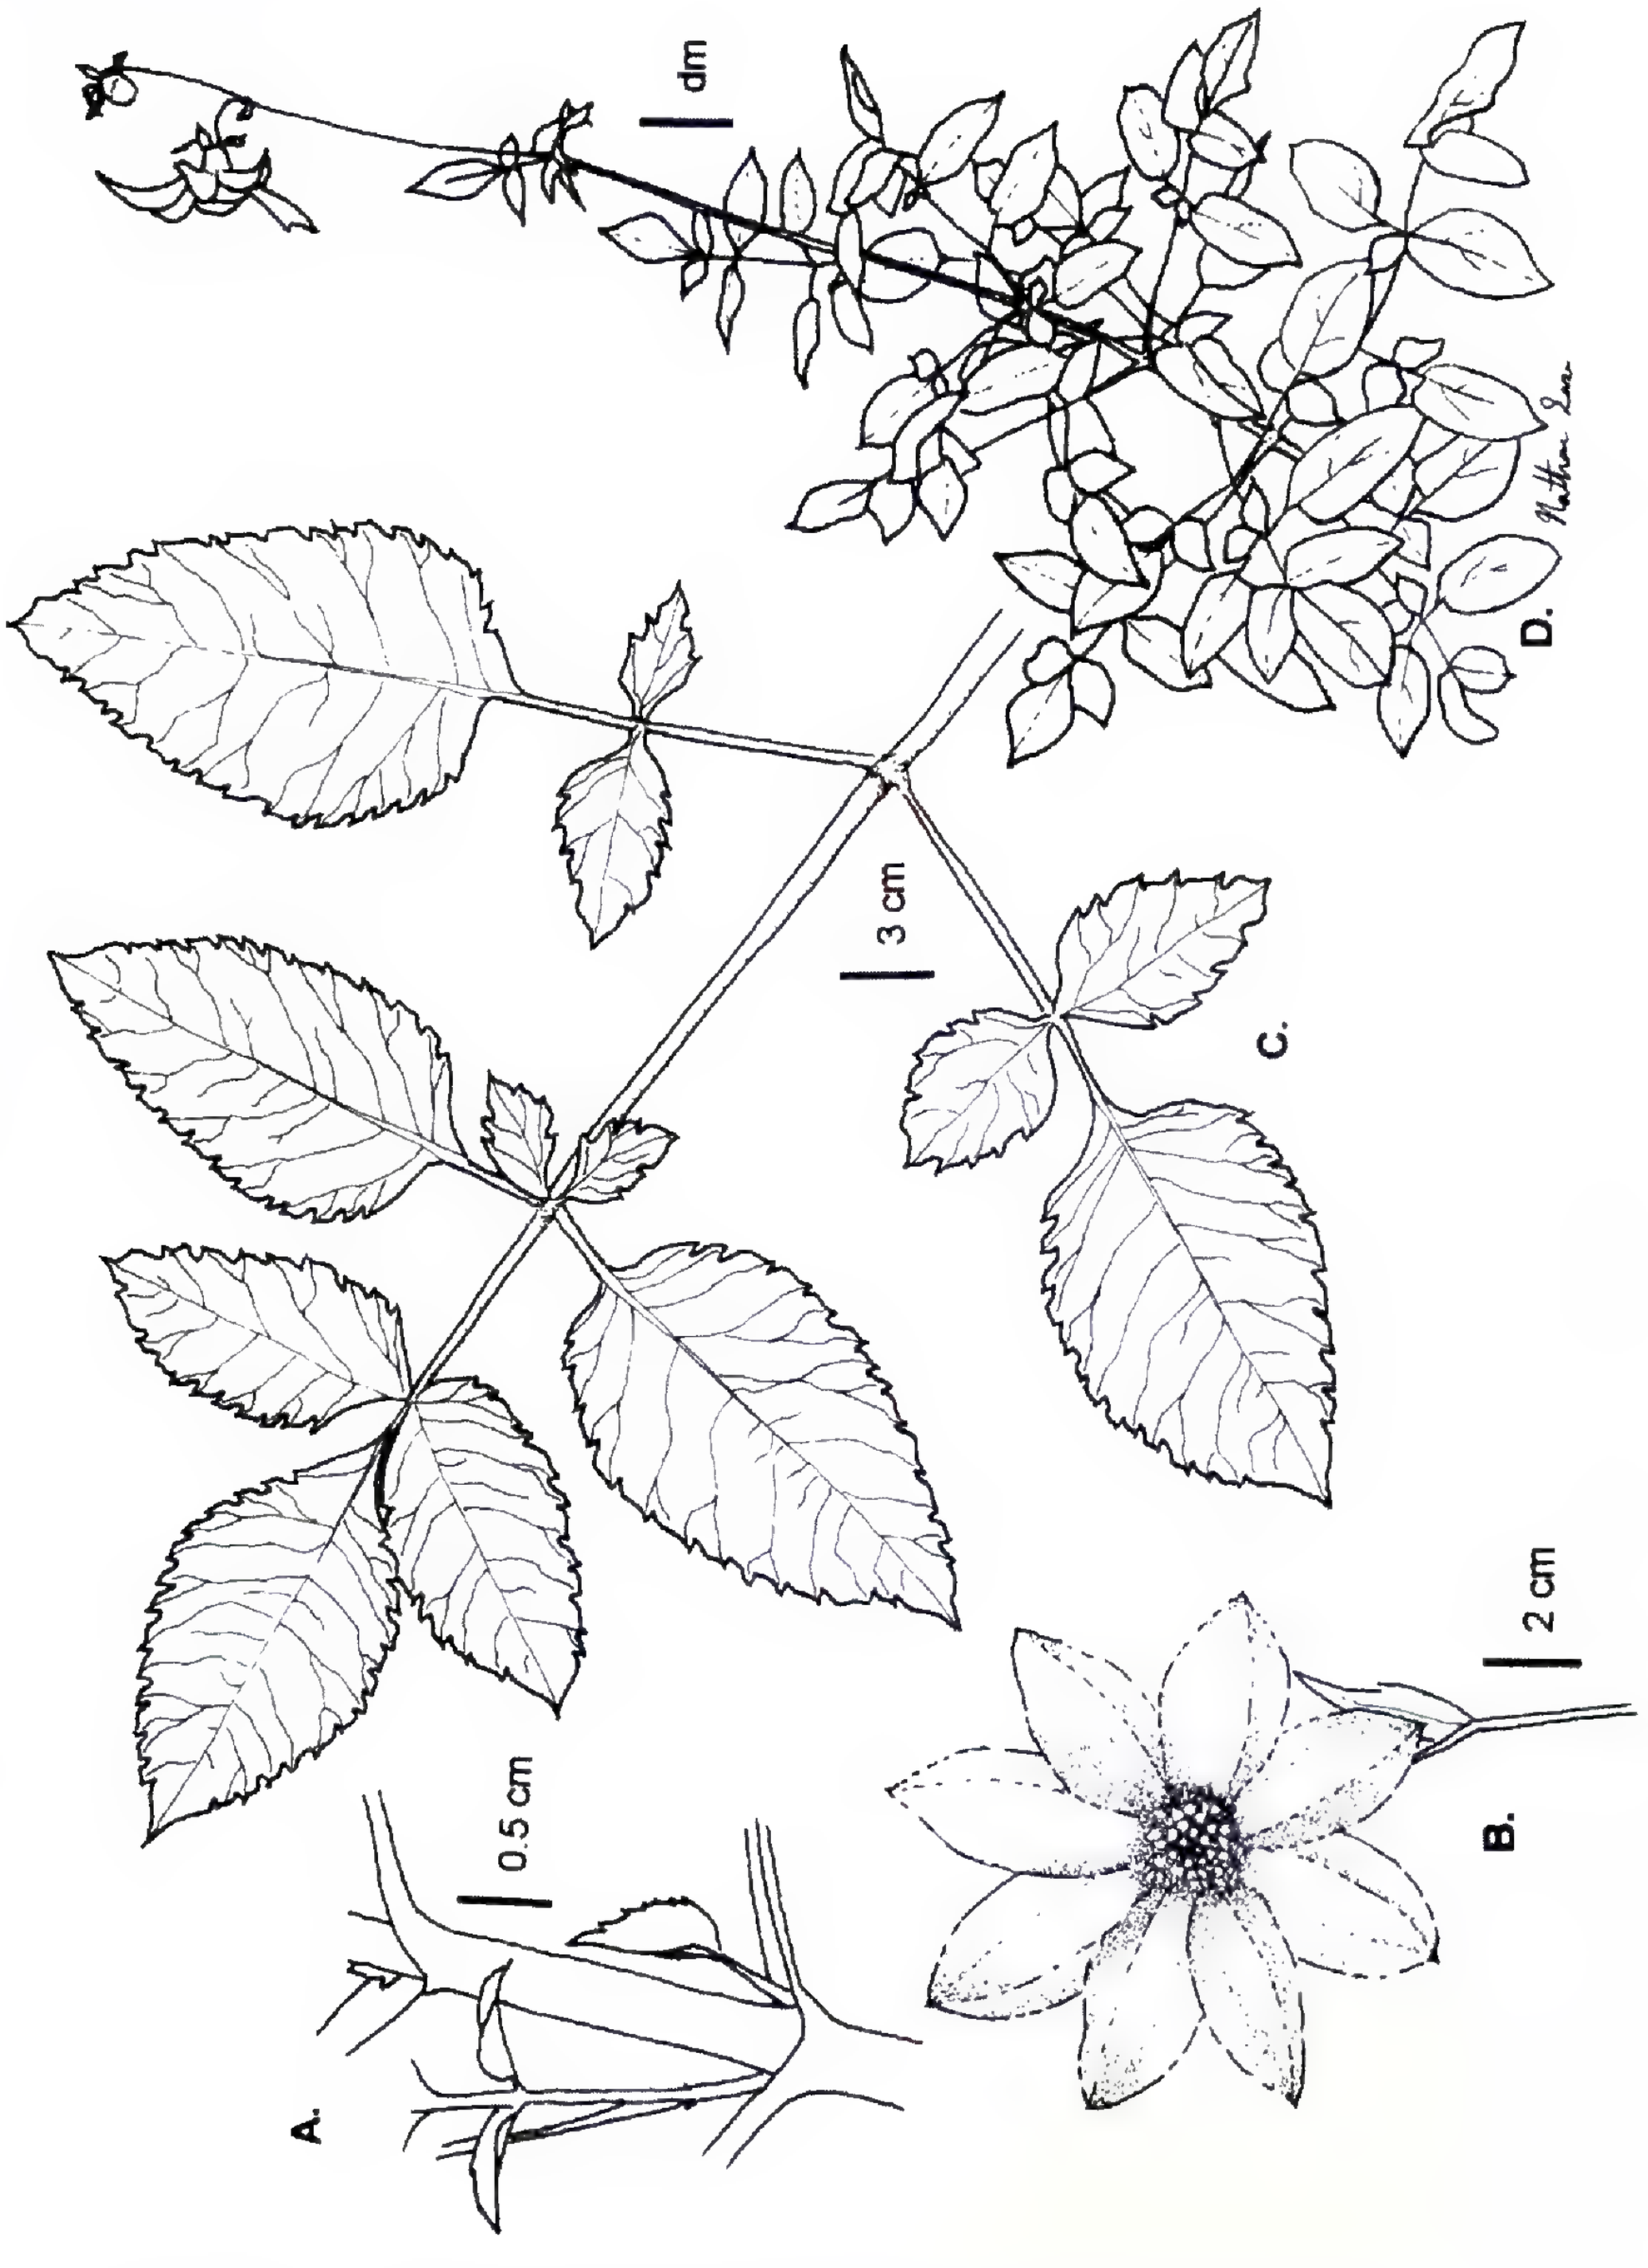

FIG. 1. *Dahlia neglecta*: **A.** leaf bases; **B.** flowering head; **C.** median leaf; **D.** general habit. Drawn from type specimens and photographs.

often called *D. variabilis* or occasionally *D. pinnata* (see Hansen & Hjerting 1996 for clarification of the latter Latin binomial). This total does, however, include three previously undescribed species currently "in review" or "in press:" *D. hjertingii* (Hansen and Sorensen in press), *D. campanulata*, and *D. cuspidata*.

ACKNOWLEDGMENTS

I thank Nathan A. Saar for preparing the illustration and Portia Gallegos for translating the abstract into Spanish. Paul Sørensen and Jens Peter Hjerting were invaluable throughout the field studies in Mexico. Guy Neson and an anonymous reviewer provided helpful comments to an earlier version of the manuscript.

THE VARIETIES OF *LIATRIS ELEGANS* (ASTERACEAE)

Mark H. Mayfield

Herbarium-Div. of Biology
Kansas State University
Manhattan, KS 66502, U.S.A.
markherb@ksu.edu

ABSTRACT

A description of two new infraspecific taxa in *Liatris elegans* is presented. ***Liatris elegans*** var. ***bridgesii***, var. nov., occurs on the Carrizo and adjacent Eocene sand formations in central Texas. ***Liatris elegans*** var. ***kralii***, var. nov., occurs on the Fall Line Sandhills and coastal plain of Alabama and Georgia to the northern panhandle of Florida. The newly described taxa are similar to each other in their cream-white to yellow (vs. anthocyanin-colored) phyllary apices but they are widely separated geographically and each is distinct in other morphological features; they are viewed here as having independent origins. *Liatris elegans* var. *flabellata* is reduced to a form of *L. elegans* var. *elegans*, while *Liatris elegans* var. *carrizana* is maintained for southern-central Texas populations. *Liatris elegans* var. *elegans* is widespread on the coastal plain from South Carolina to eastern Texas.

KEY WORDS: Liatris, Asteraceae, Texas

RESUMEN

Se presenta la descripción de dos nuevos taxa infraspecíficos en *Liatris elegans*. ***Liatris elegans*** var. ***bridgesii***, var. nov., se da en el Carrizo y formaciones arenosas adyacentes del Eoceno en el centro de Texas. ***Liatris elegans*** var. ***kralii***, var. nov., aparece en la Fall Line Sandhills y llanura costera de Alabama y Georgia hasta el estrecho de Florida. Los nuevos taxa descritos se parecen entre si por sus ápices de los filarios de blanco-crema a amarillo (vs. color de antociano) pero están ampliamente separados geográficamente y se diferencian por otras características morfológicas; Se ven aquí con dos orígenes independientes. *Liatris elegans* var. *flabellata* se ha reducido a una forma de *L. elegans* var. *elegans*, mientras que *Liatris elegans* var. *carrizana* se mantiene para las poblaciones del sur-centro de Texas. *Liatris elegans* var. *elegans* es común en la llanura costera desde Carolina del Sur al este de Texas.

Liatris elegans Michx. is an obligate psammophile, occurring in well-drained, loose to somewhat compacted sandy soils in open to sparsely forested habitats across much of the Gulf and Atlantic coastal plains and in the southern Interior Highlands province in Arkansas. Its colored, elongated, conspicuous phyllary apices in combination with white to yellowish-cream corollas distinguish it as one of the most recognizable species in the genus (cf. King & Robinson 1987). All other species have more or less herbaceous, relatively short, inconspicuous phyllaries with exserted, lavender to pink corollas (Gaiser 1946). Thus, in *L. elegans* the phyllaries rather than the flowers provide primary visible coloration of the columnar inflorescences. Throughout most of the range of *L. elegans* (herein, *L. elegans* var. *elegans* and *L. elegans* var. *carrizana* L.O. Gaiser) populations have phyllaries that are predominantly shades of lavender, pink, bluish, or magenta, colors that are presumably generated by anthocyanin

pigments. Two sets of populations, one on the western margin of the range in Texas, another in the eastern Gulf Coastal Plain in Alabama, Georgia, and Florida, mostly lack classic anthocyanin coloration at anthesis. Instead, these have primarily yellowish, cream, or nearly white phyllaries with some populations variably cream to faintly lavender. The Texas populations were discussed briefly by Gaiser (1946, p. 174, as *L. elegans* forma *fisheri* Steyermark), but accurate description of the variation is lacking. In addition, the well-defined pattern of distribution of the eastern coastal plain pale-phyllaried populations has never been addressed. While phyllary color alone may not be taken as a reliable indicator of genetic cohesion, the geographic integrity and populational uniformity of these unique populations suggests that selection for phyllary color has taken place within these populations. A recognizable suite of other morphological features supports their recognition but the presence of intergradation of both sets of populations with var. *elegans* further suggests that recognition at an infraspecific rather than specific rank is warranted. I have chosen variety to indicate that intermediate populations occur along the margins of these novel taxa.

Liatris elegans Michx. var. **bridgesii** Mayfield, var. nov. (**Fig. 1**). TYPE: U.S.A. TEXAS. MILAM CO.: 2.6 mi W of [FM 487 in] Rockdale on US 79; S side of railroad track, Simsboro Sand Formation, 505 ft, N 30°38'34" W 97°02'52", 6 Sep 1992, *Mark H. Mayfield 1549* (HOLOTYPE: TEX; ISOTYPES: F, FLAS, GA, GH, MO, NCU, NY, US).

Liatris elegans forma *fisheri* Steyermark, Field Mus. Nat. Hist., Bot. Ser. 11: 275. 1936. TYPE: TEXAS: CORYELL CO.: near and on the highway, 4 mi S of Copperas Cove, 26 Aug 1934, *George L. Fisher s.n.* (HOLOTYPE: F #761244!).

Differt a *L. eleganti* var. *eleganti* apicibus phyllariis petaloideis flavis aut eburneis vel pallide roseis aut lavandulis; differt a *L. eleganti* var. *kralii* apicibus phyllariis valde recurvatis ac capitulis coacervatis patentibus plerumque sessilibus.

Corms globose; stems sparsely to densely tomentose; lateral heads usually densely crowded, divergent-ascending to spreading at right angles, sessile; phyllaries parallel and appressed below the petaloid portion, the colored apices recurved, abaxially pubescent to tomentose, initially pale lemon yellow, then fading to cream or very pale lavender, rarely rosescent at fruiting; corollas cream-white, tubular, the tube scarcely broadened to the top of the limb, the lobes scarcely flared apically; stigmas cream to light yellow or nearly white.

PARATYPES: **U.S.A. Forma as a category fails to represent the clear geographic pattern that occurs in var. *bridgesii*. I have chosen to provide a novel epithet for the present taxon because the type locality of forma *fisheri* is apparently inaccurate. No populations of *L. elegans* var. elegans (Fig. 2) occur anywhere close to the designated location "on the highway 4 miles south of Copperas Cove" in Coryell County. While there are some thin, Cretaceous sand-bearing strata in this area as well as some river terrace sands, searches around Copperas Cove have not yielded populations or habitat suitable for *L. elegans*. Furthermore, no other collections from the area were located in searches of three major herbaria in central Texas, among others. The establishment of a new type and name will serve to solidify the concept of the taxon.

Etymology.—This variety is named for Edwin L. Bridges, prolific plant collector and knowledgeable floristician/taxonomist. Bridges' tenacity in the field and his incredible plant recognition skills are truly inspiring. Our memorable field trips into the sand-bearing strata east of Austin, Texas, were crucial to my understanding of this and many other sand-loving species.

Distribution, variation and ecology.—Liatris elegans var. *bridgesii* is best represented in the southwesternmost part of its range from north of the Colorado River in Bastrop and Lee Counties northeast to Henderson County in Texas. Here, populations consist entirely of individuals with phyllaries that are creamy white to very pale lavender, and possess long-tubed corollas with relatively short weakly flared lobes. In the Post Oak savannas of Williamson, Milam, Lee, and Robertson counties, all populations I found had consistently cream-colored phyllaries. The latter begin the flowering season with a very striking, nearly lemon yellow color in the phyllaries, a color that is otherwise not present in the phyllaries of any Liatrinae. Later in the season, well into fruiting, the color fades to creamy white, sometimes infused with a rose or lavender tinting. Further

northeast, populations seem to intergrade in terms of phyllary color but other features are consistently more like var. *bridgesii* than var. *elegans*. The phyllaries of var. *bridgesii* tend to be longer and more strongly recurved with longer, more narrowly tubular, pale cream corollas than in var. *elegans*. The var. *bridgesii* is similar to the next newly described variety in the pale coloration of the phyllaries, but it has a more compact inflorescence with more strongly recurving phyllary tips and sessile heads (see further discussion below regarding pedunculate heads).

The var. *bridgesii* occurs almost exclusively on Eocene sand-bearing strata running from southwest to northwest from the north side of the Colorado River in Bastrop County to Wood County in the northeast. Its influence is also apparent in population eastward through Cherokee and Houston, to Nacogdoches, Shelby, and San Augustine Counties where the Carrizo formation is exposed around the western margin of the Sabine uplift. Post-oak savanna is the primary habitat where this variety is found. Mixed pine forests of eastern Texas are more likely to have populations of *L. elegans* var. *elegans* (Fig. 2) but both occur therein and some intergradation is observed.

Liatris elegans var. **carrizana** L.O. Gaiser (**Fig. 3**) occurs south of the Colorado River in Texas on deep, sandy soils of xeric sandhills (cf. Gaiser 1946). This variety is characterized by its elongated, napiform corm suited to the drier climate and deep sands that prevail in this region. Its phyllaries are structurally similar to those of the var. *bridgesii*, with elongated strongly recurving apices, but they are consistently colored blue, magenta, lavender, or pink, rather than cream. Populations of var. *carrizana* just to the south of the Colorado River in Bastrop and Caldwell Counties, Texas, may have more or less globular corms but are otherwise more similar to the var. *carizzana*. In all other areas, *L. elegans* has depressed globose corms as is true of many species of the genus.

Liatris elegans Michx. var. **kralii** Mayfield, var. nov. (**Fig. 4**).TYPE: U.S.A. ALABAMA. LEE CO.: Locally abundant in open pine woods 6 mi S of Auburn, 23 Sep 1899, *F.S. Earle and E.S. Earle 94* (HOLOTYPE: KSC!; ISOTYPES: F! GH! ND NY! US).

Similis a *L. eleganti* var. *bridgesii* apicibus phyllariis flavis aut albis vel pallide lavandulis sed capitulis ascendentibus pedunculatis magis interruptis et phyllariis divergentibus (vs. appressis) infra partem petaloideum ac leniter recurvatis ad apices

Corms globose; stems sparsely to densely lanose-tomentose; lateral heads (at anthesis) usually loosely arranged, ascending to divergent, pedunculate; phyllaries abaxially tomentose to densely lanose, divergent along their length, the petaloid apices flaring only slightly or not at all, initially light yellow or cream, then fading to cream; less often pale lavender to rose, corollas pure-white, tubular, the tube flaring gradually to the top of the limb, the lobes strongly flared; stigmas white to very pale lavender.

Etymology.—This variety is named to honor Dr. Robert R. Kral, well known as one of the most knowledgeable botanists on the southeastern US flora. Kral's personal collections amassed over four decades from the coastal plain have contributed greatly to the understanding of this and many other species. His classes I took as an undergraduate in Plant Taxonomy and Dendrology stimulated my interest in botany.

Distribution, variation, and ecology.—*Liatris elegans* var. *kralii* occurs in two major population centers. Populations to the north, in the Fall-Line Sandhills of western-central Georgia to eastern-central Alabama, including the type, consistently bear phyllary apices that are white to light tan in color. A second, somewhat separated area of occurrence is further to the south in counties along the southern tier of Georgia, northern tier of Florida, and west to Mobile County in Alabama. In this area scattered populations of var. *kralii* occur sympatrically (but not apparently in mixed populations) with var. *elegans*. The var. *elegans* is much more common in this area but relatively pure populations of var. *kralii* do occur, albeit usually with both white and pale lavender forms (e.g., *Kral 37333*, Mobile Co., AL; *Kral 44342*, Geneva Co., AL; *Faircloth 5691*, Ben Hill Co., GA; *Kral 3574*, Washington Co., FL). All populations referable to var. *kralii* have short peduncles bearing the heads and the heads are well-spaced and ascending. Although pedunculate heads may otherwise occur throughout the range of the species in shaded or apically injured plants, these are rare and unusual. Also, the phyllaries of var. *kralii* are longer and narrower, with the petaloid portion especially elongate in proportion to the basal herba-

ceous portion. Another recognizable trait of var. *kralii* is the divergent phyllaries with the tips ascending, rather than recurved. All other varieties have more strongly recurved phyllary apices, with the lower herbaceous portions closely appressed.

Variety *flabellata*.—The type specimen of var. *flabellata* apparently consists of a single plant divided into two separate sheets. The only two sheets referable to this taxon are at NY; one has a single plant with root and two stems attached and a third stem severed at the base. The second sheet is a single stem that appears to have come from the severed base of the plant on the other sheet. The only feature separating this plant from var. *elegans* is its emarginate to truncate, relatively broadened (flabellate) phyllary apices. From the same locality (St. Helena Island, S.C.) numerous other specimens collected by Cuthbert at NY and FLAS have phyllary morphology as is typical for the var. *elegans*. Thus, I view the type specimen as consisting of a single plant from a locality with plants otherwise identical to the var. *elegans*. Thus it is best treated as an aberrant or freak, admittedly distinctive, but not persisting as a viable population. It is reduced here to a form of var. *elegans*.

Book Review

Ronald A. Coleman. 2002. **The Wild Orchids of Arizona and New Mexico.** (ISBN 0-8014-3950-7, hbk.) Cornell University Press. Sage House, 512 E. State Street, Ithaca, NY 14850. (Orders: www.cornellpress.cornell.edu). $39.95, 272 pp, 35 line drawings, 36 maps, 160 color plates, 6" × 9 1/4".

This volume is just one of many regional orchid floras published for North America within the last 15 years. Though the *Native Orchids of the United States and Canada* was published in 1975 by Carlyle Luer, regional floras, such as this one, update nomenclature and more clearly define geographic ranges. Since Orchidaceae is one of the largest flowering plant families, has a cosmopolitan distribution, and occupies many diverse habitats, small regional floras, like this one, provide a baseline of knowledge. Coleman presents to his readers a rather varied orchid flora in Arizona and New Mexico, composed of 35 species and 14 genera. The most diverse region in both states for spotting orchids is the Mogollon Rim. The combination of high elevation and precipitation provides habitat for orchids, in comparison to the rest of the two states where desert or high plains dominate. For those interested in collecting orchids, you might think twice. All of the orchids of Arizona and a few in New Mexico are protected by law, so all you should take away from your orchid-hunting adventures are photographs and memories.

The book begins with a lucid discussion of floral morphology, habitats and geographic distribution in Arizona and New Mexico, as well as information on blooming seasons and conservation. Next, a key to orchid genera is provided and could not be more straightforward. The terminology is basic and would be useful to anyone, even those with only a basic understanding of botanical terminology. Following the introduction are genera and species descriptions. Genera and species are listed in alphabetical order. For each genus, the author provides a citation of effective publication, etymology and a rather informal description or discussion of the group. For example, in the discussion on *Cypripedium*, the reader learns that the lip of the flower serves as a trap to the pollinator, who once inside finds it hard to escape. Moreover, the discussion on *Corallorhiza* helps enthusiasts clearly distinguish the members of this genus from those of *Hexalectris*. If there is more than one species present, a key is provided. Following the generic discussions are species descriptions, which also include a citation of publication and etymology of the epithet. In addition, synonymy, a short non-technical description, distribution, habitat, blooming season, conservation issues and threats to each species are included. Because the author has taken an informal approach to describing each species, it becomes much more interesting to the reader. A case in point is the interesting story on nomenclature of *Schiedeella arizonica* and how misapplied names can lead to taxonomic confusion. In the margin next to each species description is a line drawing of the flower. These illustrations provide a practical identification tool. A dot map for each species shows presence of that species in Arizona and New Mexico counties.

Several appendices conclude the book: 1) Excluded species, 2) Watch list of species not yet reported from Arizona or New Mexico, 3) Herbarium collections studied, and 4) Distribution of orchids in Arizona and New Mexico listed by county. Color photographs seem strategically placed at the beginning of the book, where they can whet the reader's appetite. Most of the photos are close-ups of flowers or fruits, but also include examples of plants in habitat.

This is a wonderful publication on orchids packed with an abundance of information useful to anyone with any affinity to orchids. Coleman's writing style is clear, concise, and unpretentious. It would make a lovely addition to the library of a native plant lover, botanist, or orchid enthusiast.—*Amy Trauth Nare, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX, 76102 U.S.A., amy_trauth@yahoo.com.*

DOCUMENTED CHROMOSOME NUMBERS 2002:3. CHROMOSOME COUNTS FOR *PACKERA PAUPERCULA* VAR. *APPALACHIANA* (ASTERACEAE: SENECIONEAE)

ABSTRACT

Certain populations of more or less tomentose *Packera* (Asteraceae: Senecioneae) in southeastern North America have recently been treated as *P. paupercula* var. *appalachiana* based on evidence from a common garden, canonical discriminate analyses of morphological characters and flowering date, a preliminary RAPDs analysis, and crosses. Previously they had been treated as disjuncts of *P. plattensis*, a species of the Great Plains, which may have migrated into the mid Appalachians during the post-glacial Hypsithermic Period and survived there as relicts. However, *P. plattensis* is tetraploid with $n = 46$ and $x = 23$. Our two chromosome counts of the new variety from North Carolina and from Virginia are $n = 22$ and $n =$ ca. 44, respectively, a diploid and a tetraploid, both with $x = 22$. Statistical analyses of pollen diameter provide evidence that the other individuals in the two populations are diploid and mostly tetraploid, respectively. Hybridization with *P. aurea* may be involved in the origin of the tetraploid. Thus, cytological evidence supports other data showing that these populations may be more closely related to *P. paupercula*.

RESUMEN

Ciertas poblaciones de *Packera* (Asteraceae: Senecioneae) más o menos tomentosas del sureste de Norte América han sido tratadas recientemente como *P. paupercula* var. *appalachiana* basándose en evidencias procedentes de un jardín común, análisis canónico discriminante de caracteres morfológicos y datos florales, un análisis preliminar de RAPDs, y cruces. Previamente habían sido tratados como disyuntas de *P. plattensis*, una especie de las Grandes Llanuras, que podría haber migrado a los Apalaches medios durante el periodo hipsitérmico post-glacial y sobrevivido allí como relicto. Sin embargo, *P. plattensis* es tetraploide con $n = 46$ y $x = 23$. Nuestros dos recuentos cromosomáticos de la nueva variedad de Carolina del Norte y de Virginia son $n = 22$ y $n =$ ca. 44, respectivamente, un diploide y un tetraploide, ambos con $x = 22$. Los análisis estadísticos del diámetro del polen evidencian que los otros individuos de las dos poblaciones son diploides, y preferentemente tetraploides, respectivamente. La hibridación con *P. aurea* puede ser la causa del origen del tetraploide. Así, la evidencia citológica apoya otros datos que muestran que estas poblaciones pueden estar más emparentadas con *P. paupercula*.

INTRODUCTION

Packera plattensis (Nutt.) Weber and Á Löve is distributed in dry grasslands from the eastern flanks of the southern Rocky Mountains to the Mississippi

SIDA 20(2): 605–610. 2002

River with scattered populations eastward in Wisconsin and Missouri (Barkley 1962, 1978) (Fig. 1). It is tetraploid with a base chromosome number of $x = 23$ (Kowal 1975; Kowal et al. unpubl. ms.).

Apparently disjunct populations occur in Pennsylvania, Virginia, Tennessee, North Carolina and South Carolina (Barkley1962, 1978, 1988; Uttal 1982; Rhoads & Klein 1993) (Fig. 1). Barkley hypothesized that these are remnants of the widespread eastern migration of prairie-adapted plants during the Hypsithermic Period of about 8000 years ago. Such populations in Montgomery Co., Virginia commonly hybridize with *P. aurea*, *P. anonyma*, and *P. obovata* (Uttal 1982). Because the latter three species are usually diploid with $x = 22$ (Kowal et al. unpubl. ms.), widespread hybridization with *P. plattensis* would be unexpected (Mahoney & Kowal ms. subm.; Kowal et al. unpubl. ms.). Moreover, herbarium specimens from the entire range of the eastern disjunct populations are morphologically different from *P. plattensis* of the Great Plains in their rosette and cauline leaves and in their smaller heads.

Individuals from North Carolinian and Virginian populations of putative *P. plattensis* were included in a larger study of the *P. paupercula* complex and allied species (Mahoney & Kowal ms. subm.). Replicates were grown in a standard environment transplant garden, and data on morphology and flowering time were analyzed by canonical discriminant analyses (CDA) and analyses of variance (ANOVA). Herbarium specimens of the complex, emphasizing its distribution east of the Mississippi River, were studied, and a preliminary analysis of genetic similarity using random amplified polymorphic DNAs (RAPDs) was made. One conclusion is that these central Appalachian populations are best included in the polymorphic *P. paupercula* complex as *P. paupercula* var. *appalachiana* A.M. Mahoney var nov. ined. Chromosome numbers provide critical evidence supporting this conclusion.

MATERIALS AND METHODS

Individuals of putative eastern disjunct *Packera plattensis* (*P. paupercula* var. *appalachiana)* were collected from two sites. The Paint Rock Road population (NC, Madison Co.: near Hot Springs, 3.2 mi northwest along Paint Rock Road from Hwy 25-70, *Kowal & Mahoney 3120* [WIS]) grows in loose, gravelly soil on a steep, wooded, southwest-facing slope and road cut overlooking the French Broad River. The Lover's Leap population (VA, Montgomery Co.: 2 mi west from Price's Fork on McCoy Road [rt. 652], *Kowal & Mahoney 3123* [WIS]) consists of scattered clones on exposed and wooded rocky outcrops on a south-facing bluff overlooking the New River and along the south side of McCoy road on a gravelly bank. Replicated individuals were randomly positioned in a standard-environment transplant garden in Madison, WI.

Heads from test garden individuals were fixed in Jackson's solution (4 ethanol: 2 methanol: 2 chloroform: 1 propionic acid: 1 acetone, v/v), transferred

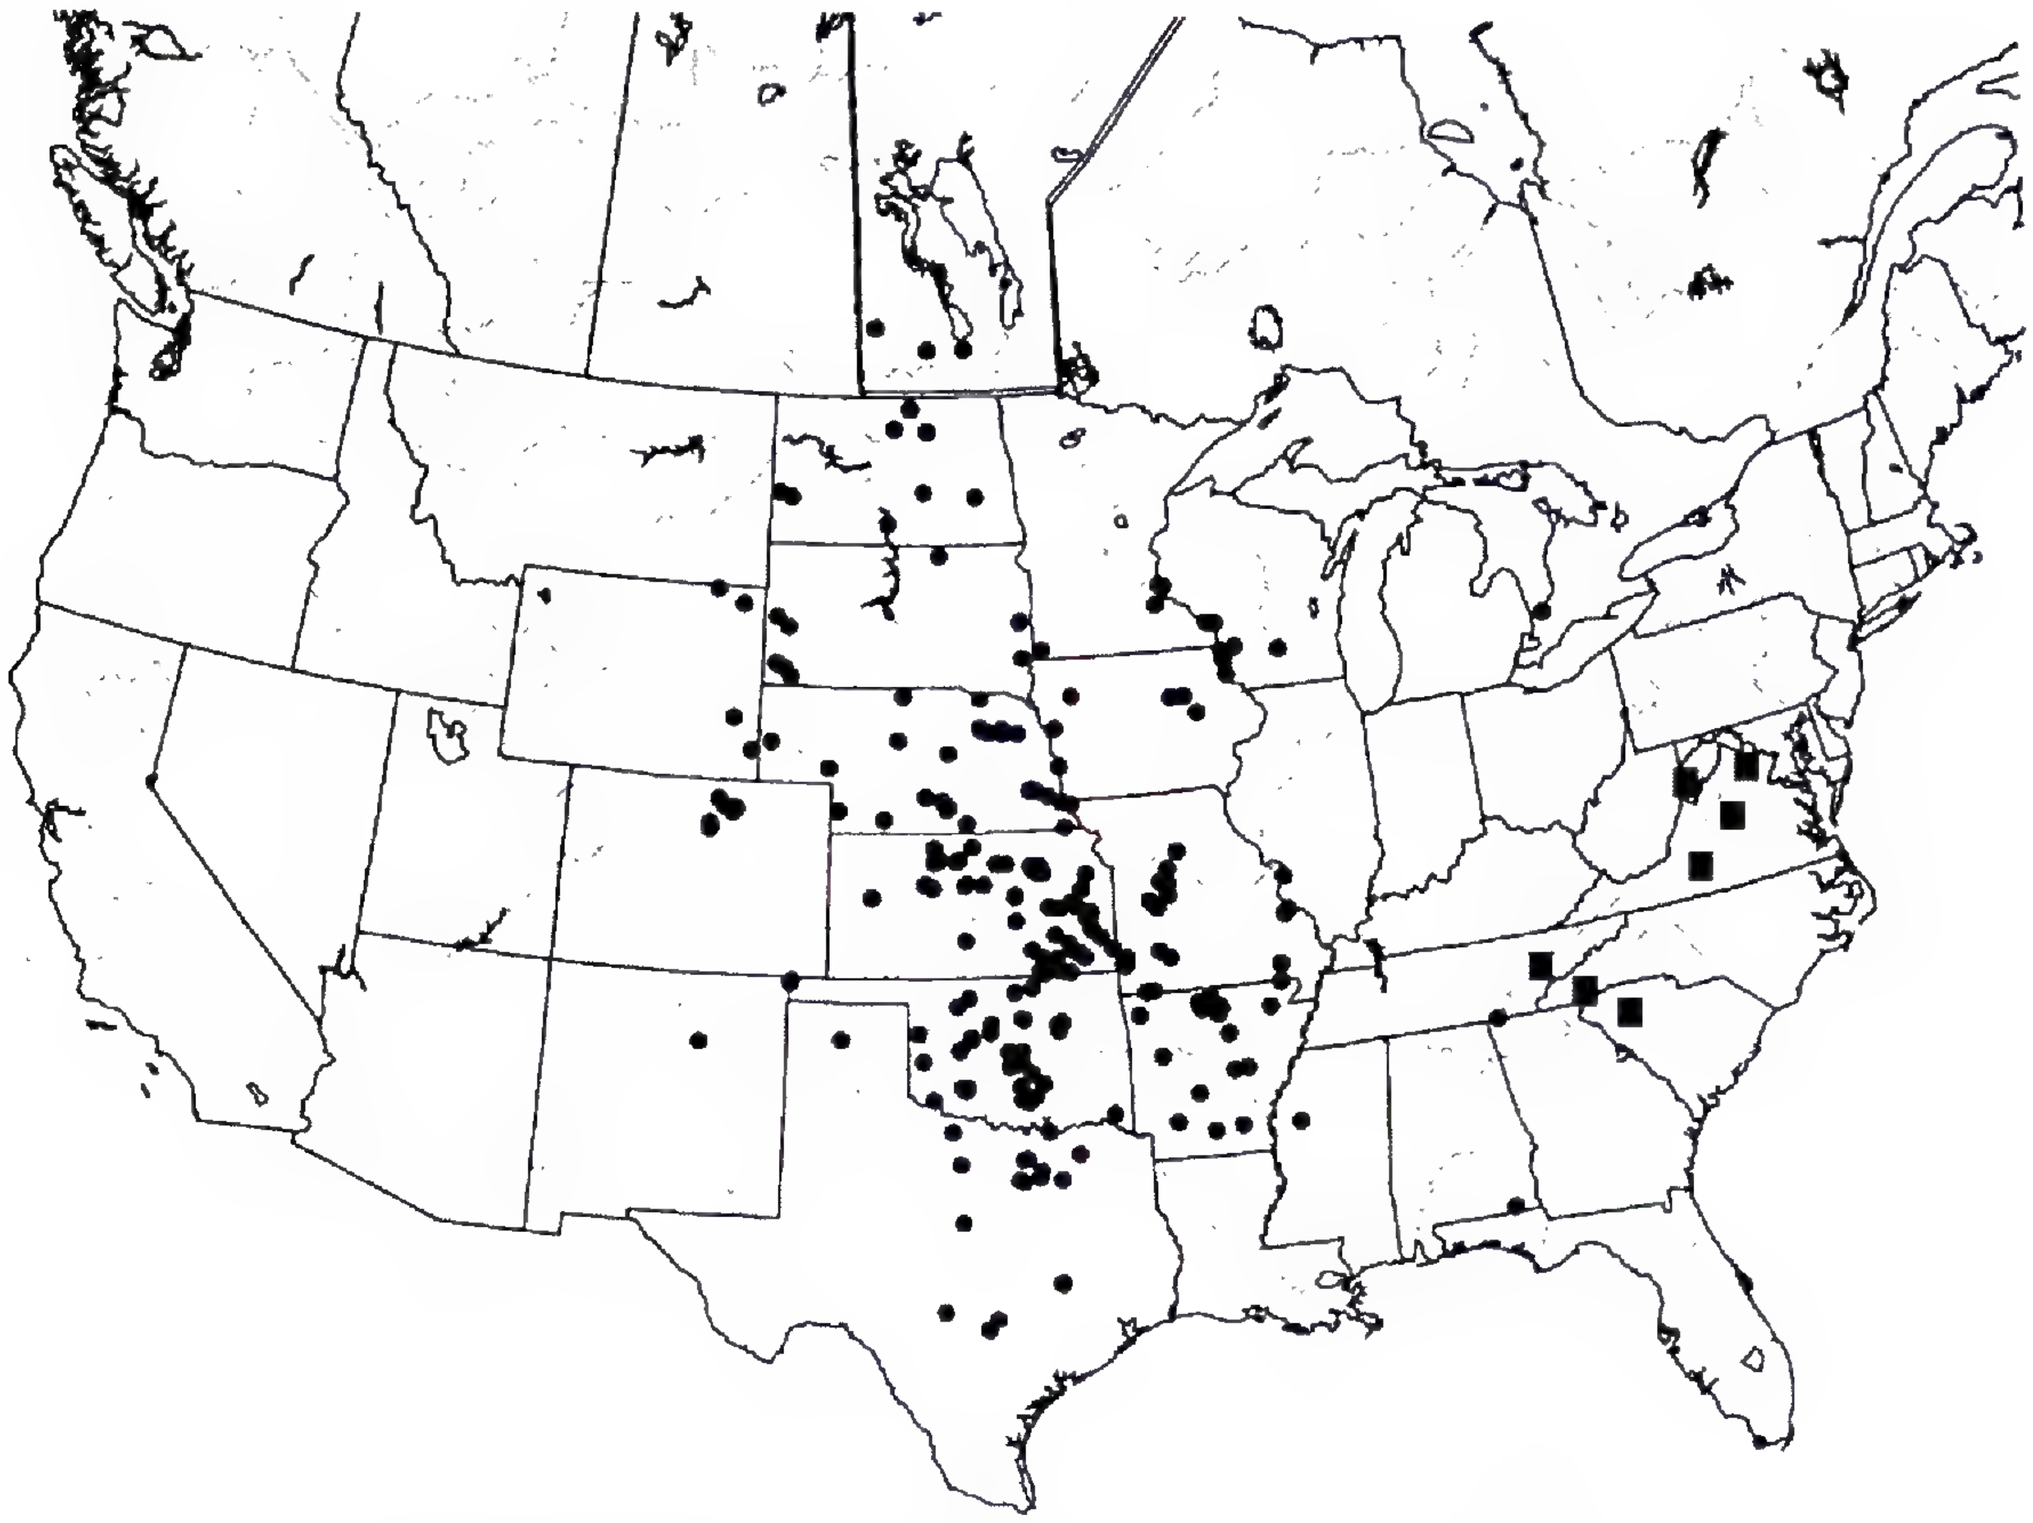

FIG. 1. Distribution of *Packera plattensis* and hypothesized disjunct populations in Virginia, North Carolina, and South Carolina (*P. paupercula* var. *appalachiana*). ● *P. plattensis*; ■ Disjunct populations (*P. paupercula* var. *appalachiana*).

after about a day to 70% ethanol, and stored in a freezer. Counts were made on meiocytes of young anthers from florets 2.5-3.0 mm in length. Using a squash technique, described in Beeks (1955) as modified by Kowal (1975) and Kong (1998), anthers were prestained in aceto-carmine and squashed between a slide and a cover slip. Each slide was scanned under the 40 × objective of a Zeiss Standard WL phase-contrast microscope, and cells with promising meiotic figures were resquashed until their chromosomes were well-separated and in one plane. Coverslips were sealed with "Zut." Counts were made with the 100 × objective under oil immersion, and cells with well-separated chromosomes were photographed with Kodak Ektachrome 160 and Technical Pan (exposed at an ASA of 100) films using a Nikon Microflex Model AFM photomicrographic attachment (Kong 1998). Results are in Table 1 and substantiating photographs are in Figures 2 and 3.

RESULTS

Individual 9 from Paint Rock Road (NC, Madison Co.) is diploid with $n = 22$ (Kong 1998; Figs. 2 & 3). Individual 9 from Lover's Leap (VA, Montgomery Co.)

TABLE 1. Chromosome counts for *Packera paupercula* var. *appalachiana*.

Taxon	Haploid number	Cells counted	Phase
NC, Paint Rock Rd, #9	22	34	Metaphase I & II
VA, Lover's Leap, #9	44	1	Anaphase I

is tetraploid with $n = 44$, based on a single, but fairly good preparation (Figs. 4 & 5). A poor anaphase I from individual 10 from Lover's Leap gave an extremely rough count of $2n$ = ca. 67, superficially, an approximately triploid count. However, the regular meioses, terminating in normal tetrads of nuclei without micronuclei, in this individual prompts the interpretation that individual 10 is tetraploid as well.

Pollen diameters from the transplant garden can be used to extend the counts of the two individuals to their respective populations, because pollen diameter is correlated with polyploid level (Kowal 1975; Mahoney & Kowal ms. subm.). A nested ANOVA indicates that the difference in mean pollen diameter between the North Carolinian and Virginian populations, 27.9 vs. 31.2 µm, is real ($F_{1,8} = 24.16$, $p = 0.0018$) and that individuals within each population do not differ ($F_{8,7} = 2.19$, $p = 0.16$). Taken together, this implies that the populations, the former containing an individual with $n = 22$ and the latter with n = ca. 44, consist of all diploids and all tetraploids, respectively. ANOVAs testing for differences among individuals within the two populations separately give absolutely no evidence ($F_{5,7} = 0.46$, $p = 0.80$) of differences in pollen diameter (and, implicitly chromosome number) in the "diploid" population but moderate evidence ($F_{3,7} = 5.11$, $p = 0.035$) in the "tetraploid" population. However, the one individual with unusually small pollen diameter (29.0 µm) is, in fact, individual 10, which is approximately tetraploid, so its aberrancy has other causes.

Uttal (1982) notes that among the specimens from Madison Co., NC (presumably the Paint Rock Road population), he saw hybrids with *P. anonyma*. This species does occur ca. 0.5 miles downstream from the var. *appalachiana* population, and 3 of the 11 individuals collected in 1995 showed morphological similarities to *P. anonyma*. Introgression here is likely, but none of the individuals in the transplant garden provided any obvious evidence of it.

Uttal (1982) reports that *P. aurea* and *P. paupercula* var. *appalachiana* (as "*P. plattensis*") "thoroughly introgress" along McCoy Road (rt. 652). Individual 10 grew on the road cut and individual 9 grew nearby, on the bluff's edge; the other individuals were from less disturbed bluff sites. Some individuals, in particular #9, have deeply pinnatifid cauline leaves with wide, distally dilated lobes and broad, undivided terminal lobes like *P. aurea*, which is rampant in an apparent sink-hole in the woodland above the bluff. A garden-grown individual of *P. aurea* from this site is lighter green than is typical for the species and

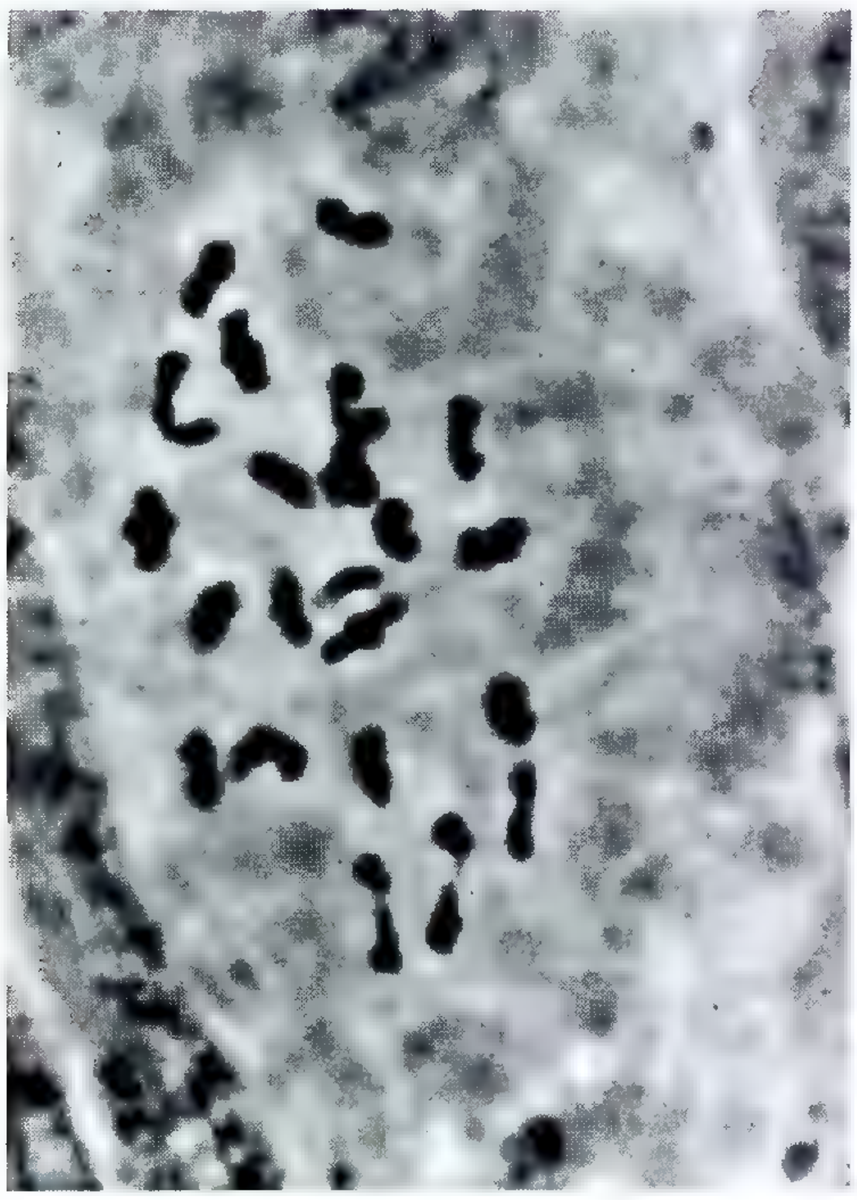

FIG. 2. NC, Paint Rock Road, #9. Metaphase I, $2n = 22$ II.

FIG. 3. NC, Paint Rock Road, #9. Metaphase II, $2n = 22 + 22$.

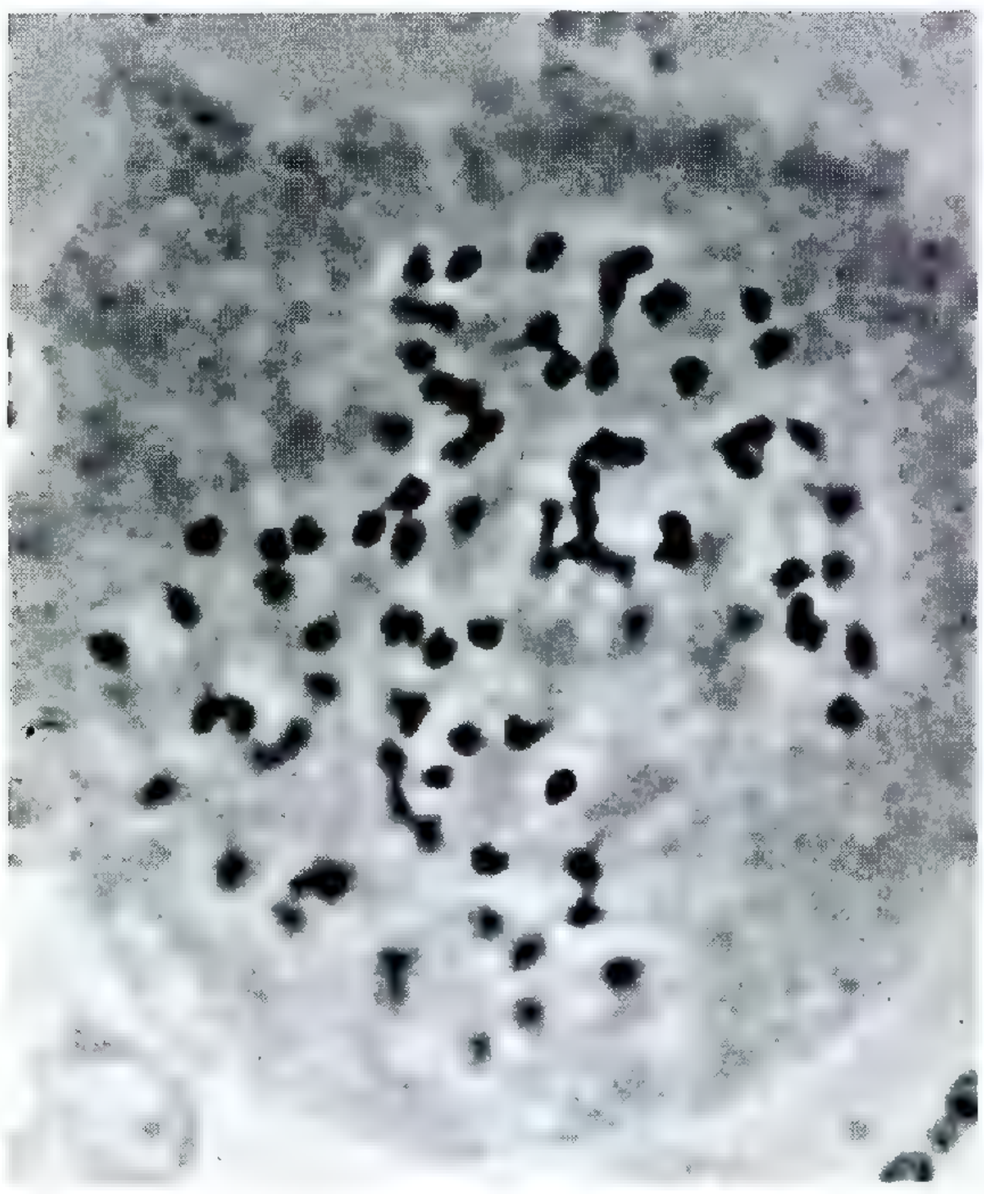

FIG. 4. VA, Lover's Leap, #9. Late anaphase I, $2n = 22 + ca$, 88.

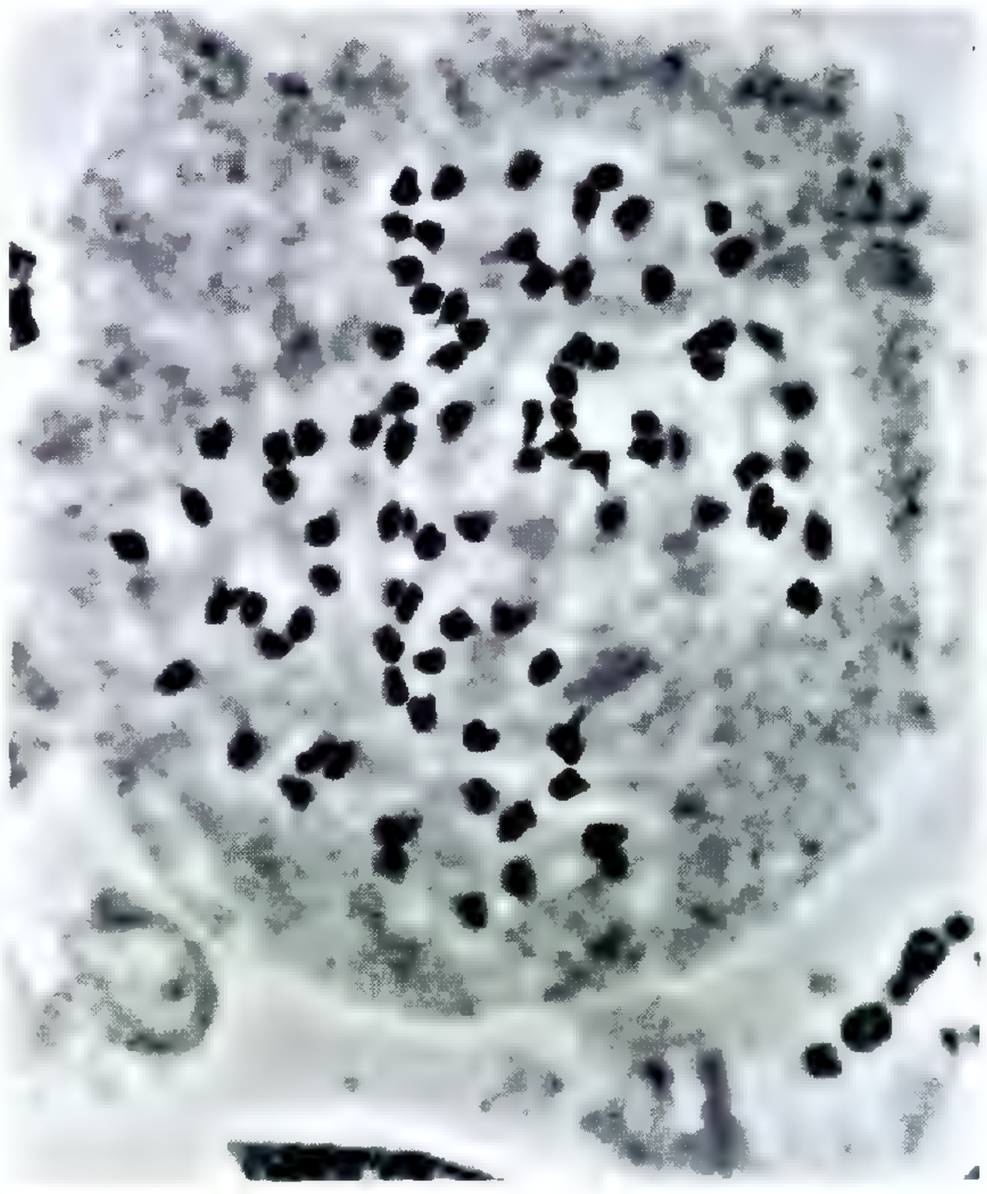

FIG. 5. Figure 3 retouched using Corel Photo-Paint 8.

reproduces abundantly and invasively by adventitious shoots on roots, unlike normal *P. aurea*. Therefore, it is likely that at least a portion of the Lover's Leap population is introgressed with *P. aurea*.

Chromosome counts indicate that *Packera plattensis* does not occur in the central Appalachians. This Great Plains species appears to be entirely tetraploid with $x = 23$ and the North Carolinian population is diploid with $x = 22$. At least some members of the Lover's Leap population in Virginia are tetraploid but probably with $x = 22$. This evidence supports the morphological and RAPDs evidence that these central Appalachian populations are best treated as *P. paupercula* var. *appalachiana* (Mahoney & Kowal ms. subm.).

ACKNOWLEDGMENTS

We would like to thank GH, MO, NCU, NY, PHIL, and UNCC for specimen loans, Kiefer Kuah and Justin Lo for assistance with photo scanning and retouching (Fig. 5), Kandis Elliot for the distribution map (Fig. 1), Dale Johnson, the staff at WIS, and especially Ted Barkley for his bountiful good advice.

NORWEGIAN AND SÁMI ETHNOBOTANY OF *VERATRUM ALBUM* (MELANTHIACEAE)

Torbjørn Alm

Department of botany
Tromsø museum
University of Tromsø
N-9037 Tromsø, NORWAY

ABSTRACT

In Fennoscandia, *Veratrum album* L. (Melanthiaceae) is restricted to the northernmost part of Norway, Finland and Russia. It is locally abundant in coastal areas of northeast Finnmark (Norway), and well known in both Norwegian and Sámi folk tradition as a toxic plant, frequently causing livestock poisoning. Until replaced by tobacco, the roots were used as snuff by the Sámi, who had also found restricted use of the plant for medicinal purposes, e.g. as a remedy for rheumatism.

RESUMEN

En Fennoscandia, *Veratrum album* L. (Melanthiaceae) está restrigida a la parte norte de Noruega, Finlandia y Rusia. Es localmente abundante en areas costeras del noreste de Finnmark (Norway), y bien conocida tanto la tradición noruega como en la finlandesa como planta toxica, que causa frecuentemente envenenamiento del ganado. Hasta que fue reemplazado por el tabaco, las raíces fueron usadas como rape por los finlandeses, quienes también encontraron un uso restringido de la planta con fines medicinales, por ejemplo como remedio para el reumatismo.

NORWEGIAN SAMMENDRAG

I Fennoskandia finnes *Veratrum album* L. (Melanthiaceae) bare i den nordligste delen av Norge, Finland og Russland. Arten er lokalt vanlig i kysttraktene i NØ-Finnmark (Norge), og velkjent både i norsk og samisk tradisjon som en farlig giftplante, som ofte er opphav til forgiftning av husdyr. Den ble tidligere brukt som snus av samene, en rolle tobakk nå helt har overtatt. I samisk tradisjon har arten også spilt en viss rolle som medisinplante, bl.a. som en kur for reumatisme.

INTRODUCTION

Veratrum album L. (Melanthiaceae) is a rare species in Fennoscandia, and confined to the area's northeastern part—the Kola peninsula in Russia (Pojarkova 1966), Finnmark in Norway (Alm 1991a), and a single, somewhat disjunct station in northeast Finland (Hämet-Ahti et al. 1998). The plants found in Fennoscandia have yellow-green flowers, and are sometimes referred to *V. album* var. *virescens* Gaudin, although their relationship to middle European plants, where both white- and yellow-flowered forms occur, has not been investigated.

Within its Norwegian distribution area, *V. album* is common locally, and often predominant on meadows, especially along brooks and rivers. It is also found in tree-less subarctic areas along the outermost coast, and grows vigorously even in *Empetrum* heath and *Salix herbacea*-type snowbeds (Alm 1991a, 1991b, 1991c).

SIDA 20(2): 611–619. 2002

Veratrum album is easily recognized, due to its large size and characteristic habit. Within the species' distribution area in Finnmark, both Norwegian and Sámi inhabitants have noted and named the species, for which a one-to-one relationship exists between the ethnotaxonomical unit and the scientific species (sensu Berlin 1992).

In a previous paper (Alm 1991b), dealing mainly with the species' distribution and ecology in Norway, I have included some data on the ethnobotany of *Veratrum album*, compiled from various literature sources. The present paper presents an expanded and revised compilation of ethnobotanical data, and adds recent ethnobotanical information from interviews with local inhabitants of both Norwegian and Sámi descent in Finnmark. Transcripts and recordings of the original interviews are stored at the Department of botany, Tromsø museum (TROM).

VERNACULAR NAMES

The vernacular names used for *Veratrum album* in Finnmark are all related to its toxicity. A characteristic feature of the chemical components of *V. album* is their ability to cause sneezing (Frohne & Pfänder 1983). The only Norwegian vernacular name recorded for *V. album*, *nysrot* or *nyserot* ("sneeze root"), reflects this property. The latter form is now also well established as an "official" (e.g. in floras) Norwegian name for the species. As such, it was first used by Gunnerus (1772).

Gunnerus mentioned two Norwegian names for *V. album*, *Hviit Nysegras* (*hvitt nysegras* in modern Norwegian), i.e. "white sneeze-grass," and *Hviit Nyseroot* (= *hvit nyserot*), i.e. "white sneeze-root." Although his flora includes much ethnobotanical information, vernacular names provided by Gunnerus should be treated with some caution. Gunnerus coined Norwegian names for numerous species, including e.g. many fungi that had little or no chance of being recognized by the layman (Eckblad & Høiland 1985). In the case of *Veratrum*, at least the preceding *hvit* ("white") must have been added by Gunnerus, probably by translating the Latin epithet of *V. album*; there is no factual basis for connecting this term with the yellow-flowered specimens found in Norway. This comment also applies to the notion of *Hvid Nyserot* as a Norwegian vernacular name in Wahlenberg (1833).

Gunnerus' original record had no indication of colour, and was a straightforward *Nyseroot* or *Nysroot*, as revealed by his letters to Carl von Linné (Linnaeus) dated 13 February and 1 April 1768 (printed in Amundsen 1976; originals in the Linnaean Society, London). Furthermore, *nyserot* has now been confirmed as a genuine and still extant vernacular name in Finnmark by interviews e.g. at the Nordkinn peninsula.

The most frequent Sámi name for *Veratrum album* is *gastinrássi* (in mod-

ern North Sámi, *gastemrasse* in older spelling), of similar meaning ("sneeze plant"); from *gastin*, to sneeze, and *rássi*, "grass" or "plant"—the latter being a preferable translation. It was first recorded by K. Leem and J.E. Gunnerus in the mid-18th century (Alm 1991b; Gunnerus 1772; Nielsen & Nesheim 1979; Qvigstad 1901), and was also noted by Wahlenberg (1812) during his 1801 visit to Finnmark. It is still widely known in Finnmark (interviews 1996).

A deviant Sámi name, *mirkkorássi* ("poisonous plant") has been recorded in the Deatnu/Tana area. It was first mentioned by Qvigstad (1901), but in ethnobotanical context as a *nomen nudum*, as he did not identify the species. Alm (1991b) suggested that the name might refer to *Veratrum album*; this has now been confirmed by interviews with Sámi inhabitants in the Sieiddá area of Deatnu/Tana.

HUMAN USE

Literature sources reveal past use of *Veratrum album* by the Finnmark Sámi as a kind of snuff, perhaps with intoxicating abilities. Such use was first suggested by Hans Lilienskiold, district governor of Finnmark in the late 17th century, and author of a large, hand-written description of the area:

"If the tobacco-hungry knew the root"s strength, little would be left standing" (cited from the printed version in Solberg 1942–43; translated from Norwegian).

Gunnerus (1772) noted that the Sámi used the pulverized root as a kind of sneezing powder, i.e. as snuff. A slightly more detailed description was given by Jens Rathke, in an account of his 1801–1802 journey in Finnmark:

"The use of the roots of this plant as snuff-tobacco has formerly been very frequent among the Sámi, but is now increasingly substituted by [ordinary] tobacco (...)" (Rathke 1899; translated from Norwegian).

Use of *Veratrum* as snuff was also noted by the Swedish botanist Göran Wahlenberg during his 1801 visit in Finnmark (Qvigstad 1932). A single 20th century record of this practice is found in Lillevik (1970), who noted that a Sámi walking companion at the Nordkinn peninsula was eagerly interested in some *Veratrum* stands they passed, showing visible pleasure. Lillevik (op.cit.) also noted that only full-grown plants were selected for human use.

The effects of using *Veratrum* snuff are not described in any Norwegian sources. The roots have a strong and bitter taste (Hoppe 1975). According to Frohne and Pfänder (1983), 1–2 grams of the dried root may be lethal for humans. However, since the poisonous constituents provoke violent sneezing, it is hardly possible to consume such amounts, except in alcoholic extracts (Hruby et al. 1981). Used as snuff, the *Veratrum* powder was supposedly spit out in a short while, certainly after causing some sort of sensation. There are no records of any kind of intoxication, although *V. album* is known to possess psychoactive abilities (Rätsch 1998). In fact, sneezing may have been just the desired effect; in

Sámi folk medicine, sneezing was considered healthy, probably as a way of "getting rid of" diseases; ordinary tobacco has also been much used to provoke sneezing (Qvigstad 1932).

Apart from this, *V. album* has found little use in folk medicine. According to Qvigstad (1932), Wahlenberg had noted that *Veratrum* was used to treat rheumatism in Finnmark. No further details are known, e.g. on ethnicity of those who used it, but it is likely to be a Sámi tradition. According to Steen (1961), Sámi inhabitants of the Lyngen area of Troms, North Norway, used *V. album* to treat rheumatism. If so, the cure must have been based on plant material imported from Finnmark, as the Lyngen area is situated far outside the present distribution of *V. album*. Steen suggests that the cure was carried out mainly by drinking a decoction of *Veratrum*; surely a dangerous practice. It could also be applied as a compress on the painful area.

Gunnerus (1772) listed a whole range of diseases that could be treated with *Veratrum*, but his account seems to be based on literary sources related to Central Europe, including Gouan (1765). Hiorthøy (1785) mentioned *Veratrum* as a cure for psychic disorders in Gudbrandsdalen, southeast Norway, again probably based on a learned tradition, and certainly on imported plant material—the nearest stations with indigenous *V. album* are situated in Central Europe; the plant used may have been *Helleborus niger* (Reichborn-Kjennerud 1922).

LIVESTOCK POISONING

Veratrum album is strongly poisonous (Bertrand et al. 1990; Frohne & Pfänder 1983; Hoppe 1975; Jaspersen-Schib et al. 1996; Keeler et al. 1978; Quatrehomme et al. 1993). In Finnmark, this is well known to anyone living in areas with large stands (Alm 1991b; Høeg 1974; Lillevik 1970). However, since the plants sprout in early spring, and unfold considerable leafage before almost any other herbs, they are frequently consumed by animals. The resulting poisoning was first commented on by Lilienskiold in the late 17th century:

"When the creatures eat its leaves in abundance towards spring, it affects their hairs, which are felled" (cited from the printed version in Solberg 1942–43; translated from Norwegian).

Lethal poisoning of a small herd of cattle was reported from the Deatnu/Tana area in Finnmark by Ruud (1938). Dissection showed haemorrhages of the heart, stomach and intestines, liver damage, and lungs with a bloody foam. The incident occurred in June, in circumstances that were typical of past poverty. Both in Norwegian and Sámi husbandry, the animals were customarily hunger-fed during the latter part of winter, and would eagerly eat anything available when released in spring—including the large, but poisonous shoots of *Veratrum album*.

Nowadays, the remaining cattle in Finnmark are usually fed on cultivated pastures, and poisoning is unlikely to occur. Sheep, on the other hand, frequently

eat shoots of *Veratrum album*. According to people at the Nordkinn peninsula, lambs would often consume at least some leaves of *Veratrum*. Poisoning is rarely lethal (though death may occur, as suggested by Lillevik 1970), but causes severe sickness, characterized by a "foam" issuing from the mouth. A recent description may be included:

"*Nysrota* ... it is the worst weed we've got. Almost every lamb will eat it, and then they get this foam at the mouth." ... "It becomes all foam. It's really awful, it even gets into the eyes" (interview 1994; translated from Norwegian).

Vomiting is frequent (Høeg 1974). According to people at Værnes (Nordkinn peninsula), the only remedy that would help was giving the affected sheep milk. When symptoms subdued, the lambs seemed to suffer no lasting consequences—and would subsequently avoid *Veratrum*, for which reason grown-up sheep are rarely affected (interview 1994).

CONTROL MEASURES

As a consequence of livestock poisoning, farmers in Finnmark at least formerly tried to decimate or eradicate *V. album*—a difficult task, given that the species has very effective vegetative propagation by its thick rhizomes. The Norwegian botanist J.M. Norman made a characteristic observation at Bonjákas in Deatnu/Tana in the late 19th century:

[*Veratrum album* occurs] "in large quantity, sometimes expanding into sites, where is was not previously noted, and threatening during the [18]80's to become a real pest, in particular in spring, when the livestock is released. One tries to curb its further spread by scything it in early spring" (Norman 1900; translated from Norwegian).

The Swedish botanist Nikolaus Svensson noted a similar practice during an 1892 visit to Deatnu/Tana:

[*Veratrum album*] "is very frequent around the Tana fjord and ascends high up into the mountains, but only in the immediate vicinity of the fjord. In Tana, a veritable war of extermination is fought against it due to its toxicity. However, it seemed to manage well, and often grew as high as a man on the small pastures along the river" (Svensson 1894; translated from Swedish).

Conscious eradication may explain the present absence of *V. album* from several sites in Finnmark where literature records suggest that it did occur in the 18th and 19th century, e.g. at Nordkapp and Porsanger (Gunnerus 1772; Wahlenberg 1812) and Vardø (Solberg 1942–43), well outside the present range (see map in Alm 1991b).

Stands of *V. album* with all stems cut at base level—obviously as a control measure—were observed in Deatnu/Tana as late as in 1975 (Alm 1991b). Such practices are probably rare by now.

At present, *V. album* is frequent on meadows e.g. in Deatnu/Tana, and little effort seems to be directed at controlling it. This is partly a consequence of

altered agricultural practices; numerous farms have been deserted, and those remaining have largely adopted modern practices of intensive grass cultivation; the former extensive use of both in- and outfield areas is hardly practised. Like many other large herbs, *V. album* thrives on abandoned meadows, and is probably more common nowadays than in the past.

VERATRUM IN OTHER AREAS

Veratrum album is widely distributed in Eurasia, from Spain to Beringia (Hultén & Fries 1986), with a close relative (*V. viride* Ait.) in North America. The latter is also strongly poisonous (Prince & Stork 2000). Throughout the area, *Veratrum*'s characteristic ability to cause sneezing has been well known.

Veratrum album is found in the mountains of mainland Greece, and may have been known to the ancient Greeks, though to what extent it was used is disputed. Theophrastus (book IX, X) noted that "The white and the black hellebore appear to have nothing in common except the name" (Hort 1916). According to Baumann (1993), *V. album* was not used by the Greeks, wheras Rätsch (1998) suggested that it was considered a medicinal plant of prime importance. Raven (2000) rejected previous identifications of the white hellebore of the ancient Greeks, and suggested *Drimia maritima* (L.) Stearn, syn. *Urginea maritima* (L.) Baker, as a more likely candidate, whereas the "black hellebore" probably refer to *Helleborus* species.

Just as in Sámi tradition, the Greeks (as recorded by Pliny the elder) considered sneezing as a way to promote health, by forcing the demons of disease to leave the body; its main use was for psychic diseases (e.g. depression), epilepsy, etc. (Rätsch 1998). Similar use is mentioned in early printed European herbals, e.g. Fuchs (1543).

In Italy, an extract of *Veratrum album* roots in alcohol has served as an antirheumatic remedy (Cappelletti et al. 1982). In Iranian folk tradition, a paste of the fresh root of *Veratrum* is used externally to relieve headache and neuralgic pains (Hooper 1937).

In North America, numerous Indian tribes have used *Veratrum* species for medicinal and other purposes (Moerman 1998). Antirheumatic use of *V. viride* is rather widespread, and known e.g. among the Bella Coola, Cherokee, Gitksan, Haisla, Hanaksiala, Iroquois, Kitasoo, Okanagan-Colville, Oweekeno, Quinault, Salish Thompson, and Tsimishian tribes (Gottesfield & Anderson 1988; Gunther 1988; Moerman 1998; Smith 1929; Turner et al. 1980, 1990). The Blackfoot Indians used powdered *Veratrum viride* to provoke sneezing and thus clear the respiration tract (Hart 1979). *V. californicum* Dur. has been used as a remedy for rheumatism, wounds and sores, and as a contraceptive (Kelly 1932; Train et al. 1941).

Veratrum species feature in a variety of other folk beliefs and traditions among the Indians of North America. The Gitksan and Haisla Indians made ceremonial use of *V. viride* to drive off evil spirits, and could wear a piece of the

root to ensure good luck, i.e. as an apotropaic. It was also used in purification rituals (Gottesfield & Anderson 1988). Haisla Indian shamans applied the plant to arrows to shoot at and drive off "disease spirits" (Moerman 1998). Among the Okangan-Colville Indians, *V. viride* featured in witchcraft (Turner et al. 1980). Gunther (1988:24) recorded that the Cowlitz indians used a chewed piece of *Veratrum* to scare off sea-monsters.

In summary, the use of *Veratrum* species as an anti-rheumatic remedy is common to the Old (Norway, Italy, Greece) and New World (American Indians). Their ability to provoke sneezing is well known in both areas, and was considered attractive either as a way to expel evil sprits, get rid of disease, or merely regarded "healthy" as in Sámi tradition.

ACKNOWLEDGMENTS

The author expresses his gratitude to people in Finnmark who have offered information on vernacular names and other traditions related to *Veratrum album*, in particular Karstein Adriansen and Eva Mikalsen (Norwegian tradition) and Ole Larsen, Terje Pedersen and Johannes Persen (Sámi).

Book Review

Donald A. Cox. 2002. **A Naturalist's Guide to Wetland Plants: An Ecology for Eastern North America.** Illustrations by Shirley A. Peron. (ISBN 0-8156-0740-7, pbk.) Syracuse University Press. 621 Skytop Road, Suite 110, Syracuse, NY 13244-5290. (Orders: 315-443-2597, Fax: 315-443-5545, supress@syr.edu) $17.95, 203 pp, 123 line drawings, 6" × 9".

Once viewed as wastelands, wetlands are now better appreciated by the public for the value they bring to human life. By some estimates, wetlands once covered more than 200 million acres in the United States. Yet, nearly half of these valuable ecosystems were destroyed by the 1950's for use in agriculture and land development. Recent legislation seeks to protect wetlands and associated biota, yet these ecosystems continue to be destroyed, albeit at a slower rate, and wetland species become threatened or endangered. This book focuses on palustrine wetlands, i.e. marshes, bogs, and swamps and within the first few pages raises the reader's awareness of the value of wetlands.

Beginning, appropriately, with a definition of wetlands as ecosystems, Cox enumerates in the first chapter the value of wetlands as habitat for biota, flood protection, recreation and groundwater recharge, among others. The introduction also touches on wetland productivity and nutrient cycling, with emphasis on carbon dioxide and global climate change due to the burning of fossil fuels. In latter half of the first chapter, some major wetlands in North America are described—the Atchafalaya Swamp, Cranberry Glades of West Virginia, the Everglades, the Great Dismal Swamp, Okefenokee, the Pocosins and prairie pothole marshes. Information about each wetland details geography, dominant vegetation, and historical and current ranges. The next five chapters emphasize the plants that grow in wetlands. Chapter two, entitled Types of Plants, explores the different forms of plant life in wetlands or for that matter, any ecosystem on the planet. Details on the life history and general characteristics of algae, fungi, slime molds, lichens, bryophytes, ferns and allies, gymnosperms and angiosperms are provided. In the next chapter, Strategies for Survival, the author presents pollination syndromes, seed dispersal mechanisms, and adaptations for water in wetland plants. Chapters on marshes and swamps and bogs and peatlands focus primarily on the vascular plants growing there. Though illustrations are scattered throughout the book, more are presented here to enhance the plant descriptions.

In the chapter, Plants of Special Interest, the amount information on poisonous plants far outweighs the details on hallucinogenic and edible plants. In fact, only one hallucinogenic plant is mentioned, sweetflag or *Acorus calamus*, and I found myself wondering about the merit of listing this plant in its own heading because of its psychoactive properties. Perhaps it would have been better served in the medicinal plants section since Native Americans used it to treat some physical ailments.

Transitions in the physical characteristics of wetlands due to seasonal climate change are discussed in chapter seven, Through the Year. Noxious aquatic weeds are also considered in some detail here. The author provides tips on collecting, preserving and identifying plants, including sound advice on where and what not to collect, obtaining permission from land owners prior to collecting and how to collect good, representative specimens. In the final chapter, suggested activities on wetlands, such as making a study on the life history of a plant or investigating the characteristics of a local wetland, encourage readers to learn more.

This book raises awareness regarding the importance of wetlands. The dynamic attributes of ecosystems and interconnected nature of wetland biota is stressed throughout. Clarity and brevity of Cox's writing style makes this book relevant to nearly all groups of people— naturalists, educators, college students, amateurs interested in birds, amphibians, reptiles or plants. Emphasis on conservation and habitat preservation make this book especially valuable.—*Amy Trauth Nare, Botanical Research Institute of Texas, 509 Pecan Street, Fort Worth, TX 76102, U.S.A., amy_trauth@yahoo.com.*

ABSTRACT

Carlo Giuseppe Bertero (1789–1831) is, among the famous Italian botanical collectors that contributed toward the knowledge of New World flora, the one who collected and travelled the most. Bertero gathered a large number of specimens, which were in turn distributed to many of his correspondents, and are now present in many herbaria worldwide. During his travels he also collected seeds, which he sent to numerous botanists, contributing toward the collections of private and public gardens. Several hundreds of his botanical collections turned out to be plants unknown to science, which were in turn described by many of his contemporary European botanists. The botanical work of Carlo Bertero in Italy has already been extensively treated by many specialists. Nevertheless, his botanical expeditions and collections in the New World have never been completely studied, although partial reports have already been published. Such studies need further investigations as new data have been recently obtained through correspondence, field books and herbarium label data in order to reconstruct the itineraries and the chronological sequence of Bertero's first expedition to the Antilles and northern Colombia (1816–1821), and his second expedition to Chile (1827–1830), Juan Fernández Islands (1829) and Tahiti (1830–1831). This preliminary study is part of an ongoing project that will produce a complete biography of Carlo Bertero and a comprehensive account of his botanical work in the New World and the South Pacific, that will be published in the near future (Delprete, Forneris & Pistarino, in progress).

KEY WORDS: Carlo Bertero (1789–1831), Giovanni Battista Balbis (1765–1831), Luigi Colla (1766–1848); biography, bibliography, botanical collections, botanical explorations, itineraries; Greater Antilles, Guadalupe, Puerto Rico, Santo Domingo, Jamaica, South America, Colombia, Chile, Juan Fernandez Islands, Tahiti, Society Islands.

RESUMEN

Carlo Giuseppe Bertero (1789–1831) es, entre los famosos colectores botánicos italianos que contribuyeron al conocimiento de la flora del Nuevo Mundo, el que más viajó y colectó. Bertero acopió un gran número de especímenes, que fueron distribuidos a la mayoría de sus correspondientes y que ahora están conservados en muchos herbarios de todo el mundo. Durante sus viajes recolectó también semillas, que mandó a muchos botánicos, contribuyendo a las colecciones de jardines públicos y privados. Varios centenares de sus especímenes se revelaron como especies desconocidas para la ciencia y fueron descritas por varios botánicos europeos contemporáneos. El trabajo botánico de Carlo

Bertero en Italia fue extensamente tratado por muchos especialistas. Sin embargo, sus expediciones y colecciones en el Nuevo Mundo nunca fueron completamente estudiadas, aunque se publicaron algunos reportes parciales. Estos estudios necesitan de ulterior investigación, puesto que fueron obtenidos nuevos datos recientemente a través de su correspondencia, cuadernos de campo y etiquetas de herbario, en el intento por reconstruir los itinerarios y la secuencia cronológica de su primera expedición a Las Antillas y norte de Colombia (1816–1821) y su segunda expedición a Chile (1827–1830), Islas de Juan Fernández (1829) y Tahití (1830–1831). Este estudio preliminar es parte de un proyecto en curso que producirá una biografía completa de Carlo Bertero y una relación comprensiva de su trabajo botánico en el Nuevo Mundo y en el Pacífico Sur, que será publicado en un futuro próximo (Delprete, Forneris & Pistarino, en curso).

PALABRAS CLAVE: Carlo Bertero (1789–1831), Giovanni Battista Balbis (1765–1831), Luigi Colla (1766–1848); biografía, bibliografía, colecciones botánicas, exploraciones botánicas, itinerarios; Antillas Mayores, Guadalupe, Puerto Rico, Santo Domingo, Jamaica, América del Sur, Colombia, Chile, Islas de Juan Fernández, Tahiti, Islas de la Sociedad.

Among the many Italian naturalists who explored the New World, Carlo Giuseppe Bertero (1789–1831) stands out as one of the early collectors who visited little-known or unexplored areas, and for the impressive amount of material that he collected in these regions. The historical, floristic and ecological importance of Bertero's collections is also that they were made in areas that are nowadays almost entirely destroyed, particularly in the Greater Antilles, Chile, and in the Juan Fernández Islands. He engaged two major trips, covering his travel expenses as a medical doctor: the first in the Antilles and the Caribbean coast of Colombia (1816–1821), and the second in central Chile (1827–1830), Juan Fernández Islands (1829) and Tahiti (1830–1831). The bulk of Bertero's collections was shipped to Giovanni Balbis (1765–1831) and Luigi Colla (1766–1848; cf. Delprete 2000), both resident at Torino, and were in turn distributed to many major European herbaria (and now partially present in many North and South American institutions), and his seeds and living material were sent to several European botanical gardens (Spin 1823; Parlatore 1841; Visiani 1855).

A considerable portion of his collections turned out to be genera and species unknown to science, and were described by many contemporary botanists. Most of Bertero's new taxa from the Caribbean region were primarily described by: A.P. de Candolle (1823–73) and Kunth (1833–50) and those from Chile by Moris (1831, 1832, 1833, 1834, 1835), A. de Jussieu (1832), and Colla (1824, 1834, 1835, 1837) among many others (i.e., Balbis, Decaisne, Delessert, Delile, Guillemin, Hooker & Arnott, Montagne, Nees, Philippi, Sprengel, Trinius, Urban and Vignolo-Lutati). Four generic names (*Berteroa* DC., *Berteroella* O.E. Schultz, *Berteromyces* Ciferri and *Terobera* Steud.) and more than 300 specific epithets were dedicated to Bertero (Mattirolo 1932a, 1932b). The correct orthography of specific epithets honoring Bertero has been discussed in Stuessy and Marticorena (1990) and Kartesz and Gandhi (1993). At last, a reef discovered a few years after Bertero's death, was named after him (Bertero's Reef, also Récif Ebrill, Tuamotu Archipelago, 22°40' South, 133°30' West, Pacific Ocean) by J.A.

Morenhout, the Consul of the United States in the Pacific Islands and his last travel companion in the Society Islands.

Bertero also contributed greatly to the knowledge of the Italian flora through his collections before and in-between his two American expeditions. Many authors have focused their work on Bertero's botanical collections in Piedmont (northwestern Italy), which are preserved at TO, in the *Herbarium Pedemontanum* (TO-HP; Re 1827; Bertoloni 1833–54; Colla 1833–37; Burnat 1883; Ferraris & Ferro 1904; Mattirolo 1929; Castiglioni 1931; Steinberg 1971; Vignolo-Lutati 1926, 1927, 1928, 1929, 1932, 1950, 1960; Forneris & Pistarino 1987–88; Forneris & Pistarino 1991; Forneris et al. 1992).

Several authors have dedicated their attention to Bertero's life and work in the Americas (e.g., Vignolo-Lutati 1955, 1956), but the subject has never been treated extensively. Therefore, it has become necessary to start a major project on Bertero's biography and botanical expeditions in the New World (Delprete et al. 2000; Delprete, Forneris & Pistarino, in progress), with the main goals to catalogue Bertero's itineraries and collections, and to produce a study on his life, dedicated to botany, until his premature death caused by a shipwreck in the high seas of the Pacific Ocean. The goal of the present article is to introduce botanists and historians who are interested in the floras of the Americas (and the Society Islands) to Bertero's major accomplishments, and to his dedication and passion for botanical research that lasted until the last day of his short life.

BIBLIOGRAPHIC SOURCES

Bibliographic information has been compiled from the works of many authors who in various occasions have mentioned Bertero's work and life in the New World (Guillemin 1830; Anonymous 1831, 1833, 1834; Hooker & Arnott 1833; Colla 1832, 1839; Astegiano 1857; Candolle 1862; Fournier 1876; Molinari 1880; Urban 1902; Mattirolo 1930, 1932a, 1932b; Gunckel 1931; Looser 1931; Mussa 1931; Vignolo-Lutati 1931a, 1931b, 1951, 1955, 1956; Pichi Sermolli 1951, 1952, 1988; Lanjouw & Stafleu 1954; Perez-Arbeláez 1970; Piovano 1970; Stafleu 1974; Stafleu & Cowan 1976; Del Vitto 1986; Montacchini et al. 1986; Brondino 1989; Forneris et al. 1989; Molinaro 1989; Pistarino & Clemente 1989; Pistarino et al. 1989; Stafleu & Mennega 1993).

Among the works that focused, at least in part, on Bertero's American expeditions, should be mentioned the *Elogio storico dell'Accademico Dottore Carlo Bertero* published by Colla (1839), Bertero's friend and colleague, and the works of Vignolo-Lutati (1955, 1956) and Pistarino et al. (1989). Colla's *Elogio* is particularly important in this biographic project, because he was one of Bertero's dearest friends, and also because it is based on the many letters, with many biographical notes, that were written to him by Bertero. Vignolo-Lutati (1955) studied Bertero's American collections preserved at TO-HG, from the Balbis and

Colla herbaria (for a total of 2,248 taxa), with scholarly work of analysis and organisation [the taxa are arranged according to the Durand (1888) classification, as the specimens still are at TO-HG]. Pistarino et al. (1989) represents the first step of the Bertero Project, of which this article is the logical continuation. Another important source of information is contained in the letters exchanged among Bertero, Colla and Balbis, which are united into 22 volumes of *Corrispondenza botanica e amicale* [Botanical and personal correspondence] and is preserved at the *Biblioteca Reale di Torino* [Royal Library of Turin]. These letters represent an extremely important documentation in the recontruction of the stages of life and the scientific activities of Bertero. A few letters are also preserved at the *Accademia delle Scienze di Torino* [Academy of Sciences of Turin] and at the *Biblioteca Civica di Torino* [Civic Library of Turin]. Nevertheless, Turin is not the only city were Bertero's letters can be found, mostly because he kept close epistolary relationships with many botanists of his time (Anonymous 1831).

Finally, the most important document examined in this study was Bertero's field book of his first trip to the Antilles and northern Colombia (Fig. 2). This precious document, currently preserved at the Library of the Department of Plant Biology of the University of Turin, is a result of 14 field books that were later bound together, to form a book of 1,095 pages, where he described 1,746 collections. The manuscript is in Latin, in Bertero's minute handwriting, and with exhaustive descriptions (sometimes more than one page long), habitats, localities, common names, local medicinal uses, and sometimes augmented by accurate discussions on systematics, taxonomy and nomenclature. In addition, many pages of the manuscript are enriched by Bertero's pencil drawings of morphological details that are often fundamental for the determination of the species collected. This manuscript was donated by Balbis to Augustin Pyramus de Candolle [who used (and sometimes copied) Bertero's descriptions of the Caribbean taxa and published them in the *Prodromus*, 1823–73], and was later returned by Alphonse de Candolle (Augustin's son) to Turin in 1857 (Vignolo-Lutati 1931a; Mattirolo 1932a). Unfortunately, Bertero's field books of his trips in Chile, Juan Fernández Islands and Tahiti have been lost.

BERTERO'S LIFE, TRAVELS, AND BOTANICAL COLLECTIONS

Bertero's Early Years In Europe

Carlo Giuseppe Bertero (Fig. 1) was born on 14 October 1789, in Santa Vittoria d'Alba, a small town in the hilly region of Langhe, about 60 km South of Turin, Piedmont region, northwestern Italy. He studied medicine and natural history at the University of Turin, and later studied botany under the famous botanist Giovanni Battista Balbis, and finally received his Laurea in Medicine in 1811. His doctoral dissertation clearly shows the first signs of his botanical inclina-

FIG. 1. Portrait of Carlo Giuseppe Bertero, with a reproduction of his signature at the bottom of the page.

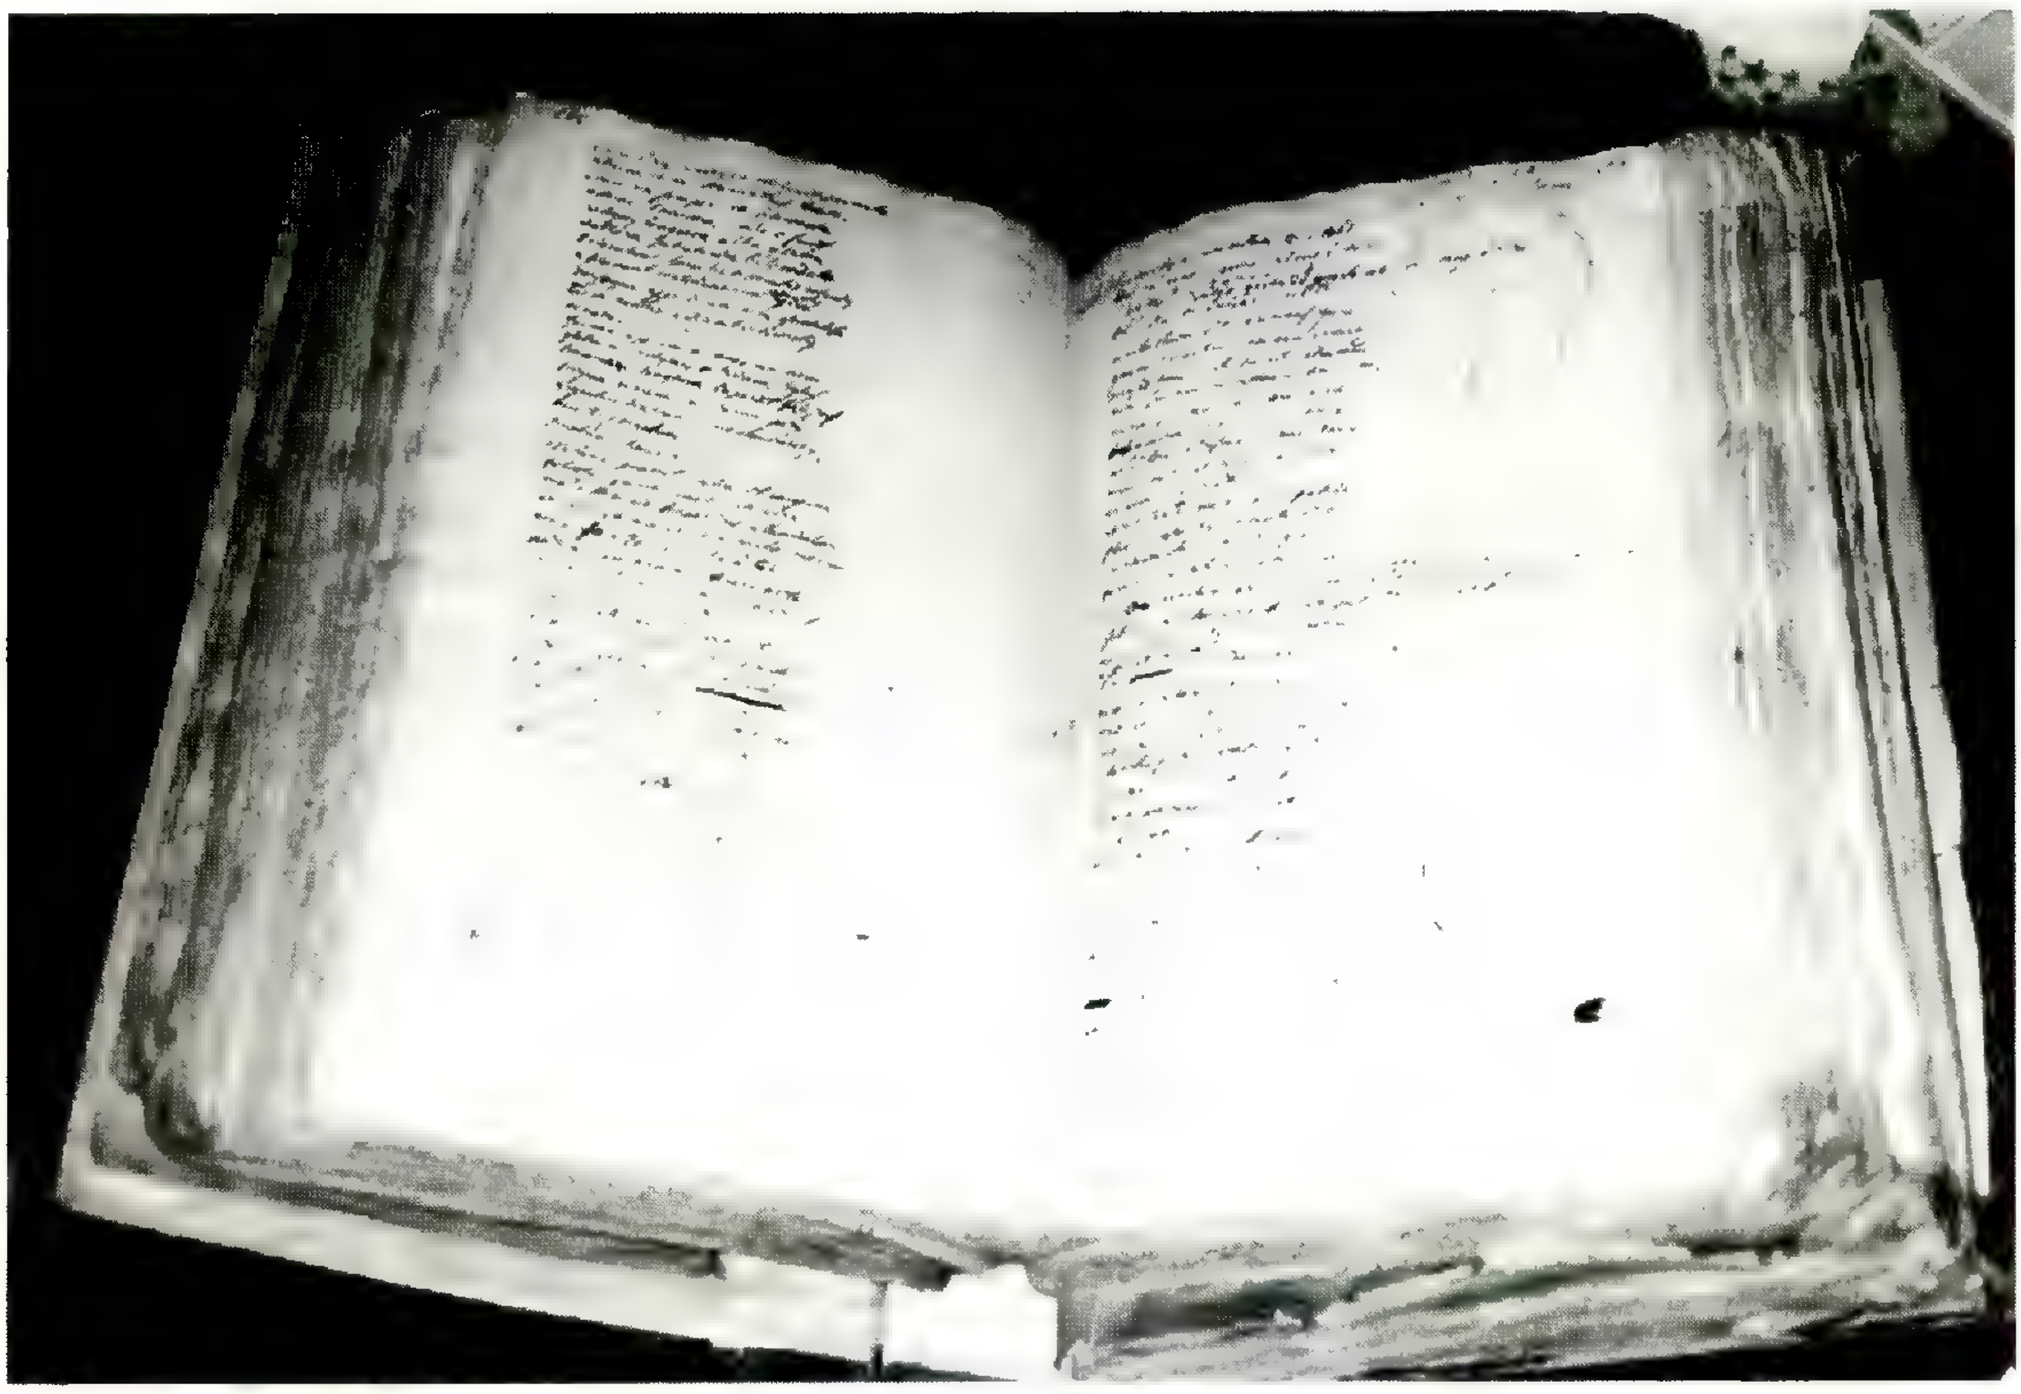

Fig. 2. Photograph of Bertero's field book, compiled by biding his notebooks (14 fascicles with collections numbers, localities, plant descriptions, drawings, etc.) written during his Caribbean expedition (1816–1821).

tion (Bertero, 1811). While studying for his medical degree, he was a frequent visitor to the *Orto Botanico*, and his botanical interests are shown in a letter [hereafter, between brackets are indicated the locality and date of the letters sent by Bertero] (Alba [Piedmont], 21 August 1809) where he asked his botanical master Balbis to find him a copy of the *Flora Pedemontana* of Allioni (1785). In these early years of formation, Bertero strengthened his own botanical knowledge and built the foundation of a strong friendship with Balbis, as is demonstrated in their frequent letters.

In the following years, Bertero proved to be quite successful in the medical sciences, but he refused to continue his medical studies at the *Collegio di Medicina* [College of Medicine], and started eagerly botanizing in the hills and valleys of Piedmont instead. The epistolary relationship between Bertero and Balbis continued strongly through this period, even when the latter moved to Pavia (Torino, 24 May 1815). In these letters, Bertero communicated his frequent botanical collections (Alba, 1 and 7 January 1816, and 6 March 1816) and put his own herbarium at the complete disposition of Balbis (Alba, 7 June 1816) and offered (Alba, 18 March 1816) to help him in the recompilation of the indexes of Willdenow's *Enumeratio plantarum* (1806–1816) and *Species plantarum* (1797–

1825), which were recompiled by Balbis because a great number of taxa were missing in both works.

Before moving to France, Bertero was living in his family home in the small town of Santa Vittoria d'Alba. The frustration caused by the increasing isolation and his desire to be part of the academic world stimulated him to search for objectives outside of Italy. He condensed these feelings of dissatisfaction in a sentence included in a letter that he sent to Balbis: "... Ce qui me console encore c'est que tou[s] mes parents sont persuadés qu'Alba n'est [pas] faite pour moi, n'ayant aucune ressource dans ce pays" [what consoles me is that all my relatives are persuaded that Alba is not made for me, there are no resources in this town (Alba, 7 June 1816)]. In July 1816, with the help of Balbis, who had connections with many European scientific personalities, Bertero moved to Paris. In this city, he had the occasion to meet many famous contemporary botanists as, for example, René Louiche Desfontaines (Paris, 20 July 1816), Jean Louis Loiseleur-Deslongchamps, and Christiaan Hendrik Persoon (Le Havre, 5 August 1816). The Parisian cultural and scientific environment, the study of herbaria containing tropical collections and the frequent visits to the *Jardin des Plantes* contributed to Bertero's rapidly increasing knowledge. It was in this exciting cultural atmosphere, and with the help of Christiaan Persoon (1761–1836), that Bertero decided to the study the flora of the Antilles.

Bertero's Expedition to the Antilles and Colombia (1816–1821)

General Foujaz de Saint Fond, captain of the ship *Guadalupe*, offered an invitation, extended through Persoon, to Bertero to travel on his boat as ship doctor; an offer that he gladly accepted. On August 1816, Bertero departed, on the *Guadalupe*, from the port of Le Havre, with destination to the West Indies. During the trip, the entire crew was infected with yellow fever, and Bertero succeeded in saving most of them, so that at the arrival in Martinique he was welcomed with extraordinary honors.

In Martinique, Bertero was much appreciated as a medical doctor and as naturalist, to the point that he was offered the direction of the local museum of natural history and of the botanical garden. This position Bertero did not accept because he wanted to be free for his botanical explorations. The earliest letter examined documenting his stay in Guadeloupe was dated 31 December 1816, where he affirmed to have collected more than 350 species and to have prepared 100 packages of seeds to be sent to Europe (Pistarino & Forneris 1992).

During this expedition that lasted nearly five years, Bertero visited Guadeloupe in 1816–1818, Saint Thomas in 1818, Puerto Rico in 1818–1819, Santo Domingo (Río Yaqui, etc.), Haiti (Jacmel, Les Cayes, Port-au-Prince, etc.) in 1819–1820, and Colombia (Santa Marta, Barranquilla, Mompós, and the lower Río Magdalena) in 1820–1821. Because of ongoing revolution in Colombia, he returned to Europe, with a short stay in Jamaica, in 1821.

During his stay in the Caribbean region, the correspondence of Bertero with Balbis and Colla is occasional; this may be related to the difficulties of delivering the mail from such remote places to Europe. The letters that we have studied were in chronological order as follows: France: Paris (20 July 1816), Le Havre (5 August 1816); Guadeloupe: Pointe-à-Pitre (31 December 1816), Grande Terre (30 January 1817), Petit Canal (30 May 1817, 15 August 1817, 1 September 1817, 13 May 1818), Pointe-à-Pitre (10 July 1818); Saint Thomas (30 July 1818); Puerto Rico: Patillas (15 January 1819); Hispaniola: Santo Domingo (4 November 1819); Jamaica: Kingston (2 June 1821); France: Paris (3 October 1821).

In several letters (Petit Canal, 1 September 1817; Pointe-à-Pitre, 10 July 1818; Santo Domingo, 4 November 1819), Bertero mentioned several trips that he planned but never realised. Colla (1839), based on the letter of 15 August 1817 from Petit Canal, referred to an itinerary that Bertero planned (and Colla assumed the he realised) from Guadeloupe to Martinique, Trinidad, Tobago and to the mouth of the Orinoco River (Venezuela), to which some other authors have referred in the reconstruction of the itinerary of Bertero's first trip (Astegiano 1857; Molinari 1880). Most likely this trip never took place, and no collections, field books, nor correspondence from any of these areas has ever been found. Urban (1902), studying Bertero's herbarium specimens, was able to make some corrections to the inexact information supplied by Colla about Bertero's trip to the Antilles and northern South America. Urban's corrections and additions were later followed by Mattirolo (1932a, 1932b) and Spada Sermonti (1967). Both specimen labels and correspondence enable us to construct a fairly accurate itinerary of Bertero's first trip (Fig. 3). Also, Table 1 summarises the localities and the periods in which Bertero made botanical collections in the Antilles and in Colombia. This table has been constructed based on data obtained from the above-cited letters, Bertero's field book, and the references published by Vignolo-Lutati (1955), who in turn extracted this information from TO-HG and Bertero's field book.

The botanical research conducted by Bertero in the Antilles took place with many difficulties. The various problems that he referred to in several letters were mostly the amount of time that he had to dedicate to his medical practice, necessary to cover his travel and living expenses, and by the few references available to him for the identification of his own collections (Pointe-à-Pitre, 31 December 1816; Petit Canal, 30 May 1817, and 1 September 1817). In those days Curt Sprengel's (1827) and A.P. de Candolle's (1823–1873) treatments were not yet available; in fact, these texts were published later and were based on many of Bertero's neotropical collections.

He stayed in the West Indies (Jamaica) until the end of July 1821, extremely saddened to have to abandon those beautiful lands but, at the same time, anxious to meet again his relatives after his trip of nearly five years. But what made Bertero even more anxious about his return to Piedmont was the possibility of

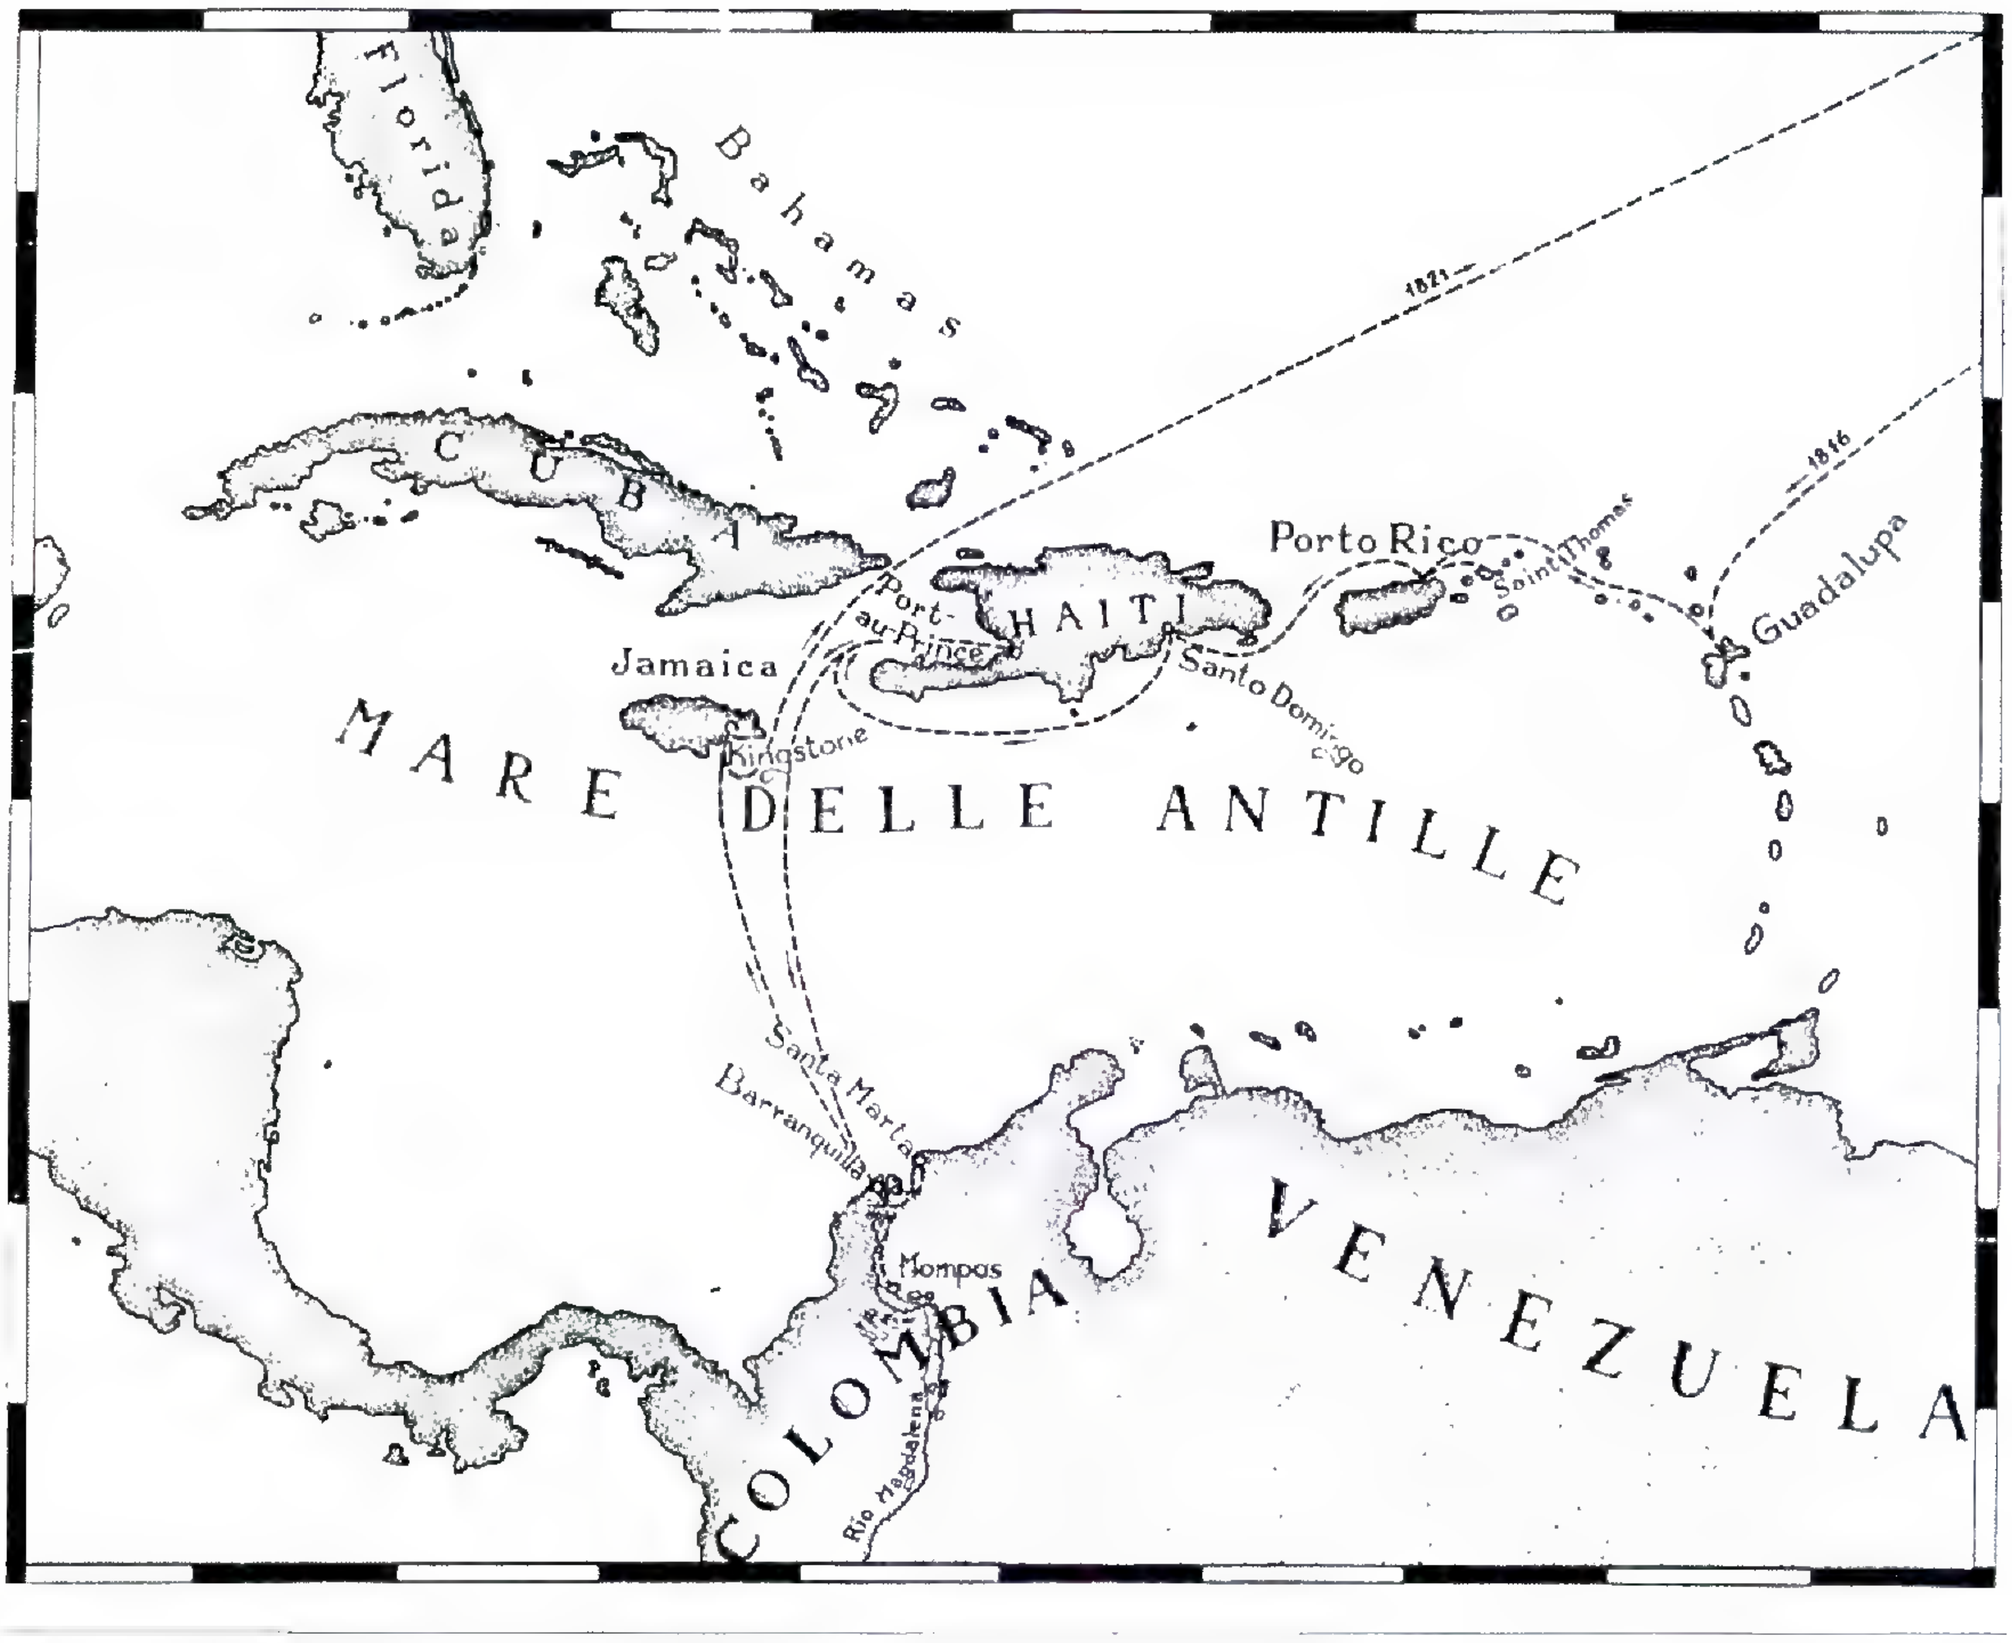

FIG. 3. Map of Bertero's itinerary in the Antilles and Colombia (1816–1821). Reproduced with permission from Molinaro (1989).

meeting Balbis, at Turin, in order to study and determine his new collections, discuss his botanical observations, and update himself on the new publications which had come out during his absence (Kingston, 2 June 1821).

Bertero's collections from the West Indies and Colombia were received by Balbis, who, after a rapid determination by Curt Sprengel (at Halle, Germany), distributed them to various botanists that specialised on Caribbean flora and to several European herbaria. The most substantial set of Bertero's Caribbean collections is preserved at TO-HG, at the University of Turin, which arrived here from Balbis' and Colla's personal herbaria, which was carefully studied by Vignolo-Lutati (1955) and is of cardinal importance in systematic, taxonomic, floristic and monographic studies of the genera occurring in the Greater Antilles (e.g., Anderson 1986; Delprete 1995; Delprete et al. 2000). Duplicate sets of Bertero's Caribbean collections were sent to A.P. de Candolle (G-DC), K. Kunth (B, destroyed), K. Krug (B, destroyed), K. Sprengel (transferred to Urban, B, destroyed), and A. Bertoloni (BOLO; Forneris et al. 1992), to the institutional herbaria of Berlin (B, destroyed), Paris (P), Munich (M), Würzburg (WB), Florence (FI), and additional Bertero's Caribbean specimens are also found at B, FI,

TABLE 1. Summary of Bertero's field book of his trip to the Antilles and northern Colombia (1816–1821), organized by localities, fascicle numbers (notebooks successively numbered by Bertero; fascicle numbers followed by * were pencilled by Vignolo-Lutati), dates, collection numbers, and page numbers of the manuscript.

Fascicles numbers	Collecting dates	Collection numbers	Book pages

HAL, L, M, MEDEL, MO, MPU, NY, P, P-JU, S, WB and probably some other institutions.

At last, Bertero also collected many samples of seeds in the Greater Antilles and sent them to Balbis, who had active exchange with several European botanical gardens (e.g., Delprete 1995). In many letters preserved at the Biblioteca Reale di Torino it is possible to ascertain the frequent requests from various botanical gardens of the precious seeds collected by Bertero in the West Indies.

Bertero's Return to Europe (1821–1827)

In 1821 Bertero arrived in Paris, and from there he returned to Italy, where he resumed his floristic explorations in Piedmont. In 1825 he was assigned to assist Giuseppe Giacinto Moris (1796–1869) in botanical collections in Sardinia (Moris 1837; Colla 1839; Mussa 1911; Mattirolo 1929; Pistarino et al. 1989), but this collaboration was interrupted. He returned to Santa Vittoria d'Alba and

for some time he continued botanical collections in Piedmont, as documented by his collection in the Gesso Valley of 1826.

Returning to Santa Vittoria d'Alba, Bertero's feelings of frustration, caused by the isolation from cultural centers and the monotony of small town life, were eventually expressed in a letter to Balbis (Alba, 3 March 1826): "... Il faudrait être au courant de la science, avoir des livres en quantité et des correspondants; je suis loin de tout cela, et je me trouve, malgré moi, forcé de rester dans cette inaction" [I need to be up to date with science, and to have books and correspondents; I am far from all that, and I found myself, against my will, forced into this inaction (Alba, 3 March 1826)]. The emptiness left by the death of his much beloved mother, the only bond that could have kept him in Piedmont (Torino, 18 April 1827), made Bertero's desire for new travels irrepressible. In 1827 he returned to Paris, and followed the suggestions made by A.P. de Candolle and B. Delessert (Paris, 25 July 1827) to choose Chile as his next goal, a land that was botanically poorly known at that time. In preparation for this expedition, he consulted the Joseph Dombey herbarium (P), constituted by material collected in southwestern South America with Hippolito Ruiz and José Pavón (Steele 1964).

In several letters from Paris (e.g., 18 August 1827), Bertero communicated to Balbis to be literally harassed by scientists, who masked their interests behind apparent manifestations of friendship in order to gain the favor of receiving a set of his future South American collections. Candolle himself offered him money in exchange for a set of his future Chilean collections, an offer that Bertero refused with disdain. Nevertheless, in his correspondence, Bertero declared his interest in sharing his collections not only with his colleagues Balbis and Colla, but also with A.P. de Candolle and several other botanists. At the same time, Bertero was conscious of the ruthless attitude of some botanists to appropriate materials and results from their colleagues. As a consequence, he considered suitable the offer of Candolle to include the descriptions of his newly found Caribbean taxa in the *Prodromus*, before they would be published by others. Candolle published several hundreds new species based on Bertero's detailed decriptions (sometimes copying them literally) of the Caribbean plants he observed and collected. The field book was returned to the Turin Herbarium 16 years after Bertero's death, by Alphonse de Candolle (A.P. de Candolle's son), with the following inscription on the front page (translated from French): "Bertero, botanical manuscripts, previously donated by Balbis to Aug. Pyramus de Candolle, with the agreement of Bertero, transmitted in 1857 to the Botanical Museum of Turin by Alphonse de Candolle, as a token of recognition for a present that he gave me of dry plants from Brazil. Geneva, 27 October 1857, Alph. de Candolle" (Fig. 4).

In addition, Bertero planned to publish the new taxa that would result from his future South American collections, before they would be supplanted by con-

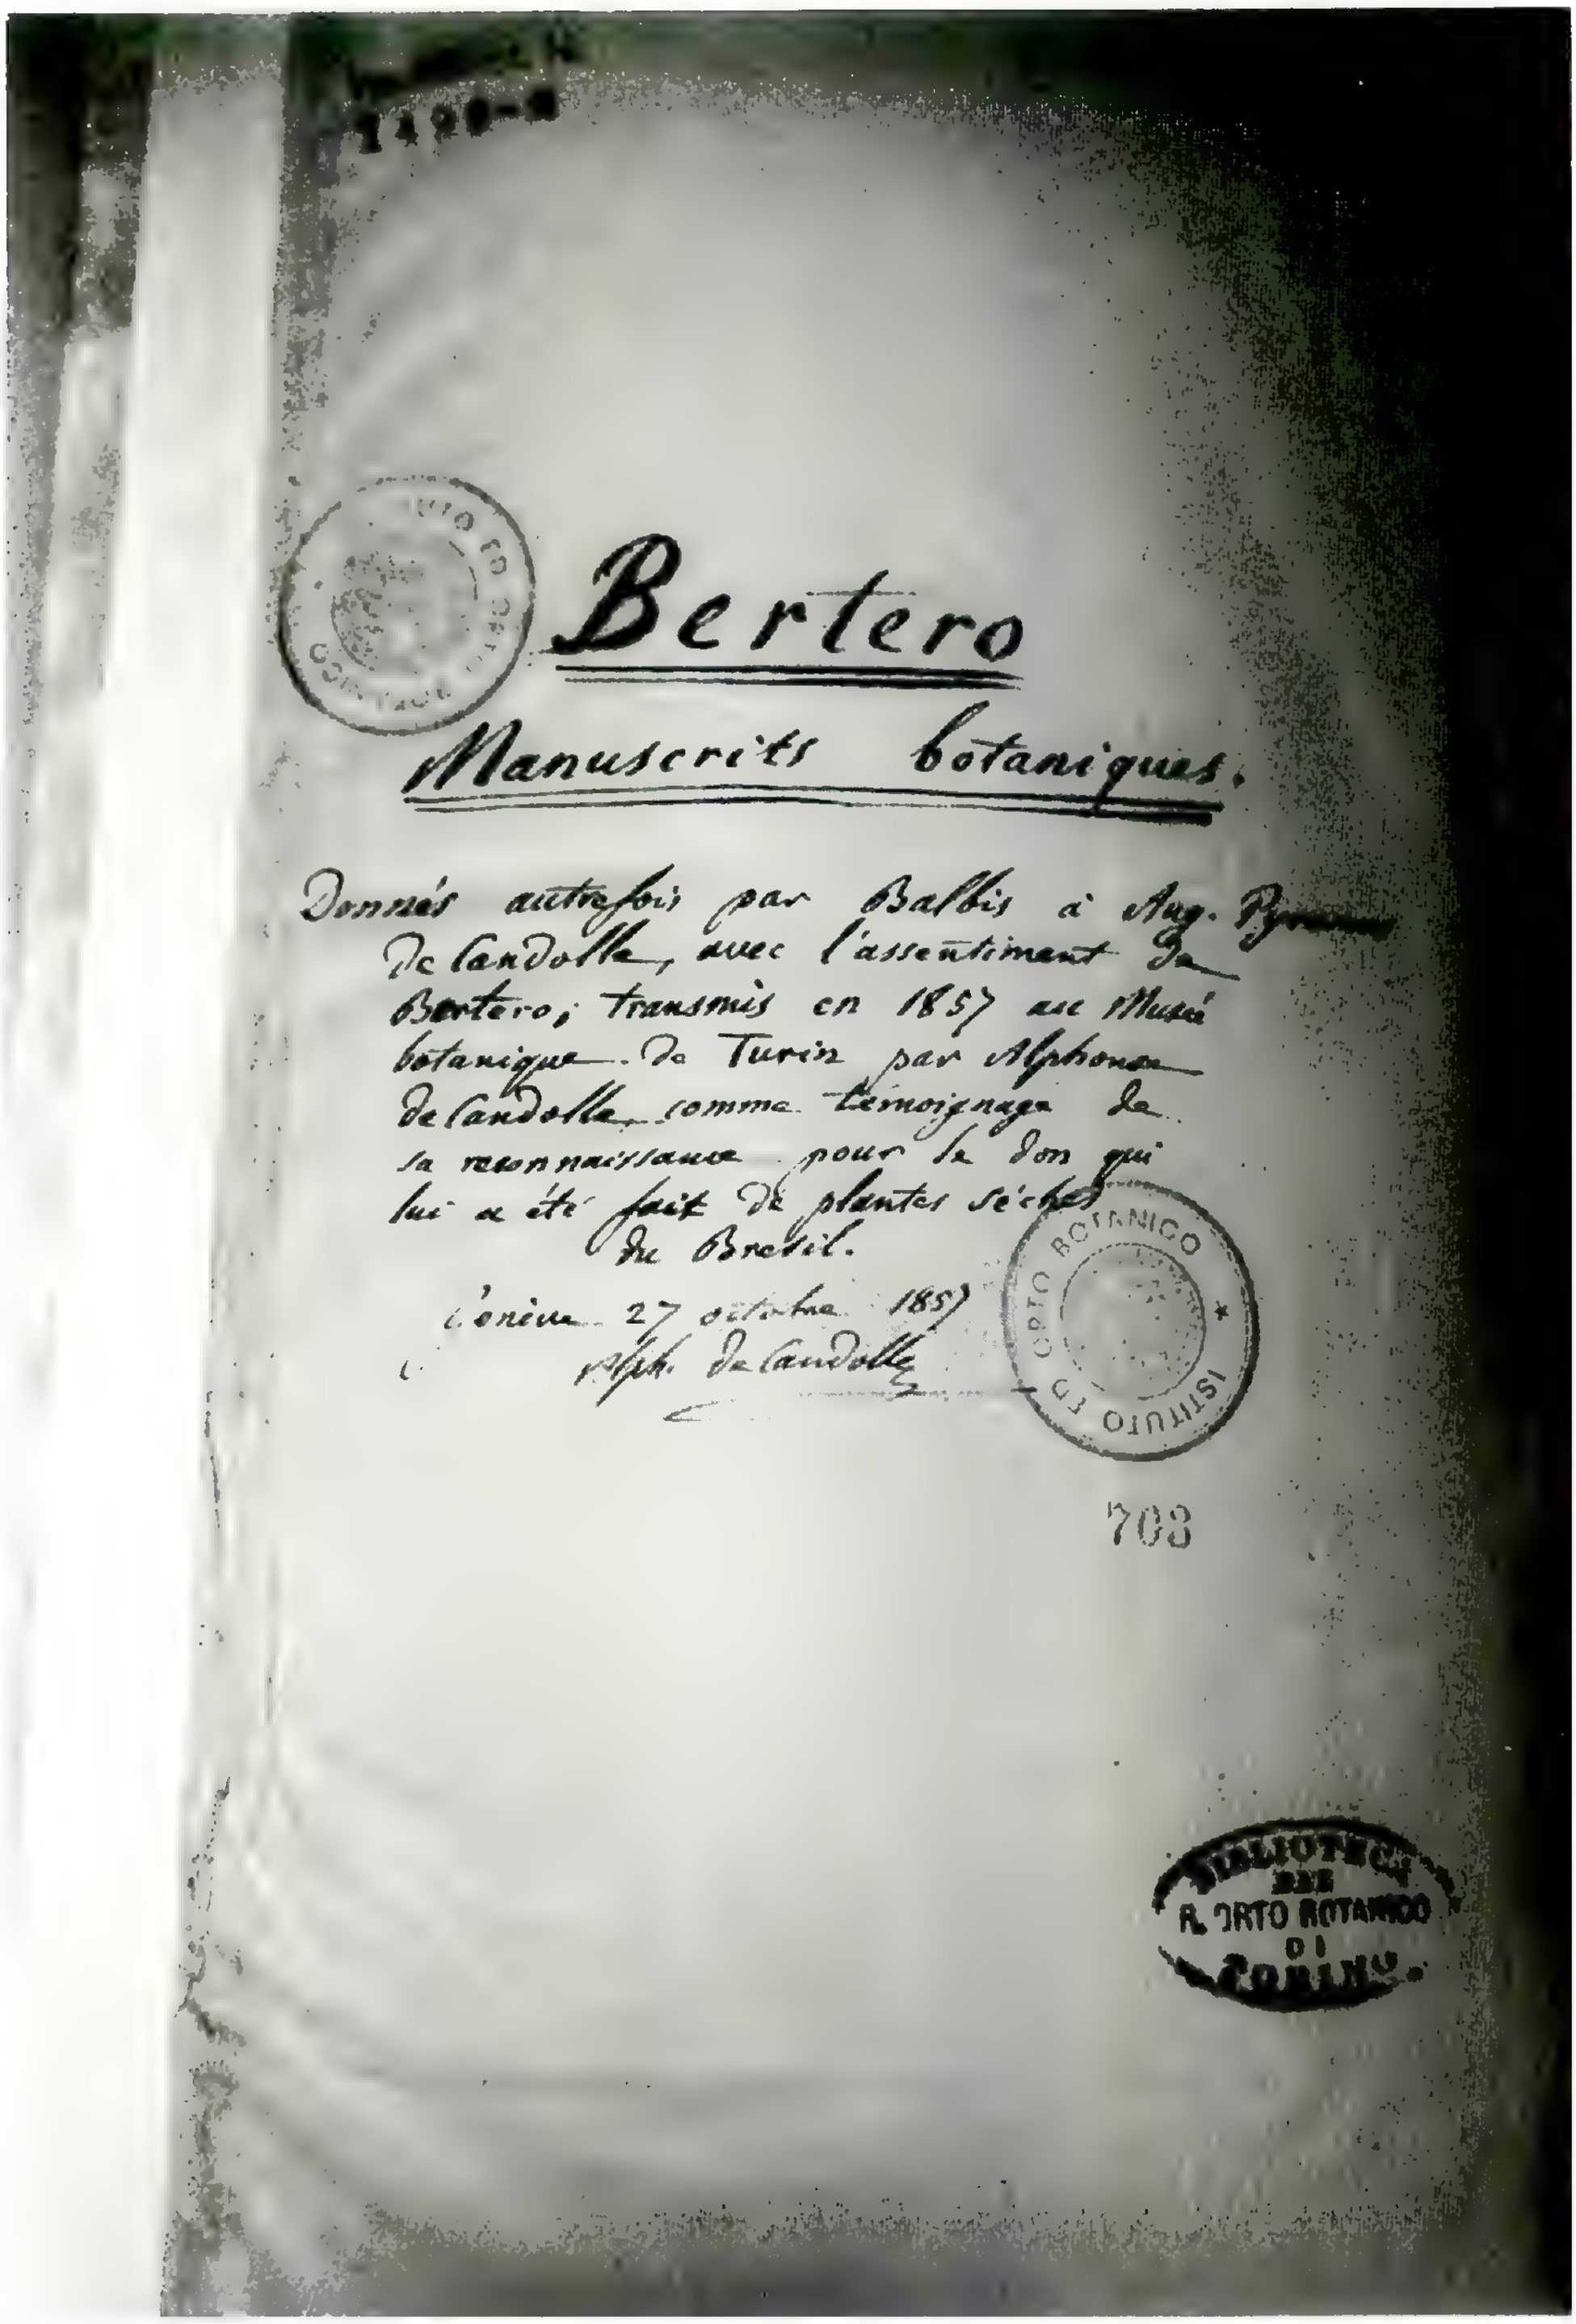

Fig. 4. Photograph of the first page of Bertero's field book, with the writing by Alphonse de Candolle: "Bertero, Manuscrits botaniques, Donnés autrefois par Balbis à Aug. Pyramus de Candolle, avec l'assentiment de Bertero, transmis en 1857 au Musée botanique de Turin par Alphonse de Candolle comme temoignage de sa reconaissance pour le don qui lui a été fait de plantes séches du Bresil. Genève 27 Octobre 1857, Alph. de Candolle."

temporary European botanists. These feelings were expressed in several letters, just before his departure for Chile: "... puisque je me suis de nouveau exposé à des dangers pour faire des découvertes je veux que rien ne parait ce qu'en mon nom..." [... because I have again exposed myself to dangers in order to make discoveries, I want them to appear under my name...] (Paris, 10 August 1827), and "... mon intention était de ramasser des matériaux les quels étant réputés de quelqu'interêt je voulais les publier moi même et payer par ce moyen un juste tribut à mon amour propre..." [... my intention was to accumulate the materials that I regarded of some interest, and wanted to publish them myself and through these means pay a tribute to my self-respect...] (Paris, 18 August 1827).

Bertero's expedition to Chile, Juan Fernández Islands, and Tahiti (1827–1831)

For the second time, Bertero travelled from Paris to Le Havre, and from there, in October 1827, he embarked on a ship with destination Chile, again as a ship doctor. That would be the last time that he saw the European continent. After 112 days of sea voyage, Bertero arrived at Valparaíso, and shortly after he received permission for medical practice in the country, which allowed him to pay his travel and living expenses.

Bertero's explorations in South America turned out to be even more difficult than those he undertook in the Antilles. In fact, in his correspondence he mentioned the many obstacles that he had to overcome: endless rains, impenetrable forests, unusable roads, earthquakes, and frequent dangers of all sorts. In addition, he had to dedicate a considerable part of his time to his medical practice, which he alternated with his botanical work, and had to postpone the shipments of his specimens to Europe several times because of the obstacles encountered in several Chilean ports. To make things more complicated, Bertero travelled in Chile while the country was in revolution (Rancagua, 30 June 1828). The Chilean government contacted Bertero in order to teach a course in Botany and Agriculture, and even planned the creation of an acclimation garden, but these projects were never realized (Valparaíso, 24 June 1829).

Bertero's correspondence with Balbis and Colla includes a wealth of information related to the flora of the regions explored, and documents his travels from Europe to South America, and his life in Chile: France: Paris (25 July 1827, 8 August 1827, 10 August 1827, 18 August 1827, 26 August 1827, 14 September 1827), Le Havre (16 September 1827, 10 October 1827); Chile: Santiago de Chile (11 March 1828, 11 March 1828), Rancagua (17 May 1828, 30 June 1828), Valparaíso (21 June 1829, 24 June 1829, 6 July 1829, 28 November 1829, 28 November 1829, 6 February 1830, 6 February 1830, 6 July 1830, 26 July 1830, 7 August 1830, 10 September 1830).

Contrary to the first expedition, the information that can be extracted from herbarium labels from the second expedition cannot be easily integrated with

the data obtained from his correspondence. In fact, the collection dates of herbarium specimens are limited to the year, reducing the possibility to reconstruct the exact chronological sequence of Bertero's movements (Fig. 5). The only sure data obtained from the material preserved at TO-HG are those correlated with his collections in Valparaíso (June 1829, June–August 1830), Quillota (July 1829), and Juan Fernández Islands (July-November 1829) (Table 2). No herbarium material was found at TO-HG from the trips that he mentioned in various letters (Santiago, 11 March 1828; Valparaíso, 24 June 1829, 6 July 1829, 26 July 1830), in the surroundings of Concepción, Petorca and Coquimbo. Nevertheless, in a letter (preserved at the Academy of Sciences of Turin) he mentioned the sending of a sample of native silver, extracted from the mines of Coquimbo, to the Academy of Sciences of Turin.

In Chile, he collected mostly in the central region. First he botanized in the surroundings of Valparaíso, and then in Viña del Mar and Quillota, on his way to Santiago; from there he travelled south to Rancagua. It is still doubtful if he travelled to Concepción, Petorca and Coquimbo, which he mentions in one letter to Colla (see below). Some references related to Bertero's work in the region were published by the Royal Society of London (1867), Pritzel (1871), Saccardo (1895-1901), Vignolo-Lutati (1956), Stafleu & Cowan (1976), and Del Vitto (1986).

Bertero published an account on the Chilean plants known to him in several articles in *El Mercurio Chileno* (Bertero 1828–1829), where taxa were listed alphabetically, with notes on common names, their uses and peculiarities. This work remained incomplete, arriving only to the letter Q, and was ended with "(Se concluirá)" [to be concluded], because the publication of the journal was stopped, due to political turmoil. Bertero's articles were translated in Italian (Colla 1829a, 1829b, 1830), English (Bertero 1831, 1833) and German (Bertero 1832) immediately after their publication in Chile, and reprinted with notes by Looser (1931), proving the importance of his work. Unfortunately, Bertero's new taxa were not supplied with a description and should be treated as *nomina nuda* (invalid names according to the code of botanical nomenclature - Greuter et al. 2000). The logical continuation to Bertero's work published in the *Mercurio Chileno* is to be found in Colla's *Plantae rariores in regionibus chilensibus* (Colla 1834, 1835, 1837) and Moris' *Plantae chilenses novae minusque cognitae* (1834, 1835). Also, a few of Bertero's new taxa were described by Moris (1831, 1832, 1833) from plants grown in the Royal Botanical Gardens of Turin (from seeds sent by Bertero from Chile). In addition, Bertero's new taxa from his Chilean collections were published in the works of many botanists from all over Europe, sometimes validating his *nomina nuda*, or disregarding his proposed binomials.

In his botanical observations in Chile, Bertero was also the first to realize that *Cyttaria* (Ascomycetes, described by Berkeley, 1841) was a fungus, and not the strange "fruits" of *Nothofagus* (Minter et al. 1987).

Because of the ongoing war in Chile, he had to discontinue his medical

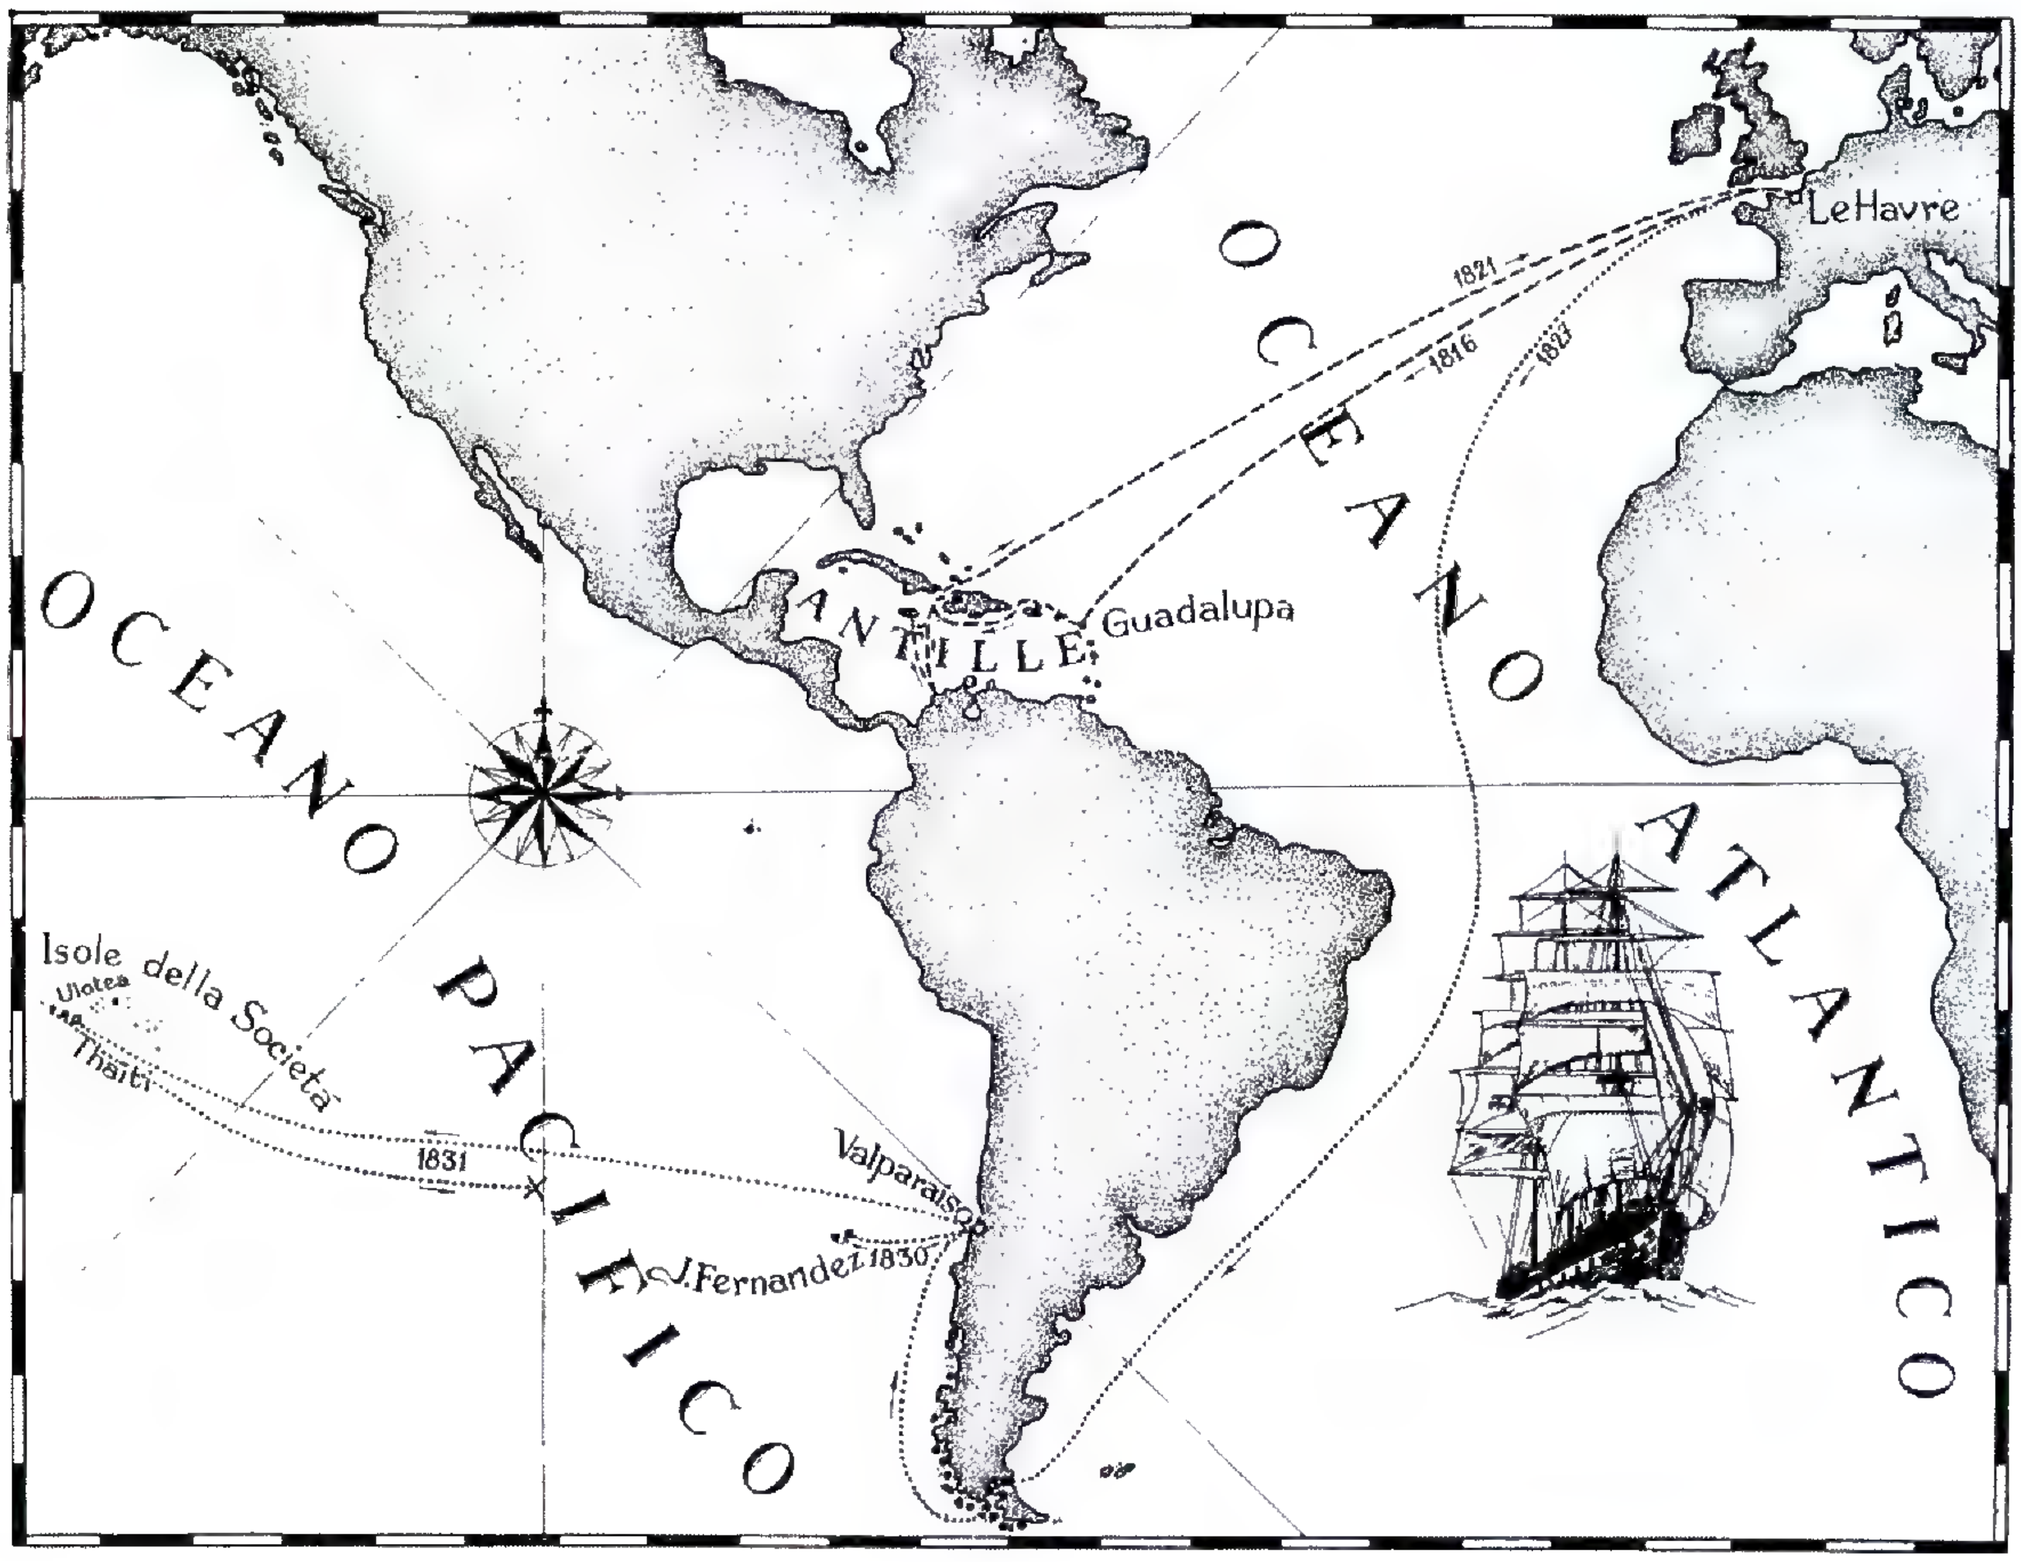

Fig. 5. Map of both Bertero's two itineraries in the Antilles and Colombia (1816–1821), and in Chile, Juan Fernández Islands, and Tahiti (1827–1831). Reproduced with permission from Molinaro (1989).

Table 2. Bertero's main localities and dates of his trips to Chile, Juan Fernández Islands, and Tahiti (1827–1831). Localities and periods were extracted from the letters exchanged among Bertero, Colla and Balbis, and from labels of herbarium specimens preserved at the Turin Herbarium (TO-HG).

Localities	Collection periods
Valparaíso	February 1828
Santiago	March 1828
Rancagua	March 1828–February 1829
Santiago	March–May 1829
Valparaíso	June 1829
Juan Fernandez Islands	July–November 1829
Valparaíso	December 1829–February 1830
Quillota	March–May 1830
Tahiti	November 1830–April 1831

practice. Therefore, from March to May 1830, he visited the Isla Más a Tierra, of the Juan Fernández Islands, accompanied by A. Caldeleugh, and returned to Chile with plant specimens accounting for about 300 species. Guillemin (1830)

published an extract of one letter written by Bertero, dated Valparaíso 7 July 1830, on the natural history of the Juan Fernández Islands. This account, for which Bertero should be rightly considered the author, is the first scientific observations of this archipelago. Among the plants collected by Bertero in Juan Fernandez Islands, should be mentioned the genus *Rea*, a name that he proposed in a letter to Colla (February-March 1830), and that was later published by M.J. Decaisne (1833). Unfortunately, this genus was described one year earlier by David Don (1832) as *Dendroseris*, and *Rea* should be treated as synonymous to it. Regarding the cryptogams collected by Bertero in Juan Fernandez Islands, the vast majority of the new taxa were described by Camille Montagne (1835a, 1835b).

On 28 September 1830, Bertero sailed from Chile, with the General Consul of North America J.A. Morenhout, to the Society Islands and arrived at Tahiti on 4 November 1830. Detailed information on Bertero's trip to Tahiti was supplied in a letter written by Morenhout (25 March 1832; Vignolo-Lutati 1956). According to Morenhout, as Bertero arrived in Tahiti, he immediately started actively botanizing and made substantial collections. A few months later, as he received news about the ongoing revolution in France, Bertero sailed on a small boat (of Morenhout's property) directed to Valparaíso on 2 April 1831, leaving his Tahitian collections to Morenhout, and arriving on the same day at the small island of Raiatea (Society Islands), where he made his last botanical collections. From Raiatea, Bertero wrote two letters (2 April 1831 to Colla, and 9 April 1831 to Morenhout); these were his last communications, at the young age of 42. In his last letter to Colla, probably feeling a premonition of his imminent death, Bertero wrote: "Adieu, bonne Santé, un Pater et un Ave pour mon âme dans le cas qu'elle soit submergée!" [Good bye, and good health, recite a Pater Noster and an Ave Maria for my soul in case that it will be sunk!].

Almost one year later, after loosing any hope of Bertero's survival, Morenhout wrote a long letter (25 March 1832) to the Academy of Sciences of Turin, where he informed them of Bertero's disappearance, and of his grand future plans to explore Peru, return to Colombia, and start his explorations in North America. Morenhout concluded his letter with the following sad notes (free translation from French): "Destiny has not permitted that he [Bertero] realized his grand projects, as he never stopped loving his interesting research! He deserves the sorrow of all his friends in science, and most of all from You, Sirs [the members of the Academy of Sciences of Turin], and from his homeland that he always fondly remembered. Honoured by his friendship, I have known the most intense sentiments of his soul, and I know that he had no other passion than Botany nor other ambition than being proud of You and his Homeland!"

While still in Chile, Bertero sent his collections to Baron Delessert at Paris, who took the responsibility of distributing duplicate sets to Balbis (now at TO-HG), Colla (now at TO-HG) and A.P. de Candolle (G-DC), keeping one for him-

self (G-DEL), and conserving the rest for the return of Bertero, as he explained in several letters from Paris (10, 18, and 26 August 1827) and from Valparaíso (24 June and 6 July 1829). Fearing that some of the boxes might become lost, Bertero also planned duplicate sets to be sent directly to Balbis (Paris, 26 August 1827). Such a plan was not followed, however, because Bertero did not receive any communications from Balbis for more than a year and a half. The last letters sent from Balbis were dated 3 August 1828 and 31 January 1829, which were delivered contemporarily to Bertero on June 1829 (Valparaíso, 24 June 1829).

Bertero's entire collection from Chile—approximately 15,000 specimens—was sold by Delessert's heirs at an auction, several years after Bertero was declared lost at sea. The collection was bought for 1,200 Francs by the travel company Unio Itineraria ("Reise Verein"), based at Esslingen (Germany) and owned by E. Steudel and C.F. Hochstetter. Unio Itineraria dismantled Bertero's Chilean collection, and sold the duplicate sets to the institutional herbaria of Berlin (B), the British Museum of London (BM), Kew (K), Leiden (L), Nancy (NCY) and Paris (P), and to the personal herbaria of E. Cosson (now P), B. Delessert (G-DEL), A.P. de Candolle (G-DC), J. Cambessèdes (now at MPU), A. Wigand (now at MB), and probably some others. According to Turrill (1920), 5,000 specimens are preserved in the Paris herbarium (P), with labels reporting localities of collection and accurate descriptions. Other than those indicated above, additional Bertero's Chilean collections are found at A, CGE, CN, E, F, FI, G, GH, KIEL, LE, M, MEL, MO, NY, OXF, PC, SGO, TCD; and those from Juan Fernández Islands at B, F, G, GH, K, L, MEL, MPU, NY, P, P-JU, PC, SGO (Lanjouw & Stafleu 1954, and pers. obs.).

In 1834, Morenhout sent Bertero's Tahitian collections to Alcide Dessalines d'Orbigny (1802–1857) who travelled in South America in 1826–1834 (Orbigny 1834–1847), at Paris in a large crate. As the crate arrived at his destination, it was noticed that it had been opened, and part of its contents was missing. A detailed account on the Tahitian collection made by Bertero and Morenhout sent to d'Orbigny, as well as descriptions of many new species, was published by J.A. Guillemin (1836, 1837). In the first article of the series, Guillemin stated that duplicates of these collections were sent to the Museum of Natural History of Paris (P), to the Royal Academy of Turin (which material has been entirely transferred to the herbarium of the University of Turin, TO), and to the personal herbaria of A.T. Brongniart (now at P) and B. Delessert (now at G-DEL), and other non specified botanists. More research on the distribution of duplicates of Bertero's Tahitian collections is necessary (none cited by Lanjouw & Stafleu 1954). Nevertheless, specimens of his Tahitian incomplete sets were found in Paris (P), Berlin (B, destroyed), Kew (K), and at the Delessert herbarium (G-DEL). Only four specimens of Bertero's Tahitian collections were found at the Turin herbarium (TO-HG), and no reference to them could be found in the correspondence.

Additional references about the distribution of Bertero's collections can be

found in: Anonymous (1833), Lasègue (1845), Caruel (1874), Parlatore (1841, 1874), Saccardo (1895–1901), Urban (1902), Mattirolo (1907), Ciferri (1931), Martelli (1931), Vignolo-Lutati (1931b), Lanjouw & Stafleu (1954), Del Vitto (1986), Matthei (1986), Rodriguez Rios (1986), and Del Vitto et al. (1993).

ACKNOWLEDGMENTS

We are grateful to the Library of the Department of Plant Biology of the University of Turin, the Royal Library of Turin (Biblioteca Reale di Torino), the Academy of Sciences of Turin (Accademia delle Science di Torino), the Civic Library of Turin (Biblioteca Civica di Torino), the Regional Museum of Natural Sciences at Turin (Museo Regionale di Scienze Naturali), and The New York Botanical Garden for their support toward this project. We are also thankful to Jim Grimes for information about Bertero's Chilean collection at the Herbarium of the Royal Botanic Gardens, Victoria (Australia), to Lucía Cortez for proofreading the Spanish version of the abstract, and to Mike Nee, Alain Liogier, Richard Howard and Tod Stuessy for reviewing the manuscript and for their valuable comments.

ON THE DERIVATION OF THE GENERIC NAME *ILIAMNA* (MALVACEAE)

William A. Weber

Edward Lee Greene is well known as a classics scholar and a botanist with strong opinions. His prowess as a classics scholar is well attested to by his historical work (Greene 1909). His idiosyncratic ideas are too well known to need documentation. But this combination of characteristics leads to some interesting speculations with regard to certain generic names that he proposed. In particular, we deal here with the name *Iliamna*, which he proposed for a genus of western American Malvaceae (Wiggins 1936).

In publishing the name, Greene (1906) did not state how he chose the name or offer any indication of its derivation. Other sources indicate its origin to be unknown (e.g. Gleason 1952; Genaust 1983) or at least mysterious ("Greek, significance obscure": Hitchcock & Cronquist 1973).

Our first considerations of the question took into account Greene's classical learning and led us to the roots *ilyos* (Greek: mud) and *amnis* (Latin: pertaining to a river), which makes a certain amount of sense, since the plants concerned occur in wet habitats. However, it seemed unlikely that Greene would have mixed Greek and Latin roots, so this derivation left us unsatisfied.

We next serendipitously discovered that there is a place name in Alaska, Iliamna, applied to a bay, a lake, a point, a village, and a volcano. The native name of the lake was reported as Oz[e]ro Bol[schi] Ilyamna on the 1852 Russian Hydrog. Dept. Chart 1455. This feature was earlier called Ozyero Shelekhovo on an 1802 Russian map. According to G.G. Martin, USGS, Iliamna is said to be "the name of a mythical great blackfish, supposed to inhabit this lake, which bites holes in the bidarkas [boats] of bad natives" (Orth 1967). The volcano's name was published by the Russians (Orth 1967) as *Sopka Ilymna* (Capt. M.D. Tebenkov, 1852, map # 5). It has therefore been suggested that the Russian name *Ilym* is the root, but this is speculative.

We presume that Greene encountered the name, liked the sound of it, and found an occasion to apply it botanically. But did he apply it because of its sound or because of its meaning? Is the origin of the name Russian or Amerindian? The genus *Iliamna* does not occur in Alaska; its species have their northernmost limit in British Columbia.

We have now learned that what appears to be the "true" derivation of the

SIDA 20(2): 645 – 646. 2002

geographical name, which Greene presumably appropriated for botanical purposes. The Dena'ina are an Athabascan people of Cook Inlet and the Alaska Peninsula where the geographical name was used. Their name *Nilamna* (phonetically) was modified by the early Russian colonists into Iliamna. The name derives from two words, *nila* (islands) and *vena* (lake), that is, "islands in the lake." We are grateful to Lydia Black of the Anthropology Department, University of Alaska, Fairbanks, for this information.

Thus, although we now know the derivation of the name *Iliamna*, we remain in the dark as to why Greene chose it as a botanical name. He may have simply liked the sound of it, but it is also possible that he chose it to confound his botanical critics into seeking a classical derivation of a name that did not have classical roots.

ABSTRACT

Plant classification and nomenclature are in a continuing state of flux and heated debate between two opposing schools—**1)** traditional taxonomists supporting "evolutionary" or "Linnaean taxonomy"; and **2)** cladists supporting "phylogenetic systematics" or "cladonomy." While it is a multifaceted controversy that has spanned several decades, relatively little attention has been focused specifically on the ramifications for floristics. The two goals of this paper are **1)** to give special emphasis to the implications of the controversy for the writers of floras, and **2)** to provide an overview of some of the arguments in a format accessible to a diverse audience of botanists interested in floristics. We examine some of the issues we have confronted in our floristic work, discuss how we are attempting to balance the strengths and weaknesses of both approaches, and indicate what we believe is the best, albeit imperfect, approach to the writing of floras at the present time. We argue that, for both practical and theoretical reasons, a modified traditional system (binomial nomenclature, ranked hierarchies) be used in floras (allowing paraphyletic groups but eliminating all polyphyletic groups despite some nomenclatural instability). Further, these floras should incorporate information on newly discovered phylogenetic relationships (even if too preliminary, tentative, or inappropriate for nomenclatural change) and discuss these in appropriate family and generic treatments in order to facilitate as complete an understanding of plant evolution as possible.

RESUMEN

La clasificación y nomenclatura de las plantas está en un flujo continuo y debate ardiente entre dos escuelas opuestas—**1)** taxónomos tradicionales que apoyan la "taxonomía Linneana" o la "evolutiva"; y **2)** cladistas que apoyan la "sistemática filogenética" o "cladonomía." Mientras esta controversia se ha extendido durante varias décadas, se ha prestado relativamente poca atención a las ramificaciones de la florística. Las dos metas de este artículo son **1)** dar un énfasis especial a las implicaciones de la controversia para los autores de floras, y **2)** ofrecer una visión general de algunos de los argumentos en un formato accesible a una audiencia diversa de botánicos interesados en la florística. Examinamos algunos de los resultados que hemos confrontado en nuestro trabajo florístico, discutimos como hemos intentado equilibrar las bondades y debilidades de ambos métodos, e indicamos lo que creemos que es el mejor, aunque imperfecto, método de escribir floras en la actualidad. Argumentamos que, tanto por razones teóricas como prácticas, se use en las floras un sistema tradicional modificado (nomenclatura binomial, sistema jerarquizado) (que permita grupos parafiléticos pero eliminando todos los grupos polifiléticos aunque causen inestabilidad nomenclatural). Además, estas floras deberían incorporar información sobre las relaciones filogenéticas recién descubiertas (incluso si son demasiado preliminares, tentativas, o inapropiadas para cambios nomenclaturales) y discutir éstas en la familia apropiada y tratamientos genéricos para facilitar una comprensión lo mas completa posible de la evolución de las plantas.

SIDA 20(2): 647 – 674. 2002

INTRODUCTION

Plant taxonomy is the science that deals with the *identification*, *nomenclature*, and *classification* of plants. The term plant systematics (or systematic botany) is often used synonymously with plant taxonomy (as is done here), but sometimes has the connotation of mainly using recently developed techniques or approaches such as chromosomal studies, electron microscopy, molecular biology, or cladistics to answer questions about plant relationships. From the definition of plant taxonomy it follows that the primary goals of the discipline are to:

1) identify and describe all the various kinds of plants;
2) develop a system of naming plants [e.g., International Code of Botanical Nomenclature (Greuter et al. 2000) or potentially a future version of the PhyloCode (2002)];
3) arrange plants with common characteristics into groups that reflect their evolutionary relationships (Lawrence 1951; Porter 1967; Radford et al. 1974; Jones & Luchsinger 1986; Judd et al. 1999, 2002).

In terms of nomenclature, the goal of plant taxonomy has been to develop a uniform, practical, and stable system of naming plants—one that can be used by both plant taxonomists and others needing a way to communicate precisely and retrieve information about plants. In the words of Stevens (2002), "The value of any naming system is how effectively it establishes conventions that allow people to communicate and to develop their ideas. ..."

Regarding classification, the goal has been to arrange plants with common characteristics into groups that reflect their relationships—in other words, to develop a scheme of classification that is useful—that conveys maximum information and has predictive value. Since the time of Darwin, a primary goal of plant taxonomists has been to reflect phylogeny or evolutionary history in their systems of classification. There are several reasons for this. One is that taxonomists want their classification system to reflect the reality of the evolutionary history of life on earth. Second, a system that reflects evolution should have maximum predictive value and usefulness (since related species should share similarities due to common descent). While this basic evolutionary approach is agreed on by virtually all botanists, in recent years there has been heated debate between two main schools of taxonomists:

1) traditional taxonomists practicing what is sometimes referred to as "Linnaean classification" (Brummitt 1997) or "evolutionary taxonomy." Traditional or evolutionary taxonomists, while attempting to have a classification system based on evolutionary relationships, also try to reflect the amount of evolutionary change undergone by groups. In addition, they try to incorporate other goals, including practicality and stability, into the classification system (see Brummitt

1997 for a detailed discussion of traditional classification). The names Linnaean classification or Linnaean taxonomy (Stuessy 2000; Forey 2001, 2002; Nicolson 2002), are perhaps inappropriate since the system is very different from that established by Linnaeus. In its more recent version it is perhaps better called "evolutionary taxonomy" (Sanders & Judd 2000) or "evolutionary systematics" (Grant 2001b) signifying the attempt to reflect evolutionary relationships. Grant (2001b) uses the acronym TTES "to include the two subschools of traditional taxonomy and evolutionary systematics." When considered from the standpoint of nomenclature, this is a system that incorporates binomial nomenclature (two-part scientific names consisting of a genus name and specific epithet) and a hierarchy of formal ranks (e.g., family, genus, etc.). The nomenclatural application of this viewpoint has been referred to as the "L-code" and its principles are embodied in the International Code of Botanical Nomenclature (Greuter et al. 2000).

2) cladists, whose method of constructing phylogenies is derived from the ideas of the German entomologist Willi Hennig, practicing "phylogenetic systematics" or "cladistic classification" (referred to as "cladonomy" by Brummitt 1997) based explicitly and solely on phylogenetic relationships. In other words, the overriding goal is that classification should reflect the branching patterns of evolution. It should be noted that in a clade-based classification and resulting nomenclature system, there are no formal ranks, including family or genus, and no formal binomial nomenclature (de Queiroz & Gauthier 1992; Lidén et al. 1997; Cantino 1998; Brummitt 2002). The nomenclatural application of this viewpoint has sometimes been referred to as the "P-code" and its ideas are embodied in the PhyloCode (2002).

Currently, classification and nomenclatural systems are in a state of flux between these two main opposing camps—both of which attempt to reflect evolutionary relationships. Those practicing cladistic systematics have made major contributions to our understanding of plant evolution, and have brought about some long overdue changes. In fact, some of their methodology has contributed to a well-recognized revival in taxonomy/systematics. Some of the most evident examples of this are the incredible breakthroughs in knowledge of plant relationships resulting from molecular phylogenetics. It should also be noted that there is significant variation in the extent to which various "phylogenetic" systematists follow all of the implications of the cladistic approach—most, for example, still use binomial nomenclature even though they may disagree with it on theoretical grounds. At the same time, the system of nomenclature (binomial, etc.) and hierarchical classification that has developed over the past 250 years has served and continues to serve the botanical and broader communities well. There are thus positive aspects to both of these approaches.

Because of major differences in philosophy and methodology, the classifi-

cation systems produced by proponents of evolutionary taxonomy and cladistics are often quite different. It is not unexpected then that the two conflicting viewpoints have produced a vigorous and heated debate (e.g., Nixon & Carpenter 2000), which has even been referred to as a "maelstrom" (Benton 2000). The proposed approach of phylogenetic classification has certainly not "mostly been politely accepted by the systematic community" as stated by Schander (1998). In fact, the tone of a few of the articles and discussions (on both sides of the argument) has been surprisingly impolite by the standards of modern scientific discourse, with Webster (2002) referring to the arguments as "an ideological cacophony of bombast and invective." There is a voluminous literature on the subject, including numerous recent articles about the different taxonomic and nomenclatural approaches (e.g., Moore 1998; Stevens 1998; Diggs et al. 1999 (Appendix 6); Mishler 1999; Benton 2000; Cantino 2000; de Queiroz 2000; McNeill 2000; Nixon & Carpenter 2000; Sanders & Judd 2000; Stevens 2000; Stuessy 2000, 2001; Withgott 2000; de Queiroz & Cantino 2001; Grant 2001a, 2001b; Langer 2001; Lee 2001; Pennisi 2001; Berry 2002; Brummitt 2002; Forey 2002; Kress & DePriest 2002; Nicolson 2002; Stevens 2002; Webster 2002). Symposia and workshops have also been held (XVI International Botanical Congress—August 1999; Smithsonian's National Museum of Natural History—March 2001; Hunt Institute for Botanical Documentation—June 2002), and a new system of nomenclature has been proposed (PhyloCode 2002). However, few authors or discussions have specifically addressed the special problems faced by writers of floras (but see Stevens 1998, Sanders & Judd 2000, and Berry 2002). This controversy is actually multifaceted, with many quite different aspects (e.g., are taxon names defined?—Stuessy 2000, 2001, de Queiroz 2000, de Queiroz & Cantino 2001; which system will ultimately be more stable?—Forey 2002) that are beyond the scope of the discussion here. In this paper we are focusing on the implications for floristics.

IMPLICATIONS FOR FLORISTICS

As writers of a flora (the *Illustrated Flora of East Texas* project—Diggs et al. in prep.; www.easttexasflora.org), we and our co-authors are faced with the question of *what type of classification and nomenclatural concepts should be followed in a large regional flora* (ca. 3,300 species or roughly 1/6 the species in North America north of Mexico). We are acutely interested in this question, because as floristicians we must translate and synthesize a variety of types of botanical research, both practical and theoretical, into a form usable by a very diverse audience—one that ranges from professional taxonomists and other scientists to lay botanists, students, and interested amateurs, many of whom are unacquainted with taxonomic methods. In fact, we believe that addressing the needs of diverse users is one of the most important tasks of floristicians. Further, developing a "general-purpose system" that effectively addresses the needs of

multiple users is often considered to be the "historical and continuing function" of taxonomy as a whole (Cronquist 1987). The answer to the question of what type of concepts should be followed varies greatly depending on who one asks. The most conservative voices would say that the traditional system of nomenclature, a ranked hierarchical system of classification, traditional families, etc., should be used due to both theoretical and practical considerations. Some would even argue that clearly polyphyletic traditional families (e.g., Liliaceae in the broad sense) should continue to be used in floras since this is a very useful and practical approach. The most extreme voices on the other side (i.e. extreme cladists) would say that no set categories should be recognized (e.g., no families, no genera; instead, only supportable clades), only monophyletic groups (= a common ancestor and **all** its descendants; Fig. 1) should be given taxonomic recognition (i.e., no paraphyletic groups should be allowed—currently many genera and families are paraphyletic; paraphyletic groups are defined as those containing a common ancestor and some, but not all, of its descendants). Further, the extreme cladists argue that binomial nomenclature should be replaced (since genera have no objective reality, there can be no generic names and hence no binomials; only clade-based names should be used). Interestingly, our previous flora (*Shinners & Mahler's Illustrated Flora of North Central Texas*—Diggs et al. 1999) was criticized by individuals from both extremes. Despite having more information on cladistics (lengthy appendix discussing the issue, discussions in numerous family synopses) than any other regional or state flora we know of (e.g., Hickman 1993; Yatskievych 1999; Rhodes & Block 2000; Wunderlin & Hansen 2000), we were criticized for not applying the cladistic approach throughout the flora. Likewise, some conservative botanists were disturbed by decisions such as lumping some groups (e.g., *Najas* into the Hydrocharitaceae), splitting others (e.g., *Senecio* into *Senecio* and *Packera*), and following an alphabetical rather than a traditional sequence (showing supposed relationships) of families and genera (a logical impossibility since a written flora is linear and evolution is a branching process). One thing to keep in mind when discussing this clash of viewpoints is the realization that any system of classification, nomenclature, and written presentation will be an imperfect reflection of the complexity represented by the evolutionary history of life on earth. In the words of Benton (2000), "phylogeny is real, classification is not." While we now have access to increasingly sophisticated and diverse sources of data, factors such as extinction, an incomplete fossil record, and the complexity of evolutionary processes (e.g., reticulate evolution—Wagner 1954; see discussion below) will prevent us from producing completely accurate phylogenetic reconstructions. Despite these limitations, as floristicians attempting to produce a useful flora, we have to use approaches to classification and nomenclature that best reflect a diverse and complex set of needs.

It is generally agreed that the primary goal of a flora is to allow identifica-

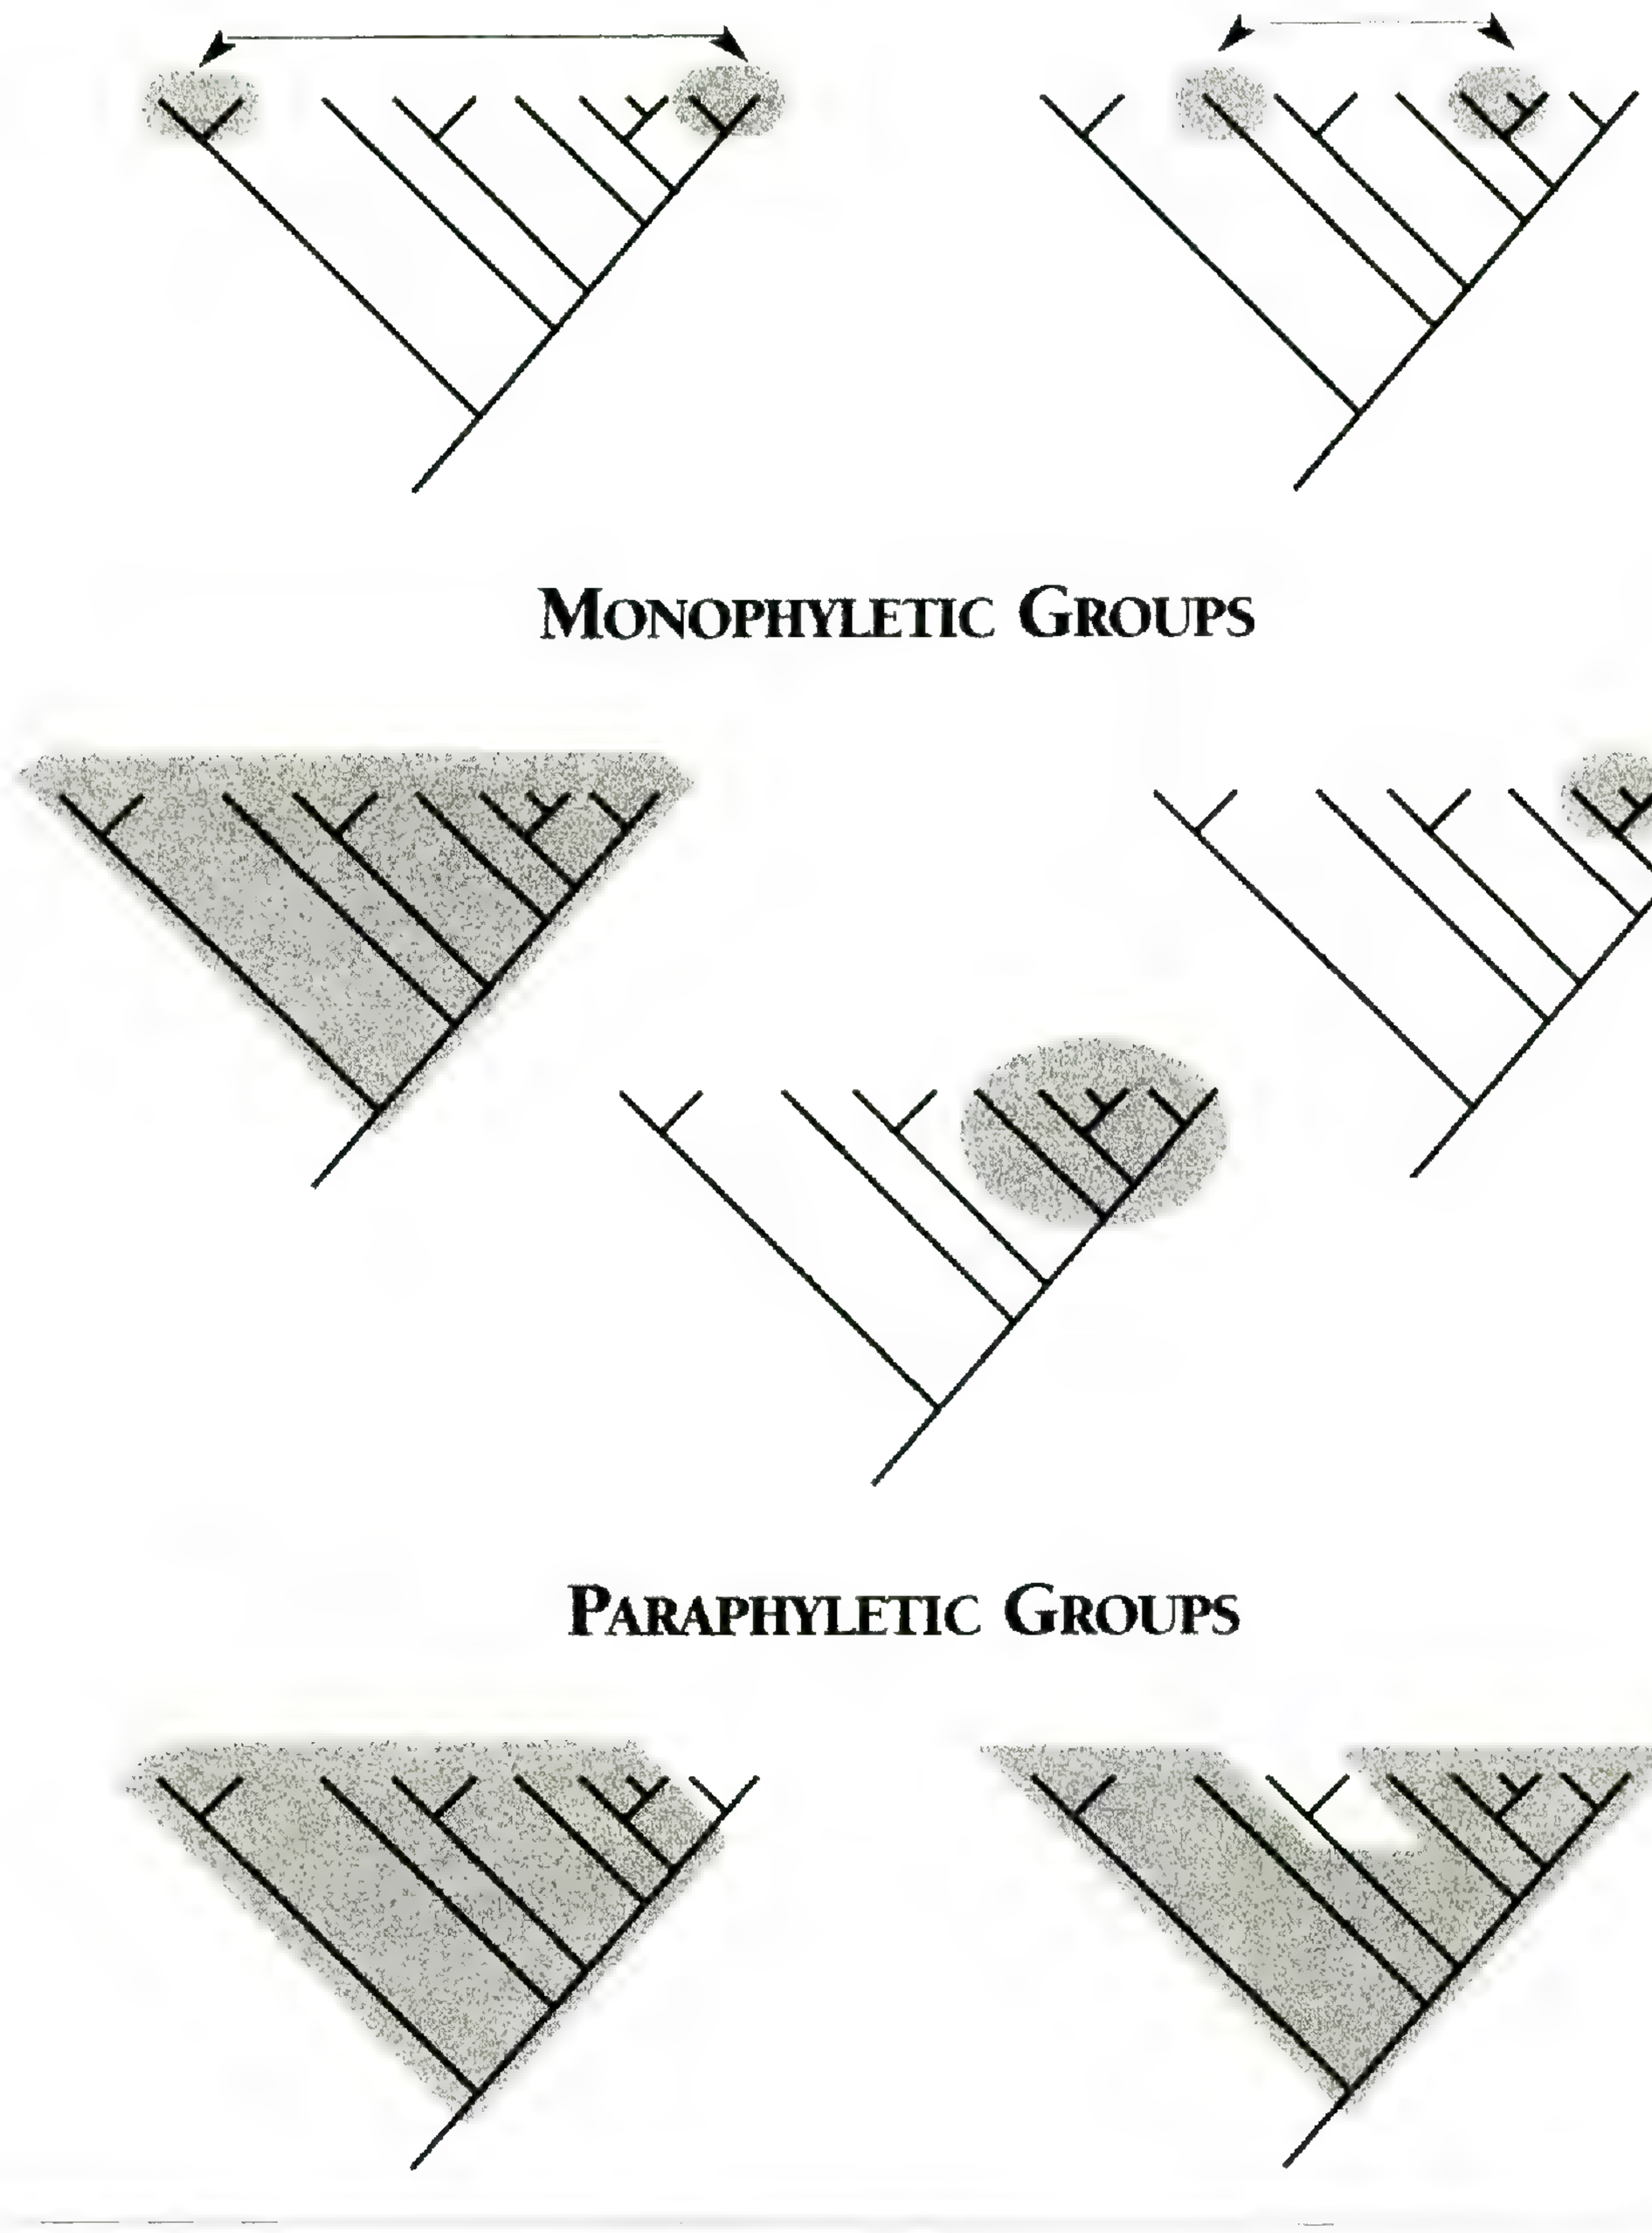

FIG. 1. Diagrammatic representation of polyphyletic, monophyletic, and paraphyletic groups (from Diggs et al. 1999).

tion of the plants treated. However, there are a number of secondary goals. According to Sanders and Judd (2000), these are: **1)** to provide entry into the systematic literature; **2)** to provide thumbnail summaries of the current state of

our knowledge (including systematic, ecological, ethnobotanical, etc.); **3)** to serve as a reference for other professionals; and **4)** to fix the concepts of taxa, especially families and genera, in the minds of users. Generally we agree with these secondary goals, and expended considerable thought and effort in applying them in our previous floristic effort (Diggs et al. 1999). We also agree with Sanders and Judd (2000) that there is a critical need for the collaboration (and probably more importantly cross-training) of floristic, monographic, and phylogenetic researchers. However, we disagree with Sanders and Judd (2000) in *how* to accomplish the fourth of their stated goals. They argue that the methods of phylogenetic classification should be applied consistently in floras (e.g., only monophyletic groups allowed, hence precluding paraphyletic families). We believe that this approach, if inflexibly applied, would hinder the primary goal (of a flora) of allowing effective identification. Further, if all aspects of the cladistic approach are followed (e.g., elimination of ranks and binomial nomenclature) in a flora, we envision significant erosion of this primary goal. The loss of many morphologically coherent and easily recognizable paraphyletic families, the discontinuity in information retrieval due to a radical change in nomenclature, the lack of effective mnemonic devices to replace such widely recognized and practically important ranks as family and genus, and instability in nomenclature (and hence identification) associated with rapidly changing cladograms are a few of the reasons for this concern.

In some cases, floristicians, for practical or historical reasons, are unable to apply even the most important recent phylogenetic discoveries in their floras. For example, the critically important Flora of North America Project, because of the long time span necessary for such a massive multi-volume work, had to adopt a standard years ago (Cronquist system of families)—hence, the Liliaceae (in the broad sense), now known to be clearly polyphyletic, is still being recognized in a forthcoming volume (with an extensive discussion of phylogeny). While we strongly agree with cladists that polyphyletic groups should be eliminated (whenever possible), we disagree with the advisability of eliminating the numerous useful and meaningful paraphyletic groups, particularly at the levels of family and genus (see further discussion below). We would add three other goals to the four (Sanders & Judd 2000) enumerated above: **5)** to address specifically the needs of diverse users (discussed above); **6)** to connect the work of monographers and other researchers to the "consumers of botanical information" (T. Barkley, pers. comm.; Barkley 2000) who need to use these discoveries; and **7)** to use systems of classification and nomenclature that allow meaningful comparisons with other floristic works. In other words, for conservation, biogeographical, ecological, etc. purposes, it should be easy to compare data such as the total number of species, the number of endemics, or the number of introduced species from flora to flora (with the realization that the comparisons will be far from perfect, but useful nonetheless). Ultimately, we somehow

hope to combine several important but not necessarily compatible approaches. We not only want to produce a useful, informative, and user-friendly flora, but also one that accurately reflects evolutionary history (i.e., be phylogenetically informative) and incorporates recent discoveries in botany.

APPROACH TAKEN IN THE *ILLUSTRATED FLORA OF EAST TEXAS*

After considerable thought, discussion with a variety of individuals, and a review of the pertinent literature, we are taking what we hope is an intermediate, albeit somewhat conservative, approach in the *Illustrated Flora of East Texas*. Our goal is to provide maximum information while retaining a practical and utilitarian framework.

Cladistic side

On the ***cladistic/phylogenetic systematics side*** of the argument, a number of our decisions have been influenced by the desire to increase information content and accuracy:

1) We are attempting to provide detailed information on the known evolutionary relationships of various plant groups. A tremendous amount of new information has become available recently (primarily, but not exclusively, as a result of the application of Hennigian principles to molecular data), and as much of this as possible is being included and references provided. For example, in the draft family synopsis of the Lemnaceae (duckweed family), we (Diggs et al. in prep.) have included the following statement.

> Lemnaceae are tiny and extremely reduced morphologically making it difficult in the past to determine the phylogenetic relationships of the family. Kvacek (1995) suggested that the fossil genus *Limnobiophyllum* is a fossil link between Araceae and Lemnaceae, and Stockey et al. (1997), using a cladistic approach and material of *Limnobiophyllum*, concluded that *Pistia* (a free-floating member of the Araceae) plus *Limnobiophylum* and Lemnaceae form a monophyletic group. Indeed, this linkage of Lemnaceae to Araceae goes back over 175 years (Hooker and Brown in Smith 1824; see discussion in Les et al. 2002). In addition, molecular studies have linked *Lemna* with *Pistia* (Araceae) (Duvall et al. 1993b) or more recently to Araceae subfamily Aroideae (French et al. 1995). In fact, the Lemnaceae is considered by many authorities to have evolved from within Araceae (JACK-IN-THE-PULPIT family) by extreme reduction, and it has been suggested that Lemnaceae be reduced to a subgroup within a more inclusive Araceae (Mayo et al. 1995, 1997, 1998; Stockey et al. 1997). From a cladistic standpoint, Araceae (without Lemnaceae) are paraphyletic and inappropriate for formal recognition.
>
> Even where very preliminary information is available, we have included and referenced it in an attempt to foster a better understanding of evolutionary relationships.

2) Also on the cladistic side (and on that of most other plant taxonomists), we are rejecting all clearly polyphyletic groups, even when these are practical and of long-term or wide usage. The best example of this is the Liliaceae (lily family) sensu lato (in the broad sense). Extensive morphological and molecular data

now clearly indicate that as broadly conceived, this family is a heterogeneous mixture based on superficial similarities in flower structure (e.g., Fay et al. 2000; Rudall et al. 2000b). In fact, recent molecular studies (e.g., Chase et al. 2000) have shown that species traditionally treated in the Liliaceae should be placed in at least four different *orders*. As a result, we are recognizing 14 separate families (all previously treated in the Liliaceae) for East Texas. However, from the standpoint of usability, we are incorporating a table in the Liliaceae (narrow sense) family treatment that clearly indicates in what family the genera formerly included in the Liliaceae (broad sense) are now placed. Furthermore, in the main key to families, as many as possible of the liliaceous (broad sense) families will be clustered together and clearly indicated. Likewise, the genus *Nolina* (bear-grass) and its relatives, which have often been included in the Agavaceae (agave family), are now known to not be closely related to that family and we are excluding them. In a draft family synopsis we (Diggs et al. in prep.) say,

> In the past, taxa included here in the Nolinaceae were sometimes included in a broadly conceived Liliaceae (e.g., Kartez 1999) or often in the Agavaceae (e.g., Correll & Johnston 1970; Diggs et al. 1999; Verhoek & Hess 2002 following Cronquist 1988) based on certain morphological similarities. However, recent evidence suggests that the Agavaceae and Nolinaceae are not closely related and should be recognized separately (Dahlgren et al. 1985; Eguiarte et al. 1994; Bogler & Simpson 1995, 1996; Kubitzki et al. 1998; Chase et al. 2000). Molecular evidence indicates that Nolinaceae is closely related to Convallariaceae and Ruscaceae, and some studies (e.g., Chase et al. 1995a; Chase et al. 2000; Fay et al. 2000) have suggested that the Nolinaceae should be included in the Convallariaceae. Following such preliminary studies, Judd et al. (1999), lumped the Nolinaceae into the Convallariaceae. On the other hand, Rudall et al. (2000a) and Judd et al. (2002) included the Nolinaceae in a broadly interpreted Ruscaceae. However, there has been disagreement in molecular analyses of the family and its presumed relatives (e.g., Rudall et al. 2000a; Yamashita & Tamura 2000). Since the Nolinaceae appears to be a well-defined monophyletic group (Bogler & Simpson 1995, 1996), and until the phylogeny of this complex is clarified and the nomenclature more stable, we are recognizing it as a distinct family.

Hopefully, such explanations will allow users to see that the understanding of plant relationships is still changing and improving. With such insights, we hope that non-taxonomists will be less resistant to *needed* nomenclatural changes.

3) Again on the cladistic side, when *established useful family concepts are not excessively distorted*, we are lumping small groups whose relationships have now become clear. For example, the monogeneric family Najadaceae (the genus *Najas*) is now known to be derived from within the Hydrocharitaceae (R. Haynes, pers. comm.; Shaffer-Fehre 1991; Les et al. 1993; Les & Haynes 1995; Haynes et al. 1998; Haynes 2000). Including *Najas* in the Hydrocharitaceae more accurately reflects evolutionary history, yet does not substantially modify the concept of the Hydrocharitaceae nor distort it beyond the bounds of usability. We are therefore following several recent floristic treatments (e.g., Thorne 1993; Diggs et al. 1999) in lumping *Najas* into the Hydrocharitaceae.

4) Our families, genera, and species are arranged alphabetically. Some very traditional taxonomists want "related" families placed together in the linear sequence physically required of a book. However, the complex branching pattern of evolution does not follow such a linear form and thus any linear sequence is highly arbitrary and distorts actual evolutionary relationships. An easy to use alphabetical sequence, while not reflecting relationships, at least does not distort them. In addition, an alphabetical arrangement allows quick and easy access to the material so arranged.

Evolutionary taxonomy side

On the ***evolutionary taxonomy*** side of the argument, a number of our decisions have been influenced by both practical and/or theoretical considerations:

1) We are continuing to use the system of nomenclature that has developed over the past 250 years (International Code of Botanical Nomenclature—Greuter et al. 2000). This (particularly the use of binomials) is an eminently useable system that addresses the needs of an audience far broader than the taxonomic community ("the consumers of botanical information"—T. Barkley, pers. comm.; Barkley 2000). We believe that eliminating it would cause great confusion among the many non-taxonomists who use plant names. In fact, it is likely that if plant taxonomy went to a specialized non-binomial, clade-based system, some separate static system of "accepted plant names" would be developed by the horticultural community or other user groups (e.g. agricultural, ecological, conservation). Such a move would both marginalize plant taxonomy and ultimately result in a nomenclatural system with much less information content than at present. This practical consideration may well be one of the most important reasons for maintaining our current system of classification and nomenclature. In fact, even those developing the PhyloCode (2002), the nomenclatural system being produced by phylogenetic systematists, have not yet come to grips with what to do regarding the naming of "species." It is interesting to note that Stevens (2002) has argued that binomials have been used so long and so widely (across many cultures and in many contexts) because they are inherent in human perception—in other words, having such a two word nomenclature system may be built into the organization of our nervous systems. Nixon and Carpenter (2000) in a similar vein suggested that, "Our natural form of communication (even as evidenced by the common human binomial system of naming ourselves) is clarified by the use of ranks and binomials." Likewise, anthropologist Brent Berlin (1992) noted that there are widespread cross-cultural regularities in the classification and naming of living organisms by people in traditional, nonliterate societies—these systems more closely approximate Linnaean binomials than clade-based nomenclature. Further, when the diverse users of a flora are considered, a radical shift in the system of nomenclature used seems particularly ill-advised, especially at a time when the public needs to be brought closer

to, rather than pushed further away from, an appreciation and understanding of botany. Indeed, these ideas raise questions about a "dominant" code (T. Barkley, pers. comm.) of nomenclature. Undoubtedly, a P-code will be used, but it remains to be seen how widely such a system will be accepted by the diverse users of botanical information—the L-code may continue to be used as the primary or dominant code by the user community long after a functioning P-code (presumably the PhyloCode) is finalized.

2) While many taxonomists have long realized that the traditional ranked categories (e.g., family, genus) are not used consistently and are simply human constructs (unlike species which have some biological reality), they do, however, provide important mental pegboards or mnemonic devices to allow a practical way to arrange our thinking. As Stevens (2002) has said, "Hierarchical naming systems pervade our whole language and thought." We are thus retaining a traditional ranked hierarchical system of classification (in other words, groups of organisms arranged in a hierarchy of categories—genus, family, etc.). While there are evident problems with such a system, the "cornucopia of categories" (Colless 1977) resulting from a cladistic approach does not seem to be an overall improvement in communication, and in fact seems less suited to human mental abilities. In a clade-based system, a particular species is in dozens if not hundreds of successively larger clades—how does one choose which of these clades to use in real-world situations (e.g., floras, textbooks). This point seems to be particularly crucial to writers of floras—unless all genera or even species are to be arranged alphabetically, which would be extremely user unfriendly, some higher level organization must be agreed upon. It seems clear that some *arbitrary convention* to replace the convenience of currently used families would have to be developed for use in a completely clade-based system—in other words, someone would arbitrarily have to decide which of the innumerable clades to recognize. Otherwise, there would be no practical way to group species in floras (now grouped in families and then genera) and no groups to refer consistently to when comparing different floras, etc. In fact, for practical reasons many cladists still use traditional ranks such as family and genus (e.g., Judd et al. 2002), despite stating that "one logical step would be to eliminate ranks altogether." Currently, only three words (e.g., Fagaceae, *Quercus alba*) are needed to communicate a great deal of information about a particular organism and these are used consistently by botanists. In our flora for example, genera are being arranged alphabetically under alphabetically arranged families. Does this mean that these families are viewed as somehow being equivalent?—of course not. They are, however, effective means of conveying information. As stressed by Stevens (2002), if we are going to be able to effectively communicate, "...conventions will be needed. To paraphrase Linnaeus, without convention, all is chaos." As Stevens (2002) so clearly pointed out, even early botanists (e.g., Linnaeus, Bentham) were quite concerned about effective communication.

What would be the system of organization under a system of unranked clades and how could consistency (and thus communication, information retrieval, comparability, etc.) be assured in different floras, textbooks, etc.? Ultimately, some arbitrary convention (not unlike our current family system) would seem to be required. To be fair, it should be noted that the PhyloCode (2002) is not yet complete and nomenclatural conventions will have to be worked out in the future. Whatever system is ultimately settled upon, the conventions used should take into consideration a variety of factors (e.g., accuracy of information conveyed, effectiveness of communication to a broad range of users, compatibility with the organization of the human nervous system, etc.).

3) Furthermore, we are *not* rejecting paraphyletic groups (e.g., families). For example, it now seems clear (as stated above) that the Lemnaceae (duckweed family) arose from within the Araceae (arum family), which is thus paraphyletic. It seems more reasonable to us to continue to recognize both easily distinguishable families, and unambiguously state in discussions associated with both what the evolutionary relationships between the two are. Clearly the duckweeds have undergone extraordinary morphological and genetic divergence in adapting to an aquatic environment—so much so that the question of their ancestry was only recently resolved. To lump the two families and have their genera mingled in a taxonomic treatment accomplishes little and seems to result in a loss of clarity and evolutionary information. As currently recognized, both families have significant morphological coherence and thus recognition and predictive value—together, they are a mixture of two very different types of morphology. A similar example can be seen with the Cactaceae. That family has recently been shown to have evolved from within the Portulacaceae (Hershkovitz & Zimmer 1997; Applequist & Wallace 2001). Lumping the two families in a floristic treatment would only obscure the many differences between these useful and easily recognizable groups. This reflects the view of evolutionary taxonomists, who while attempting to have a classification system based on evolutionary relationships, also try to reflect the amount of evolutionary change undergone by groups (Fig. 2). Evolutionary taxonomists argue that classification is "... more than just branching patterns of evolution" (Stuessy 1997). Brummitt (2002) stressed Mayr's (1995) observation that Darwin indicated evolutionary classification depends on two factors, descent and modification, not descent alone. To use a well known animal example, because birds are so different from other vertebrates (e.g., fly, have feathers, etc.), they are treated as a different class of vertebrate even though they are known to have evolved from within the paraphyletic class known as reptiles (Fig. 3). From the practical standpoint, there are numerous other useful and evolutionary meaningful paraphyletic groups. Examples include the Araceae, Capparaceae, Clusiaceae, Moraceae, Portulacaceae, etc. Radically changing their circumscription (e.g.,

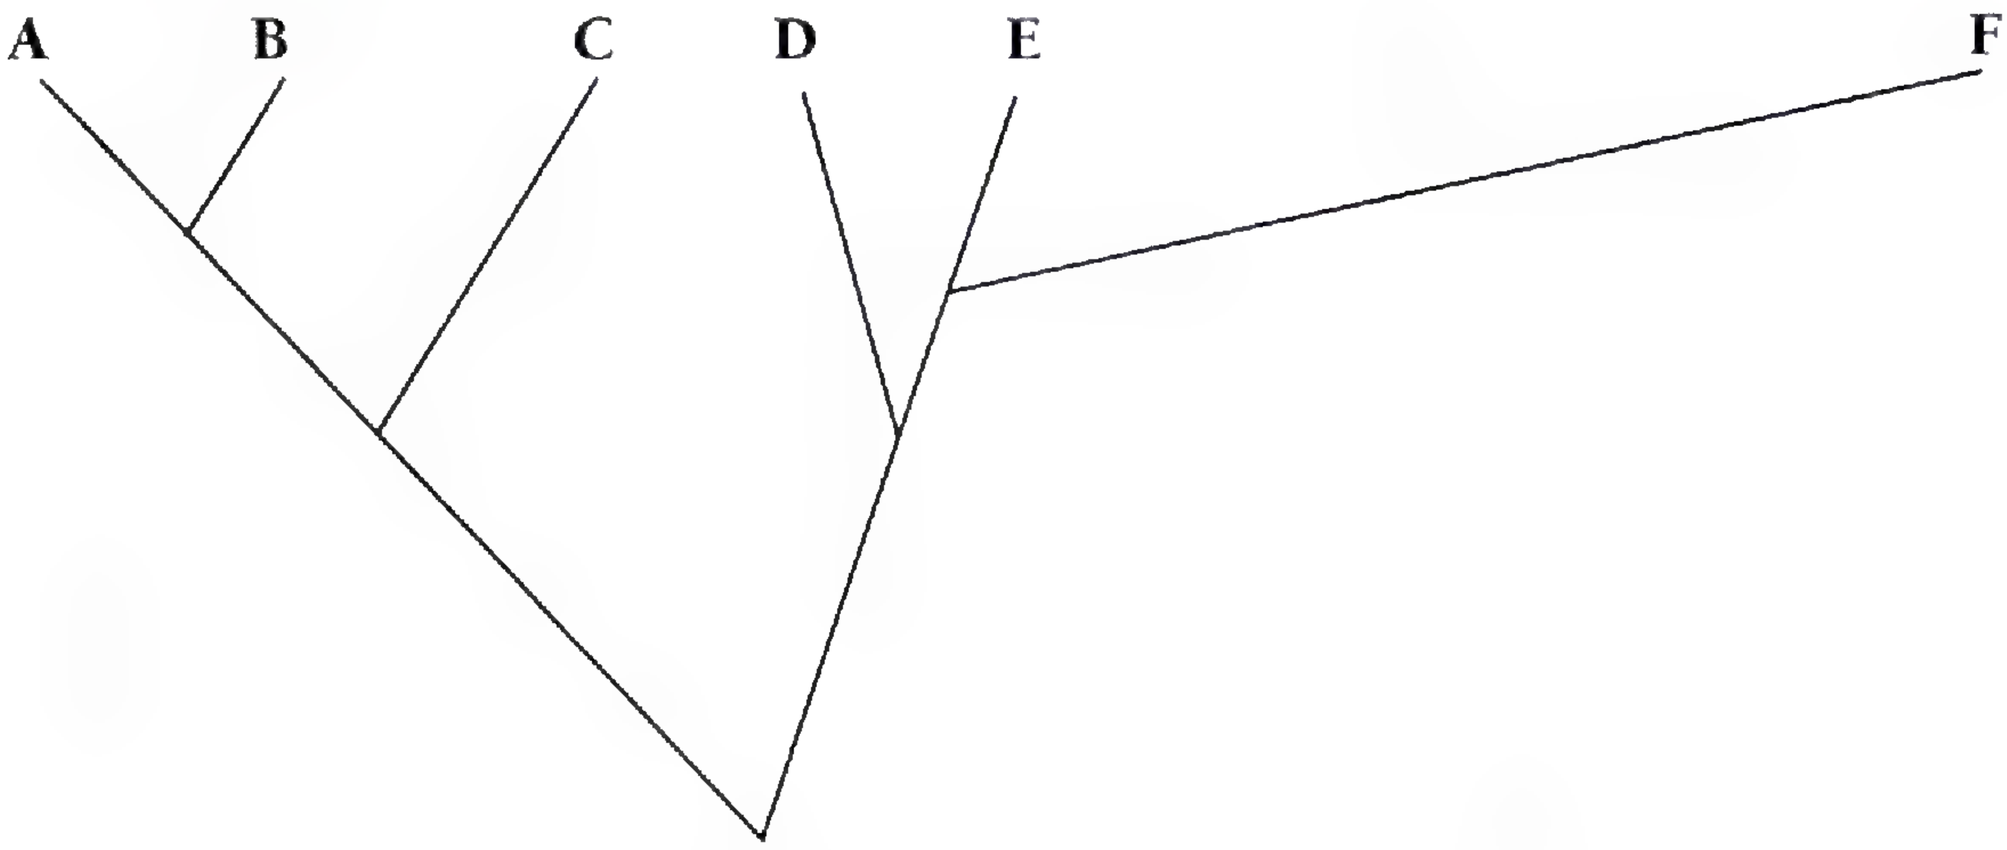

FIG. 2. Phenetic distance diagram; horizontal distance between species indicates phenetic difference. Note that species F, while most closely related phylogenetically to species E, is quite different in terms of phenetics (from Diggs et al. 1999).

adding Cactaceae to Portulacaceae, Podostemaceae to Clusiaceae, or Lemnaceae to Araceae) results in confusion and a loss of information. This risk of confusion is particularly problematic if the same name is variously used to include quite different sets of species (e.g., Portulacaceae in the narrow sense or in the broad sense including Cactaceae). The risk of a nomenclatural "train wreck" (Stevens 2002) is a troubling possibility. Very different uses of the same names "will be decidedly unsettling for society and perhaps damaging for our discipline" (Stevens 2002). Unfortunately, taxonomists have long had the reputation of changing names without regard for the implications, and great care needs to be taken to avoid non-essential changes. Grant (2001b) stressed that splitting up paraphyletic groups (e.g., genera such as *Gilia* or *Linanthus*) obscures relationships and multiplies generic names where one would be sufficient. Does the splitting up of recognizable and well known genera really best serve the broad constituency of users (keeping in mind that professional taxonomists are a small fraction of the users of scientific names)? Changes in classification at the generic level are particularly significant because of the resulting changes in scientific names.

Further, Brummitt (1997, 2002) has argued that paraphyletic groups are inevitable. He goes on to say that any genus "must have originated from a species in another genus, which is thus paraphyletic." The same logic applies at other levels in the hierarchy, including the species level. Species, unlike other categories in our hierarchical system of classification, have some objective biological reality (e.g., Rieseberg & Burke 2001). However, if a small subgroup of a species differentiates or specializes enough to become a distinct entity, the original species is thus rendered paraphyletic even though it may still be a reproductively isolated or otherwise distinct group. Species can be excluded by defi-

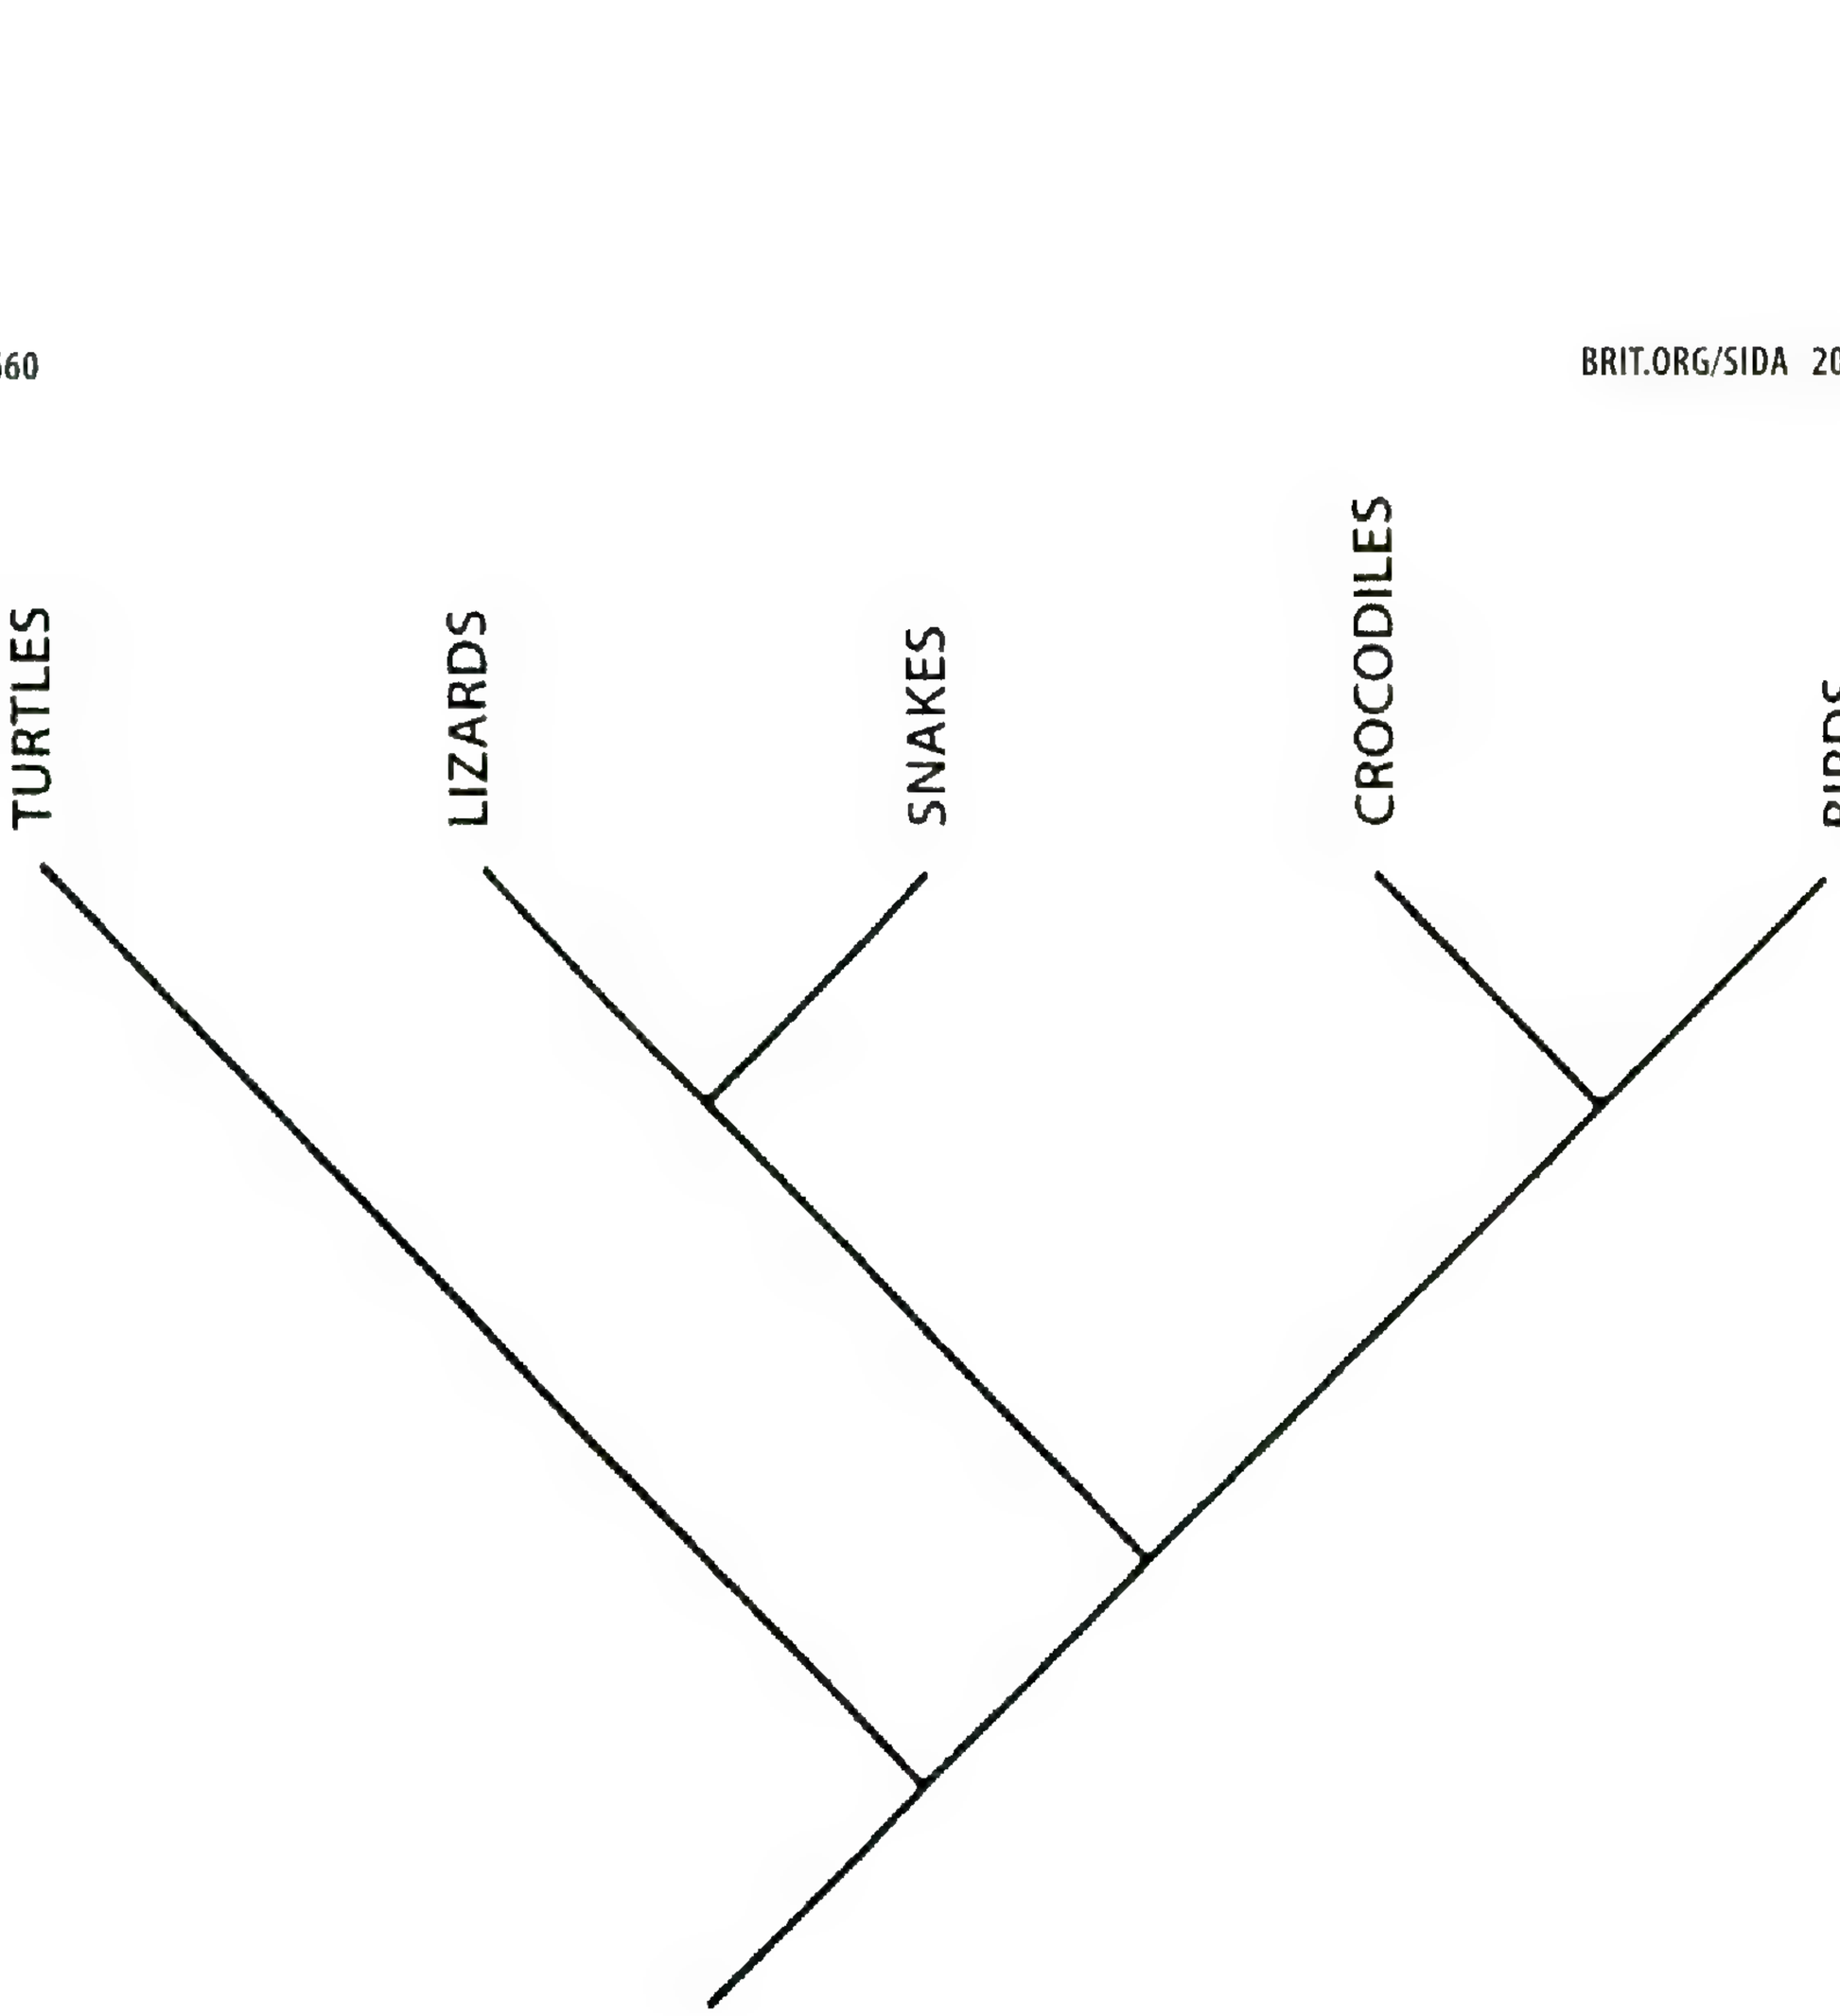

FIG. 3. Dendrogram showing relationships of some vertebrate groups. Note the paraphyletic nature of the "Reptilia" (from Diggs et al. 1999).

nition as not being paraphyletic (Sanders & Judd 2000) as done by some cladists, but in reality, by standard use of the term, they are often paraphyletic (see Mishler 1999, 2000). As Brummitt (2002) noted, the abandonment of species "seems to me to be a necessary logical extension to abandoning all other ranks" (Brummitt 2002). Further, Rieseberg and Brouillet (1994) argued that based on the modes of speciation known to occur in plants, paraphyletic species are common. In the words of Sosef (1997), "When a single diaspore [e.g., seed] accidentally reaches an isolated habitat and its offspring gradually changes (a linear process) and produces a new species, nothing 'happens' to the parent species." The new species thus renders the unchanged previous species paraphyletic. Ultimately, paraphyly thus seems unavoidable. An excellent example of this problem can be seen in the California tarweeds (genus *Raillardiopsis*) and the Hawaiian silverswords (genera *Argyroxiphium*, *Dubautia*, and *Wilkesia*) in the Asteraceae. It now appears (Baldwin et al. 1991) that *Raillardiopsis* (which had previously been considered a "phenotypically conservative genus of two nearly identical species") was the "ancestral genetic source" for the endemic and extremely morphologically divergent Hawaiian silversword alliance. *Raillardiopsis*

is thus clearly paraphyletic, even though its two species are "nearly identical." When taken to its logical extreme, the failure to recognize paraphyletic groups would require the rejection of many useful groups (e.g. tarweeds). In animal taxonomy, this means the rejection not just of the group Reptilia (which gave rise to birds), but also Amphibia (which gave rise to reptiles), and Pices (which gave rise to Amphibia). Anyone understanding the basics of evolution realizes that fishes gave rise to amphibians. Does that make the class Pices any less useful a concept? Likewise, the capers (Capparaceae) gave rise to the mustards (Brassicaceae)—both families are still useful and meaningful concepts that can help us understand evolution and organize our thinking. Cronquist (1987) stressed the need for paraphyletic groups, indicating that both evolutionary relationships and the amount of evolutionary divergence among taxa is important. He said that "the reasons for this belief are rooted in the historical and continuing function of taxonomy as a general-purpose system of classification that can be used by all who are concerned with similarities and differences among organisms"—in other words, diverse users of botanical information. While we believe it is critically important for paraphyletic groups to be clearly distinguished from monophyletic groups, the usefulness of paraphyletic taxa (e.g., effective communication, recognition of divergence, morphological similarities, etc.) seems to be an important consideration.

4) Additionally, there are many cases where it is not yet clear what should be done cladistically. Thus in these cases we are retaining traditional usage until more information is available. For example, it is very likely that such families as the Lamiaceae (mint family), Verbenaceae (vervain family), and Scrophulariaceae (figwort family), as traditionally conceived, will have to be changed substantially. However, if we had to finalize treatments of these families today for our flora (which fortunately does not have to happen since these dicot groups will be treated in Vol. 2 of the *Illustrated Flora of East Texas* to be published in 2008), we would probably follow the traditional circumscriptions and accompany them with substantial explanations. The reason is that adequate research has not yet been done on these groups to provide answers that are definitive enough to warrant major changes in classification and nomenclature. In the words of Berry (2002), "it will be some time before our sampling of organisms at the molecular level will be good enough that we can get an adequate idea of relationships across the entire span of biological diversity." Further, it does not seem desirable that classification (and nomenclature) should change with every new cladistic discovery—do we really want nomenclature that "depend[s] rigidly on the particular cladogram favoured at the moment" (Benton 2000)? Indeed, Sanders and Judd (2000) discuss the criteria for accepting revised classifications. Before making major nomenclatural changes, there should be substantial taxonomic evidence, to avoid more of the numerous ex-

amples where initial cladistic hypotheses have proven to be wrong. For example, in the past, some authorities have suggested major changes in family circumscription based on preliminary information (e.g., lumping the Apiaceae (carrot) and Araliaceae (aralia) families—Judd et al. 1994; Zomlefer 1994), only to have more detailed work (Plunkett et al. 1996 [1997]) clarify the situation and indicate that the families should be maintained in nearly their traditional circumscriptions. According to Plunkett et al. (1996 [1997]), the approach taken by Judd et al. (1994) "hides rather than resolves the difficulties in Apiales." Likewise, Downie et al. (2001) did not lump the Araliaceae. Another example is the genus *Trillium*—it has often been treated in the Liliaceae in the broad sense (e.g., Correll & Johnston 1970) or based on early phylogenetic analyses in the Trilliaceae (e.g., Zomlefer 1996; Tamura 1998d; Judd et al. 1999). However, more recent phylogenetic analyses (e.g., Rudall et al. 2000b) indicate that it belongs in the Melanthiaceae. There are also instances where the best and most recent evidence conflicts. A number of molecular studies have suggested that Burmanniaceae (previously considered to be related to Orchidaceae) is in the Dioscoreales and thus more closely related to such families as Dioscoreaceae and Nartheciaceae than to Orchidaceae (which is in order Asparagales) (Chase et al. 1995b; Caddick et al. 2000, 2002; Chase et al. 2000). In contrast, other recent molecular research including more genera than previously sampled, indicates that the family (minus the superficially similar but unrelated genus *Corsia*) plus Thismiaceae is in a relatively isolated position "not closely aligned with either the Dioscoreales or the Orchidaceae" (Neyland 2002). Writers of floras are thus faced with having to judge which cladistic studies to accept and when there is enough evidence to use the new discoveries in floristic treatments. At the same time, writers of floras must avoid the instability and confusion that would result from changing classification and nomenclature with every new study published. Furthermore, recent tests (Grant 2001a) of the accuracy of cladograms when compared with known phylogenies (e.g., domesticated and experimental plant groups with known pedigrees), raises questions about bas ing classification and nomenclature solely on cladistic methodology. Grant (2001a) demonstrated that the "cladograms of the four plant groups [tested] all differ in significant details from the known pedigrees." Particularly important is his following point: "It is also recognized by all evolutionary systematists and most cladists that reconstructed phylogenies are unverified hypotheses. Some cladists, however, seem to regard their cladograms as real phylogenies." He (Grant 2001b) also indicated that "Molecular cladograms are very good indicators, but we should not lose sight of the fact that the groupings they indicate are molecular clades, not taxa." A recent paper by Rydin et al. (2002) on Gnetales is particularly telling in this regard. Depending on which molecular analysis was used, the phyogenetic position of Gnetales differed significantly. According to Rydin et al. (2002), "It is becoming increasingly clear that the understanding of

molecular evolution and its impact on phylogenetic studies is poor. Nucleotide data alone might not be able to solve phylogeny and evolution of this ancient, once rapidly evolving group, and attempts to do so should include a comprehensive taxon sampling and several genes. Molecular data can definitely be misleading, and by ignoring that, science will not progress." From the standpoint of a floristician, while recognizing the obviously valuable contributions made by molecular systematists and cladists, careful thought must be given to avoid accepting major, sometimes disruptive (and occasionally incorrect) classification and nomenclature changes prematurely.

5) Finally, we are *not* accepting some aspects of phylogenetic classification (particularly strict monophyly—sometimes and perhaps better referred to as holophyly) since there are **serious *theoretical* problems** that make it at least partially incompatible with the reality of the natural world (however, see Freudenstein 1998 for an opposing viewpoint). Brummitt (2002, pers. comm.) has stressed the importance of these theoretical considerations, and in terms of the implications for floristics, these are perhaps as important as or even more important than the purely practical considerations. **One of the most serious problems** (referred to as a "fatal one" by Stuessy 1997) is that cladistics uses only branching information in phylogeny. In contrast, evolution is a complex process including such phenomena as asexual reproduction, progenitor-derivative species pairs, lateral gene transfer, polyploidy, and reticulate evolution (the latter resulting from hybridization between species and subsequent speciation in the offspring) (Rieseberg & Brouillet 1994; Sosef 1997; Stuessy 1997). These complexities cannot be accommodated in a classification system requiring only strict monophyletic groups and dichotomous branching. In the words of Stuessy (1997), "... simple dichotomous branching diagrams cannot do justice to the real world of higher plant phylogeny." An excellent example can be seen in the reticulate evolution of the fern genus *Asplenium* as discussed in the classic paper by Wagner (1954). In this case, the hybrids between two parental species become reproductively isolated (and thus constitute a separate new species). Another example can be seen in the Triticeae (*Elymus*, *Hordeum*, *Secale*, *Triticum*, and their relatives; Poaceae). This tribe has an extremely complex evolutionary history involving hybridization, polyploidy, and reticulate evolution (Barkworth 2000; Mason-Gamer & Kellogg 2000). Both of these examples emphasize that some evolutionary relationships are simply impossible to reflect accurately in a system requiring strict monophyly and only dichotomous branching. As Brummitt (1997) indicated, "No matter how much we may long for all our taxa to be monophyletic, if we are considering the whole evolutionary process, it is a logical impossibility." Another way of stating the problem is that simple branching patterns are unable to reveal all significant dimensions of phylogeny (Stuessy 1997).

A second theoretical problem with strict monophyly is that "only the tips

of evolutionary branches can be classified" (Meacham & Duncan 1987) in such a system, and "Species at the interior nodes of the tree must remain unclassified." Not including ancestral species, some of which may well have survived to the present, seems untenable. However, including them leads cladists insisting on strict monophyly (holophyly) down the path of the "telescoping" or "snowball" effect (also known as the "taxonomic black hole") where more and more organisms have to be included in a futile attempt to reach the mythical (and impossible to reach) strictly monophyletic group (Sosef 1997; Brummitt 2002; but see Stevens 1998 and Sanders and Judd 2000 for a different viewpoint). Ultimately, the whole Tree of Life (2002) would have to be included in one giant monophyletic group. In the words of Brummitt (2002), "If we are classifying all the products of evolution, i.e., the whole evolutionary tree of life, every taxon we recognise must make another taxon paraphyletic. That is a simple logical fact. It is obvious to most people that if you cannot have paraphyletic taxa, you cannot have a classification showing anything beyond one original species, genus, family, etc." He points out that *if ranks are to be used* (which seems essential from the standpoint of practicality), paraphyly is unavoidable (Webster 2002 referred to this as "Brummitt's Paradox"). Thus, there is a "fundamental incompatibility between Linnaean classification and a system of monophyletic taxa, or clades" (Brummitt 2002). In other words, including all extinct species would mean that no monophyletic groups (or only one huge one) could be recognized. From this standpoint, "extinction [and our lack of knowledge about extinct species] is the saving grace of phylogenetic systematics" (T. Barkley, pers. comm.). *Importantly, "Brummitt's Paradox" means that simply converting cladograms into Linnaean nomenclature is impossible.* Ultimately, this means that in order to have strict monophyly, phylogenetic systematists must develop a rankless system such as the PhyloCode. While some modern phylogenetic systematists continue to recognize families for practical/pedagogical reasons (e.g., Judd et al. 2002), if carried to its logical conclusions, cladistics would mean that these families (particularly if extinct taxa are considered) would be telescoped into ever larger groups.

A third related theoretical problem demonstrates that a strictly monophyletic system *using Linnaean ranks* is incompatible with evolution (Brummitt, pers. comm.). As Brummitt (2002) indicated, "...I think we all understand that evolution has continually been throwing up greater and greater diversification of plants and animals, and yet the cladistic idea of classification requires that all successive descendant groups have to have lower and lower taxonomic rank. Something which has evolved from within one genus must have a rank lower than genus. Is this view of taxonomy really a sensible idea? How can we apply lower and lower ranks when evolution is producing wider and wider variation? In a clade-based classification you can go on extending your clades as evolution progresses *ad infinitum*, but if you are using a traditional taxon-based classification you can't keep on giving them lower ranks." Without paraphyly, the use

of ranks in a monophyletic system therefore is simply not workable (hence the advocacy of a rankless Phylocode by some cladists). This problem seems to clearly indicate the logical impossibility of a rank-based, strictly monophyletic system.

A fourth theoretical problem is that our current methodology of obtaining phylogenetic trees is based on a series of assumptions and indirect evidence (e.g., character polarity, choice of outgroups, etc.) (Stuessy 1997), as well as mathematical algorithms (e.g., parsimony) that result in trees that "are almost always inappropriate as phylogenetic hypotheses in any but the most general sense" (Zander 1998). Zander (1999) further indicated that, "Selecting one phylogenetic hypothesis of several or many reasonable alternatives as 'best' and presenting it as a reconstruction cannot provide a probabilistic or dependable basis for action." Is the pursuit of the shortest tree the ultimate goal of systematics? The answer seems clearly to be no, since there are well-documented nonparsimonious pathways of evolution (Stussey 1997). Thus, totally tying classification and nomenclature to such a system seems problematic. A final concern that follows from this is that the current classification and nomenclature system is independent of a particular approach. As stated by Jørgensen (2000), "A problem inherent with the system proposed by Cantino & de Queiroz (2000) [PhyloCode] is that their nomenclature depends upon a specific way of taxonomic thinking, i.e., nomenclature is ruled by the taxonomic system. This probably reflects that they are as convinced of their taxonomic system as Linnaeus was of his, but, please, at least consider the possibility that new taxonomies may evolve. Should we then change the nomenclatural system each time?"

FURTHER IDEAS AND DISCUSSION

The following ideas and quotes seem to provide substantial insight into the controversy. Because of both philosophical and practical implementation problems, Brummitt (1997) pointed out that while the controversy should be debated, it seems unlikely that "Linnaean classification" will soon be abandoned. Brummitt (1997) suggested that both a "Linnaean classification" system and a clade-based phylogeny are desirable because they have different functions. He argued that both be allowed to exist side by side and that the nomenclature of the two should be easily recognized as different (Brummitt 1997). In summarizing his ideas he stated, "... we should not follow traditional practices just because they are traditional, but neither should we adopt new ideas just because they are new. We need to understand the possibilities and appreciate the different objectives and functions of the different options. In the meantime, it seems to me and to many others that the compromise of maintaining Linnaean classification but trying to eliminate paraphyletic taxa is nonsensical and should be abandoned before any more damage is done to existing classifications and nomenclature." Lidén et al. (1997) indicated, "If applied consistently, Phyllis [= Lidén et al. term for

nomenclatural application of cladistics] will cause confusion and loss of information content and mnemonic devices, without any substantial scientific or practical advantage. ... any attempts to make Phyllis formal would be disastrous. We can find no conclusive, valid arguments against keeping the body of our current system intact." Sosef (1997) stressed the same idea saying, "The quest for monophyletic taxa and the splitting of former paraphyletic ones should halt immediately, as they unnecessarily deteriorate classifications which will often prove to be valid."

An interesting point was also made by Stuessy (1997) when he said, "... in this urgent climate of seeking to inventory the world's biota (Anonymous 1994), and requesting funds from the rest of society to do so, it would be highly counterproductive to simultaneously recommend whole-scale change of names of organisms for any reason." In the words of Paul Ehrlich (2002), who was stressing the need for taxonomists to focus on conservation activities, "Others spend their time trying to replace the functional Linnaean system for general communication about organisms with one based on estimates of times of phylogenetic divergence; a sillier enterprise is hard to imagine. ..."

While recognizing it is not perfect, Wheeler (2001, and quoted in Forey 2002) noted that Linnaean nomenclature "is stable enough to say what we know, flexible enough to accommodate what we learn; independent of specific theory, yet reflective of known empirical data; compatible with phylogenetic theory, but not a slave to it; particular enough for precise communication, general enough to reflect refuted hypotheses."

While strongly supporting a cladistic system, Welzen (1998) also noted that a compromise between the two types of classification is impossible. He also understood that because of practical reasons it is impossible to abandon Linnaean classification "... because too few cladograms are available to replace the existing system with a complete phylogenetic classification. Moreover, quite a few cladograms will not be that trustworthy due to the many homoplasies [result of convergent evolution] that have evolved; they will therefore, provide an unstable classification at best." Welzen (1997) went on to say, "I think, therefore, that the best solution is to choose the second option that Brummitt (1997) provides in his paper, namely, 'retaining Linnaean classification, with paraphyletic taxa, but developing alongside it an independent clade-based dichotomous system with its own separate nomenclature.'" Recently, Brummitt (2002) indicated that, "If people insist on monophyly, the clade-based PhyloCode will provide a logical solution. If they want to use the traditional ranks, the answer is very simple: recognise paraphyletic taxa." Brummitt (1997) made what seems to be a very reasonable suggestion: "Our task is to produce an optimally practical classification, and indicate which genera have evolved from which other genera, which families from which other families, and so on."

Indeed, recently it seems to have become clearer that two separate systems

will be necessary (Cantino 2000; Brummitt 2002). Years ago, Woodger (1952, and quoted by Brummitt 2002) concluded that, "The taxonomic system and the evolutionary phylogenetic scheme are quite different things doing quite different jobs, and only confusion will arise from identifying or mixing them." Similarly, it has been argued more recently that to attempt to apply cladistic rules (e.g., elimination of all paraphyletic groups) on the traditional Linnaean system is a logical impossibility (Brummitt 2002) or at minimum highly detrimental (see discussion above). According to Brummitt (2002), "I believe there is no middle way which will combine universal monophyly with formal Linnaean ranks, and this is now increasingly being realized." However, while it is becoming more widely recognized that the two systems are incompatible (but see Stevens 2002), there is clearly value in having a strictly phylogenetic system of classification. It would thus seem that the most reasonable course for the near term would be to allow the concurrent existence of two separate systems—Linnaean and phylogenetic. The Linnaean system would retain hierarchical ranks, binomial nomenclature, and paraphyletic taxa, while the phylogenetic system (e.g., PhyloCode) would recognize monophyletic clades (but have neither ranks, binomial nomenclature, nor paraphyletic taxa, and possibly not even species). Because of practical considerations, the Linnaean system will probably continue to be the "dominant" system used (nearly exclusively) to communicate information about plants by scientists outside of systematics (e.g., ecologists, horticulturalists, conservationists, etc.) and by the general public. The phylogenetic system will make contributions among systematists and others attempting to further understand the evolutionary history of life on earth.

SUMMARY

Where does all this leave the writers of floras? We would argue that a modified traditional system (binomial nomenclature, ranked hierarchies—L-code) be used in floras (allowing paraphyletic groups but eliminating all polyphyletic groups despite some nomenclatural instability), and that these floras (and this is a critical point) should also incorporate newly discovered information on phylogenetic relationships. In order to facilitate as complete an understanding of plant evolution as possible, this new information should be briefly discussed/summarized in appropriate family and generic treatments even if too preliminary, tentative, or inappropriate for nomenclatural change (e.g., that would result in the loss of meaningful paraphyletic taxa).

In summary, in the *Illustrated Flora of East Texa*, we are thus attempting to reflect some of the many contributions and insights from "phylogenetic systematics," while retaining the practical benefits of an "evolutionary taxonomy" framework. As indicated above, no system will be a totally accurate representation of the complexity of the evolutionary history of life on earth. We believe, however, that by reflecting both evolutionary relationships and the amount of

evolutionary change, while maintaining a flexible approach punctuated with practicality, that a classification and nomenclature system useful to a broad audience, including non-taxonomists, can be achieved. We agree fully with Berry (2002) who said, "there are many users of scientific names—myself included—who are interested in both floristic inventories and evolutionary relationships, and nomenclatural stability as well." Ultimately, writers of floras need to present information accurately (i.e., reflect evolution) *and* in ways that can be used—that allow effective communication and identification, promote information retrieval, and are useful comparatively (e.g., in conservation assessments, to evaluate levels of endemism, to determine levels of introduced exotics, to form the basis of biogeographical studies, to do ecological surveys). All of these uses depend on having a unit (species) that can be meaningfully compared and classification and nomenclatural systems that allows effective communication. Taxonomic botanists are thus faced with the challenge of working toward systems that make such communication and comparisons possible (Berry 2002). Writers of floras, in particular, as the translators of botanical information to a wider audience, are uniquely faced with a difficult task—to apply the evolving concepts of modern systematic botany to floristics in a way that allows modern floras to be both accurate and useful. It is hoped that this article will stimulate discussion among those involved in or interested in the writing of floras.

ACKNOWLEDGMENTS

We would like to thank Ted Barkley for helpful discussions and comments. We also thank Richard Brummitt, Verne Grant, Roger Sanders, and Rudolf Schmid for their extremely constructive reviews which improved this paper.

ABSTRACT

Extreme deforestation and overuse of resources have devastated El Salvador's natural environment while continued population pressure underscores the need for the few remaining natural areas to be studied and preserved. The 150-ha Monumento Nacional Laguna de Alegría is located inside the crater of Tecapa Volcano in southeastern El Salvador and includes both primary and disturbed subtropical forest, steep and rocky crater walls, and a sulfuric lake in the basin. The flora of the Laguna de Alegría was surveyed from December 1998 to November 1999 and results of this survey were combined with reports from other collectors and published reports to compile a list of 447 specific and 2 hybrid taxa representing 106 families. The taxa are cataloged in an annotated list that includes collection number and herbarium of deposit. Exotic species are designated. *Trigonospermum annum* McVaugh & Lask. is a new report for El Salvador.

RESUMEN

La deforestación extrema y la sobreexplotación de recursos han devastado la naturaleza de El Salvador, mientras la incesante presión demográfica subraya la necesidad de estudiar y preservar las restantes áreas naturales. El Monumento Nacional Laguna de Alegría mide 150 hectáreas y está ubicado dentro del cráter del Volcán Tecapa en el sur-este de El Salvador. El parque incluye bosque subtropical primario y perturbado, paredes volcánicas rocosas y empinadas, y una laguna sulfúrica en la cuenca. Se identificó la flora de la Laguna de Alegría desde diciembre de 1998 hasta noviembre de 1999 y se combinaron los resultados del estudio con los reportes de otros colectores y reportes publicados para compilar un listado de 447 taxa específicos y 2 híbridos. Estas representan 106 familias. Los taxa fueron catalogados en un listado anotado que incluye el número de la colección y del herbario, y se designaron las especies exóticas. Es el primer reporte de *Trigonospermum annum* McVaugh & Lask. en El Salvador.

INTRODUCTION

The Republic of El Salvador, with a land area of only 21,000 km^2 and a population of more than 6 million, is the smallest and most densely crowded of the Central American countries. Extreme population pressure has devastated El Salvador's environment, causing the loss of 97% of the country's original forest (Benitez 1996 unpublished, cited from Berendsohn 1991) and forcing farmers to convert ever more forest and marginal land to crop production. Recent estimates of forest cover indicate that only 130,000 ha, or 6.1% of the national territory, is

SIDA 20(2): 675 – 690. 2002

now covered by natural forest (DIPRAT 1997), most of which is composed of small, relictual parcels.

The government of El Salvador recognizes the urgency of protecting the few remaining forests and forest fragments in the country and has identified 125 natural areas to form the "Sistema de Areas Naturales Protegidas" (http:/www.marn.gob.sv/sia/anp.htm). These natural areas are all relatively small, but are of supreme importance as the country's last refuges for wildlife and gene pools that could provide the primary materials for reforestation and regeneration of other areas. However, there is no infrastructure to administer most of these areas; only three areas have legal protection by legislative or executive decree; and nearly all of them are still exploited for firewood, grazing lands, and for squatter's homesteads. Moreover, there is an almost complete lack of basic biological information about these areas and few in-country resources to gather this information. Apart from El Imposible National Park, none of El Salvador's protected areas has previously had a complete floral survey. While biologists from developed countries tend to disregard El Salvador in favor of studying other countries with better preserved and more extensive wild areas, the very precarious ecological situation in El Salvador should make it a high priority for study so that the natural resources still intact can be managed and preserved in the most effective manner possible.

THE LAGUNA DE ALEGRÍA

The Laguna de Alegría is a tiny but spectacular natural area in the crater of the extinct Tecapa Volcano in the department of Usulután, and is the only national monument proposed within the Salvadoran system of protected areas. Tecapa is located at 13°29'40" N latitude and 88°29'43" W longitude (Fig. 1) and rises to a height of 1599 m. It is the second largest peak in the Chinameca chain of volcanoes that dominates much of the southeastern corner of El Salvador and forms part of the Central American chain that extends from southwest Mexico, through Guatemala, El Salvador, Nicaragua, Costa Rica and Panama.

The interior of the Tecapa crater is 150 ha and is comprised of an emerald-green, sulfuric lake in the caldera surrounded by natural forest. The ecological value of this small forest is immense in this heavily deforested country and the natural beauty of the lake and sheer crater walls make for a striking setting.

There are no historical records of volcanic activity, though there are emissions of steam mixed with volcanic gases on the southwest side of the lake. The gaseous emissions, which have a high concentration of sulfur compounds, have contributed to the low pH of soils in much of the basin of the caldera and to the extreme acidity of the lake. The sulfur compounds give the lake a characteristic emerald green color and have bleached the beach and lake substrate white. It has been suggested that only algae and diatoms are able to live permanently in the extreme conditions of the water (SACDEL 1997), but exoskeletons of drag-

Fig. 1. Map of Central America showing the approximate location of the Laguna de Alegría, El Salvador.

onfly nymphs have been observed (Williams, pers. obs.) and a species of *Eleocharis* (Cyperaceae) has been reported growing in the margins of the lake (Fassett 1952).

Holdridge (1975) classifies the area in and around the summit of Tecapa Volcano as very humid subtropical forest and much of the forest is primary growth, especially those parts located on the steep inner slopes. Local residents report that some of the valuable timber species have been removed from the more accessible areas of the forest in the basin, and three areas of the forest were cleared and planted in coffee: one in a small area of the basin, now abandoned, and two others, on the northeast and northwest slopes, both still in cultivation. The inner walls of three sides of the crater are a nearly vertical 300 m tall making them inaccessible without specialized climbing equipment and only there has the forest been left completely undisturbed by humans.

The outer slopes of the volcano are not officially included in the protected area, and what parts have not been planted in coffee have been deforested for firewood. The coffee grown in plantations on the outer slopes is mixed with

shade trees, thereby offering some protection for the buffer zone. Unfortunately, the coffee plantations do not have the density of vegetation in natural forest and some recently replanted areas have come so close to the edge of the steep inner slope that severe erosion and landslides have resulted from the loss of cover (Williams, pers. obs.).

The Laguna de Alegría is currently being managed by the Asociación de Desarrollo Comunal Alberto Masferrer (ADESCAM), a local organization created in 1995 and given charge of the area for development for ecotourism and recreation by the municipal government. The area has become popular as a tourist destination due to promotion and development by ADESCAM on a national scale. However, the balance between conservation and tourism is often difficult, especially in the case of the Laguna de Alegría because the amphitheater-like setting of the interior of the crater amplifies the presence of humans in the natural area. This study was undertaken to provide ADESCAM with part of the basic biological information necessary to write a management plan for sustainable use of the area.

METHODS

The majority of the species listed in this survey are documented by herbarium vouchers we collected in the Laguna de Alegría between 9 Dec 1998 and 20 Nov 1999. Most of the vouchers were taken from the basin of the crater, e.g., the beaches of the lake, the edges of the forest along the sides of the road, and those parts of the forest accessible from the basin. Some collections were made from the top of the rim, but most of the vegetation of the cliff areas of the crater is not accounted for in this survey because we did not attempt to scale the steep slopes.

The samples were pressed and dried and sent to the herbarium at the Jardín Botánico La Laguna (LAGU) in San Salvador where we later identified them. Major references used to identify specimens include Davidse et al. (1995) and Standley and Steyermark (1960).

At LAGU we encountered specimens collected in the 1960s and 1970s in the Laguna de Alegría by the German botanist Hans Winkler. We revised those reports and added them to ours.

We also added a list of species collected by Alex Monro that are vouchered at The Natural History Museum in London (BM). Unfortunately, we were not able to visit BM and not all of Monro's collections had been identified to species at the time of this report. More information may be available when he completes his work.

In addition to reporting herbarium collections, we included reports of plants from the Laguna de Alegría in two previous publications: Fritz Hamer's book *Las Orquídeas de El Salvador* (1974) and a descriptive survey of tree species of the Laguna de Alegría made by the Salvadoran dendrologist Maria Luisa

Reyna de Aguilar (SACDEL 1997). Unfortunately, Hamer did not publish the sources of his reports and Reyna de Aguilar took only four voucher specimens during her survey, so it is not possible to verify their identifications.

Edy Montalvo (pers. com.), former curator of the herbarium of the Universidad de El Salvador (ITIC), made several collecting trips to the Laguna de Alegría in the 1970s. We had hoped to peruse ITIC's collections and add Montalvo's reports and any other specimens from the Laguna de Alegria that might be housed there, but due to a shortage of staffing, we were never able to gain permission to ITIC. It would be valuable to revise ITIC's collections and add them to this list.

After the identification phase was completed, we returned to the Laguna de Alegría and noted another 17 species that had not been collected in the previous year nor noted by other authors. We also verified an older collection of 100 woody species made in 1998 for ADESCAM.

It should be noted that we also collected non-vascular plants, i.e., mosses and lichens, during the 1999 survey. Those vouchers were deposited in LAGU as well, but since materials and expertise are not yet available to identify them, they are not included in this list.

RESULTS AND DISCUSSION

We compiled a list of 821 voucher specimens and visual reports to identify a total of 447 species and 2 hybrids of vascular plants from 319 genera and 106 families from the Laguna de Alegría (Table 1). Of the two hybrids reported in our list, one is a natural hybrid orchid, the other, the artificial hybrid that creates the many varieties of bananas and plantains. Neither of the parent species for either of these two hybrids are known from the Laguna de Alegría.

The most important families in terms of numbers of species present are Asteraceae (54 species), Fabaceae (41 species), Poaceae (34 species), and Orchidaceae (29 species and 1 hybrid). The families Asteraceae and the Poaceae both tend to be composed of pioneer and secondary vegetation specialist species and most of the species from these families found in the Laguna de Alegría were found along the roadsides, in landslide zones, and on the beaches of the laguna. Many of the species of Poaceae collected in the Laguna de Alegría are naturalized exotics. The high numbers of species in these families indicates the large amount of disturbance in many parts of the protected area.

The orchid species found in the Laguna de Alegría, on the other hand, tend to be primary forest species, and none are exotic. All of the orchids we found were in the forest or undisturbed areas of the cliffs with the exception of just two terrestrial species found in open areas. The large number of species of orchids, therefore, supports the notion that the less accessible parts of the forest have been intact and undisturbed for a long time.

The hybrid orchid, *Mormodes* × *salvadorensis* Hamer & Garay, is a natural

TABLE 1. Statistical summary by taxa of the flora of the Laguna de Alegría.

	Families	Genera	Species	Hybrids
Ferns and fern allies	13	22	34	0
Gymnosperms	3	3	4	0
Monocots	12	69	99	2
Dicots	78	225	310	0
Total	106	319	447	2

hybrid first reported by Hamer (1974) from two locations in El Salvador. One of these locations was the Laguna de Alegría, but *M.* × *salvadorensis* was not found in our 1999 survey. It is possible that it has become extirpated in the 25 intervening years. However, neither of the two parent species was found either by Hamer or by us, though they most likely exist or once existed within the bounds of the park. This fact suggests that there probably are more orchid species present which have not been recorded, a fact which is very likely considering the difficultly of encountering epiphytic orchids in the dense forest and the steep cliffs of the crater.

We found 36 exotic species in the Laguna de Alegría, making up just 8.2% of the total number of species. In comparison with a national figure of 28%, the percentage of exotic taxa in the Laguna de Alegría is very small, a fact that serves as another indicator that the area is still in a very natural state. Many of the exotics found are plants cultivated in the coffee plantations and around the margins of the lake, but nine of the species have been introduced intentionally by ADESCAM for ornamental purposes in recreational areas or for "reforestation" in areas where natural growth would have occurred. Apparently only eight species have invaded under their own power: seven grasses and "higuero" or "castor bean" (*Ricinus communis* L. Euphorbiaceae). These eight plants are all aggressive colonizers and have taken advantage of man-made disturbances such as roads and trails and other clearings to spread to new locations. One species, "frijol de palo" or "pigeon pea" (*Cajanus cajan* (L.) Millsp. Fabaceae), is of uncertain invasion status, being a plant that is widely cultivated for its edible beans, but also widely naturalized and an aggressive colonizer.

The distribution status of the majority of El Salvador's flora is poorly known, and there is no official list of threatened or endangered species for the country. At least one species collected in this survey, *Cibotium regale* Verschaff. & Lem. Dicksoniaceae, is endangered throughout its habitat (Davidse et al. 1995). The only individual of *Bixa orellana* L. Bixaceae in the Laguna de Alegría was destroyed by a landslide in 1998. However, *B. orellana* is common throughout most of El Salvador.

Despite the poor knowledge of El Salvador's flora, we found relatively few

new reports in our survey. *Trigonospermum annum* McVaugh & Lask. Asteraceae is the only verified new report for El Salvador. *Peperomia cf. liebmanii* C. DC. Piperaceae and *Tillandsia cf. kammi* Rauh Bromeliaceae, if confirmed as such, will also be new reports.

The total species count is relatively large for such a small area, especially when one considers that more extensive studies would most likely provide new reports and that the cliffs of the crater have never been surveyed. The total number of species registered for El Salvador is 4670 (Reyna de Aguilar 1995), meaning that the Laguna de Alegría, with an areal extent of less than 0.005% of the land area of the country, harbors 9.4% of the country's plant species. It is evident that the continued preservation of the tiny Laguna de Alegría is crucial to maintaining El Salvador's plant diversity.

APPENDIX

Annotated list of the vascular species of the Laguna de Alegría

Collectors/authors of reports: DW: Denise Williams and Rudys Herrera, AM: Alex Monro, FH: Fritz Hamer, JBL/Author: specimen housed at the Jardin Botanico La Laguna, MLRA: Maria Luisa Reyna de Aguilar, ADESCAM: collection of the Asociación de Desarrollo Comunal Alberto Masferrer.

* refers to introduced exotic species, ** refers to naturalized exotic species, † extinct.

Note.—At the end of each entry with multiple collections follows a list of herbaria where a duplicate of at least one of the collections was sent. This does not mean to imply that *each* herbarium has a duplicate of *every* collection listed for that entry. LAGU was the main repository for the specimens we collected and it retained one duplicate of all our collections.

Tithonia rotundifolia (Mill.) S.F. Blake, *DW187* (LAGU, MO)
Tridax procumbens L., *DW216, DW430* (B, LAGU, MO)
Trigonospermum annuum McVaugh & Lask., *DW203* (LAGU, MO)
Verbesina cf. *punctata* B.L. Rob. & Greenm., *DW82* (LAGU)
Verbesina sp., *DW367* (B, K, LAGU, MEXU, MO)
Vernonia cf. *deppeana* Less., *DW263* (B, LAGU, MO)
Vernonia leiocarpa DC., *DW9* (B, K, LAGU, MO)
Vernonia patens Kunth, *DW114* (B, K, LAGU, MO)
cf. *Vernonia* sp., *DW517* (LAGU)
Wedelia parviceps S.F. Blake, *DW23, DW157, DW249, DW420* (LAGU)
***Zinnia elegans* Jacq., *DW251, DW399* (B, K, LAGU, MO)

BEGONIACEAE

Begonia plebeja Liebm., *DW79* (LAGU)

BIGNONIACEAE

**Jacaranda mimosifolia* D. Don, *DW550* (LAGU)
Macfadyena unguis-cati (L.) A.H. Gentry, *DW435* (LAGU)
Tabebuia cf. *chrysantha* (Jacq.) G. Nicholson, *ADESCAM*
Tabebuia rosea (Bertol.) A. DC., *DW260* (B, EAP, LAGU, MEXU, MO)
Tecoma stans (L.) Juss. ex Kunth, *DW28, DW106* (LAGU, MO)

BIXACEAE

†*Bixa orellana* L., *ADESCAM*

BOMBACACEAE

Ceiba aesculifolia (Kunth) Britt. & Baker f., *MLRA*
Ceiba pentandra (L.) Gaertn., *DW576* (LAGU)

BORAGINACEAE

Cordia alliodora (Ruiz & Pav.) Oken, *ADESCAM*
Cordia bullata (L.) Roem. & Schult., *DW296, DW400* (B, LAGU, MO)

Cordia inermis (Mill.) I.M. Johnst., *DW426* (LAGU)
Heliotropium rufipilum (Benth.) I.M. Johnst., *DW259* (B, LAGU, MO)
Heliotropium sp., *DW124* (B, EAP, LAGU, MO)

BRASSICACEAE
Lepidium virginicum L., *DW268, DW417* (LAGU, MO)

BURSERACEAE
Bursera simaruba (L.) Sarg., *DW445, AM3023* (BM, LAGU)

CAMPANULACEAE
Diastatea micrantha (Kunth) McVaugh, *DW8, DW272, DW330* (B, LAGU, MO)
Lobelia laxiflora Kunth, *DW67, DW152* (LAGU)

CARICACEAE
Carica cauliflora Jacq., *DW121* (LAGU)

CARYOPHYLLACEAE
Arenaria lanuginosa (Michx.) Rohrb., *DW407* (LAGU, MO)
Drymaria cordata (L.) Willd. ex Schult., *DW213, DW383* (B, LAGU, MO)
Stellaria ovata Willd. ex Schltdl., *DW408* (LAGU, MO)

CASUARINACEAE
**Casuarina equisetifolia* L., *DW621* (LAGU)

CECROPIACEAE
Cecropia peltata L., *DW577* (LAGU)

CLETHRACEAE
Clethra lanata M. Martens & Galeotti, *MLRA*
Clethra mexicana DC., *DW143, DW438* (B, EAP, LAGU, MO)

CLUSIACEAE
Calophyllum brasiliense (Standl.) Standl. var. *rekoi, DW524* (LAGU, MO)
cf. *Garcinia* sp., *DW452* (LAGU)

COCHLOSPERMACEAE
Cochlospermum vitifolium (Willd.) Spreng., *ADESCAM*

CONVOLVULACEAE
Ipomoea cholulensis Kunth, *DW154, DW158, DW241* (LAGU, MO)
Ipomoea cf. *mairetii* Choisy, *DW208* (LAGU)
Ipomoea santae-rosae Standl. & Steyerm., *DW145* (LAGU)
Ipomoea squamosa Choisy, *DW177, DW350* (B, LAGU, MO)
Ipomoea cf. *trifida* (Kunth) G. Don, *DW47* (LAGU, MO)
Ipomoea umbraticola House, *DW44, DW227, DW278* (B, LAGU, MO)

CUCURBITACEAE
Cayaponia sp., *DW620* (LAGU)
Microsechium sp., *DW188* (LAGU, MO)
Rytidostylis ciliata (Cogn) Kuntze, *DW62, DW98* (LAGU)
Sechium edule (Jacq.) Sw., *DW*
Sycios sertuliferus Cogn., *DW142* (LAGU, MO)

ERICACEAE
Gaultheria erecta Vent., *DW437* (LAGU, MO)

EUPHORBIACEAE
Acalypha macrostachya Jacq., *DW255* (B, LAGU, MO)
Chamaesyce hirta (L.) Millsp., *DW324, DW511* (LAGU)
Croton xalapensis Kunth, *DW89* (B, F, LAGU, MO)
Euphorbia graminea Jacq., *DW172, DW498* (LAGU)
Euphorbia heterophylla L., *DW66* (B, K, LAGU, MO)
**Euphorbia pulcherrima* Willd. ex Klotzsch, *ADESCAM*
**Ricinus communis* L., *DW122* (LAGU)

FABACEAE
Acacia hindsii Benth., *DW443* (LAGU)
**Caesalpinia pulcherrima* (L.) Sw., *DW80* (LAGU, MO)
**Cajanus cajan* (L.) Millsp., *DW175* (LAGU)
Calliandra sp., *DW627* (LAGU)
Canavalia sp., *DW38* (K, LAGU, MO)
**Cassia siamea* Lam., *DW575* (LAGU)
Centrosema virginianum (L.) Benth, *DW210* (LAGU, MO)
Chamaecrista nictitans (L.) Moench, *DW239, DW359* (LAGU)
Chamaecrista zygophylloides (Britton & Rose) H.S. Irwin & Barneby var. *deamii, DW444* (LAGU)
Clitoria mexicana Link, *DW204* (LAGU)
Cologania cf. *rufescens* Rose, *DW181* (LAGU)
Coursetia caribaea (Jacq.) Lavin, *DW130* (LAGU, MO)
Crotalaria mollicula Kunth, *DW138* (B, LAGU, MO)
Dalea cliffortiana Willd., *DW349* (B, LAGU, MO)
Dalea sp., *DW240* (LAGU)
Desmodium barbatum (L.) Benth., *DW342* (LAGU)
Desmodium cajanifolium (Kunth) DC., *DW447* (LAGU)

Desmodium incanum DC., *DW406, DW414* (LAGU)
Desmodium procumbens (Schindl.) B.G. Schub. var. *longipes, DW194* (B, K, LAGU, MO)
Diphysa robinioides Benth., *DW520* (LAGU, MO)
Erythrina berteroana Urb., *ADESCAM*
Hymenaea courbaril L., *ADESCAM*
Inga paterno Harms, *DW*
Inga pavoniana G. Don, *DW571* (LAGU)
Inga punctata Willd., *DW523* (LAGU)
Lonchocarpus rugosus (Lundell) M. Sousa subsp. *apricus, DW448, DW454* (LAGU, MO)
Lysiloma cf. *acapulcense* (Kunth) Benth., *DW439* (B, LAGU, MEXU, MO)
Macroptilium atropurpureum (Moc. & Sessé ex DC.) Urb., *DW273* (LAGU)
Mimosa albida Humb. & Bonpl. ex Willd., *DW170* (B, K, LAGU, MO)
Mimosa pudica L., *DW378* (LAGU)
Phaseolus leptostachyus Benth., *DW169, DW214* (LAGU, MO)
Phaseolus lunatus L., *DW3* (B, LAGU)
Piscidia grandifolia (Donn. Sm.) I.M. Johnst., *DW469* (LAGU)
Poiretia punctata (Willd.) Desv., *DW174* (LAGU, MO)
Senna hirsuta H.S. Irwin & Barneby var. *hirta, DW372* (B, LAGU, MO)
Spathodia campanulata Beauv., *DW*
Stylosanthes guianensis (Aubl.) Sw., *DW41, DW96* (B, K, LAGU, MO)
Teramnus uncinatus (L.) Sw., *DW182* (LAGU)
Vigna sp., *DW183* (LAGU)
Zapoteca tetragona (Willd.) H.M. Hern., *DW135* (LAGU, MO)
Zornia diphylla (L.) Pers., *DW171* (LAGU)

FAGACEAE
Quercus sapotifolia Liebm., *DW144,, MLRA1506* (B, K, LAGU, MO)
Quercus sp., *DW97, DW269* (LAGU)

FLACOURTIACEAE
Casearia sylvestris Sw., *DW467, DW451, MLRA1504* (B, LAGU, MEXU, MO,)
Prockia crucis P. Br. ex L., *DW375, AM3012* (B, BM, LAGU, MEXU, MO)
Xylosma flexuosa (Kunth) Hemsl., *DW339* (LAGU)

GESNERIACEAE
Achimenes erecta (Lam.) H.P. Fuchs, *DW394, DW492* (LAGU, MO)
Achimenes longiflora DC., *DW329* (B, LAGU, MO)
Achimenes misera Lindl., *DW344* (LAGU, MO)
Achimenes pedunculata Benth., *DW63, DW365, DW374* (B, LAGU, MO)
Phinaea repens (Donn. Sm.) Soler., *DW316* (B, LAGU, MO)

HERNANDACEAE
Gyrocarpus americanus Jacq., *DW569* (LAGU)

HYDROPHYLLACEAE
Wigandia urens (Ruiz & Pav.) Kunth, *DW223* (LAGU)

JUGLANDACEAE
Juglans olanchana Standl. & L.O. Williams, *DW*

LAMIACEAE
Hyptis pectinata (L.) Poit., *DW45* (B, LAGU, MO)
Hyptis suaveolens (L.) Poit., *DW94* (LAGU)
Hyptis urticoides Kunth, *DW101, DW205* (B, LAGU, MO)
Marsypianthes chamaedrys (Vahl) Kuntze, *DW370* (B, LAGU, MO)
Salvia occidentalis Sw., *DW2, DW111, DW353* (B, K, LAGU, MO)
Salvia polystachya Ortega, *DW110* (LAGU, MO)
Salvia purpurea Cav., *DW270* (B, LAGU, MO)
**Salvia splendens* Sellow ex Roem. & Schult., *DW40* (B, K, LAGU, MO)

LAURACEAE
Nectandra sinuata Mez, *DW538* (LAGU)
Persea americana Mill., *ADESCAM*

LOASACEAE
Klaprothia fasciculata (C. Presl.) Poston, *DW332, DW524* (B, LAGU, MO)
Metzelia sp., *DW358, DW376* (LAGU)

LOGANIACEAE
Buddleja americana L., *DW266* (LAGU)

LORANTHACEAE
Oryctanthus cordifolius (C. Presl.) Urban, *DW522* (LAGU)

MALPIGHIACEAE
Byrsonima crassifolia (L.) Kunth, *ADESCAM*
Gaudichaudia albida Cham. & Schltdl., *DW93, DW168* (B, LAGU, MO)
Tetrapteris schiedeana Cham. & Schltdl., *DW37, DW343, DW494, DW499* (LAGU)
Stigmaphyllon ellipticum (Kunth) A. Juss., *DW33* (LAGU, MO)

MALVACEAE

**Hibiscus rosa-sinensis* L., *DW236* (B, LAGU, MO)
Malvaviscus arboreus Cav., *DW75* (B, EAP, LAGU, MO, US)
Sida acuta Burm. f., *DW92* (B, LAGU, MO)
Sida glabra Mill., *DW34* (LAGU, MO)
Sida urens L., *DW72* (LAGU, MO)

MELASTOMATACEAE

Conostegia xalapensis (Bonpl.) D. Don ex DC., *DW258, DW446, AM3001* (B, BM, LAGU, MO)
Heterocentron hondurense Gleason, *DW95* (LAGU, MO)
Heterocentron glandulosum var. *longicalyx* Whiffin, *DW167* (LAGU)
Miconia argentea (Sw.) DC., *MLRA*
Miconia guatemalensis Cogn., *DW369, DW468, AM3022* (B, BM, CAS, LAGU, MEXU, MO)
Miconia lauriformis Naudin, *DW196* (LAGU)
Monochaetum floribundum (Schltdl.) Naudin, *DW35* (B, CAS, LAGU, MO)
Pterolepis pumila (Bonpl.) Cogn., *DW102, DW325* (B, LAGU, MO)
Schwackaea cupheoides (Benth.) Cogn., *DW32* (LAGU)
Tibouchina longifolia (Vahl) Baill., *DW91, DW99* (LAGU)

MELIACEAE

Cedrela odorata L., *DW392, DW474* (LAGU)
Cedrela tonduzii C. DC., *MLRA*
**Melia azedarach* L., *DW*
Trichilia havanensis Jacq., *DW64, DW371, AM3020* (BM, LAGU)
Trichilia hirta L., *DW257, AM3009* (BM, LAGU)
Trichilia tomentosa Kunth, *MLRA*

MENISPERMACEAE

Cissampelos pareira L., *DW509* (LAGU, MO)

MORACEAE

Ficus goldmanii Standl., *DW211* (LAGU)
Ficus obtusifolia Kunth, *DW215, DW539* (LAGU)
Ficus ovalis (Liebm.) Miq., *DW163, DW166, DW405, DW409* (B, LAGU, MO)
Ficus pertusa L. f., *DW186* (B, F, LAGU, MO)

MYRICACEAE

Myrica cerifera L., *DW31, DW440* (B, LAGU, MO)

MYRSINACEAE

Ardisia compressa Kunth, *DW119, DW162* (LAGU, MO)
Rapanea myricoides (Schltdl.) Lundell, *DW411* (LAGU)

MYRTACEAE

Eugenia cf. *acapulcensis* Steud., *AM3003* (BM, LAGU)
Psidium guajava L., *MLRA*
Psidium guineense Sw., *DW16, DW77, DW533* (LAGU, MO)
Psidium oerstedianum O. Berg, *MLRA*

NYCTAGINACEAE

**Bougainvillea glabra* Choisy, *DW235* (LAGU)
Mirabilis jalapa L., *DW161, DW253* (LAGU)
cf. *Mirabilis* sp., *DW388* (LAGU)
Pisonia aculeata L., *DW265, DW336* (LAGU)

OXALIDACEAE

Oxalis corniculata L., *DW505* (LAGU)
Oxalis debilis (DC.) Lourteig var. *corymbosa*, *DW622* (LAGU)
Oxalis frutescens L., *DW1, DW159, DW497, DW517* (B, F, LAGU, MO)

PAPAVERACEAE

Bocconia frutescens L., *DW234* (LAGU)

PASSIFLORACEAE

Passiflora ornithoura Mast., *DW49* (LAGU)

PHYTOLACCACEAE

Phytolacca icosandra L., *DW160, DW418* (LAGU, MO)
Rivina humilis L., *DW13, DW107* (B, LAGU, MO)

PIPERACEAE

Peperomia arboricola C. DC., *DW280* (LAGU, MO)
Peperomia granulosa Trel., *DW317* (LAGU, MO)
Peperomia deppeana Schltdl. & Cham., *DW279* (LAGU, MO)
Peperomia lanceolato-peltata (C. DC.), *DW531* (LAGU, MO)
Peperomia cf. *liebmannii* C. DC., *DW515* (F, LAGU, MO)
Peperomia sp., *DW184* (LAGU)
Piper amalago L., *DW456, DW458, DW462, DW466* (LAGU, MO)
Piper hispidum Sw., *DW473, DW464* (LAGU, MO)
Piper jacquemontianum Kunth, *DW304, DW485* (LAGU)
Piper marginatum Jacq., *DW475, DW486* (LAGU)
Piper umbellatum L., *DW461, DW474* (LAGU)

POLEMONIACEAE

Loeselia glandulosa (Cav.) G. Don, *DW7, DW73, DW507* (B, LAGU, MO)

POLYGALACEAE

Polygala hondurana Chodat, *DW48, DW320* (LAGU)

Polygala longicaulis Kunth, *DW393, DW525* (LAGU, MO)

Polygala paniculata L., *DW225, DW398, DW493* (LAGU)

Polygala sp., *DW189* (LAGU)

PORTULACACEAE

Talinum paniculatum (Jacq.) Gaertn., *DW618* (LAGU)

PROTEACEAE

Roupala glaberrima Pittier, *DW470* (LAGU)

RHAMNACEAE

Colubrina reclinata (L'Her.) Brongn., *DW570* (LAGU)

ROSACEAE

**Eriobotrya japonica* (Thunb.) Lindl., *DW*

Prunus brachybotrya Zucc., *MLRA1505, AM3013* (BM, LAGU)

Rubus irasuensis Liebm., *DW449, DW476* (LAGU, MO)

**Rubus niveus* Thunb., *DW481* (B, LAGU, MO)

RUBIACEAE

Borreria cf. *latifolia* (Aubl.) K. Schum., *DW362* (LAGU)

Borreria ocymoides (Burm.f.) DC., *DW201, DW218, DW232* (B, F, LAGU, MO)

Bouvardia leiantha Benth., *DW276, DW480, DW484* (B, LAGU, MO)

**Coffea arabica* L., *DW460* (LAGU)

**Coffea liberica* W. Bull ex Hiern, *DW*

Crusea longiflora (Willd. ex Roem. & Schult.) W.R. Anderson, *DW495* (LAGU)

Hamelia patens Jacq., *DW233, DW464* (B, LAGU, MO)

Hoffmannia angustifolia Standl., *AM3002* (BM, LAGU)

Manettia reclinata L., *DW192* (LAGU)

Mitracarpus villosus (Sw.) Cham. & Schltdl., *DW22, DW533, DW534* (LAGU, MO)

Psychotria pubescens Sw., *DW366* (LAGU, MEXU, MO)

Richardia scabra L., *DW30* (LAGU, MO)

RUTACEAE

Casimiroa edulis La Llave & Lex., *DW197* (B, LAGU, MO)

**Citrus limetta* Risso, *ADESCAM*

**Citrus sinensis* (L.) Osbeck, *DW*

Zanthoxyllum cf. *culantrillo* Kunth, *ADESCAM*

SAPINDACEAE

Sapindus saponaria L., *DW457* (LAGU)

SAPOTACEAE

Sideroxylon persimile (Hemsl.) T.D. Penn., *DW242, AM3018* (BM, LAGU, MO)

SCROPHULARIACEAE

Castilleja arvensis Schltdl. & Cham., *DW104* (B, BKL, F, LAGU, MO)

Russelia sarmentosa Jacq., *DW275, DW506* (LAGU)

SOLANACEAE

Brachistus stramoniifolius (Kunth) Miers, *DW528* (B, LAGU, MO)

Cestrum lanatum M. Martens & Galeotti, *DW432* (LAGU)

Physalis pubescens L., *DW529, DW530* (B, LAGU, MO)

Solanum lanceifolium Jacq., *DW513, DW521* (LAGU, MO)

Solanum nigrum var. *americanum* (Mill.) O.E. Schulz, *DW147* (LAGU)

Solanum torvum Sw., *DW473* (LAGU)

STERCULIACEAE

Waltheria glomerosa C. Presl., *DW198* (LAGU)

Waltheria indica L., *DW36, DW198* (LAGU, MO)

STYRACACEAE

Styrax argenteus C. Presl., *DW411* (B, LAGU, MO)

TILIACEAE

Heliocarpus mexicanus (Turcz.) Sprague, *DW479* (B, EAP, LAGU, MEXU, MO)

Triumfetta speciosa Seem., *DW202* (LAGU)

Triumfetta bogotensis DC., *DW478* (LAGU)

ULMACEAE

Trema micrantha (L.) Blume, *ADESCAM*

THE FLORA OF OKTIBBEHA COUNTY, MISSISSIPPI

Andreas Leidolf[1], Sidney McDaniel, and Tim Nuttle[2]

Institute for Botanical Exploration (IBE)
PO Drawer EN
Mississippi State, MS 39762-5668, U.S.A.

ABSTRACT

We surveyed the flora of Oktibbeha County, Mississippi, U.S.A., from February 1994 to 1996. Occupying 118 square kilometers in east-central Mississippi, Oktibbeha County lies among 3 physiographic regions that include, from west to east, Interior Flatwoods, Pontotoc Ridge, and Black Prairie. Accordingly, the county harbors a diverse flora. Based on field work, as well as an extensive review of published literature and herbarium records at IBE and MISSA, we recorded a total of 1,148 taxa (1,125 species, 7 hybrids, 16 infraspecific taxa) belonging to 514 genera in 160 families; over 85% of all taxa documented were native. Compared to 3 other counties in east-central Mississippi, Oktibbeha County has the second largest recorded flora. The number of state-listed (endangered, threatened, or of special concern) taxa (67) documented in this survey far exceeds that reported from any other county in the region. Three introduced species, *Ilex cornuta* Lindl. & Paxton, *Mahonia bealei* (Fortune) Carrière, and *Nandina domestica* Thunb., are reported in a naturalized state for the first time from Mississippi. We also describe 16 different plant communities belonging to 5 broad habitat categories: bottomland forests, upland forests and prairies, aquatic habitats, seepage areas, and human-influenced habitats. A detailed description of the vegetation associated with each of these communities is provided.

RESUMEN

Hemos investigado la flora del condado de Oktibbeha, Mississippi, U.S.A., desde febrero de 1994 a 1996. Con 118 kilómetros cuadrados en el centro-este de Mississippi, el condado de Oktibbeha está entre 3 regiones fisiográficas que son, de oeste a este, Interior Flatwoods, Pontotoc Ridge, y Black Prairie. Consecuentemente, el condado alberga una flora diversa. Basados en el trabajo de campo, así como en una extensa revision de la bibliografía publicada y pliegos de herbario depositado en IBE y MISSA, hemos recopilado un total de 1,148 taxa (1,125 especies, 7 híbridos, 16 taxa infraespecíficos) pertenecientes a 514 géneros de 160 familias; más del 85% de los taxa documentados fueron autóctonos. Comparado con otros 3 condados del centro-este de Mississippi, el condado de Oktibbeha tiene la segunda flora más numerosa. El número de taxa (67) listados para el estado (en peligro, amenazada, o de atención especial) documentados en este trabajo excede con mucho a los de cualquier otro condado de la región. Tres especies introducidas, *Ilex cornuta* Lindl. & Paxton, *Mahonia bealei* (Fortune) Carrière, y *Nandina domestica* Thunb., se citan en estado naturalizado por primera vez en Mississippi. También se describen 16 comunidades vegetales diferentes pertenecientes a 5 categorías de hábitat: bosques de tierras bajas, bosques de meseta y praderas, hábitats acuáticos, áreas de filtración, y hábitats influenciados por el hombre. Se aporta una descripción detallada de la vegetación asociada a cada una de estas comunidades.

ZUSAMMENFASSUNG

Wir untersuchten die Flora des Verwaltungsbezirks Oktibbeha im Bundesstaat Mississippi, Vereinigte Staaten von Amerika, im Zeitraum Februar 1994 bis 1996. Der Verwaltungsbezirk umfaßt 118

SIDA 20(2): 691 – 765. 2002

Quadratkilometer im Mittelosten Mississippis und gehört, von West nach Ost, zu 3 physiographischen Regionen (Interior Flatwoods, Pontotoc Ridge und Black Prairie), weshalb die Flora sehr artenreich ist. Aufgrund unserer Freilandarbeit, sowie eines umfangreichen Studiums der Fachliteratur und zahlreicher Herbariumsbelege in IBE und MISSA, waren wir in der Lage 1.148 Taxa (1.125 Arten, 7 Hybriden und 16 Unterarten oder Varietäten) aus 514 Gattungen und 160 Familien zu katalogisieren. 85% aller Taxa waren in Mississippi beheimatet. Der Verwaltungsbezirk Oktibbeha hat im Vergleich zu 3 anderen Verwaltungsbezirken im Mittelosten Mississippis die zweitgrößte Flora. Die Anzahl der Arten auf der Roten Liste Mississippis (vom Aussterben bedroht oder von besonderem Belang) übersteigt mit 66 weit die aller anderen Verwaltungsbezirke in der Region. Drei eingeschleppte Arten, *Ilex cornuta* Lindl. & Paxton, *Mahonia bealei* (Fortune) Carrière und *Nandina domestica* Thunb. werden hier zum ersten Mal von Mississippi erwähnt. Im weiteren Verlauf beschreiben wir außerdem im Detail 16 verschiedene Pflanzengesellschaften in 5 Lebensraumkategorien: Auenwälder, Hochlandwälder und Prairien, Aquatische Lebensräume, Sickerstellen und vom Menschen beeinflußte Lebensräume.

INTRODUCTION

Unlike other areas in the southeastern United States, Mississippi is largely unexplored botanically (Duncan 1953; Pullen 1966; Bryson & Carter 1992; Bryson et al. 1996; Sorrie & Leonard 1999; Alford 2001). To date, there is no comprehensive flora for the state, although there are 8 public herbaria (DSC, HGCRL, IBE, MISS, MISSA, MSCW, SWSL, University of Southern Mississippi) with combined holdings of more than 400,000 specimens (Holmgren et al. 1990). In addition, the Mississippi Museum of Natural Science (MMNS) maintains a herbarium of ca. 8,000 specimens, as well as a computer database of plant records, both of which are accessible to the public.

Historically, botanical explorations of Mississippi have been sporadic, and largely concentrated on the southern part of the state (Flint 1882a; Halsted 1891). The naturalist William Bartram traveled through parts of Mississippi in 1777 (Van Doren 1928), and the renowned botanist Thomas Nuttall reportedly collected plants around Natchez, Mississippi, in 1811 and 1820 (Graustein 1967). In 1840, John Claiborne began his exploration of the pine forests of southern Mississippi (McDaniel 1986); twenty years later, Hilgard (1860) published comments on the phytogeography of Mississippi. In the early twentieth century, Harper (1906, 1914) gave a superficial account of the pine barren vegetation of southern Mississippi based on his travels through that region. Lowe (1921) published the first checklist of vascular plants for the state.

In 1964, the Flora of Mississippi Project, funded by the National Science Foundation, was initiated by Samuel B. Jones, Jr., Thomas M. Pullen, and Ray Watson. A number of publications (Pullen et al. 1968a, 1968b; Jones et al. 1969; Watson 1969, 1970a, 1970b; Jones 1974a, 1974b, 1975a, 1975b, 1976a, 1976b) resulted, but the goal of a comprehensive floristic treatment was never achieved. A definitive treatment of the flora of Oktibbeha County has also been lacking so far, although floristic surveys have been performed for several Mississippi counties (Flint 1882b; Ferrari 1970; Morgan 1979; Meeks 1984; Morris 1987;

Winstead 1990; MacDonald 1996; Alford 2001), as well as other selected areas (Lassetter 1968; Massey 1974; Carter 1978; McCook 1982; Moore 1993). Hilgard (1860) stated: "With the Flatwoods of Octibbeha [sic] county, I am not personally acquainted," and the floristic literature for Oktibbeha County remains sparse. In the first published checklist of Mississippi plants, Lowe (1921) cites several vascular plant collections from Oktibbeha County, among them many species considered rare today by the Mississippi Natural Heritage Program (MNHP). However, the first botanical work dealing explicitly with the flora of Oktibbeha County was a survey of liver- and hornworts (Woods 1964). In recent years, some of the rare plant communities found in Oktibbeha County have been studied (Morris et al. 1993; Leidolf & McDaniel 1998).

The objectives of this study were to develop an annotated checklist of vascular plants and bryophytes (excluding Bryopsida) for Oktibbeha County. In addition, we wanted to provide information on habitat association and abundance of the plant species included in this checklist. In doing so, we hope to establish a botanical baseline for ecological research in this area, while at the same time making an important contribution to the recently revived Flora of Mississippi Project (e.g., Bryson & Carter 1992).

STUDY AREA

Location and Description of Oktibbeha County

Oktibbeha County is located in east-central Mississippi, approximately 200 km northeast of the state capital Jackson, and ca. 60 km west of the Mississippi-Alabama state line. It covers an area of approximately 118 km^2, and is bordered by 6 other counties: Lowndes County to the east, Winston and Noxubee Counties to the south, Webster and Choctaw Counties to the west, and Clay County to the north (Fig. 1). The county seat of Starkville is located 10 km northeast of the geographic center of Oktibbeha County, at the junction of State Highway 25 and U.S. Highway 82. Mississippi State University (MSU) and the Mississippi Agricultural and Forestry Experiment Station are located 2.5 km east of Starkville (Fig. 1). Starkville is the largest town in Oktibbeha County, followed by Maben and Sturgis (Brent 1973).

Climate

The climate of Oktibbeha County is warm and humid, and influenced by the subtropical latitude, the extensive landmass to the north, and the warm temperatures of the Gulf of Mexico (Brent 1973). Annual precipitation averages 141.86 cm, with monthly precipitation ranging from 8.23 cm in October to 15.24 cm in March (Table 1). Winter and spring are the wettest seasons of the year, with fall being the driest. Snow is rare and remains on the ground for short durations only (Brent 1973). Temperatures in Oktibbeha County range from an average low of 5.2°C in January to an average high of 27.0°C in July (Table 1). The average annual number of frost-free days (above 0°C) is 226 (Brent 1973).

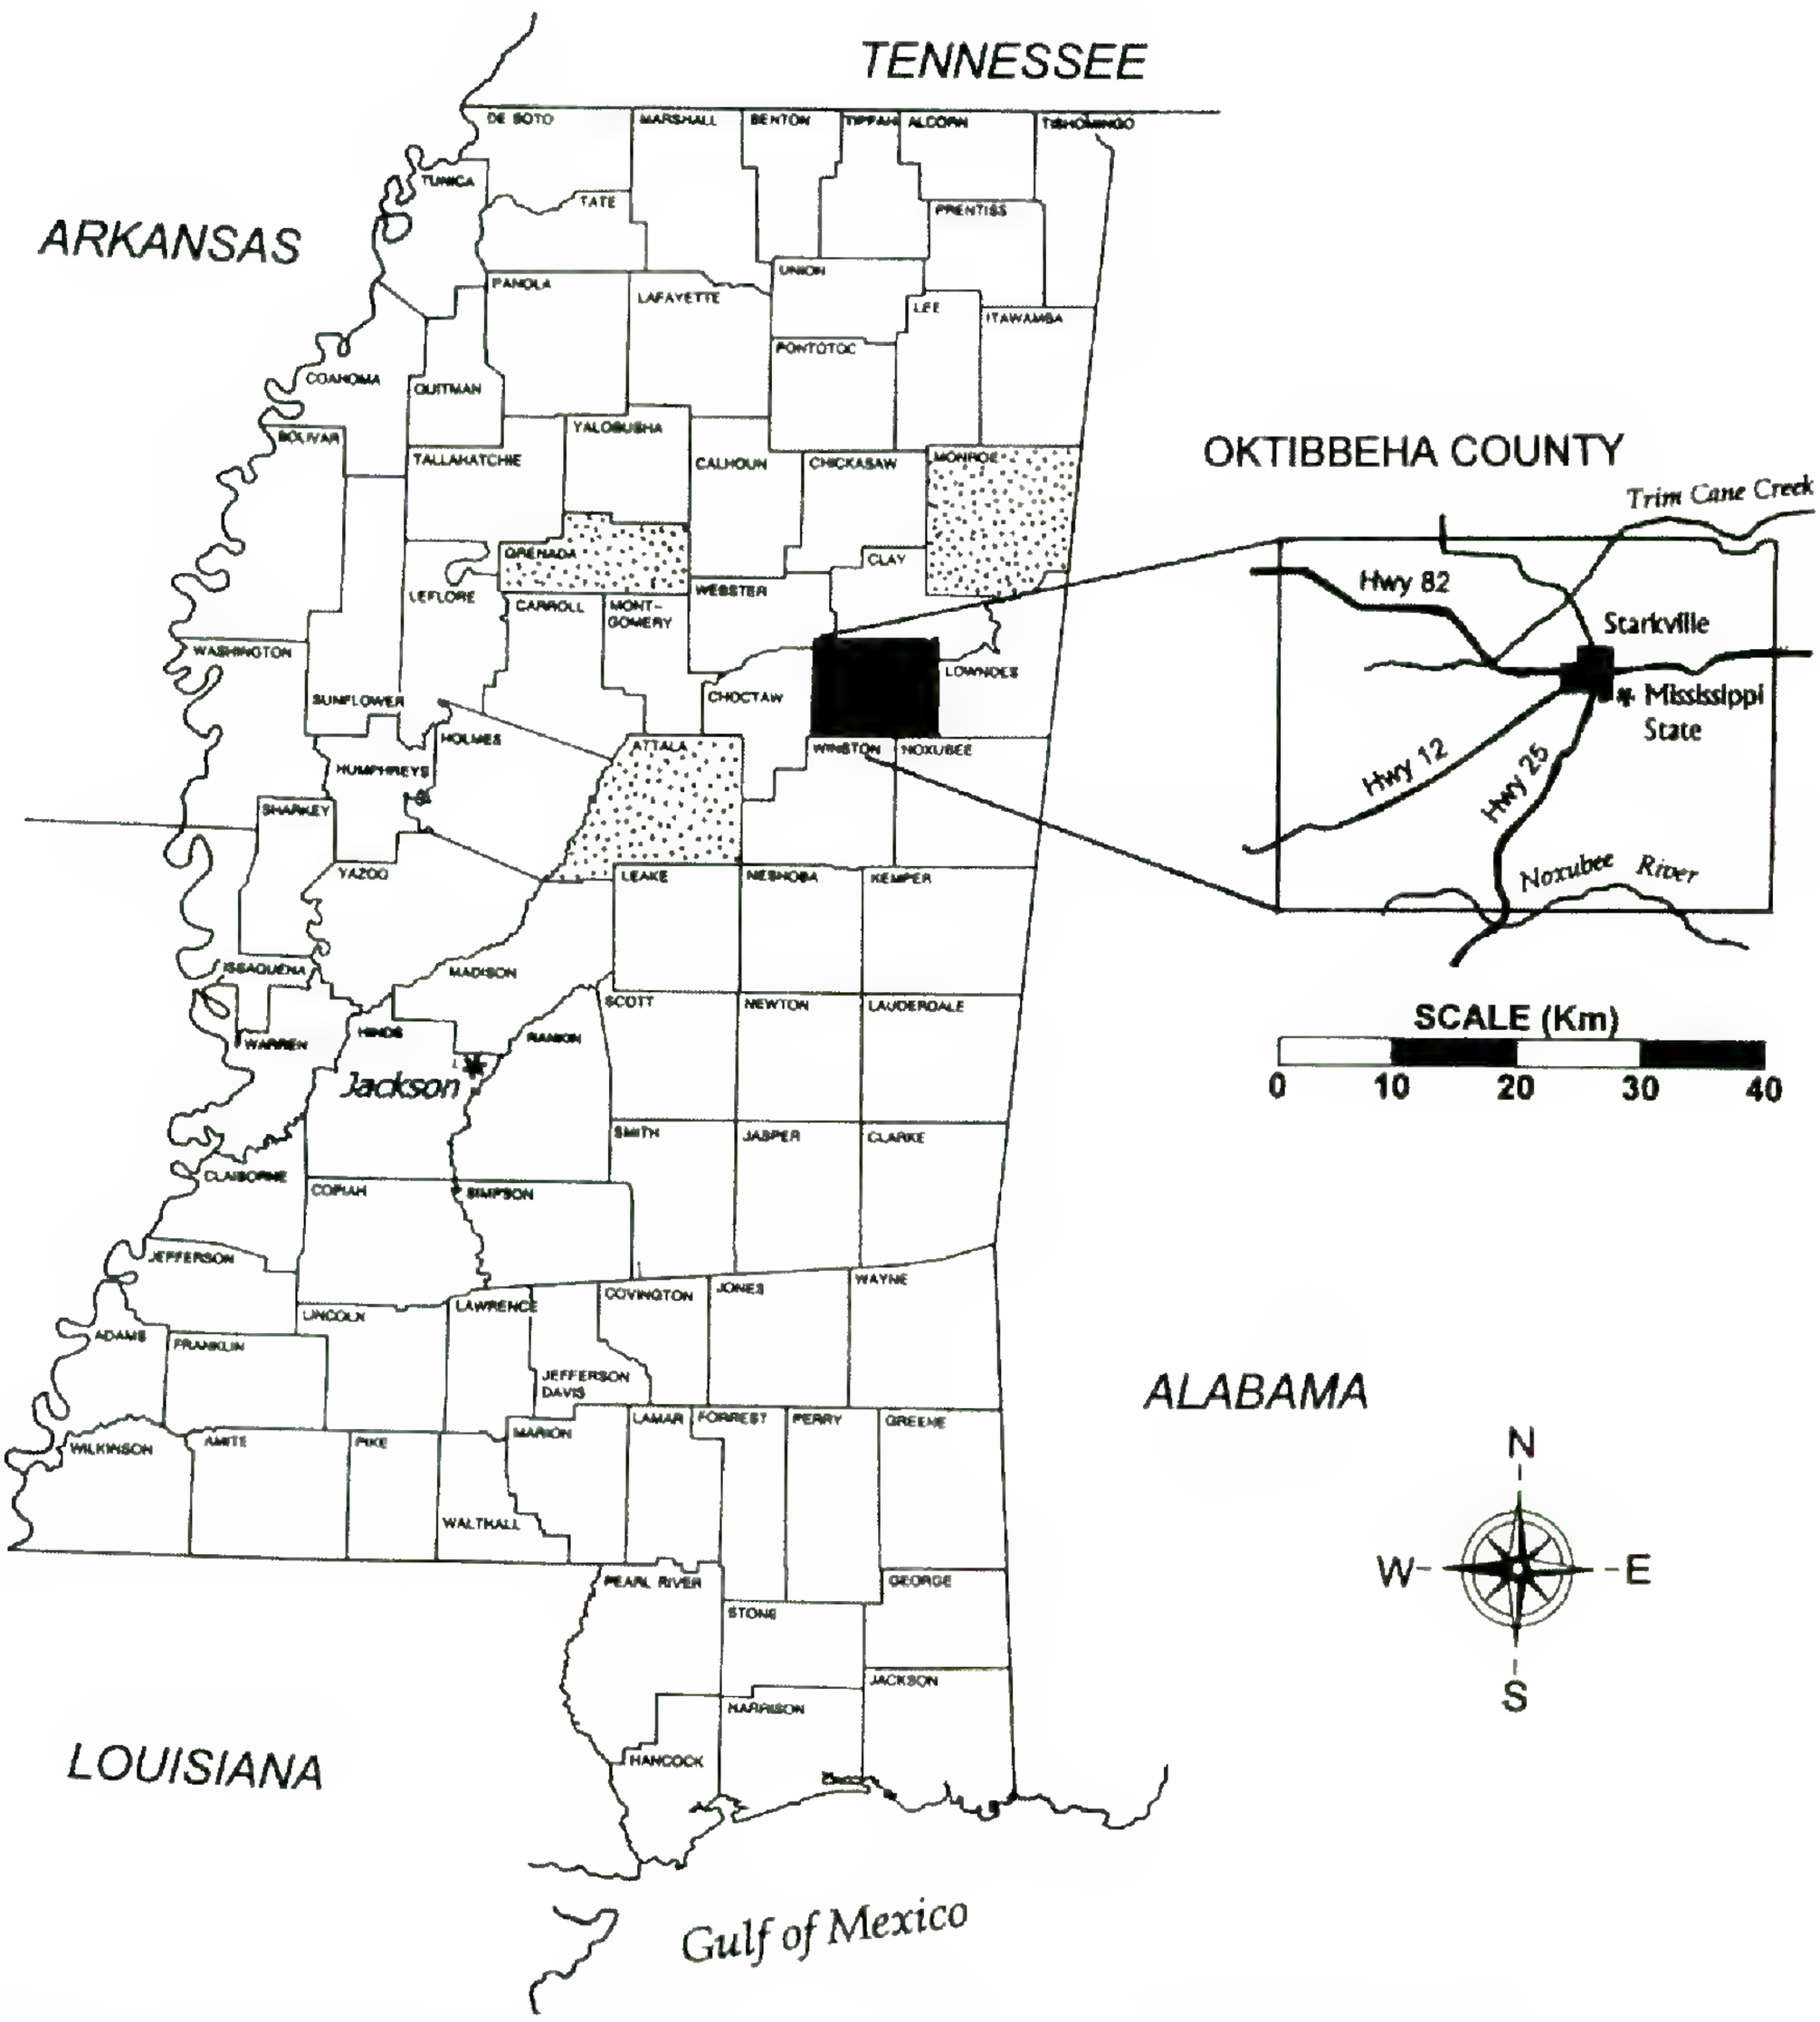

FIG. 1. Map of Mississippi, showing counties, and general location of study area and areas with which comparisons are made. Enlargement shows study area, Oktibbeha County.

Topography, Physiography, Geology, and Soils

Oktibbeha County is located within the Hilly Coastal Plain physiographic province (Fenneman 1938), a predominantly pine (*Pinus* spp.)-covered region in the southeastern United States. Elevation in the county ranges from 50 m a.s.l. in the Tibbe Creek floodplain in the northeastern corner of the county to 180 m a.s.l. in the southwestern corner of the county. The county is mapped on the 7.5' series U.S. Geological Survey topographic maps Artesia, Bluff Lake, Bradley, Cedar Bluff, Crawford West, Double Springs, Longview, Maben, Pheba, Starkville, Sturgis, and West Point. Oktibbeha county is drained into the Tombigbee River

November	18.4	6.2	12.3	10.80
December	12.8	1.5	7.2	15.06
Total:	22.9	10.9	16.9	141.86

by two major drainage systems: the Tibbe Creek system, which includes Sun Creek, Trim Cane Creek, Sand Creek, and Catalpa Creek, drains the northern half of the county; in the southern part of the county, the Noxubee River and its tributaries drain southeastward into the Tombigbee River (Fig. 1, Brent 1973).

Oktibbeha County is situated among three physiographic regions (Fig. 2). The eastern part of the county extends into the Black or Northeastern Prairie Region. Vegetation in this region is influenced by alkaline soils derived from underlying chalk of Upper Cretaceous age, including Demopolis, a bedded chalk consisting primarily of calcite, with small additions of montmorillonitic clay, mica, and sand; and Prairie Bluff, a mixture of bedded chalk and calcareous sandstone (Brent 1973). To the west, the Black Prairie is bordered by the Pontotoc Ridge; here, the Prairie Bluff chalk is, on the highest points, overlain with red clays derived from the Ripley formation, also of Upper Cretaceous age and made up of calcareous sands and clays (Brent 1973). The western portion of the county lies within the Interior Flatwoods, a 5 to 20 km wide band of level to slightly hilly lands (Hilgard 1860). This region was formed from geologic formations of Tertiary age, which include Clayton, a heterogenous formation consisting of sand, calcareous sandstone, chalk conglomerate, clay, or marl; Porters Creek, made up of montmorillonitic clays; Wilcox, a formation consisting of quartz sand, silty clay, bauxitic clay, and clay-ball conglomerates; and Naheola. In addition to these substrates, recent alluvial deposits, as well as older terrace deposits, may be found in the stream valleys and flood plains (Brent 1973).

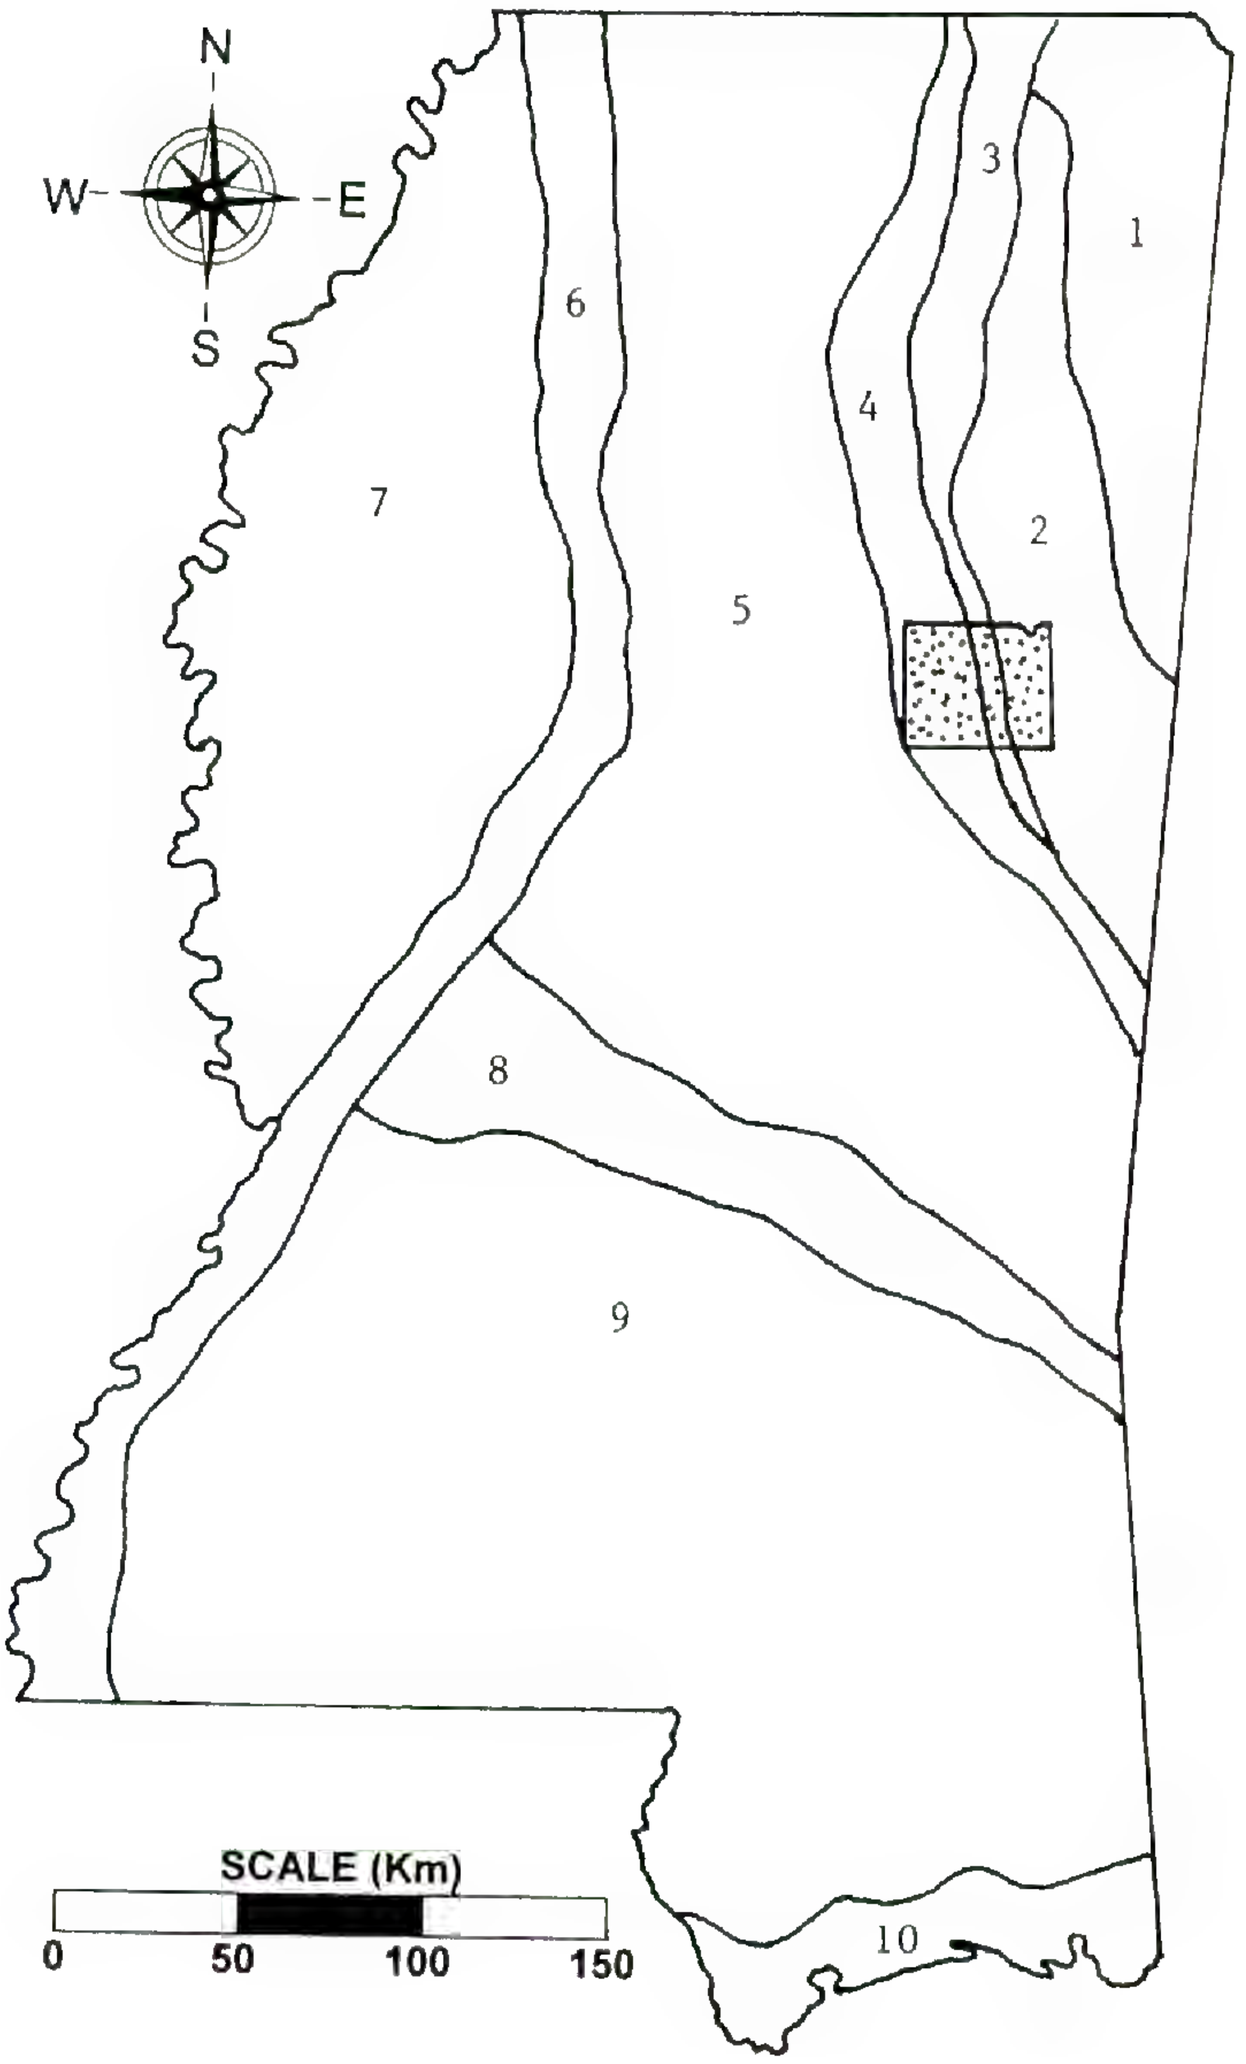

Fig. 2. Map of Mississippi, showing location of study area Oktibbeha County and Mississippi physiographic regions. 1 = Tennessee River Hills 2 = Black Prairie 3 = Pontotoc Ridge 4 = Interior Flatwoods 5 = North Central Plateau 6 = Loess Bluff Hills 7 = Mississippi Alluvial Valley (Yazoo-Mississippi Delta) 8 = Jackson Prairie 9 = Longleaf Pine Belt 10 = Coastal Pine Meadows (after Lowe 1921).

The soils found in Oktibbeha County have been grouped into 10 soil associations (Brent 1973). Three associations consisting of nearly level, somewhat poorly to moderately well-drained soils, occur in floodplains in the Black Prairie (Leeper-Marietta-Catalpa) and the Interior Flatwoods (Mathiston-Urbo, Mantachie-Mathiston-Ochlockonee) physiographic regions. The remaining 7 associations are found on uplands. The most prominent upland soil association in the Black Prairie is the Kipling-Savannah-Oktibbeha Association, which covers 21% of the county and consists of somewhat poorly to moderately well-drained soils with clayey subsoils or moderately well-drained soils with loamy

subsoils and a fragipan. The Kipling-Sumter-Gullied Land Association, made up of somewhat poorly drained to well-drained soils with clayey subsoils developed from chalk that are severely gullied in some areas, is another interesting soil association of the Black Prairie: although it covers only 4% of the county, it is of botanical interest because of the chalk outcrops it includes. Prominent upland soil associations of the Interior Flatwoods physiographic province include the Longview-Falkner-Prentiss Association, which consists of somewhat poorly to moderately well-drained soils with loamy to clayey subsoils and covers 25% of the county, and the Stough-Prentiss-Myatt Association, which is made up of poorly to moderately well-drained soils with loamy subsoils and covers 8% of the county. The narrow ridgetops and sidelopes in the extreme western portion of Oktibbeha County are dominated by the Maben-Ruston-Savannah Association, consisting of moderately well- to well-drained soils with loamy subsoils (Brent 1973).

Presettlement Vegetation

The first white settlers did not arrive in the area of present-day Oktibbeha County until 1820, when Presbyterian missionaries built a mission in Mayhew. Oktibbeha County was created through an act of the state legislature on 23 December 1833, after the land had been acquired from the Choctaw Indians in the Treaty of Dancing Rabbit Creek on 27 September 1830 (Brent 1973). By the 1840 census, 4,276 people lived in Oktibbeha County, of which 1,702 were engaged in agriculture (U.S. Census Bureau 1840). The best available information on pre- and early settlement vegetaion in the area comes from Hilgard's (1860) seminal report on the phytogeography of Mississippi, which was based on his travels through the state in the early to mid-1850's. Although Hilgard (1860) did not visit Oktibbeha County, his comments on the Prairie Belt of neighboring Lowndes County, as well as on the Flatwoods of neighboring Chickasaw, Calhoun, and Choctaw Counties (which, at the time, included present-day Clay and Webster Counties) provide a reasonable estimate of Oktibbeha County's early settlement vegetation. At the time, Oktibbeha County had a population of 9,171, with 20% of its land area (23,655 ha) in improved farmland, distributed among 560 farms (U.S. Census Bureau 1850). However, it is likely that most of this farmland, and therefore, most of the population, was concentrated in the Black Prairie part of the county, with the Interior Flatwoods "... thus far but thinly settled ..." (Hilgard 1860:281).

Based on Hilgard's observations, it is apparent that presettlement vegetation of the Black Prairie was dominated by grasslands, which were "... level, or very gently undulating tracts, possessing a deep black, heavy soil, on which timber is very much scattered or altogether wanting ..." (Hilgard 1860:261). Chalk outcops were already an important component of the landscape at the time, "... forming 'bald prairies' and 'bald hilltops'—in which the limestone is too close

to the surface to allow of the growth of trees or other deep rooted plants, and not unfrequently forms white areas many acres across in extent, strewn with fossils (especially oysters) washed out of the mass, and only here and there a patch of *Verbena* [probably *V. bipinnatifida* and *V. simplex*], or *Cassia* (*C. obtusifolia, occidentalis, marilandica*)." (Hilgard 1860:77). Interspersed with these tracts of open prairie and chalk outcrops were "... tracts of a more rolling surface, mostly with shallow, pale, light soil, timbered with the common upland Oaks—Spanish ("*Red*") [*Quercus falcata*], Post [*Q. stellata*], Black Jack [*Q. marilandica*], and sometimes Red and Black ("Black") [*Q. velutina*] and Scarlet ("Spanish") Oak [*Q. coccinea*] ..." (Hilgard 1860:261). Hilgard's (1860) statements regarding Black Prairie vegetation are echoed by Lowe (1921:32): "The region has a gently rolling surface, and was originally prairies, having only here and there scattered patches of trees, except on the stream bottoms, which supported heavy growths of timber. This Prairie Belt is now largely in cultivation, but some timber remains in the bottoms."

Little can be said regarding the presettlement vegetation of the Pontotoc Ridge in Oktibbeha County. Hilgard (1860) crossed the Pontotoc Ridge far to the north of Oktibbeha County, so his observations may not be entirely representative. However, speaking of the Pontotoc Ridge in general, he referred to it as a "... narrow belt of fertile land underlaid [sic] by marl beds" (Hilgard 1860:266), and further commented on the variable nature of the Pontotoc Ridge vegetation, which ranges from open prairie-like communities in calcareous areas to mesophytic upland hardwood forests on moist, north-facing exposures and xeric upland hardwood forests on sandstone ridges. Lowe (1921:35) noted that the red soils of the Pontotoc Ridge "... support a rich growth ..." and that "[t]he plants of the Pontotoc Ridge present decided differences from those of the prairies lying to the east, and the tertiary flatwoods on the west."

Presettlement vegetation of the Interior Flatwoods in the western part of Oktibbeha County likely consisted of upland hardwood forest dominated by *Quercus stellata* Wangenh., *Q. marilandica* Muenchh., and *Pinus* spp., with *Liriodendron tulipifera* L. common on sideslopes and in hollows. *Vaccinium* spp. was abundant in the understory; herbacious ground cover was sparse. Moving east and south into the Interior Flatwoods, these upland species were gradually replaced by *Quercus alba* L., *Q. falcata* Michx., *Q. rubra* L., and *Carya* spp., with the ground "... covered with a fine growth of grass." (Hilgard 1860:280-282).

Land Use, Present-day Vegetation, and Disturbance

Prior to 1923, most (> 75%) of Oktibbeha County had been farmed at one time or another, with the main crop being cotton (*Gossypium* sp.; U.S. Census Bureau 1920, Brent 1973). As recent as 1964, 67% of the county's land area was farmland (Brent 1973); today, in part due to such government programs as the Conservation Reserve Program (U.S. Department of Agriculture [USDA] Farm Ser-

vice Agency) and the Stewardship Incentives Program (USDA Forest Service), forestry and recreation have supplanted agriculture as the primary land uses in the county. As of 1997, there were 329 farms covering 35,000 ha, or 30% of Oktibbeha County (USDA National Agricultural Statistics Service [NASS], http://www.nass.usda.gov). On the other hand, forest land now makes up 64% of the county, with 28% pine, 58% hardwood, and 14% mixed forest (Mississippi Forestry Commission, http://www.mfc.state.ms.edu). The John W. Starr Memorial Forest and Noxubee National Wildlife Refuge (NWR), which represent extensive areas of forested land and provide a variety of recreational opportunities, are partially located in Oktibbeha County. The remainder of the county is urban land.

With the exception of the John W. Starr Memorial Forest and Noxubee NWR, most areas of the county have been heavily impacted by anthropogenic disturbance, including agriculture and forestry, and the condition of the vegetation is correspondingly poor. Disturbance from agriculture is most evident in the Black Prairie physiographic region, with much of the native prairie vegetation having been replaced by crop- and pasture land. Despite the fact that a sizeable percentage of land has been taken out of cultivation over the last decades, these lands have shown a tendency to grow up in trees rather than returning to their original grassland vegetation (Lowe 1921, Leidolf & McDaniel 1998). Furthermore, the few remnant prairies that remain today are subject to a combination of anthropogenic and natural disturbances, including exotic species invasions, recreation, and erosion.

Disturbance from forest operations is a major factor affecting the vegetation of the Interior Flatwoods. This is especially true for privately owned forest land, where management appears to be driven primarily by economic considerations; accordingly, treatments are often severe, with minimal rotation lengths. On the John W. Starr Memorial Forest and Noxubee NWR, forest management more closely mimics natural processes and generally follows Mississippi Best Management Practices that attempt to minimize the effect of forest operations on land condition.

METHODS

We made vascular plant and bryophyte collections from February 1994 to 1996. Collecting trips were conducted on a regular basis, at an average rate of one trip per week, covering all parts of Oktibbeha County. We processed all collections using standard field and herbarium techniques (Blake 1932; Smith 1971; Jones & Luchsinger 1986). Field notes included information on habitat, species association, relative abundance, and natural history/ecology. Whenever possible, we collected duplicate vouchers, except in the case of rare species. A complete set of voucher specimens has been deposited at IBE, with partial sets distributed to

BRIT, FR, UTC, and the Mississippi State University College of Forest Resources Herbarium (MSUSFR).

After completion of field work, we conducted a complete herbarium review of existing records at IBE and MISSA. All other herbaria in the state were judged to have too few specimens from Oktibbeha County to warrant close attention. Specimens from Oktibbeha County were verified and annotated. Where available, we incorporated label information on physiographic region, habitat of occurrence, and relative abundance into our annotated checklist. We examined 710 specimens in this manner. We also reviewed pertinent literature and published checklists for records from Oktibbeha County and, after critical evaluation, incorporated them into the checklist. Since the specimens upon which the reports are based were usually not seen, only the reference is provided.

Sources used for identification and verification of specimens, as well as for nomenclatural reference, included Allen (1992), Bailey and Bailey (1976), Barkworth et al. (In preparation), Britton and Brown (1970), Burkhart (1969), Correll and Johnston (1970), Cronquist (1980), Davenport (1988), Godfrey and Wooten (1979, 1981), Great Plains Flora Association (1986), Hitchcock (1951), Isley (1990), Krüssmann (1977), Lellinger (1985), Morris (1989), Radford et al. (1968), Shinners (1962), and Steyermark (1963). Where used, herbarium acronyms follow Holmgren et al. (1990). Abbreviations of botanical journals follow Bridson and Smith (1991).

RESULTS AND DISCUSSION

General

We documented 1,148 plant taxa (1,125 species, 7 hybrid taxa, and 16 infraspecific taxa) from Oktibbeha County, belonging to 160 families and 514 genera. Of these taxa, 976 (85%) are native (Table 2). Seventeen families are represented by 5 genera or more (Table 3); 46 genera are represented by 5 taxa or more (Table 4). Noteworthy collections include 3 introduced species documented in a naturalized state from Mississippi for the first time: *Ilex cornuta* Lindl. & Paxton, *Mahonia bealei* (Fortune) Carrière, and *Nandina domestica* Thunb. [The last species has since been reported from Amite County, Mississippi (Alford 2001)]. All 3 species are used frequently for landscaping by MSU and were encountered in a mesophytic upland hardwood forest in the Pontotoc Ridge physiographic region adjacent to campus. Given the common characteristics of their seeds (all 3 species produce fleshy berries readily consumed by birds [Dirr 1990]), animals, specifically birds, represent the most likely disperal vector.

Compared to 3 other counties in east-central Mississippi, Oktibbeha County has the second largest documented vascular flora. It has 17% and 11% more vascular plant taxa than Attala (Winstead 1990) and Grenada County (Morris 1987), respectively, and 14% less vascular plant taxa than Monroe County (MacDonald 1996). Compared to these 3 counties, Oktibbeha County has the highest species

richness in 5 out of 20 representative flowering plant families; for an additional 11 families, Oktibbeha County ranks second in species richness (Table 5). The 1,103 species of vascular plants documented from Oktibbeha County comprise 38.7% of all vascular plant species known to occur in Mississippi (USDA, Natural Resources Conservation Service [NRCS] Plants database, http://plants.usda.gov).

Rare/Protected Species

Oktibbeha County features a large number of rare and protected species. Sixty-seven species are currently listed as sensitive (MNHP 2002a, 2002b; Table 6), far exceeding the number of state-listed species reported from 3 other counties in east-central Mississippi (Table 5). Statewide, Oktibbeha County ranks 4th in the number of sensitive species, after Jackson, Tishomingo, and Perry Counties

(MMNS database, June 2002). Four species are also listed as either threatened or rare by the USDA Forest Service (Kral 1983, Table 6); of these, *Apios priceana* B.L. Rob. is currently the only species listed as federally threatened (5 January 1990, 55 FR 433) under the Endangered Species Act (16 USCS §1531 et seq.). Nineteen species in the families Araliaceae, Cactaceae, and Orchidaceae are also afforded special protection as Appendix II species under the Convention on International Trade in Endangered Species of Wild Flora and Fauna (27 UST 1087; TIAS No. 8249; Table 6). The most significant discovery in the category of rare and protected species is that of a small population of *Alisma subcordatum* Raf. at Oktibbeha County Lake, a plant species previously considered to be of only historical occurrence in Mississippi.

Plant Communities

We recognized 16 different plant communities that can be grouped into 5 broad categories: bottomland forests, upland forests and prairies, aquatic communities, seepage areas, and human-influenced communities.

BOTTOMLAND FORESTS

Bottomland forests are formed by alluvial processes of erosion and sediment deposition that result in diverse topographical formations such as ridges, sloughs, flats, and terraces. Topographical variation results in a variety of flooding regimes; thus, small differences in topography effect large differences in edaphic conditions, and the resulting differences in plant associations are obvious. The two main types of bottomland forest we recognized, bottomland hardwood forest and swamp forest, owe their respective plant communities primarily to differences in flooding regime. Because Oktibbeha County lacks major streams, the extent of bottomland sites is limited.

[a]Nomenclature follows Kartesz (1994) and Barkworth et al. (In preparation).—[b]Mississippi Natural Heritage Program (2002a, 2002b) rank: Critically imperiled globally (G1), imperiled globally (G2), rare and local throughout range, found locally in a restricted range, or vulnerable to extinction (G3), apparently secure globally, but may be rare in parts of its range (G4), demonstrably secure globally (G5), with "?" indicating uncertainty about or inexactness of a rank. State (S) ranks are same as global ranks, except in that "state" is substituted for "global", with SH, SJ, and S? indicating historical occurrence but suspected to be extant, uncertain rank, and unranked, respectively.—[c]Endangered Species Act, 16 USCS §1531 et seq. T= threatened species, i.e., a species likely to become endangered within the foreseeable future throughout all or a significant portion of its range.—[d]Convention on

1. Bottomland hardwood forests.—Bottomland hardwood forests in Oktibbeha County are found primarily in the Interior Flatwoods physiographic region, where they occur on seasonally flooded sites associated with creeks and minor streams. The high foliage volume of these forests gives credence to their reputation for high productivity. Depending on mode of establishment and disturbance history (e.g., logging), bottomland hardwood forests in Oktibbeha County may have multiple layers, including overstory, midstory (subcanopy), and woody and herbaceous understory layers (the latter may be weakly developed or lacking in forests subject to recent logging); however, due to variations in tree height and extensive growth of such lianas as *Rhus radicans* L., *Bignonia capreolata* L., *Ampelopsis* spp., *Parthenocissus quinquefolia* (L.) Planch., *Vitis* spp., and *Smilax* spp., stratification may not be readily apparent at any given site. In addition to the vegetation layers already mentioned, unique and locally important features include palmetto [*Sabal minor* (Jacq.) Pers.] thickets and dense cane [*Arundinaria gigantea* (Walter) Muhl.] brakes.

The overstory of bottomland hardwood forests is generally dominated by oaks (*Quercus* spp.) with species composition depending on moisture. From wet to dry, dominants include *Q. lyrata* Walter, *Q. michauxii* Nutt., *Q. nigra* L., *Q. phellos* L., and *Q. pagoda* Raf. Co-dominants include *Q. alba* L., *Q. falcata* Michx., *Q. laurifolia* Michx., *Q. rubra* L., *Q. shumardii* Buckley, *Q. stellata* Wangenh., *Q. texana* Buckley, *Fagus grandifolia* Ehrh., *Liquidambar styraciflua* L., *Carya carolinae-septentrionalis* (Ashe) Engl. & Graebn., *C. cordiformis* (Wangenh.) K. Koch, *C. glabra* (Mill.) Sweet, *C. ovalis* (Wangenh.) Sarg., *C. ovata* (Mill.) K. Koch, *C. tomentosa* (Lam. ex Poir.) Nutt., and *Liriodendron tulipifera* L.; noteworthy is *Carya leiodermis* Sarg., which is listed as imperiled to rare and local in the state (S2S3, MNHP 2002a). Common intermediate/midstory trees include *Acer rubrum* L., *Nyssa sylvatica* Marshall, *Celtis laevigata* Willd., *Ulmus americana* L., and *U. alata* Michx. Examples of small trees/large shrubs include *Asimina triloba* Dunal, *Ilex decidua* Walter, *Carpinus caroliniana* Walter, *Ostrya virginiana* (Mill.) K. Koch, *Rhododendron canescens* (Michx.) Sweet, *Aesculus pavia* L., *Hamamelis virginiana* L., *Lindera benzoin* (L.) Blume, *Sassafras albidum* (Nutt.) Nees, *Amelanchier arborea* (F. Michx.) Fernald, *Crataegus viridis* L., and *Planera aquatica* J.F. Gmel.; noteworthy records include *Ptelea trifoliata* L. and *Staphylea trifolia* L., which are listed as rare and local to apparently secure (S2S3) and rare and local (S3) in the state, respectively (MNHP 2002a, 2002b). The understory consists of a mixture of small shrubs, includ-

---

Table 6 legend (continued)

International Trade in Endangered Species of Wild Fauna and Flora, 27 UST 1087; TIAS No. 8249. II – Appendix II species, i.e., (a) a species which, although not necessarily threatened with extinction, may become so unless trade is subject to strict regulations, or (b) a species which must be subject to regulation in order that trade in certain specimens of species referred to under (a) may be brought under effective control, i.e., species similar in appearance.—[e]USDA Forest Service Technical Publication R8-TP2 (Kral 1983). T = threatened, R = rare.

ing *Cornus stricta* Lam., *Vaccinium* spp., *Hydrangea quercifolia* W. Bartram, and *Itea virginica* L.; and herbs, including such ferns as *Botrychium biternatum* (Sav.) Underw. and *Onoclea sensibilis* L., such forbs as *Thaspium trifoliatum* (L.) A. Gray, *Dicliptera brachiata* (Pursh) Spreng., *Amsonia tabernaemontana* Walter, *Aristolochia tomentosa* Sims, *Pluchea camphorata* (L.) DC., *Solidago caesia* L., *Lobelia cardinalis* L., *Specularia biflora* (Ruiz & Pav.) Fisch. & C.A. Mey., *Desmodium canescens* (L.) DC., *D. cuspidatum* (Muhl. ex Willd.) DC. ex Loudon, *Vicia caroliniana* Walter, *Triadenum* spp., *Collinsonia tuberosa* Michx., *Lycopus virginicus* L., *Spigelia marilandica* L., *Ludwigia* spp., *Polygonum virginianum* L., *Epifagus virginiana* (L.) Baton, *Gratiola* spp., *Arisaema dracontium* (L.) Schott, *Commelina virginica* L., *Tradescantia virginiana* L., *Maianthemum racemosum* (L.) Link, and *Dioscorea villosa* L., and such graminoids as *Carex abscondita* Mack., *C. annectens* (E.P. Bicknell) E.P. Bicknell, *C. caroliniana* Schwein., *C. corrugata* Fernald, *C. flaccosperma* Dewey, *C. leavenworthii* Dewey, *C. longii* Mack., *C. louisianica* L.H. Bailey, *C. reniformis* (L.H. Bailey) Small, *C. typhina* Michx., *Cinna arundinacea* L., *Dichanthelium commutatum* (Schult.) Gould, *Leersia oryzoides* (L.) Sw., *L. virginica* Willd., *Panicum rigidulum* Bosc ex Nees in Mart., and *Paspalum repens* P.J. Bergius. *Pleopeltis polypodioides* (L.) E.G. Andrews & Windham var. *michauxiana* (Weath.) E.G. Andrews & Windham in Windham is a common epiphyte. Noteworthy understory species listed as sensitive (MNHP 2002a, 2002b) include *Dasistoma macrophylla* (Nutt.) Raf. (rare and local to apparently secure–S3S4), *Lilium superbum* L. (S3S4), *Muhlenbergia glabriflora* Scribn. (uncertain status–S?), *Spiranthes ovalis* Lindl. (imperiled to rare and local–S2S3), and *Triphora trianthophora* (Sw.) Rydb. (S2S3).

In the Black Prairie physiographic region, intensive agriculture has reduced once extensive bottomland hardwood forests to narrow gallery forests along small streams. Here, noteworthy species include *Quercus nigra* L., *Q. durandii* Buckley, *Carya tomentosa* (Lam. ex Poir.) Nutt., and *C. laciniosa* (F. Michx.) G. Don, which is listed as imperiled to rare and local in the state (S2S3, MNHP 2002a), in the overstory, with *Acer negundo* L., *Morus rubra* L., and *Ulmus rubra* Muhl. as intermediates. Shrubs include *Asimina triloba* (L.) Dunal, *Aesculus glabra* Willd., which is listed as possibly imperiled in the state (S2?, MNHP 2002a), *A. pavia* L., and *Prunus americana* Marshall; *Zizia aurea* (L.) W.D.J. Koch and *Eupatorium rugosum* are common herbaceous species.

2. *Swamp Forests.*—Swamp forests are permanently/semi-permanently inundated, and occur along the shallow margins of existing stream channels and old oxbow lakes that have been cut off from the main channel and have been partially silted in. Because of the small size of streams in Oktibbeha County, swamp forests are fairly limited in extent, with shallow water depths. Furthermore, they are restricted to the Interior Flatwoods physiographic region; the Black Prairie lacks streams of sufficient size. Frequency and duration of flood-

ing limits the species that can occur in swamp forests to extremely water-tolerant species. Germination for most species can only occur during periods of low water when the soil is exposed. Thus, in contrast to bottomland hardwood forests, swamp forests have a fairly sparse foliage profile. The overstory is dominated by *Quercus lyrata* Walter and, occasionally, *Taxodium distichum* (L.) L.C. Rich. Where present, water-tolerant shrubs and small trees (e.g., *Itea virginica* L. and *Vaccinium arboreum* Marshall) grow in small patches or singly and sparsely distributed. Because of the presence of standing water, ground vegetation is often absent, or may consist of small patches or scattered individuals of *Justicia ovata* (Walter) Lindau var. *lanceolata* (Chapm.) R.W. Long, *Bidens discoidea* (Torr. & A. Gray) Britton, *Polygonum densiflorum* Meisn., *Saururus cernuus* L., *Gratiola virginiana* L., *Pilea pumila* (L.) A. Gray, *Carex intumescens* Rudge, *C. joorii* L.H. Bailey, and *Leersia lenticularis* Michx.

Upland Forests and Prairies

1. Mesophytic upland hardwood forests.—Mesophytic upland hardwood forests are typically found in the Pontotoc Ridge physiographic region (see Morris et al. 1993); in the Interior Flatwoods, they rarely occur in the transition zone between upland pine/pine-mixed hardwood forests and bottomland forests; in the Black Prairie, they rarely occur in association with streams. Mesophytic upland hardwood forests are among the most diverse plant communities in Oktibbeha County; they are also home to some of the rarest plants in the county, featuring 18 species listed by the MNHP (2002a, 2002b), with many of them occurring only in this community. Mesophytic upland hardwood forests are characterized by an overstory of mixed deciduous hardwoods, including *Acer barbatum* Michx., *Fagus grandifolia* Ehrh., *Quercus alba* L., *Q. muehlenbergii* Engelm., *Q. shumardii* Buckley, *Q. stellata* Wangenh., *Carya carolinae-septentrionalis* (Ashe) Engl. & Graebn., *C. myristiciformis* (F. Michx.) Nutt., *Juglans nigra* L., *Liriodendron tulipifera* L., and *Platanus occidentalis* L.; noteworthy overstory species are *Fraxinus quadrangulata* Michx. and *Ulmus serotina* Sarg., which are listed as imperiled (S2) and possibly rare and local (S3?) in the state, respectively (MNHP 2002a). Conifers are absent from this community. Common under- and midstory trees and shrub include *Asimina triloba* (L.) Dunal, *Viburnum rufidulum* Raf., *Ostrya virginiana* (Mill.) K. Koch, *Cornus florida* L., *Rhododendron canescens* (Michx.) Sweet, *Aesculus pavia* L., *Tilia americana* L., and *Ulmus americana* L.; noteworthy mid- and understory associates are *Evonymus atropurpureus* Jacq. and *Crataegus calpodendron* (Ehrh.) Medik., which are listed as imperiled to rare and local (S2S3) and being of uncertain status (S?) in Mississippi, respectively (MNHP 2002a). Also common are lianas, including *Smilax bona-nox* L., *S. lasioneura* Hook., and *S. pulverulenta* Michx. The herbaceous plant layer is characterized by such forbs as *Sanicula odorata* (Raf.) K.M. Pryer & L.R. Phillippe, *Thaspium barbinode* (Michx.) Nutt.,

Heliopsis gracilis Nutt., *Podophyllum peltatum* L., *Cynoglossum virginianum* L., *Lithospermum latifolium* Michx., *Myosotis macrosperma* Engelm., *Cardamine concatenata* (Michx.) Sw., *Monotropa hypopithys* L., *Desmodium glutinosum* (L.) DC., *D. rotundifolium* DC., *Vicia caroliniana* Walter, *Spigelia marilandica* L., *Oxalis violacea* L., *Sanguinaria canadensis* L., *Anemone virginiana* L., *Thalictrum thalictroides* (L.) Eames & B. Boivin, *Agrimonia rostellata* Wallr., *Galium uniflorum* Michx., *Pedicularis canadensis* L., *Scrophularia marilandica* L., *Physalis heterophylla* Nees, *Viola* spp., *Arisaema* spp., *Lilium michauxii* Poir., *Tipularia discolor* (Pursh) Nutt., and *Trillium recurvatum* L.C. Beck, including such spring ephemerals as *Claytonia virginica* L., *Allium canadense* L., *Nothoscordum bivalve* (L.) Britton, *Uvularia sessilifolia* L., and *Hypoxis hirsuta* (L.) Coville; such graminoids as *Carex albicans* Willd. ex Spreng. var. *albicans*, *C. lupulina* Muhl. ex Willd., *C. striatula* Michx., *C. vulpinoidea* Michx., *Luzula echinata* (Small) F.J. Herm., *Agrostis perennans* (Walter) Tuck., *Chasmanthium latifolium* (Michx.) H.O. Yates, *C. sessiliflorum* (Poir.) H.O. Yates, *Dichanthelium boscii* (Poir.) Gould & C.A. Clark, *D. polyanthes* (Schult.) Mohlenbr., *Melica mutica* Walter, *Panium anceps* Michx., and *Poa autumnalis* Muhl. ex Elliott; as well as a diverse array of ferns and fern allies, including *Selaginella apoda* (L.) Spring, *Woodwardia areolata* (L.) T.Moore, *Polystichum acrostichoides* (Michx.) Schott, *Botrychium virginianum* (L.) Sw., *Osmunda cinnamomea* L., *O. regalis* L., *Pleopeltis polypodioides* (L.) E.G. Andrews & Windham var. *michauxiana* (Weath.) E.G. Andrews & Windham in Windham, *Athyrium filix-femina* (L.) Roth ex Mert. ssp. *asplenioides* (Michx.) Farw., and *Onoclea sensibilis* L.; noteworthy species from this association listed by MNHP (2002a, 2002b) are *Apios priceana* B.L. Rob. (critically imperiled–S1, federally threatened), *Asarum canadense* L. (imperiled to rare and local–S2S3), *Carex gracilescens* Steud. (S2S3), *C. jamesii* Schwein. (critically imperiled to imperiled–S1S2), *C. laxiflora* Lam. (S1), *Dasistoma macrophylla* (Nutt.) Raf. (rare and local to apparently secure–S3S4), *Frasera caroliniensis* Walter (S2S3), *Hexalectris spicata* (Walter) Barnhart (imperiled–S2), *Hybanthus concolor* (T.F. Forst.) Spreng. (S2), *Menispermum canadense* L. (S3S4), *Panax quinquefolius* L. (rare and local–S3), *Taenidia intergerrima* (L.) Drude (S1), *Thalictrum debile* Buckley (S1S2), and *Triosteum angustifolium* L. (S3).

2. *Xeric upland hardwood forests.*—In Oktibbeha County, xeric upland hardwood forests occur on dry secondary sandstone ridges in all 3 physiographic regions: on isolated hills scattered throughout the Black Prairie, on the Pontotoc Ridge, and in the transition zone from the Interior Flatwoods to the North-central Plateau physiographic region. Xeric upland hardwood forests in Oktibbeha County feature a unique complement of floristic elements, many of which are found in no other plant community in the county. In the Black Prairie, dominant overstory species include *Quercus marilandica* Muenchh., *Q. muehlenbergii* Engelm., *Q. velutina* Lam., *Liquidambar styraciflua* L., *Carya*

myristiciformis (F. Michx.) Nutt., and *C. tomentosa* (Lam. ex Poir.) Nutt.; noteworthy overstory species include *Quercus macrocarpa* Michx., which is listed as imperiled in the state (S2, MNHP 2002a). Common trees, shrubs, and woody vines of the mid- and understory are *Campsis radicans* (L.) Seem. ex Bureau, *Symphoricarpos orbiculatus* Moench, *Cornus drummondii* C.A. Mey., *Vaccinium arboreum* Marshall, *Amorpha fruticosa* L., *Sassafras albidum* (Nutt.) Nees, *Maclura pomifera* (Raf.) C.K. Schneider, *Crataegus engelmannii* Sarg., and *Zanthoxylum clava-herculis* L. Examples of characteristic herbaceous species are *Matelea gonocarpos* (Walter) Shinners, *Rudbeckia hirta* L., *Sagina decumbens* (Elliott) Torr. & A. Gray, *Desmodium ciliare* (Muhl. ex Willd.) DC., *Anagallis minima* (L.) Krause, *Ranunculus micranthus* Nutt., *Agrimonia rostellata* Wallr., *Fragaria virginiana* Duchesne, *Galium pilosum* Aiton, *Carex blanda* Dewey, *C. bushii* Mack., *C. umbellata* Schkuhr ex Willd., *Juncus tenuis* Willd., and *Luzula bulbosa* (Alph. Wood) Smyth & Smyth; noteworthy associates are *Erythronium albidum* Nutt. and *Spiranthes lacera* (Raf.) Raf., which are listed as imperiled (S2) and rare and local to apparently seure (S3S4) in the state, respectively (MNHP 2002a, 2002b). On the Pontotoc Ridge, characteristic woody species include *Campsis radicans* (L.) Seem. ex Bureau, *Lonicera sempervirens* L., *Quercus shumardii* Buckey, *Liquidambar styraciflua* L., *Carya myristiciformis* (F. Michx.) Nutt., *Sassafras albidum* (Nutt.) Nees, *Celtis laevigata* Willd., and *Smilax lasioneura* Hook., with *Antennaria plantaginifolia* (L.) Richardson, *Erigeron strigosus* Muhl. ex Willd., *Vicia minutiflora* F.Dietr., *Oxalis violacea* L., *Passiflora lutea* L., *Carex blanda* Dewey, *C. cephalophora* Muhl. ex Willd., *C. triangularis* Boeck, and *Juncus tenuis* Willd. being typical herbaceous species; *Echinacea purpurea* (L.) Moench, listed as rare and local to apparently secure in the state (S3S4, MNHP 2002a), is a noteworthy record from this association. The overstory of xeric upland hardwood forests in the Interior Flatwoods physiographic region is dominated by such species as *Quercus alba* L., *Q. falcata* Michx., *Q. nigra* L., *Q. pagoda* Raf., *Q. shumardii* Buckley, *Liquidambar styraciflua* L., and *Carya glabra* (Mill.) Sweet; *Campsis radicans* (L.) Seem. ex Bureau, *Sassafras albidum* (Nutt.) Nees, *Crataegus spathulata* Michx., and *Ampelopsis arborea* (L.) Koehne are common shrubs and vines of the mid- and understory. *Asclepias amplexicaulis* Small, *Matelea gonocarpos* (Walter) Shinners, *Euphorbia corollata* L., *Lespedeza virginica* (L.) Britton, *Pycnanthemum tenuifolium* Schrad., *Trichostema brachiatum* L., *Rhexia mariana* L. var. *mariana*, *Oxalis violacea* L., *Passiflora lutea* L., *Aureolaria flava* (L.) Farw., *Juncus tenuis* Willd., *Luzula bulbosa* (Alph. Wood) Smyth & Smyth, *Chasmanthium sessiliflorum* (Poir.) H.O. Yates, and *Dichanthelium boscii* (Poir.) Gould & C.A. Clark are typical herbaceous species.

3. *Pine Forests and Pine-Mixed Hardwood Forests.*—By and large, pine forests and pine-mixed hardwood forests in Oktibbeha County are restricted to the Interior Flatwoods physiographic region. The vast majority are intensively

managed pine plantations; naturally regenerated, unmanaged pine forests are rare. Management activities associated with timber production, including prescribed burns on variable rotations, pre-commercial and commercial thinning, and herbicide injection of undesirable hardwoods, result in reduced vegetation stratification and woody species richness in managed pine forests, and prevent naturally occurring plant succession. As a result, species composition differs significantly between managed and natural stands (Table 7). For example, natural pine or pine-hardwood forests, in addition to having a more diverse overstory, usually feature a well-developed midstory consisting of a diverse array of hardwoods, including *Acer rubrum* L., *Carya tomentosa* (Lam. ex Poir.) Nutt., *Cornus florida* L., *Liquidambar styraciflua* L., *Nyssa sylvatica* Marshall, *Diospyros virginiana* L., *Quercus* spp., *Sassafras albidum* (Nutt.) Nees, *Prunus serotina* Ehrh., and *Ulmus alata* Michx. (Table 7). Managed pine forests, on the other hand, where development of midstory vegetation is actively prevented, have only two vegetation layers: an overstory composed almost exclusively of *Pinus taeda* L. (and some *P. echinata* Mill.), and an understory that, much like that of pine-mixed hardwood forests, is characterized by a diverse assemblage of plants, including such graminoids as *Dichanthelium acuminatum* (Sw.) Gould & C.A. Clark ssp. *lindheimeri* (Nash) Freckmann & Lelong in ed., *D. laxiflorum* (Lam.) Gould, *Saccharum brevibarbe* (Michx.) Pers. ssp. *contortum* (Elliott) R.D. Webster, *S. giganteum* (Walter) Pers., and *Schizachyrium scoparium* (Michx.) Nash in Small, as well as the fire-adapted *Andropogon gerardii* Vitman and *Sorghastrum nutans* (L.) Nash in Small; a variety of forbs, including *Apocynum cannabinum* L., *Asclepias tuberosa* L., *Aster solidagineus* Michx., *Bidens aristosa* (Michx.) Britton, *Eupatorium* spp., *Euthamia tenuifolia* (Pursh) Nutt., *Liatris spicata* (L.) Willd., *Solidago* spp., *Chamaecrista fasciculata* (Michx.) Greene, *Lespedeza* spp., *Tephrosia virginiana* (L.) Pers., *Seymeria cassioides* (J.F. Gmel.) S.F. Blake, *Aletris aurea* Walter, and *Spiranthes tuberosa* Raf.; such lianas as *Rhus radicans* L., *Lonicera japonica* Thunb., *Gelsemium sempervirens* (L.) W.T. Aiton, *Vitis rotundifolia* Michx., *Smilax glauca* Walter, and *S. rotundifolia* L.; shrubs and small trees, including *Aralia spinosa* L., *Vaccinium* spp., *Hyperium hypericoides* (L.) Crantz, *Crataegus* spp., and *Rubus* spp.; and tree seedlings, inluding *Carya glabra* (Mill.) Sweet and *Quercus* spp. (Table 7). Noteworthy pine and pine-mixed hardwood forest associates include *Asclepias hirtella* (Pennell) Woodson and *Lobelia appendiculata* A.DC., which are listed as imperiled (S2) and imperiled to rare and local (S2S3) in the state, respectively (MNHP 2002a).

4. Prairies.—Betz (1977) defines a prairie as a vegetative community composed of native perennial grasses and other herbaceous plants, and in which grasses contribute much of the vegetative cover. Prairies in Oktibbeha County are located largely in the Black Prairie physiographic region, and are of the blackland type, so named after the deep mantle of fertile black soil high in organic

TABLE 7. Importance value[a] of under-, mid-, and overstory plant species in representative managed and unmanaged pine forests and pine-mixed hardwood forests, Oktibbeha County, Mississippi, Fall 1993 (data from Theriot et al. 1993)[b].

Species	Pine forest (managed)	Pine forest (unmanaged)	Pine-mixed hardwood forest
Understory			
Carya glabra (Mill.) Sweet	38.98	-	-
Lonicera japonica Thunb.	61.71	72.19	58.34
Rubus spp.	9.23	93.87	10.23
Smilax spp.	15.67	22.61	8.14
Solidago spp.	9.12	22.33	16.91
Rhus radicans L.	11.67	6.13	17.03
Ulmus alata Michx.	2.83	14.41	2.45

matter, which occurs over a substrate of Cretaceous chalk or marl (Foti 1989). Today, most native prairies in Oktibbeha County have been replaced by agriculture (Lowe 1921; Brent 1973), with only few relicts of this highly threatened ecoregion remaining along highway and powerline rights-of-way. Prairies are among the most diverse plant communities in Oktibbeha County, albeit the condition of the prairie vegetation is generally quite poor due to the extent of human disturbance. Prairies are also home to some of the rarest plants in the county, featuring 19 species listed by the MNHP (2002a, 2002b), with many of them occurring only in this community. Prairie habitats in Oktibbeha County are dominated by a complex of graminoids, composites, and legumes. Characteristic graminoids include *Carex basiantha* Steud., *C. cherokeensis* Schwein., *C. granularis* Muhl. ex Willd., *C. hirsutella* Mack., *C. muehlenbergii* Schkuhr ex Willd., *Scleria oligantha* Michx., *Juncus torreyi* Coville, *Andropogon glomeratus* (Walter) Britton, Sterns & Poggenb., *A. virginicus* L., *Aristida longespica* Poir. in Lam., *A. oligantha* Michx., *Bothriochloa laguroides* (DC.) Pilger in Engler ssp. *torreyana* (Steud.) Allred & Gould, *Dichanthelium depauperatum* (Muhl.) Gould, *Panicum virgatum* L., *Phalaris caroliniana* Walter, *Schizachyrium scoparium* (Michx.) Nash in Small, *Setaria parviflora* (Poir.) Kerguélen, and *Sporobolus vaginiflorus* (Torr. ex A. Gray) Alph. Wood. Common forbs are *Ruellia humilis* Nutt., *Apocynum cannabinum* L., *Asclepias* spp., *Aster* spp., *Cacalia plantaginea* (Raf.) Shinners, *Dracopis amplexicaulis* (Vahl) Cass., *Heterotheca camporum* (Greene) Shinners, *Liatris* spp., *Ratibida pinnata* (Vent.) Barnh., *Rudbeckia fulgida* Aiton, *Silphium* spp., *Solidago* spp., *Lithospermum canescens* (Michx.) Lehm., *Lobelia spicata* Lam., *Cuscuta pentagona* Engelm. var. *pentagona*, *Croton* spp., *Euphorbia* spp., *Tragia urticifolia* Michx., *Crotalaria sagittalis* L., *Dalea candida* Willd., *D. purpurea* Vent., *Sabatia angularis* (L.) Pursh, *Hypericum sphaerocarpum* Michx., *Monarda citriodora* Cerv. ex. Lag., *Anemone caroliniana* Walter, *Delphinium carolinianum* Walter ssp. *carolinianum*, *Ranunculus fascicularis* Muhl. ex Bigelow, *Potentilla simplex* Michx., *Hedyotis* spp., *Agalinis* spp., *Buchnera floridana* Gandog., *Penstemon digitalis* Nutt. ex Sims, *P. laevigatus* Aiton, *Verbena bipinnatifida* Nutt., *V. simplex* Lehm., *Manfreda virginica* (L.) Salisb. ex Rose, *Hypoxis hirsuta* (L.) Coville, and *Sisyrinchium albidum* Raf. In disturbed areas, such ruderal species as *Ambrosia psilostachya* DC., *A. trifida* L., *Iva annua* L., *Lactuca saligna* L., *Lepidium virginicum* L., *Medicago lupulina* L., and *Melilotus alba* Medik. may be evident. Noteworthy prairie species listed by MNHP (2002a, 2002b) include *Perideridia americana* (Nutt. ex DC.) Reichenb. (critically imperiled to imperiled–S1S2), *Amphiachyris*

---

[a]The importance value is the sum of relative frequency, relative density, and relative dominance (Daubenmire 1968).—[b]Data for understory estimates based on 100 ft. of line transect per habitat type using the intercept method (Canfield 1942); data for mid- and overstory estimates based on 10 sample points per habitat type using the point-centered-quarter (PCQ) method (Cottam & Curtis 1956).

dracunculoides (DC.) Nutt. (critically imperiled–S1), *Aster ericoides* L. (imperiled–S2), *Evax prolifera* Nutt. ex DC. (S1), *Prenanthes aspera* Michx. (S2), *Neptunia lutea* (Leavenw.) Benth. (rare and local to apparently secure–S3S4), *Linum sulcatum* Riddell (S3S4), *Dodecatheon meadia* L. (S2), *Delphinium tricorne* Michx. (S2), *Agalinis pseudaphylla* (Pennell) Shinners (S2), *Penstemon tenuiflorus* Pennell (imperiled to rare and local–S2S3), *Tomanthera auriculata* (Michx.) Raf. (S1), *Carex jamesii* Schwein. (S1S2), *C. meadii* Dewey (S3S4), *C. microdonta* Torr. & Hook. (possibly imperiled–S2?), *Nemastylis geminiflora* Nutt. (S2), *Spiranthes magnicamporum* Sheviak (S2S3), and *Bouteloua curtipendula* (Michx.) Torr. in Marcy (S3S4); *Onosmodium molle* Michx. ssp. *hispidissimum* (Mack.) B. Boivin is considered rare by USDA Forest Service (Kral 1983). Further discussion of Black Prairie floristics in Oktibbeha County can be found in Leidolf and McDaniel (1998).

5. Prairie Cedar Woodlands.—Leidolf and McDaniel (1998) define a prairie cedar woodland as "...*Juniperus virginiana* L.-dominated patches of woody vegetation restricted to thin, highly erodible, calcareous soils over chalk ... that are often interspersed with areas of exposed chalk, giving them a glade-like appearance". Prairie cedar woodlands are commonly found in the Black Prairie physiographic region of Oktibbeha County. Leidolf and McDaniel (1998) suggested that the apparent abundance of this plant community is a rather recent feature, and linked it to the absence of natural disturbance. Lowe (1921) also noted that "... lands formerly in cultivation and now thrown out, show a strong tendency to grow up in trees, ..."

Characteristic tree and shrub species of this community include *Juniperus virginiana* L. var. *virginiana*, *Rhus aromatica* Aiton, *Ilex decidua* Walter, *Viburnum rufidulum* Raf., *Cornus drummondii* C.A. Mey., *Quercus marilandica* Muenchh., *Q. muehlenbergii* Engelm., *Q. stellata* Wangenh., *Sassafras albidum* (Nutt.) Nees, *Maclura pomifera* (Raf.) C.K. Schneid., *Morus rubra* L., *Fraxinus americana* L., *Ligustrum sinense* Lour., *Ceanothus americanus* L., *Rhamnus caroliniana* Walter, *Crataegus crus-galli* L., *C. engelmannii* Sarg., *Rosa carolina* L., *Rubus cuneifolius* Pursh, *Bumelia lycioides* (L.) Pers., *Celtis laevigata* Willd., *Ulmus alata* Michx., and *U. rubra* Muhl.; *Campsis radicans* (L.) Seem. ex Bureau, *Lonicera japonica* Thunb., *Berchemia scandens* (Hill) K. Koch, *Ampelopsis arborea* (L.) Koehne, *Parthenocissus quinquefolia* (L.) Planch., *Vitis aestivalis* Michx., and *Smilax bona-nox* L. are common lianas. Herbaceous vegetation is sparse and includes *Ruellia caroliniensis* (J.F. Gmel.) Steud., *Sanicula canadensis* L., *Euphorbia spathulata* Lam., *Apios americana* Medik., *Cocculus carolinus* (L.) DC., *Fragaria virginiana* Duchesne, *Carex bushii* Mack., *C. cherokeensis* Schwein., and *C. oxylepis* Torr. & Hook var. *pubescens* J.K. Underw.; occasionally ferns, such as *Asplenium platyneuron* (L.) Oakes and *Pleopeltis polypodioides* (L.) E.G. Andrews & Windham var. *michauxiana* (Weath.) E.G. Andrews & Windham in Windham can be found. A number of unique floristic elements

found in no other habitat in Oktibbeha County were also found: *Rhus toxicodendron* L., *Helianthus divaricatus* L., and *Panicum flexile* (Gatt.) Scribn. in Kearney. Noteworthy prairie cedar woodland species listed by MNHP (2002a, 2002b) include *Ophioglossum engelmannii* Prantl (critically imperiled–S1), *Neptunia lutea* (Leavenw.) Benth. (rare and local to apparently secure–S3S4), *Dodecatheon meadia* L. (imperiled–S2), *Rhamnus lanceolata* Pursh (S2), *Penstemon tenuiflorus* Pennell (imperiled to rare and local–S2S3), and *Ponthieva racemosa* (Walter) C.Mohr (possibly imperiled–S2?). Morris et al. (1993) and Leidolf and McDaniel (1998) provide additional comments on prairie cedar woodland floristics in Oktibbeha County.

6. Chalk Outcrops.—Chalk outcrops in Oktibbeha County are restricted to the Black Prairie physiographic region. They were first recognized as being floristically distinct by Hilgard (1860), who referred to them as "bald prairies". Leidolf and McDaniel (1998) defined chalk outcrops as "... areas of exposed chalk, with all of the overlying soil eroded away ...", and suggested that aggravated erosion during periods of intense cultivation may have been responsible for an apparent decline in native prairie grasslands accompanied by a simultaneous increase in the abundance of chalk outcrops. Because conditions for plant growth in this unique habitat are severe, chalk outcrops do not support a diverse plant community; however, they harbor floristic elements not found elsewhere in Oktibbeha County, including *Senecio obovatus* Muhl. ex Willd., *Chamaesyce humistrata* (Engelm.) Small, *C. serpens* (Kunth) Small, *Lespedeza procumbens* Michx., and *Mirabilis albida* (Walter) Heimerl. Due to ample rainfall and low evaporation, the ground is usually moist during winter and spring months, and colonies of the blue-green alga *Nostoc* sp. can occasionally be found; in the summer, harsher, drier conditions prevail. Plant species characteristic of this habitat type include both native prairie grassland remnants, and plants that colonize chalk outcrops after erosion. Commonly found trees and shrubs include *Juniperus virginiana* L. var. *virginiana*, *Rhus aromatica* Aiton, *Cornus drummondii* C.A. Mey., *Hypericum sphaerocarpum* Michx., *Ceanothus americanus* L., *Rhamnus caroliniana* Walter, and *Prunus angustifolia* Marshall. Characteristic herbs are *Amaranthus rudis* J.D. Sauer, *Asclepias viridis* Walter, *Aster patens* Aiton, *Brickelia eupatorioides* (L.) Shinners var. *eupatorioides*, *Coreopsis lanceolata* L., *Heterotheca camporum* (Greene) Shinners, *Liatris squarrosa* (L.) Michx., *Silphium laciniatum* L., *Lithospermum canescens* (Michx.) Lehm., *Brassica erucastrum* L., *Euphorbia corollata* L., *Dalea candida* Willd., *D. purpurea* Vent., *Sabatia angularis* (L.) Pursh, *Agalinis tenuifolia* (Vahl) Raf., *Verbena bipinnatifida* Nutt., *V. simplex* Lehm., and *Sisyrinchium albidum* Raf. Noteworthy members of this association listed by MNHP (2002a) are *Sedum pulchellum* Michx. (critically imperiled–S1), *Rhamnus lanceolata* Pursh (imperiled–S2), *Penstemon tenuiflorus* Pennell (imperiled to rare and local–S2S3), and *Nemastylis geminiflora* Nutt. (S2). Further discussions of chalk outcrop

floristics in Oktibbeha County are provided by Morris et al. (1993) and Leidolf and McDaniel (1998).

Aquatic Communities

Aquatic communities in Oktibbeha County include both such lotic systems as rivers, creeks, canals, and drainage ditches, and lentic systems, including lakes, ponds, and artificial impoundments. Vegetation in these communities is mostly restricted to narrow regions near the shore referred to as riparian areas. Riparian areas generally have higher species diversity than either the adjacent terrestrial or aquatic communities, because they serve as a transition between the two systems. They are also generally more productive because of periodic influxes of nutrients from seasonal floods, and favorable moisture conditions yearround. Species composition at any point in a riparian area is largely a function of the degree or periodicity of inundation from the adjacent stream (Mitsch & Gosselink 1986).

1. Rivers/Creeks.—We discuss here the flora associated with riparian areas immediately adjacent to the stream bank, including those species growing on banks, associated mud flats, and directly in the stream (emergents). Submergent species are generally absent in local streams, because the turbid water effectively prevents photosynthesis; where clear-water streams do exist (i.e., in the Black Prairie physiographic region) pH is likely too high for plant growth, and consequently, no submergent species were observed. As mentioned previously, there are no major alluvial systems in Oktibbeha County; thus extensive riparian swamp forests are not represented.

In the Interior Flatwoods physiographic region, streambank associations include such small trees and shrubs as *Quercus lyrata* Walter, *Planera aquatica* J.F. Gmel., *Salix nigra* Marshall, *Acer negundo* L., *Betula nigra* L., *Prunus serotina* Ehrh., and *Evonymus americanus* L., as well as such woody vines as the introduced *Lonicera japonica* Thunb., and herbaceous plants, including *Thaspium trifoliatum* (L.) A. Gray, *Aristolochia tomentosa* Sims, *Leersia virginica* Willd., and *Paspalum repens* P.J. Bergius; noteworthy members of this association include *Ptelea trifoliata* L., which is listed as rare and local to apparently secure in the state (S3S4, MNHP 2002b). Due to their ephemeral nature, mudflat communities in the Interior Flatwoods are generally limited to such herbaceous plants as *Lobelia cardinalis* L., *Lycopus virginicus* L., *Samolus valerandi* L. ssp. *parviflorus* (Raf.) Hultén, *Lindernia dubia* (L.) Pennell, *Mimulus alatus* Aiton, *Physalis virginiana* Mill., *Boehmeria cylindrica* (L.) Sw., and *Commelina virginica* L. Emergents are few, and include *Ammania coccinea* Rottb., *Hydrolea uniflora* Raf., and *Penthorum sedoides* L.

Streambank associations in the Black Prairie physiographic region are characterized by *Aesculus pavia* L., *Tilia americana* L., *Lonicera japonica* Thunb., *Apios americana* Medik., *Mimulus alatus* Aiton, and *Silphium perfoliatum* L.

Noteworthy streambank associates include *Aesculus glabra* Willd., which is listed as possibly imperiled in the state (S2?, MNHP 2002a), and was found exclusively on Catalpa silty clay loam. Common emergents are *Ludwigia peploides* (Kunth) Raven and *Juncus acuminatus* Michx.

2. *Canals/Drainage Ditches.*—Canals/drainage ditches include both artificial, human-made structures, such as irrigation canals and culverts, and semi-natural features, such as unimproved roadside ditches. These habitats vary considerably with respect to extent, seasonality, and speed of water flow; they include habitats subject to year-round water flow as well as ephemeral habitats. Like rivers and creeks, the vegetation associated with canals/drainage ditches can be separated into riparian species (i.e., those species growing on the banks) and emergent species; additionally, the flora of canals/drainage ditches includes a small number of submergent species.

In the Interior Flatwoods physiographic region, plants commonly found on canal and ditch banks include such small trees and shrubs as *Sambucus canadensis* L. *and Cephalanthus occidentalis* L., as well as such herbaceous species as *Justicia ovata* (Walter) Lindau var. *lanceolata* (Chapm.) R.W. Long, *Ptilimnium capillaceum* (Michx.) Raf., *Rotala ramosior* (L.) Koehne, *Ranunculus pusillus* Poir., *Dichanthelium polyanthes* (Schultes) Mohlenbr., *D. sphaerocarpon* (Elliott) Gould, and *Urochloa ramosa* (L.) T.Q. Nguyen; noteworthy bank species include *Muhlenbergia glabriflora* Scribn., which is listed as being of uncertain status in Mississippi (S?, MNHP 2002a). Dominant emergent species primarily include such obligate and facultative aquatic forbs, sedges, and rushes as *Physostegia angustifolia* Fern., *Mollugo verticillata* L., *Ludwigia* spp., *Penthorum sedoides* L., *Polygonum* spp., *Gratiola* spp., *Commelina virginica* L., *Carex flaccosperma* Dewey, *C. joorii* L.H. Bailey, *Cyperus odoratus* L., *C. strigosus* L., *Eleocharis* spp., *Fimbristylis* spp., *Rhynchospora corniculata* (Lam.) A. Gray, *Scirpus atrovirens* Willd., *Iris virginica* L., *Juncus* spp., and *Typha latifolia* L.; noteworthy emergents include *Alisma subcordatum* Raf., which is listed as being of historical occurrence in Oktibbeha County (SH, MNHP 2002a). Submergent species include *Callitriche heterophylla* Pursh and *Najas guadalupensis* (Spreng.) Magnus.

In the Black Prairie physiographic region, canal and ditch banks are characterized by *Sambucus canadensis* L., *Salix exigua* Nutt., *Rorippa sessiliflora* (Nutt.) Hitchc., *Apios americana* Medik., *Ranunculus pusillus* Poir., and *Dichanthelium ravenellii* (Scribn. & Merr.) Gould. Characteristic emergent species in the Black Prairie are *Physostegia angustifolia* Fern., *Ludwigia peploides* (Kunth) Raven, *Polygonum lapathifolium* L., *Lysimachia nummularia* L., *Commelina communis* L., *Carex frankii* Kunth, *Cyperus odoratus* L., *C. acuminatus* Torr. & Hook. ex Torr., *Eleocharis obtusa* (Willd.) Schult., *Scirpus pendulus* Muhl., *Juncus* spp., and *Typha* spp.

3. *Lakes/Ponds/Impoundments.*—All lakes and ponds in Oktibbeha County

are artificial impoundments formed by damming a river, creek, or other drainage. Only two sizable (>250 ha) examples are present, both in the Interior Flatwoods physiographic region: Oktibbeha County Lake and Bluff Lake (most of which is in neighboring Noxubee County). Most other lentic systems are less than 10 ha in size and completely surrounded by private land; thus the flora of these areas may be underrepresented in this document because of poor access. We were able to obtain a fair representation from one such smaller lake, Dorman Lake, which is on public land and also located in the Interior Flatwoods.

The flora of lakes and ponds can be discussed in terms of those species growing in the riparian zone, including the margin or bank, and associated mudflats; those growing in the littoral zone, i.e., the shallow part of the lake immediately adjacent to the shore, including emergents, submergents, rooted-floating, and free-floating species; and those growing in the profundal zone, i.e., the deeper or interior part of the lake, including rooted-floating and free-floating species.

Common species along the margins of lakes and ponds include such small trees and shrubs as *Baccharis halimifolia* L., *Betula nigra* L., *Itea virginica* L., *Cephalanthus occidentalis* L., which also occurs in standing water in mudflats and in the littoral zone, and *Salix humilis* Marshall, as well as herbaceous species, including *Baptisia alba* (L.) R.Br. var. *macrophylla* (Larisey) Isley and *Leptochloa panicoides* (J. Presl) Hitchc. Mudflat associates include *Eryngium prostratum* Nutt. ex DC., *Pluchea camphorata* (L.) DC., *Lobelia cardinalis* L., *Polygala mariana* Mill., *Polygonum aviculare* L., *Ranunculus abortivus* L., *Micranthemum umbrosum* (J.F. Gmel.) S.F. Blake, *Arisaema dracontium* (L.) Schott, *Cyperus erythrorhizos* Muhl., *Cinna arundinacea* L., *Juncus elliottii* Chapm., *Scirpus cyperinus* (L.) Kunth, *Echinodorus cordifolius* (L.) Griseb., and *Sagittaria platyphylla* (Engelm.) J.G. Sm. These last 3 species, along with *Hydrolea uniflora* Raf., *Ludwigia palustris* (L.) Elliott, *Polygonum* spp., *Eleocharis quadrangulata* (Michx.) Roem. & Schult., and *Juncus nodatus* Coville, are also representative emergent species. A noteworthy collection from this association is *Alisma subcordatum* Raf., which is listed as being of historical occurrence in Oktibbeha County (SH, MNHP 2002a).

As their name implies, rooted-floating plants are attached to the substrate, with leaves floating at the lake surface. Rooted-floating and submergent vegetation occurs from the lake margin to a depth of ca. 2 m in the littoral zone. In contrast, free-floating species, including *Azolla caroliniana* Willd. and *Spirodela polyrrhiza* (L.) Schleid., occur in both the littoral and the profundal zone, but generally are blown into clumps on the lee side of water bodies. Submergent species of the littoral zone include *Callitriche heterophylla* Pursh, *Utricularia gibba* L., *Najas minor* All., and *Zanichellia palustris* L. Representative rooted-floating plants are *Brasenia schreberi* J.F. Gmel., *Limnobium spongia* (Bosc) Rich. ex Steud., *Nelumbo lutea* Willd., *Nymphaea odorata* Aiton,

Potamogeton diversifolius Raf., and *P. nodosus* Poir. Frequently, dense vegetation mats formed by rooted-floating plants provide a substrate for other plants to grow hydroponically. However, no evidence of this was found in Oktibbeha County.

Seepage Areas

Seepage areas are highly localized habitats that occur on relatively thin soil covering an underlying hardpan or rock formation and that, depending on local soil conditions and vegetation, vary considerably with respect to the source and extent of water flow, acidity, and degree and duration of stagnation. However, with the exception of a small number of natural springs, most seepage areas in Oktibbeha County consist of small ground depressions along roadsides in the Interior Flatwoods physiographic region. They are fed by sub-lateral flow from associated pine forests and occur on sandy loams overlain by a thin layer of clay. Consequently, water flow is acidic and highly unpredictable, with very little stagnation occurring. Within the constraints imposed by the local species pool, the vegetation of seepage areas most closely resembles that of a southern pine bog. Characteristic plant species include ferns and fern allies, such as *Lycopodiella alopecuroides* (L.) Cranfill, *L. appressa* (Chapm.) Cranfill, *L. prostrata* (R.M. Harper) Cranfill, *Woodwardia areolata* (L.) T.Moore, and *Pteridium aquilinum* (L.) Kuhn var. *pseudocaudatum* (Clute) A.Heller; graminoids, including *Carex frankii* Kunth, *Cyperus polystachyos* Rottb., *C. rotundus* L., *Kyllinga odorata* Vahl, *Rhynchospora caduca* Elliott, *R. inexpansa* (Michx.) Vahl, *Panicum virgatum* L., and *Paspalum* spp.; as well as numerous forbs, including *Aster solidagineus* Michx., *Pityopsis graminifolia* (Michx.) Nutt., *Buchnera floridana* Gandog., *Ruellia caroliniensis* (J.F. Gmel.) Steud., *Drosera brevifolia* Pursh, *Eryngium prostratum* Nutt. ex DC., *E. yuccifolium* Michx., *Lysimachia ciliata* L., *Polygala nana* (Michx.) DC., *Aletris aurea* Walter, *Spiranthes cernua* (L.) Rich., *S. praecox* (Walter) S.Watson, and *Xyris torta* Small; noteworthy species from this association include *Platanthera cristata* (Michx.) Lindl., which is listed as rare and local in the state (S3, MNHP 2002a). Occasionally, the small shrub *Salix humilis* Marshall can be found. Where stagnant pools of water occur, *Callitriche heterophylla* Pursh may be found submergent.

Human-influenced Communities

1. Cultivated Fields.—As of 1997, 17,500 ha, or 15%, of Oktibbeha County was cropland (USDA NASS, http://www.nass.usda.gov). Due to its productive soils, most cropland in the county is located in the Black Prairie physiographic region. Crops commonly planted include corn (*Zea mays* L.), cotton, and soy bean (*Glycine max* [L.] Merr.). A variety of weedy species, both native and exotic, readily invades these cultivated fields. Common natives found in this habitat include such forbs as *Amaranthus* spp., *Ciclospermum leptophyllum* (Pers.) Sprague ex Britton & Wilson, *Aster pilosus* Willd. var. *pilosus*, *Helenium*

autumnale L., *Ipomoea lacunosa* L., *I. pandurata* (L.) G.Mey., *Myosotis verna* Nutt., *Rorippa sessiliflora* (Nutt.) Hitchc., *Sibara virginica* (L.) Rollins, *Chamaesyce* spp., *Oenothera laciniata* Hill., *Myosurus minimus* L., *Ranunculus hispidus* Michx. var. *hispidus*, and *Linaria canadensis* (L.) Chaz.; as well as graminoids, including *Juncus bufonius* L., *J. torreyi* Coville, *Digitaria ciliaris* (Retz.) Koel., *Panicum capillare* L., *Paspalum pubiflorum* Rupr. ex E.Fourn., and *Urochloa platyphylla* (Munro ex Wright) R.D. Webster. Frequently encountered exotic forbs are *Arctium minus* Bernh., *Ipomoea hederacea* Jacq., *Capsella bursa-pastoris* (L.) Medik., *Cerastium glomeratum* Thuill., *Spergula arvense* L., *Medicago arabica* (L.) Huds., *Vicia grandiflora* Scop., *Abutilon theophrasti* Medik., *Polygonum aviculare* L., *Rumex crispus* L., *Ranunculus arvensis* L., and *R. muricatus* L.; representative exotic graminoids include *Cyperus esculentus* L., *C. rotundus* L., *Cyonodon dactylon* (L.) Pers., *Echinochloa colona* (L.) Link, *E. muricata* (P.Beauv.) Fernald, *Lolium multiflorum* Lam., *Paspalum dilatatum* Poir. in Lam., *Poa annua* L., *Setaria faberi* R.A.W. Herm., and *Sorghum halepense* (L.) Pers.

2. *Grass/Forb Meadows.*—Plant species occurring in grass/forb meadows, which include hay fields, pastures, and wildlife food plots, have to withstand or escape the frequent grazing or mowing characteristic for this community. Some species escape this disturbance by growing close to the ground, such as *Galium pilosum* Aiton, *Hedyotis crassifolia* Raf., *Ranunculus pusillus* Poir., *Veronica persica* Poir., and *Kyllinga odorata* Vahl., whereas other species, such as *Panicum scoparium* Lam., *Trifolium arvense* L., or *T. pratense* L., persist even under heavy grazing. Another group of plants found in this community are early spring ephemerals, such as *Claytonia virginica* L. and *Nothoscordum bivalve* (L.) Britton.

Grass/forb meadow associations in the Interior Flatwoods physiographic region are characterized by such species as *Euthamia tenuifolia* (Pursh) Nutt., *Eupatorium rotundifolium* L., *Cardamine bulbosa* (Schreb. ex Muhl.) Britton, Sterns & Poggenb., *Cuscuta pentagona* Engelm. var. *pentagona*, *Euphorbia spathulata* Lam., *Hypericum punctatum* Lam., *Prunella vulgaris* L., *Trichostema brachiatum* L., *Hedyotis crassifolia* Raf., *Glyceria declinata* Bréb., and *Dichanthelium scoparium* (Lam.) Gould; moist depressions may hold such wetland species as *Ludwigia alternifolia* L., *L. hirtella* Raf., and *Gratiola neglecta* Torr.; noteworthy records from this association include *Asclepias hirtella* (Pennell) Woodson, which is listed as imperiled in the state (S2, MNHP 2002a).

In the Black Prairie physiographic region, species representative of grass/forb meadows include *Ruellia humilis* Nutt., *Silphium laciniatum* L., *Vernonia gigantea* (Walter) Trel. var. *gigantea*, *Lithospermum canescens* (Michx.) Lehm., *Opuntia humifusa* (Raf.) Raf., *Galium pilosum* Aiton, *Carex festucacea* Schkuhr ex Willd., and *Kyllinga odorata* Vahl; noteworthy collections from this association include *Armoracia lacustris* (A. Gray) Al-Shebaz & Bates and *Camassia*

scilloides Corey, which are listed as critically imperiled to imperiled (S1S2), and imperiled to rare and local (S2S3) in the state, respectively (MNHP 2002a).

3. *Roadsides.*—Roadsides are among the most interesting plant communities in Oktibbeha County, as they represent a conglomerate of floristic elements of diverse origins. Because roads are frequently associated with human habitation, both past and present, roadside plant communities often feature species that have escaped from or persist after cultivation. Examples in Oktibbeha County include *Catalpa bignonioides* Walter, *Wisteria sinensis* (Sims) DC., *Broussonetia papyrifera* (L.) L'Hér. ex Vent., *Populus alba* L., *Lycoris radiata* (L'Hér.) Herb., *Narcissus* spp., *Hemerocallis fulva* (L.) L., *Muscari neglectum* Guss. ex Ten., and *Belamcanda chinensis* (L.) DC. The high frequency of disturbance, e.g., mowing of rights-of-way, associated with roadsides also provides suitable habitat for a diverse array of native herbs and exotic weeds ("ruderals"). New introductions are likely to be seen first along roads that can provide far-reaching connections between seed source and suitable dispersal habitat. Examples of common native roadside species include *Bidens aristosa* (Michx.) Britton, *Cirsium horridulum* Michx., *Erigeron annuus* (L.) Pers., *Iva annua* L., *Senecio anonymus* Wood, *Acalypha virginica* L., *Chamaesyce maculata* (L.) Small, *Croton capitatus* Michx., *Desmanthus illinoensis* (Michx.) MacMill. ex B.L. Rob. & Fernald, *Lespedeza cuneata* (Dum.Cours.) G. Don, *Blephilia ciliata* (L.) Benth., *Hedeoma hispida* Pursh, *Prunella vulgaris* L., *Plantago rugelii* Decne., *Rumex hastatulus* Baldwin, *Carex frankii* Kunth, *C. triangularis* Boeck., *Dichanthelium laxiflorum* (Lam.) Gould & C.A. Clark, *D. scabriusculum* (Elliott) Gould & C.A. Clark, *Elymus virginicus* L., and *Tridens flavus* (L.) Hitchc. Exotics frequently encountered include *Daucus carota* L., *Torilis arvensis* (Huds.) Link, *Taraxacum officinale* Weber ex F.H. Wigg., *Capsella bursa-pastoris* (L.) Medik., *Lonicera japonica* Thunb., *Cerastium glomeratum* Thuill., *Medicago lupulina* L., *Trifolium repens* L., *Lamium* spp., *Verbena brasiliensis* Vell., *Bothriochloa pertusa* (L.) A.Camus, *Setaria parviflora* (Poir.) Kerguélen, and *Sorghum halepense* (L.) Pers. Whereas the species mentioned thus far can be found along roads throughout the county, roadside communities, to a large degree, also reflect the plant communities that immediately surround them. Thus, roadsides in the Interior Flatwoods often feature such species as *Boltonia diffusa* Elliott, *Elephantopus carolinianus* Raeusch., *Acalypha rhomboidea* Raf., *Desmodium paniculatum* (L.) DC., *Lespedeza capitata* Michx., *Hypericum lobocarpum* Gatt., *Rhexia mariana* L. var. *mariana*, *Phlox pilosa* L., *Polygala sanguinea* L., *Aletris aurea* Walter, *Spiranthes vernalis* Engelm. & A. Gray, *Paspalum floridanum* Michx., *P. laeve* Michx., *Tridens strictus* (Nutt.) Nash in Small, and *Tripsacum dactyloides* (L.) L.; noteworthy collections from this association include *Asclepias hirtella* (Pennell) Woodson and *Lobelia appendiculata* A.DC., which are listed as imperiled (S2) and rare and local to apparently secure (S3S4) in the state, respectively (MNHP 2002a). Typical Black Prairie roadside species are *Aster novae-angliae* L., *A.*

praealtus Poir. var. *praealtus*, *A. undulatus* L., *Ratibida pinnata* (Vent.) Barnhart, *Rudbeckia fulgida* Aiton, *Silphium laciniatum* L., *Specularia perfoliata* (L.) A.DC., *Oenothera speciosa* Nutt., *Anemone caroliniana* Walter, *Penstemon laevigatus* Aiton, *Panicum capillare* L., and *P. dichotomiflorum* Michx.; noteworthy records include *Dasistoma macrophylla* (Nutt.) Raf. (rare and local to apparently secure–S3S4), *Penstemon tenuiflorus* Pennell (imperiled to rare and local–S2S3), *Tomanthera auriculata* (Michx.) Raf. (critically imperiled–S1), and *Spiranthes magnicamporum* Sheviak (S2S3, MNHP 2002a, 2002b).

4. Urban Areas (including lawns).—The flora of urban areas is depauperate, and consists mostly of plants that have escaped from, are spreading from, or persist after cultivation; as well as weedy species that aggressively invade lawns, flower beds, sidewalks, and roadsides. Examples of local escapes include *Vinca major* L., *Ratibida columnifera* (Nutt.) Wooton & Standl., *Evonymus fortunei* (Turcz.) Hand.-Mazz., *Elaeagnus umbellata* Thunb., *Wisteria sinensis* (Sims) DC., *Populus alba* L., *Ailanthus altissima* (Mill.) Swingle, *Lycoris radiata* (L'Hér.) Herb., *Narcissus* spp., *Hemerocallis fulva* (L.) L., and *Hyacinthoides nonscripta* (L.) Chouard ex Rothm. Commonly found native species include such forbs as *Bowlesia incana* Ruiz & Pav., *Acmella oppositifolia* (Lam.) R.K. Jansen var. *repens* (Walter) R.K. Jansen, *Ambrosia trifida* L., *Hieracium gronovii* L., *Lactuca serriola* L., *Draba brachycarpa* Nutt. ex Torr & A. Gray, *Sagina decumbens* (Elliott) Torr & A. Gray, *Chamaesyce* spp., *Plantago* spp., *Rumex hastatulus* Baldwin, and *Ranunculus* spp.; as well as many graminoids, including *Cyperus* spp., *Fimbristylis annua* (All.) Roem. & Schult., *Kyllinga* spp., *Scirpus koilolepis* (Steud.) Gleason, *Juncus tenuis* Willd., *Axonopus fissifolius* (Raddi) Kuhlm., *Hordeum pusillum* Nutt., *Dichanthelium* spp., *Sphenopholis obtusata* (Michx.) Scribn., and *Urochloa ramosa* (L.) T.Q. Nguyen. Exotic weeds characteristic of urban areas include *Arctium minus* Bernh., *Centaurea cyanus* L., *Lactuca saligna* L., *Taraxacum officinale* Weber ex F.H. Wigg., *Youngia japonica* (L.) DC., *Brassica juncea* (L.) Czern., *Capsella bursa-pastoris* (L.) Medik., *Cardamine hirsuta* L., *Cerastium glomeratum* Thuill., *Stellaria media* (L.) Vill., *Medicago arabica* (L.) Huds., *Trifolium* spp., *Lamium* spp., *Sherardia arvensis* L., *Valerianella locusta* (L.) Betcke, *Verbena brasiliensis* Vell., and *Poa* spp.

ANNOTATED CHECKLIST

Species and lesser taxa are grouped by division, class, and family. Plant divisions and classes are arranged according to phylogeny following Flora of North America Editorial Committee (1993); families, and genera and species within families, are arranged alphabetically. Non-vascular plant family and genus concepts follow Schuster (1966, 1969, 1974, 1980) for Anthocerotopsida and Hepaticopsida. Vascular plant family and genus concepts follow Brummitt (1992). Nativity status is based on the USDA NRCS Plants database (http://

plants.usda.gov). Species names are followed by the authority, with abbreviations according to Brummitt and Powell (1992). In general, nomenclature follows Kartesz (1994), with the exception of Poaceae, which follow Barkworth et al. (In preparation). Synonyms are given in brackets where pertinent. The physiographic region/regions in which a species occurs is/are indicated by the abbreviations BP (Black Prairie), PR (Pontotoc Ridge), or IF (Interior Flatwoods), followed by the plant community/communities in which that species is found. Relative abundance within a plant community is listed as very abundant (AA), abundant (A), common (C), occasional (O), uncommon (U), rare (R), very rare (RR), or historical (H). A plant that is common, abundant, or very abundant, but local in distribution, is indicated with (l) following the abundance designation. The status of a species is indicated in **bold** as federally threatened (**FT**) or sensitive (**S**), which includes the designations critically imperiled (**S1**), imperiled (**S2**), rare and local (**S3**), apparently secure (**S4**), demonstrably secure (**S5**), of historical occurrence (**SH**), and of uncertain status (**SU**; MNHP 2002a, 2002b). This is followed by a literature citation or accession number, composed of collector name, collection number (with "R" indicating a recollection), and source/depository herbarium acronym (Holmgren et al. 1990). Collections of the senior author are cited first (no collector name given), followed by those of others (collector name given, in a list for first specimen only); absence of an herbarium acronym indicates the specimen is referenced at IBE. Species preceded by an asterisk (*) are non-native species. An ampersand (&) indicates the species is a new record for Mississippi.

BRYOPHYTA
HEPATICOPSIDA

CEPHALOZIACEAE

Cephalozia bicuspidata (L.) Dumort., IF, lakes/ponds/impoundments, U; Woods (1964)

CEPHALOZIELLACEAE

Cephaloziella hampeana (Nees) Schiffn. ex Loeske, IF, U; Woods (1964)

GEOCALYCACEAE

Chiloscyphus pallescens (Ehrh.) Dumort., IF, rivers/creeks, U; Woods (1964)

Lophocolea bidentata (L.) Dumort., IF, lakes/ponds/impoundments, U; Woods (1964)

Lophocolea heterophylla (Schrad.) Dumort., IF, lakes/ponds/impoundments, C; Woods (1964)

Lophocolea minor Nees, IF, lakes/ponds/impoundments, C; Woods (1964)

JUBULACEAE

Frullania eboracensis Gottsche, PR, mesophytic upland hardwood forests, C; Woods (1964)

Frullania inflata Gottsche, IF, lakes/ponds/impoundments, U; Woods (1964)

Frullania kunzei Lehm. & Lindenb., IF, lakes/ponds/impoundments, U; Woods (1964)

Frullania squarrosa (Reinw., Bl. & Nees) Dumort., PR, mesophytic upland hardwood forests, A; Woods (1964)

JUNGERMANNIACEAE

Solenostoma pumilum (With.) K. Müll. [= *Jungermannia pumila* With.], IF, rivers/creeks, U; Woods (1964)

LEJEUNEACEAE

Cololejeunea minutissima (Smith) Schiffn., BP, prairie cedar woodlands, O; Woods (1964)

Leucolejeunea clypeata (Schwein.) A. Evans, IF, bottomland hardwood forests, C; Woods (1964)

Leucolejeunea unciloba (Lindenb.) A. Evans, IF, pine forests, C; Woods (1964)

PALLAVACINIACEAE

Pallavacinia lyellii (Hook.) Carruth., IF, lakes/ponds/impoundments, U; Woods (1964)

PORELLACEAE

Porella platyphylloidea (Schwein.) Lindenb., PR, mesophytic upland hardwood forests, C; Woods (1964)

RICCIACEAE

Riccia fluitans L., IF, lakes/ponds/impoundments, A; Woods (1964)

Riccia hirta (Austin) Underw., IF, roadsides, U; Woods (1964)

Riccia membranacea Gottsche & Lindenb., IF, rivers/creeks, C; Woods (1964)

Riccia sullivantii Austin, IF, rivers/creeks, C; Woods (1964)

SCAPANIACEAE

Scapania nemorosa (L.) Dumort., IF, lakes/ponds/impoundments, C; Woods (1964)

SPHAEROCARPACEAE

Sphaerocarpus texanus Austin, IF, grass/forb meadows, C; Woods (1964)

ANTHOCEROTOPSIDA

ANTHOCEROTACEAE

Anthoceros punctatus L., IF, lakes/ponds/impoundments, U; Woods (1964)

LYCOPODIOPHYTA

LYCOPODIACEAE

Lycopodiella alopecuroides (L.) Cranfill, IF, seepage areas, C; *651*

Lycopodiella appressa (Chapm.) Cranfill, IF, seepage areas, roadsides, O/C; *482, 1557, McDaniel 24335*

Lycopodiella prostrata (R.M. Harper) Cranfill, IF, seepage areas, C; *530*

Lycopodium digitatum Dill. ex A. Braun, IF, pine forests, RR; McDaniel pers. obs.

SELAGINELLACEAE

Selaginella apoda (L.) Spring, IF, mesophytic upland hardwood forests, R; *914, 1298 (R914)*

POLYPODIOPHYTA

ASPLENIACEAE

Asplenium platyneuron (L.) Oakes, BP, IF, pine forests, prairie cedar woodlands, O; *619, 720, 879*, Evans (1978), Leidolf and McDaniel (1998)

AZOLLACEAE

Azolla caroliniana Willd., BP, lakes/ponds/impoundments (littoral/profundal–free-floating), A(I); McDaniel pers. obs.

BLECHNACEAE

Woodwardia areolata (L.) T. Moore, IF, mesophytic upland hardwood forests, pine-mixed hardwood forests, canals/drainage ditches (riparian–banks), seepage areas, O; *901, 1556*, Evans (1978), Jones et al. (1969), *McDaniel 22136, Ray 6793* (MISSA)

DENNSTAEDTIACEAE

Pteridium aquilinum (L.) Kuhn var. *pseudocaudatum* (Clute) A. Heller, IF, pine forests, seepage areas, O/A(I); *983, McDaniel 2442*

DRYOPTERIDACEAE

Polystichum acrostichoides (Michx.) Schott, PR, IF, mesophytic upland hardwood forests, O; *338*, Evans (1978), *H.B.B. s.n.* (MISSA), *McDaniel 28886*

OPHIOGLOSSACEAE

Botrychium biternatum (Sav.) Underw., PR, IF, bottomland hardwood forests, pine forests, O/C; *878, 971, Bennett s.n., Brooks 562*, Evans (1978), Theriot et al. (1993)

Botrychium virginianum (L.) Sw., BP, PR, mesophytic upland hardwood forests, O; *1330, 1350*, Jones et al. (1969), *McDaniel 31022*, Morris et al. (1993), *Tracy s.n.* (MISSA)

Ophioglossum crotalophoroides Walter; Evans (1978)

Ophioglossum engelmannii Prantl, BP, prairie cedar woodlands, A(I), **S1**; Evans (1978), *McDaniel 10583*

OSMUNDACEAE

Osmunda cinnamomea L., IF, mesophytic upland hardwood forests, O/C; *899, 1380 (R899)*, Evans (1978), Jones et al. (1969)

Osmunda regalis L., IF, mesophytic upland hardwood forests, O/C; *900, 1379 (R900)*

POLYPODIACEAE

Pleopeltis polypodioides (L.) E.G. Andrews & Windham var. *michauxiana* (Weath.) E.G. Andrews & Windham in Windham, BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, prairie cedar woodlands, O/C; *44*, *Beal s.n.* (MISSA), *Channell s.n.* (MISSA), Evans (1978), Jones et al. (1969), Leidolf and McDaniel (1998), Morris et al. (1993), *Ray 8005* (MISSA), Theriot et al. (1993)

THELYPTERIDACEAE

**Macrothelypteris torresiana* (Gaudich.) Ching [= *Thelypteris torresiana* (Gaudich.) Alston], IF, bottomland hardwood forests, R; Theriot et al. (1993)

WOODSIACEAE

Athyrium filix-femina (L.) Roth ex Mert. ssp. *asplenioides* (Michx.) Farw., IF, mesophytic upland hardwood forests, C; *460*, *659 (R460)*, *H.B.B. s.n.* (MISSA), Jones et al. (1969)

Onoclea sensibilis L., IF, bottomland hardwood forests, mesophytic upland hardwood forests, O/C; *335*, *913 (R335)*, Theriot et al. (1993)

PINOPHYTA

CUPRESSACEAE

Juniperus virginiana L. var. *virginiana*, BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, pine-mixed hardwood forests, prairies, prairie cedar woodlands, chalk outcrops, R/AA; *6*, *7*, *1605*, Bryson (1980), *Henry s.n.* (MISSA), Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

PINACEAE

Pinus echinata Mill., IF, pine forests, pine-mixed hardwood forests, O/C; *1377a*

Pinus taeda L., BP, IF, bottomland hardwood forests, pine forests, pine-mixed hardwood forests, prairie cedar woodlands, chalk outcrops, O; Leidolf and McDaniel (1998), Theriot et al. (1993)

TAXODIACEAE

Taxodium distichum (L.) L.C. Rich, IF, swamp forests, C; *Leidolf s.n.*

MAGNOLIOPHYTA
MAGNOLIOPSIDA

ACANTHACEAE

Dicliptera brachiata (Pursh) Spreng., IF, bottomland hardwood forests, A; *Smith 946*

Justicia ovata (Walter) Lindau var. *lanceolata* (Chapm.) R.W. Long, IF, bottomland hardwood forests, swamp forests, canals/drainage ditches (riparian–banks), seepage areas, C(I); *359*, *536*, *1577*, Theriot et al. (1993)

Ruellia caroliniensis (J.F. Gmel.) Steud., BP, IF, bottomland hardwood forests, prairie cedar woodlands, seepage areas, roadsides, O/C; *496*, *1561*, Leidolf and McDaniel (1998), Theriot et al. (1993)

Ruellia humilis Nutt., BP, prairies, grass/forb meadows, O/C; *366*, Leidolf and McDaniel (1998), *McDaniel 13447*, Morris et al. (1993)

Ruellia strepens L., BP, PR, mesophytic upland hardwood forests, roadsides, O/C; *278*, *McDaniel 31326*, Morris et al. (1993)

ACERACEAE

Acer barbatum Michx., PR, mesophytic upland hardwood forests, C(I); *1337*, Morris et al. (1993)

Acer negundo L., BP, PR, IF, bottomland hardwood forests, rivers/creeks (riparian–banks), O; *226*, *Askew 25*, Morris et al. (1993), Theriot et al. (1993)

Acer rubrum L., PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, pine-mixed hardwood forests, C; *25*, *35*, *129 (R25)*, Morris et al. (1993), Theriot et al. (1993)

AMARANTHACEAE

Amaranthus albus L., BP, cultivated fields; *MacDonald 10885*

Amaranthus hybridus L., BP, cultivated fields, C(I)/A; *896*, *Bryson 3448b*, *Gasparini 201*, *McDaniel 28083*

Amaranthus rudis J.D. Sauer, BP, chalk outcrops, cultivated fields, roadsides, C(I)/A; *682*, *815*, *Bryson 3450*, *McDaniel 22196*, *31332*

Amaranthus spinosus L., BP, IF, cultivated fields, grass/forb meadows, C(I); *897*, *Clonts 1406*

Amaranthus viridis L., BP, cultivated fields, C(I); *894*

ANACARDIACEAE

Rhus aromatica Aiton, BP, mesophytic upland hardwood forests, prairies, prairie cedar woodlands, chalk outcrops, A; *186, 389, 788 (R186), 1327 (R389), 1342 (R186)*, Leidolf and McDaniel (1998), *MacDonald 7528, McDaniel 25016*, Pullen et al. (1968b), *Smith 1410, 1896, 1936*

Rhus copallinum L., IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, O; *445*, Theriot et al. (1993)

Rhus glabra L., BP, PR, IF, pine forests, prairies, prairie cedar woodlands, roadsides, A(l); *301, 644*, Leidolf and McDaniel (1998), *McDaniel 13464, 31647*, Morris et al. (1993)

Rhus radicans L. [= *Toxicodendron radicans* (L.) Kuntze ssp. *radicans*], PR, IF, bottomland hardwood forests, pine forests, pine-mixed hardwood forests, C; *472*, Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

Rhus toxicodendron L. [= *Toxicodendron pubescens* Mill.], BP, prairie cedar woodlands, O; *431*

ANNONACEAE

Asimina triloba (L.) Dunal, BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, A(l) *120, 353 (R120), 666, Askew 31, Gordon 2059 (MMNS), Leidolf s.n.*, Morris et al. (1993), Theriot et al. (1993)

APIACEAE (UMBELLIFERAE)

Bowlesia incana Ruiz & Pav., PR, urban areas, A(l); *1215, Maddux 1287*

Chaerophyllum tainturieri Hook., BP, roadsides, C; *158*, Lowe (1921)

Ciclospermum leptophyllum (Pers.) Sprague ex Britton & Wilson, BP, cultivated fields; *Bryson 1349*

Cicuta maculata L., IF, seepage areas, A(l); *1543*

Cryptotaenia canadensis (L.) DC., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, pine-mixed hardwood forests, O; *308, 391, 1515*

Cynosciadium digitatum DC., BP, roadsides; *Sundell 1542*

**Daucus carota* L., BP, IF, prairies, roadsides, C; *239*, Leidolf and McDaniel (1998), Pullen et al. (1968b)

Eryngium prostratum Nutt. ex DC., IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, lakes/ponds/impoundments (riparian–mudflats), seepage areas, U; *334, 498, 561, 1585 (R334), Bryson 674, Copeland s.n.*

Eryngium yuccifolium Michx. var. *yuccifolium*, IF, seepage areas, R; *566, 653*

Osmorhiza longistylis (Torr.) DC., PR, **S3**; *Green s.n.* (MISSA)

Perideridia americana (Nutt. ex DC.) Reichenb., BP, prairies, **S1/S2**; *Brooks 150*

Polytaenia nuttallii DC., PR, **S2**; *Baker 57* (MISSA), *Lott s.n.* (MISSA)

Ptilimnium capillaceum (Michx.) Raf., BP, IF, bottomland hardwood forests, mesophytic upland hardwood forests, canals/drainage ditches (riparian–banks), seepage areas, O/C; *332, 464, Bryson 719, Clonts 818*

Ptilimnium nuttallii (DC.) Britt., BP, IF, seepage areas, grass/forb meadows, urban areas, O; *500, MacDonald 7289, McDaniel 13494*

Sanicula canadensis L., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, prairie cedar woodlands, O; *302, Bryson 720*, Leidolf and McDaniel (1998), Lowe (1921), Morris et al. (1993), Theriot et al. (1993)

Sanicula odorata (Raf.) K.M. Pryer & L.R. Phillippe, PR, mesophytic upland hardwood forests, O; Morris et al. (1993)

Sanicula smallii E.P. Bicknell, IF, mesophytic upland hardwood forests, O; *340*

Spermolepis inermis (Nutt. ex DC.) Mathias & Constance, BP, prairies, O/C; *1512, MacDonald 8719*

Taenidia integerrima (L.) Drude, PR, mesophytic upland hardwood forests, **S1**; *Gordon 2034*

Thaspium barbinode (Michx.) Nutt., PR, mesophytic upland hardwood forests, C; *Gordon 2037*

Thaspium trifoliatum (L.) A. Gray, BP, PR, IF, bottomland hardwood forests, rivers/creeks (riparian–banks), O; *356*, Lowe (1921), *McDaniel 24966*, Morris et al. (1993), Theriot et al. (1993)

**Torilis arvensis* (Huds.) Link, BP, PR, prairies, roadsides, C; *1502, Clonts 816, McDaniel 13461*, Pullen et al. (1968b)

Trepocarpus aethusae Nutt. ex DC., BP, canals/drainage ditches (riparian–banks), seepage areas, O; *313*, Lowe (1921)

Zizia aurea (L.) W.D.J. Koch, BP, bottomland hardwood forests, O; *105*

APOCYNACEAE

Amsonia ornata McDaniel in ed., BP, canals/drainage ditches (riparian–banks), seepage areas, A(I); *209, McDaniel 29755*

Amsonia tabernaemontana Walter, IF, bottomland hardwood forests, O; Leidolf pers. obs., Theriot et al. (1993)

Apocynum cannabinum L., BP, IF, prairies, pine forests, A(I); *1517, Brooks 130, McDaniel 13463*

Trachelospermum difforme (Walter) A. Gray, IF, bottomland hardwood forests, pine forests, C(I) *1497, Brooks 397*, Theriot et al. (1993)

**Vinca major* L., BP, urban areas, A(I); *1448*

AQUIFOLIACEAE

&**Ilex cornuta* Lindl. & Paxton, PR, mesophytic upland hardwood forests, R; *887*

Ilex decidua Walter, BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, pine-mixed hardwood forests, prairies, prairie cedar woodlands, chalk outcrops, roadsides, C; *38, 40, 946, Askew 69a, Clonts s.n.*, Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

Ilex opaca Aiton, BP, IF, bottomland hardwood forests, mesophytic upland hardwood forests, C; *951, Laird 22*, Theriot et al. (1993)

ARALIACEAE

Aralia spinosa L., IF, bottomland hardwood forests, pine forests, pine-mixed hardwood forests, roadsides, C(I); *586*, Theriot et al. (1993)

Panax quinquefolius L., BP, PR, mesophytic upland hardwood forests, R, **S3**; *Bryson 8830*, Morris et al. (1993), *Smith 1415*

ARISTOLOCHIACEAE

Aristolochia tomentosa Sims, IF, bottomland hardwood forests, rivers/creeks (riparian–banks), U; *Smith 542a*, Theriot et al. (1993), *Timme 5435*

Asarum canadense L., PR, mesophytic upland hardwood forests, C, **S2S3**; *Harrelson 21* (MISSA)

ASCLEPIADACEAE

Asclepias amplexicaulis Small, IF, xeric upland hardwood forests, R; *1546*

Asclepias hirtella (Pennell) Woodson, IF, pine forests, grass/forb meadows, roadsides, C(I), **S2**; *1563, Bryson 681, 6001, 7000, Ray 4751* (MISSA), *Stauffer s.n.* (MISSA)

Asclepias purpurascens L., **S1**; *Easley s.n.* (MISSA)

Asclepias tuberosa L., BP, IF, prairies, pine forests, roadsides, C(I); *291, 853, 1536, Bryson 679, 703*, Leidolf and McDaniel (1998), *McDaniel 31093*, Morris et al. (1993)

Asclepias variegata L., IF, roadsides; *Copeland s.n.*

Asclepias verticillata L., IF, bottomland hardwood forests, mesophytic upland hardwood forests, roadsides, U; *919, Clonts 827, Gordon 2039*

Asclepias viridiflora Raf., BP, prairies, R/C; *1508, 1526, 1602*, Leidolf and McDaniel (1998), *McDaniel 13455, 31098*, Morris et al. (1993)

Asclepias viridis Walter, BP, IF, prairies, chalk outcrops, roadsides, C/A; *204, 1457 (R204), 1525, Brooks 148, Carter 3017*, Leidolf and McDaniel (1998), *McDaniel 29757, 31035, 31067*, Morris et al. (1993), *Sundell 1536*

Matelea gonocarpos (Walter) Shinners, BP, PR, IF, bottomland hardwood forests, pine-mixed hardwood forests, xeric upland hardwood forests, cultivated fields, R; *1527, 1574, Bryson 2599, 2600, McDaniel 31066*, Theriot et al. (1993)

ASTERACEAE (COMPOSITAE)

**Achillea millefolium* L., BP, prairies, O; *McDaniel 13492*

Acmella oppositifolia (Lam.) R.K. Jansen var. *repens* (Walter) R.K. Jansen, PR, urban areas, RR; *McDaniel 12494*

Ambrosia artemisiifolia L., IF, bottomland hard wood forests, roadsides, C/A(I); *984, Brooks 483*, Theriot et al. (1993), *Wigley 314085*

Ambrosia bidentata Michx., IF, roadsides, C; *915*

Ambrosia psilostachya DC., BP, IF, pine forests, prairies, prairie cedar woodlands, chalk outcrops, C/A; *789*, Leidolf and McDaniel (1998), *McDaniel 15463, 22929*

Ambrosia trifida L., BP, prairies, urban areas, C/A; *993, Brooks 468, McDaniel 24964, Wigley 313093*

Amphiachyris dracunculoides (DC.) Nutt., BP, prairies, AA(I), **S1**; *McDaniel 22927*

Antennaria plantaginifolia (L.) Richardson, BP, IF, xeric upland hardwood forests, roadsides, O; *1262, 1535*

**Arctium minus* Bernh., BP, PR, cultivated fields, urban areas, O; *706, Bryson 3078*

Aster attenuatus Lindl. ex Hook., BP, prairies, O/C(I); *1015, MacDonald 8145*

Aster cordifolius L. var. *sagittifolius* (Wedem. ex Willd.) A.G. Jones, PR, bottomland hardwood forests, O; Morris et al. (1993)

Aster dumosus L., BP, PR, IF, bottomland hardwood forests, pine forests, prairies, C; *961, 991, Copeland s.n.*, Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993), *Wigley 314104*

Aster ericoides L., BP, prairies, C(I), **S2**; *1004, 1009a, 1011*, Leidolf and McDaniel (1998), *MacDonald 8142, 8152*

Aster laevis L., BP, prairies, O; *933*, Leidolf and McDaniel (1998)

Aster novae angliae L., BP, prairies, cultivated fields, roadsides, O/C; *1005, 1007, 1019, Gasparini 208*, Leidolf and McDaniel (1998), *McDaniel 1044*

Aster paludosus Aiton ssp. *hemisphericus* (Alexander) Cronquist, BP, IF, pine forests, prairies, seepage areas, roadsides, O/A(I); *650, 654, Brooks 410, Bryson 6986, Clonts 571, Copeland s.n.*

Aster patens Aiton, BP, IF, pine forests, prairies, chalk outcrops, O; *968*, Leidolf and McDaniel (1998), Morris et al. (1993)

Aster pilosus Willd. var. *pilosus*, BP, IF, prairies, cultivated fields, O; *990*, Leidolf and McDaniel (1998), *Gasparini 207, Wigley 313124*

Aster praealtus Poir. var. *praealtus*, BP, prairies, roadsides, O/C; *1009, 1012*, Leidolf and McDaniel (1998), *MacDonald 8149*

Aster sericeus Vent. var. *microphyllus* DC., BP, prairies, R/C(I); *1013*, Leidolf and McDaniel (1998), *MacDonald 8147*

Aster solidagineus Michx., IF, pine forests, pine mixed hardwood forests, seepage areas, roadsides, C(I); *349, 529, 1494, 1540, Bruza 929, Bryson 684, Clonts 831*

Aster subulatus Michx. var. *ligulatus* Shinners, PR, urban areas; *McDaniel 12528*

Aster undulatus L., BP, prairies, prairie cedar woodlands, roadsides, U/C(I); *1003, 1008, 1014*, Leidolf and McDaniel (1998), *MacDonald 8143, 8148, 8151*

Baccharis halimifolia L., BP, IF, bottomland hardwood forests, lakes/ponds/impoundments (riparian–banks), roadsides, C(I); *Clonts 472, McDaniel 31324, 31325*, Theriot et al. (1993), *Wigley 313120*

Bidens aristosa (Michx.) Britton, BP, IF, bottomland hardwood forests, pine forests, roadsides, O; *873, Brooks 482, Copeland s.n.*, Theriot et al. (1993), *Wigley 314083*

Bidens discoidea (Torr. & A. Gray) Britton, IF, bottomland hardwood forests, swamp forests; *Stewart 269*, Theriot et al. (1993)

Boltonia diffusa Elliott, IF, pine forests, roadsides, O; *664, Copeland s.n.*

Brickellia eupatorioides (L.) Shinners var. *eupatorioides*, BP, IF, chalk outcrops, C(I); *McDaniel 2193, 31310*

Brintonia discoidea (Elliott) Greene, IF, bottomland hardwood forests, pine forests, roadsides, O; *922*, Theriot et al. (1993)

Cacalia ovata Walter [= *Arnoglossum ovatum* (Walter) H. Rob.], IF, mesophytic upland hardwood forests, O; *902*

Cacalia plantaginea (Raf.) Shinners [= *Arnoglossum plantagineum* Raf.], BP, prairies, R/A; *375, 1445 (R375)*, Leidolf and McDaniel (1998), *McDaniel 13456, 31074*, Morris et al. (1993)

**Centaurea cyanus* L., PR, urban areas, RR; *McDaniel 13442*

Chrysopsis mariana (L.) Elliott, IF, mesophytic upland hardwood forests, roadsides, O/C; *954, Mathies 867*

**Cichorium intybus* L., BP, roadsides, RR; *680*

Cirsium discolor (Muhl. ex Willd.) Spreng., BP, prairies, chalk outcrops, lakes/ponds/impoundments (riparian–banks), O; *823, 832, Wigley 313092*

Cirsium horridulum Michx., BP, IF, prairies, prairie cedar woodlands, roadsides, O; *1438, 1455*, Leidolf and McDaniel (1998)

Coreopsis lanceolata L., BP, prairies, chalk outcrops, roadsides, C(I); *200, 268, 1451*, Leidolf and McDaniel (1998)

Coreopsis pubescens Elliott, BP, IF, pine forests, prairies, roadsides; *343, Brooks 122, 143, McDaniel 1089*

Coreopsis tinctoria Nutt., IF, roadsides, urban areas, C; *1573, Copeland s.n.*

Coreopsis tripteris L., IF, roadsides, C(I); *658, Brooks 494*

**Crepis pulchra* L., BP, urban areas, O; *1450*

Dracopis amplexicaulis (Vahl) Cass., BP, IF, prairies, roadsides, C; *289, 396, Copeland s.n.,* Leidolf and McDaniel (1998), *Sundell 1548*

Echinacea purpurea (L.) Moench, PR, xeric upland hardwood forests, **S3S4**; *Ray 4715* (MISSA)

Eclipta prostrata (L.) L., BP, IF, bottomland hardwood forests, pine forests, canals/drainage ditches (riparian–banks), lakes/ponds/impoundments (riparian–mudflats), seepage areas, cultivated fields, C/A; *609, Brooks 481, Bryson 3423, McDaniel 31333*, Theriot et al. (1993)

Elephantopus carolinianus Raeusch., IF, bottomland hardwood forests, pine forests, roadsides, O/A; *806, 877*, Lowe (1921), *Smith 945*, Theriot et al. (1993)

Elephantopus tomentosus L., IF, mesophytic upland hardwood forests, pine forests, pine-mixed hardwood forests, lakes/ponds/impoundments (riparian–banks), C; *1582, Brooks 488, Carraway 174, McDaniel 9797, 15726*

Erechtites hieracifolia (L.) Raf. ex DC., IF, bottomland hardwood forests; Theriot et al. (1993)

Erigeron annuus (L.) Pers., BP, PR, roadsides, O/A; *1503, Carter 3015*

Erigeron canadensis L. [= *Conyza canadensis* (L.) Cronquist var. *canadensis*], BP, PR, IF, prairies, roadsides, C; *551, 1597, McDaniel 31625, Wigley 313062*

Erigeron philadelphicus L., IF, seepage areas, O; *138*

Erigeron strigosus Muhl. ex Willd., BP, IF, bottomland hardwood forests, xeric upland hardwood forests, prairies, chalk outcrops, O; *203, 470, Bryson 716, Clonts 828*, Leidolf and McDaniel (1998)

Eupatorium altissimum L., BP, prairies, chalk outcrops, roadsides, O/A; *803*, Leidolf and McDaniel (1998), *McDaniel 20934, 22928, 28077, 31649*

Eupatorium capillifolium (Lam.) Small, IF, pine forests, urban areas; *Copeland s.n., Snow 39*

Eupatorium coelestinum L., BP, IF, bottomland hardwood forests, pine forests, chalk outcrops, lakes/ponds/impoundments (riparian–banks), roadsides, C/A(I); *528, 958, Bryson 706*, Lowe (1921), *McDaniel 31319, Wigley 313098*

Eupatorium hyssopifolium L., IF, pine forests, O; *700*

Eupatorium incarnatum Walter, BP, C; *McDaniel 31322*

Eupatorium perfoliatum L., IF, pine forests, O/C; *811, Brooks 475, Copeland s.n.*

Eupatorium rotundifolium L., IF, grass/forb meadows, roadsides, A; *471, Clonts 841, Mathies 841*

Eupatorium rugosum Houtt. [= *Ageratina altissima* (L.) King & H. Rob. var. *altissima*], BP, IF, bottomland hardwood forests, C; *972, McDaniel 31328*, Theriot et al. (1993)

Eupatorium scabridum Elliott [= *E. rotundifolium* L. var. *scabridum* (Elliott) Gray], IF, pine forests, roadsides, O; *655, Wigley 314088*

Eupatorium semiserratum DC., IF, mesophytic upland hardwood forests, pine forests, O; *555, Wigley 314087*

Eupatorium serotinum Michx., BP, IF, pine forests, chalk outcrops, seepage areas, C(I)/A; *683, Copeland s.n., McDaniel 22192, 22932*

Euthamia leptocephala (Torr. & A. Gray) Greene, IF, pine forests; *Wigley 314105*

Euthamia tenuifolia (Pursh) Nutt., PR, IF, pine forests, grass/forb meadows, O; *848, 875*

Evax prolifera Nutt. ex DC., BP, prairies, AA(I), **S1**; *195, 1442 (R195)*, Leidolf and McDaniel (1998)

**Facelis retusa* (Lam.) Sch. Bip., PR, IF, roadsides, urban areas, C(I); *1317, 1504*

Gnaphalium helleri Britton, IF, pine forests, O; *955*

Gnaphalium obtusifolium L., BP, IF, bottomland hardwood forests, pine forests, R/O; *McDaniel 1560, 31644*, Theriot et al. (1993)

Gnaphalium purpureum L. [= *Gamochaeta purpurea* (L.) Cabrera], PR, IF, pine-mixed hardwood forests, seepage areas, roadsides, urban areas, O/C; *180, 1290, McDaniel 15072, Wigley 313126*

Helenium amarum (Raf.) H. Rock, BP, IF, roadsides, A; *394, Wigley 312046*

Helenium autumnale L., BP, IF, bottomland hardwood forests, pine forests, prairie cedar woodlands, chalk outcrops, cultivated fields, O; *830, Copeland s.n., Gasparini 209*, Leidolf and McDaniel (1998), *McDaniel 1435, 15731, 31315*, Theriot et al. (1993)

Helenium flexuosum Raf., IF, mesophytic upland hardwood forests, O; *444, McDaniel 2540*

Helianthus angustifolius L., IF, roadsides, A(I); *872, Mathies 840*

Helianthus annuus L., BP, roadsides, A(I); *397*
Helianthus divaricatus L., BP, prairie cedar woodlands, O; *427*
Helianthus giganteus L., IF, roadsides, O; *881*
Helianthus hirsutus Raf., IF, pine forests, grass/forb meadows, O; *577, Clonts 840*
Helianthus mollis Lam., IF, pine forests, O; *589, 699*
Helianthus silphioides Nutt., IF, pine mixed hardwood forests, O; *808, Brooks 489, McDaniel 1433*
Helianthus strumosus L., BP, prairies, roadsides, O; *927*, Leidolf and McDaniel (1998), *McDaniel 15508*
Heliopsis gracilis Nutt., IF, mesophytic upland hardwood forests, O; *336*
Heterotheca camporum (Greene) Shinners, BP, prairies, chalk outcrops, C/A; *796, 841, 1596*, Leidolf and McDaniel (1998), *MacDonald 8146, McDaniel 22925*, Morris et al. (1993)
Hieracium gronovii L., IF, pine forests, urban areas, O/C(I); *648, McDaniel 2195, 2196*
Iva annua L., BP, IF, prairies, roadsides, A(I); *992, Copeland s.n., McDaniel 31630*
Krigia dandelion (L.) Nutt., PR, IF, roadsides, O; *175, Askew 48*
Krigia cespitosa (Raf.) K.L. Chambers, BP, PR, cultivated fields, roadsides, O; *179, Bryson 3499*
Lactuca canadensis L., BP, IF, xeric upland hardwood forests, prairies, lakes/ponds/impoundments (riparian–banks), roadsides, C; *Carraway 175, McDaniel 30273, Wigley 312049*
Lactuca floridana (L.) Gaertn., BP, IF, bottomland hardwood forests, prairie cedar woodlands, roadsides, O; *838*, Leidolf and McDaniel (1998), Theriot et al. (1993)
Lactuca hirsuta Muhl. ex Nutt., IF; *Bryson 677*
**Lactuca saligna* L., BP, PR, xeric upland hardwood forests, prairies, urban areas, O; *MacDonald 9897, McDaniel 30271*
**Lactuca serriola* L., PR, urban areas, O; *1598*
**Leucanthemum vulgare* Lam., BP, urban areas, C(I); *1447, 1463*
Liatris aspera Michx., BP, IF, prairies, roadsides, A; *516, 615 (R516), Copeland s.n.*, Leidolf and McDaniel (1998)
Liatris spicata (L.) Willd., BP, IF, pine forests, pine-mixed hardwood forests, prairies, R/U; *515, 563, Clonts s.n.*, Leidolf and McDaniel (1998), *McDaniel 2660*
Liatris squarrosa (L.) Michx., BP, prairies, chalk outcrops, R/A; *370, Clonts s.n.*, Leidolf and McDaniel (1998), *McDaniel 15505*, Morris et al. (1993)
Liatris squarrulosa Michx., BP, IF, prairies, chalk outcrops, roadsides, R/O; *969*, Leidolf and McDaniel (1998), *McDaniel 22924*
Mikania scandens (L.) Willd., BP, IF, bottomland hardwood forests, chalk outcrops, lakes/ponds/impoundments (riparian–banks), roadsides, C/A(I); *585, Brooks 479, McDaniel 22167*, Theriot et al. (1993), *Wigley 314084*
Pityopsis graminifolia (Michx.) Nutt., IF, seepage areas, C; *868*
Pluchea camphorata (L.) DC., BP, IF, bottomland hardwood forests, canals/drainage ditches (riparian–banks), lakes/ponds/impoundments (riparian–mudflats), seepage areas, C; *849*, Theriot et al. (1993), *Wigley 313100*
Prenanthes altissima L., PR, mesophytic upland hardwood forests, O; Morris et al. (1993)
Prenanthes aspera Michx., BP, prairies, O, **S2**; Leidolf and McDaniel (1998), *McDaniel 15622*
Pyrrhopappus carolinianus (Walter) DC., IF, pine forests, O; *574, 579, Bryson 726*
Pyrrhopappus pauciflorus (D. Don) DC., BP, prairies, roadsides, O; *McDaniel 31072, Sundell 1548*
**Ratibida columnifera* (Nutt.) Wooton & Standl., PR, urban areas, RR; *Smith s.n.*
Ratibida pinnata (Vent.) Barnhart, BP, prairies, prairie cedar woodlands, chalk outcrops, roadsides, O; *424, Copeland s.n.*, Leidolf and McDaniel (1998), *McDaniel 13445*, Morris et al. (1993)
Rudbeckia fulgida Aiton, BP, prairies, roadsides, O; *844*, Leidolf and McDaniel (1998)
Rudbeckia hirta L., BP, bottomland hardwood forests, xeric upland hardwood forests, prairies, O/A; *282, Bryson 723, Clonts 823*, Leidolf and McDaniel (1998), *McDaniel 31073, 31619*
Rudbeckia laciniata L., IF, bottomland hardwood forests; *Brooks 564*
Senecio anonymus Wood, BP, IF, pine forests, roadsides, urban areas, C; *255, 1441, 1449, McDaniel 13216, 29753, 31031*
Senecio glabellus Poir., PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, roadsides, C; *133, 1372, Smith 1932*, Theriot et al. (1993)
Senecio obovatus Muhl. ex Willd., BP, chalk out

crops, O; *McDaniel 31032*, *Morris 3097*, Morris et al. (1993)

Silphium integrifolium Michx., PR, roadsides, C; Leidolf pers. obs. (with *1001*)

Silphium laciniatum L., BP, chalk outcrops, grass/forb meadows, roadsides, C; *392*, *Clonts s.n.*, Leidolf and McDaniel (1998), Morris et al. (1993)

Silphium laciniatum L. × *S. terebinthinaceum* Jacq., BP, roadsides, RR; *852*

Silphium perfoliatum L., BP, IF, rivers/creeks (riparian–banks), roadsides, O; *625*, *687*, *McDaniel 25285*, *28877*

Silphium perfoliatum L. × *S. trifoliatum* L. var. *latifolium* A. Gray, BP, roadsides, RR; *837*

Silphium terebinthinaceum Jacq., BP, PR, bottomland hardwood forests, prairies, O; *843*, Leidolf and McDaniel (1998), Morris et al. (1993)

Silphium trifoliatum L. var. *latifolium* A. Gray, BP, prairies, chalk outcrops, C; *517*, *622*, *McDaniel 15502*

Solidago caesia L., IF, bottomland hardwood forests, mesophytic upland hardwood forests, O/C(l); *953*, Theriot et al. (1993)

Solidago canadensis L. var. *scabra* Torr. & A. Gray, BP, IF, pine forests, chalk outcrops, roadsides, O/C; *956*, *Copeland s.n.*, *McDaniel 28076*, *Wigley 313119*

Solidago gigantea Aiton, BP, IF, pine forests, prairies, chalk outcrops, O; *824*, *Brooks 316*, *McDaniel 31314*

Solidago hispida Muhl. ex Willd., IF, pine-mixed hardwood forests, C; *McDaniel 14665*

Solidago juncea Aiton, IF; *Wigley 312050*

Solidago nemoralis Aiton var. *haleana* Fernald, IF; *Bryson 6/8*

Solidago nemoralis Aiton var. *nemoralis*, BP, IF, bottomland hardwood forests, prairies, chalk outcrops, lakes/ponds/impoundments (riparian–banks), roadsides, O/C; *792*, *Carraway 176*, Leidolf and McDaniel (1998), Theriot et al. (1993)

Solidago odora Aiton var. *odora*, IF, pine forests, O/C; *962*, *Copeland s.n.*, *McDaniel 2192*

Solidago petiolaris Aiton, IF, pine forests, C; *McDaniel 15727*

Solidago rigida L., BP, prairies, C; *790*, Leidolf and McDaniel (1998)

Solidago rugosa Mill. ssp. *aspera* (Aiton) Cronquist, IF, pine-mixed hardwood forests, roadsides, O/C; *Copeland s.n.*, *Mathies 844*, *McDaniel 9795*, *14663*

Solidago ulmifolia Muhl. ex Willd., BP, IF, bottomland hardwood forests, pine forests, pine-mixed hardwood forests, prairies, O/C; *596*, *638*, Leidolf and McDaniel (1998), *McDaniel 31631*, Morris et al. (1993), Theriot et al. (1993)

**Soliva sessilis* Ruiz & Pav., PR, urban areas, O; *1214*

**Sonchus asper* (L.) Hill, BP, roadsides, O; *1339*, *1464*

**Sonchus oleraceus* L., BP, roadsides, O; *1459*

**Taraxacum officinale* Weber ex F.H. Wigg., BP, PR, bottomland hardwood forests, prairie cedar woodlands, roadsides, urban areas, O; *1268*, Leidolf and McDaniel (1998), Morris et al. (1993), *Wigley 313111*

Verbesina alternifolia (L.) Britton ex Kearney, IF, bottomland hardwood forests, roadsides, C; *973*, *1537*, *Brooks 563*, Theriot et al. (1993)

Verbesina helianthoides Michx., IF, pine forests, roadsides, C(l); *Brooks 277*, *Bruza 936*

Verbesina virginica L., BP, chalk outcrops, lakes/ponds/impoundments (riparian–banks), roadsides, O/A; *836*, *McDaniel 1491*, *31321*

Vernonia gigantea (Walter) Trel. ssp. *gigantea*, BP, PR, IF, bottomland hardwood forests, pine forests, grass/forb meadows, roadsides, O/C; *578*, *628*, *Bruza 1001*, *McDaniel 22930*, Morris et al. (1993)

**Xanthium strumarium* L., BP, IF, lakes/ponds/impoundments (riparian–banks), cultivated fields, grass/forb meadows, R/A(l); *819*, *Clonts 1404*, *McDaniel 31329*, *Wigley 313099*

**Youngia japonica* (L.) DC., BP, urban areas, O; *1520*

BALSAMINACEAE

Impatiens capensis Meerb.; Jones (1976b)

BERBERIDACEAE

*&*Mahonia bealei* (Fortune) Carrière, PR, mesophytic upland hardwood forests, R; *886*, *1307*

*&*Nandina domestica* Thunb., PR, mesophytic upland hardwood forests, R; *889*

Podophyllum peltatum L., PR, IF, mesophytic upland hardwood forests, AA(l); *88*, *99*, *1308*, *Askew 41*, Morris et al. (1993)

BETULACEAE

Betula nigra L., IF, bottomland hardwood forests, rivers/creeks (riparian–banks), lakes/ponds/impoundments (riparian–banks); *Anderson s.n.* (MISSA), *Hansbrough s.n.* (MISSA)

BIGNONIACEAE

Bignonia capreolata L., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, O/C; *134*, *Askew 60*, *McDaniel 2355*, Morris et al. (1993), Theriot et al. (1993)

Campsis radicans (L.) Seem. ex Bureau, BP, PR, IF, bottomland hardwood forests, pine-mixed hardwood forests, xeric upland hardwood forests, prairie cedar woodlands, C; *300*, *345*, Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

Catalpa bignonioides Walter, IF, rivers/creeks (riparian–banks), roadsides, O; *1492*, *Clonts 748*

BORAGINACEAE

**Buglossoides arvensis* (L.) I.M. Johnst., BP, roadsides, A(I); *144*

Cynoglossum virginianum L., PR, mesophytic upland hardwood forests, A(I); *1332*, Jones (1976b), Morris et al. (1993)

**Heliotropium indicum* L., IF, bottomland hardwood forests, pine forests, urban areas; *Clonts 1405*, *Copeland s.n.*, Jones (1976b), Theriot et al. (1993)

Heliotropium tenellum (Nutt.) Torr., BP, prairies, chalk outcrops, O/A; *368*, Jones (1976b), Leidolf and McDaniel (1998), *MacDonald 7529*, *McDaniel 15507*, *31088*, *31313*, Morris et al. (1993), Pullen et al. (1968b)

Lithospermum canescens (Michx.) Lehm., BP, prairies, chalk outcrops, grass/forb meadows, roadsides, O/C(I); *210*, *1269*, *Bryson 414*, Jones (1976b), Leidolf and McDaniel (1998), *McDaniel 31015*, *Morris 3096*, Morris et al. (1993)

Lithospermum latifolium Michx., PR, mesophytic upland hardwood forests; *Gordon 2064*

Lithospermum tuberosum Rugel ex DC., PR, mesophytic upland hardwood forests, O/C; *1331*, Jones (1976b), *Smith 1933*

Myosotis macrosperma Engelm., PR, mesophytic upland hardwood forests, O; *1334*, *1352*, Jones (1976b)

Myosotis verna Nutt., BP, cultivated fields; *Bryson 3484*, Jones (1976b)

Onosmodium molle Michx. ssp. *hispidissimum* (Mack.) B. Boivin, BP, prairies, O; *1603*, Jones (1976b), *McDaniel 31064*, Morris et al. (1993)

BRASSICACEAE (CRUCIFERAE)

**Arabidopsis thaliana* (L.) Heynh.; Jones (1975a)

Armoracia lacustris (A. Gray) Al-Shehbaz & Bates, BP, grass/forb meadows, O, **S1S2**; *McDaniel 25025*

**Brassica erucastrum* L. [= *Erucastrum gallicum* (Willd.) O.E. Schulz], BP, chalk outcrops, O/C; *78*, *465*, *1461*, *McDaniel 24994*, *Smith 1448*

**Brassica juncea* (L.) Czern., PR, urban areas, RR; *1325*

**Brassica napus* L., PR, roadsides, RR; *1260*

**Capsella bursa-pastoris* (L.) Medik., BP, PR, cultivated fields, roadsides, urban areas, C; *63*, *Bryson 3488*, *Stewart 128*

Cardamine bulbosa (Schreb. ex Muhl.) Britton, Sterns & Poggenb., PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, grass/forb meadows, O; *90*, *1333*, *1377*, *Askew 45*, Jones (1975a)

Cardamine concatenata (Michx.) Sw., PR, mesophytic upland hardwood forests, O; *151*, *Morris 3091*, Morris et al. (1993)

**Cardamine hirsuta* L., PR, urban areas, A; *23*, *1209*, Jones (1975a), *Stewart 145*

Cardamine parviflora L.; Jones (1975a)

**Coronopus didymus* (L.) Small, PR, IF, pine forests, urban areas, O; *1205*, *Copeland and Warren s.n.*

Draba brachycarpa Nutt. ex Torr. & A. Gray, BP, prairies, urban areas, A; *1266*

Draba cuneifolia Nutt. ex Torr. & A. Gray, BP, prairies, C(I); *McDaniel 10415*

**Lepidium perfoliatum* L., BP, urban areas, RR; *Ray s.n.* (MISSA)

Lepidium virginicum L., BP, prairies, cultivated fields, roadsides, A; *199*, *395*, *1287*

**Raphanus raphanistrum* L., PR, roadsides, O; *76*

Rorippa sessiliflora (Nutt.) Hitchc., BP, PR, canals/drainage ditches (riparian–banks), cultivated fields, grass/forb meadows, urban areas, R/C; *1305*, *Bryson 7420*, *McDaniel 24753*, *25027*

Sibara virginica (L.) Rollins, BP, cultivated fields, roadsides, A; *1272*, *1279*, *Bryson 3490*, Jones (1975a)

**Sisymbrium officinale* (L.) Scop.; Jones (1975a)

**Thlaspi perfoliatum* L., BP, roadsides, C; *McDaniel 33025*

BUDDLEJACACEAE

Polypremum procumbens L., BP, IF, xeric upland hardwood forests, canals/drainage ditches (riparian–banks), seepage areas, cultivated fields, roadsides, urban areas, C(I); *441*, *1570*, *Bryson 2612*, *McDaniel 1503*

CABOMBACEAE

Brasenia schreberi J.F. Gmel., IF, lakes/ponds/impoundments (littoral–rooted-floating), A(I) *580, 657*

CACTACEAE

Opuntia humifusa (Raf.) Raf., BP, PR, grass/forb meadows, roadsides, R; *813, 940*

CALLITRICHACEAE

Callitriche heterophylla Pursh, IF, canals/drainage ditches (submergent), lakes/ponds/impoundments (littoral–submergent), seepage areas, C(I); *126, McDaniel 10491*

CAMPANULACEAE

Campanula americana L. [= *Campanulastrum americanum* (L.) Small], BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, prairie cedar woodlands, roadsides, O/C(I); *624, 822, 1604, MacDonald 9720, McDaniel 28888, 31640*, Morris et al. (1993), *Smith 1411*

Lobelia appendiculata A. DC., IF, pine-mixed hardwood forests, roadsides, A(I), **S2S3**; *322, 342, 363, 364*

Lobelia cardinalis L., IF, bottomland hardwood forests, mesophytic upland hardwood forests, rivers/creeks (riparian–mudflats), lakes/ponds/impoundments (riparian–mudflats), R/C; *812, 944, 980, Bruza 1332*, Theriot et al. (1993)

Lobelia puberula Michx., BP, IF, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, pine forests, pine-mixed hardwood forests, seepage areas, roadsides, O; *524a, 809, 957, Clonts 572, McDaniel 31621*, Theriot et al. (1993)

Lobelia spicata Lam., BP, prairies, O; *295*, Leidolf and McDaniel (1998), *McDaniel 15511*, Morris et al. (1993)

Specularia biflora (Ruiz & Pav.) Fisch. & C.A. Mey. [= *Triodanis perfoliata* (L.) Nieuwl. var. *biflora* (Ruiz & Pav.) Bradley], IF, bottomland hardwood forests, O; *230*

Specularia perfoliata (L.) A. DC. [= *Triodanis perfoliata* (L.) Nieuwl. var. *perfoliata*], BP, prairies, roadsides, O; *1361, 1454, 1465, Brooks 155*, Lowe (1921), *McDaniel 31013*

CANNABACEAE

**Cannabis sativa* L., IF, roadsides, RR; *807*

CAPRIFOLIACEAE

**Lonicera japonica* Thunb., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, prairie cedar woodlands, pine forests, pine-mixed hardwood forests, rivers/creeks (riparian–banks), roadsides, C; *215, Brooks 129*, Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

Lonicera sempervirens L., PR, xeric upland hardwood forests, R; *1366*

Sambucus canadensis L., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, canals/drainage ditches (riparian–banks), C; *309*, Morris et al. (1993), Theriot et al. (1993)

Symphoricarpos orbiculatus Moench, BP, PR, mesophytic upland hardwood forests, xeric upland hardwood forests, roadsides, O/C; *799, McDaniel 1501, 31650*, Morris et al. (1993)

Triosteum angustifolium L., PR, mesophytic upland hardwood forests, R/C, **S3**; *Channell s.n.* (MISSA), *Funchess s.n.* (MISSA), *Hull s.n.* (MISSA), *Rainwater s.n.* (MISSA), *Ray 931* (MISSA), *Smith 1934*

Viburnum rufidulum Raf., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, prairie cedar woodlands, O; *114, 150, 160*, Leidolf and McDaniel (1998), Morris et al. (1993)

CARYOPHYLLACEAE

**Arenaria serpyllifolia* L., BP, roadsides, A(I); *McDaniel 29754*

**Cerastium brachypetalum* Desportes, BP, roadsides, C; *71a*

**Cerastium glomeratum* Thuill., BP, PR, cultivated fields, roadsides, urban areas, C/A; *71, 1211, Bryson 3486*

Sagina decumbens (Elliott) Torr. & A. Gray, BP, PR, xeric upland hardwood forests, urban areas, C/A; *1277, 1357*

Silene antirrhina L., BP, IF, grass/forb meadows, roadsides, O/A; *1485, Bryson 8862*, Pullen et al. (1968b)

Silene stellata (L.) W.T. Aiton, PR, IF, mesophytic upland hardwood forests, O; *885, McDaniel 28885*, Morris et al. (1993)

**Spergula arvense* L., BP, cultivated fields, A; *1286*

**Stellaria media* (L.) Vill., PR, urban areas, A; *10, 1212*

CELASTRACEAE

Evonymus americanus L., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, rivers/creeks (riparian–banks), roadsides, O; *259*, *945*, *Bryson 728*, Morris et al. (1993), Theriot et al. (1993)

Evonymus atropurpureus Jacq., PR, mesophytic upland hardwood forests, RR, **S2S3**; *Morris 3086*, Morris et al. (1993)

**Evonymus fortunei* (Turcz.) Hand. -Mazz., PR, urban areas, RR; *MacDonald 9994*

CISTACEAE

Lechea mucronata Raf., IF, grass/forb meadows, O; *1586*

Lechea tenuifolia Michx., IF, pine forests, seepage areas, roadsides, C(I); *485*, *573*, *1534*, *McDaniel 13489*

CONVOLVULACEAE

Cuscuta compacta Juss. ex Choisy; *Anonymous s.n.* (MISSA)

Cuscuta pentagona Engelm. var. *pentagona*, BP, IF, prairies, grass/forb meadows, A(I); *428*, *942*

**Ipomoea hederacea* Jacq., BP, cultivated fields, C/A; *821*, *Bryson 2598*

Ipomoea lacunosa L., BP, cultivated fields, C/A; *820*, *Bryson 2597*

Ipomoea pandurata (L.) G. Mey., BP, cultivated fields, A; *519*

**Ipomoea wrightii* A. Gray, IF, cultivated fields, A(I); *711*

Jacquemontia tamnifolia (L.) Griseb., IF, lakes/ponds/impoundments (riparian–mudflats), grass/forb meadows, roadsides, O; *598*, *Clonts 1407*

CORNACEAE

Cornus drummondii C.A. Mey., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, prairie cedar woodlands, chalk outcrops, roadsides, O; *274*, *620*, *Bryson 8294*, *Carter 3005*, Leidolf and McDaniel (1998), *McDaniel 31068*, Morris et al. (1993)

Cornus florida L., PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, pine-mixed hardwood forests, C; *124*, *351*, *964*, *Askew 39*, Morris et al. (1993), Theriot et al. (1993)

Cornus stricta Lam. [– *C. foemina* Mill.], IF, bottomland hardwood forests, O; *244*, *McDaniel 1562*, Theriot et al. (1993)

Nyssa sylvatica Marshall, IF, bottomland hardwood forests, pine forests, pine-mixed hardwood forests, C; *1482*, *Smith 2540*, Theriot et al. (1993)

CORYLACEAE

Carpinus caroliniana Walter, IF, bottomland hardwood forests, C; *234*

Ostrya virginiana (Mill.) K. Koch, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, O; *Leidolf s.n.*, Morris et al. (1993)

CRASSULACEAE

Sedum pulchellum Michx., BP, PR, chalk outcrops, R, **S1**; *Brent 181*, *Stauffer s.n.* (MISSA)

CUCURBITACEAE

Cayaponia quinqueloba (Raf.) Shinners; Jones (1976b), Pullen et al. (1968b)

Melothria pendula L., BP, PR, IF, lakes/ponds/impoundments (riparian–banks), roadsides, C; *705*, *724*, Jones (1976b), *McDaniel 31327*

DROSERACEAE

Drosera brevifolia Pursh, IF, seepage areas, R; *1289*, *1437 (R1289)*

EBENACEAE

Diospyros virginiana L., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, pine-mixed hard wood forests, prairie cedar woodlands, chalk outcrops, O; *1462*, Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

ELAEAGNACEAE

**Elaeagnus pungens* Thunb., PR, mesophytic upland hardwood forests, O; *888*

**Elaeagnus umbellata* Thunb., PR, urban areas, RR; *1324*

ERICACEAE

Monotropa hypopithys L., PR, mesophytic upland hardwood forests, R; Morris et al. (1993)

Monotropa uniflora L., IF; *Stewart 116*

Rhododendron canescens (Michx.) Sweet, IF, bottomland hardwood forests, mesophytic upland hardwood forests, O/C; *125*, *130*, *Askew 40*, *Leidolf s.n.*, Theriot et al. (1993)

Vaccinium arboreum Marshall, BP, IF, bottomland

hardwood forests, swamp forests, xeric upland hardwood forests, pine forests, O; *1359, 1550, Brooks 132, Carter 3020, Clonts 830, McDaniel 1091*, Theriot et al. (1993)

Vaccinium elliottii Chapm., IF, bottomland hard wood forests, pine-mixed hardwood forests, O; *36*, Theriot et al. (1993)

Vaccinium elliottii Chapm. × *V. fuscatum* Aiton, IF, bottomland hardwood forests, RR; Theriot et al. (1993)

Vaccinium stamineum L., PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, pine-mixed hardwood forests, R/C; *593, 665, 1291, 1351(R665), 1381, Brooks 120*, Theriot et al. (1993)

Vaccinium virgatum Aiton, IF, bottomland hardwood forests; *McDaniel 3000*

ESCALLONIACEAE

Itea virginica L., IF, bottomland hardwood forests, swamp forests, lakes/ponds/impoundments (riparian–banks), O; *265, McDaniel 1828*

EUPHORBIACEAE

Acalypha gracilens A. Gray, IF, seepage areas, O; *649*

Acalypha ostryifolia Riddell, BP, IF, prairies, cultivated fields, roadsides, C; *794, 1544, Gasparini 203*, Pullen et al. (1968b)

Acalypha rhomboidea Raf. [= *A. virginica* L. var. *rhomboidea* (Raf.) Cooperr.], IF, rivers/creeks (riparian–banks), roadsides, O; *686*

Acalypha virginica L., BP, IF, chalk outcrops, lakes/ponds/impoundments (riparian–banks), roadsides, O; *600, 630, Brooks 485, McDaniel 22197*, Pullen et al. (1968b)

Chamaesyce humistrata (Engelm.) Small, BP, chalk outcrops, C; *McDaniel 22201*

Chamaesyce maculata (L.) Small, BP, PR, IF, chalk outcrops, rivers/creeks (riparian–banks), cultivated fields, roadsides, urban areas, C; *423, 544, 690, McDaniel 2202, 22199*

Chamaesyce nutans (Lag.) Small, BP, IF, rivers/creeks (riparian–banks), canals/drainage ditches (riparian–banks), cultivated fields, O/A; *504, Brooks 469, Bryson 3443, MacDonald 7, McDaniel 31627*

Chamaesyce prostrata (Aiton) Small, BP, PR, cultivated fields, urban areas, C; *Bryson 3445, McDaniel 2203, Stewart 151*

Chamaesyce serpens (Kunth) Small, BP, chalk outcrops, C; *McDaniel 22198*

Croton capitatus Michx., BP, IF, pine-mixed hardwood forests, prairies, roadsides, C; *379, 565, Brooks 323*

Croton glandulosus L. var. *septentrionalis* Müll. Arg., IF, pine-mixed hardwood forests, roadsides, C(I); *538, Brooks 319*

Croton monanthogynus Michx., BP, prairies, chalk outcrops, cultivated fields, C/A(I); *367, Bryson 8315*, Leidolf and McDaniel (1998), *McDaniel 1492, 24447, 31317, 31629*, Morris et al. (1993), Pullen et al. (1968b)

Euphorbia commutata Engelm., PR, mesophytic upland hardwood forests, O; Morris et al. (1993)

Euphorbia corollata L., BP, IF, xeric upland hardwood forests, pine forests, prairies, chalk outcrops, roadsides, C; *281, 641, Brooks 144, 318, Bryson 8296*, Leidolf and McDaniel (1998), *McDaniel 15622a*, Morris et al. (1993)

Euphorbia dentata Michx., IF, rivers/creeks (riparian–banks), O; *684*, Pullen et al. (1968b)

Euphorbia heterophylla L., BP, prairies, A; *McDaniel 15620*

Euphorbia spathulata Lam., BP, IF, prairies, prairie cedar woodlands, grass/forb meadows, O; *1346, 1511, Morris 3081*, Morris et al. (1993)

Tragia cordata Michx., BP, PR, IF, xeric upland hardwood forests, R; *1528, McDaniel 28890*

Tragia urticifolia Michx., BP, prairies, O; *1519, McDaniel 31632*, Morris et al. (1993), Pullen et al. (1968b)

FABACEAE (LEGUMINOSAE)

**Albizia julibrissin* Durazz., PR, roadsides, C; *462*

Amorpha fruticosa L., BP, IF, bottomland hardwood forests, xeric upland hardwood forests, roadsides, O; *271, 643, McDaniel 31026*, Theriot et al. (1993)

Amphicarpaea bracteata (L.) Fernald, IF, mesophytic upland hardwood forests, O; *904*

Apios americana Medik., BP, PR, prairie cedar woodlands, rivers/creeks (riparian–banks), canals/drainage ditches (riparian–banks), O/A(I); *677, 1606, McDaniel 28926*

Apios priceana B.L. Rob., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, C(I), **FT**, **S1**; *Gordon 2050, 2051, Morris 3100*, Morris et al. (1993)

Astragalus canadensis L. var. *canadensis*, BP, U;, **S2**; *Gordon 2048*

Baptisia alba (L.) R. Br. var. *macrophylla* (Larisey) Isley, IF, lakes/ponds/impoundments (riparian–banks), roadsides, O; *1471, 1568*

Centrosema virginianum (L.) Benth., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, rivers/creeks (riparian–banks), roadsides, O; *533, 674, Bruza 1007, McDaniel 28883*

Cercis canadensis L., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, prairies, prairie cedar woodlands, rivers/creeks (riparian–banks), C; *64, 74, 201*, Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

Chamaecrista fasciculata (Michx.) Greene, BP, IF, pine forests, prairies, urban areas, C; *365, Brooks 315*, Leidolf and McDaniel (1998)

Chamaecrista nictitans (L.) Moench, IF, pine forests, O; *Brooks 408*

Clitoria mariana L., IF, pine forests, lakes/ponds/impoundments (riparian–banks), O; *637, Brooks 317, Copeland s.n.*

**Coronilla varia* L., BP, roadsides; *Brooks 210, Mac Donald 10888*

Crotalaria sagittalis L., BP, IF, prairies, seepage areas, O; *297, 701*, Leidolf and McDaniel (1998)

Dalea candida Willd., BP, prairies, chalk outcrops, C/A; *284, Bruza 938*, Leidolf and McDaniel (1998), *McDaniel 13457, 31094*, Morris et al. (1993)

Dalea purpurea Vent., BP, prairies, chalk outcrops, R/A; *283, Bruza 939*, Leidolf and McDaniel (1998), *McDaniel 13459, 31095, 31101*, Morris et al. (1993)

Desmanthus illinoensis (Michx.) MacMill. ex B.L. Rob. & Fernald, BP, IF, xeric upland hardwood forests, prairies, canals/drainage ditches (riparian–banks), roadsides, O; *398, 642, Clonts s.n.*, Leidolf and McDaniel (1998), *Wigley 315064*

Desmodium canescens (L.) DC., BP, IF, bottomland hardwood forests, rivers/creeks (riparian–banks), O; *678*, Theriot et al. (1993)

Desmodium ciliare (Muhl. ex Willd.) DC., BP, xeric upland hardwood forests, prairies, chalk outcrops, O/C; *793*, Leidolf and McDaniel (1998), *McDaniel 1502, 15504, Wigley 315067*

Desmodium cuspidatum (Muhl. ex Willd.) DC. ex Loudon, PR, bottomland hardwood forests, O; Morris et al. (1993)

Desmodium glabellum (Michx.) DC., IF, seepage areas, roadsides, O; *986*

Desmodium glutinosum (Muhl. ex Willd.) Alph. Wood, PR, IF, mesophytic upland hardwood forests, O/C; *560, McDaniel 28884*

Desmodium laevigatum (Nutt.) DC., IF, pine forests; *Brooks 473*

Desmodium nudiflorum (L.) DC., PR, IF, mesophytic upland hardwood forests, C; *559*, Morris et al. (1993)

Desmodium paniculatum (L.) DC., IF, pine forests, roadsides, O; *858, Wigley 314113*

Desmodium pauciflorum (Nutt.) DC., PR, mesophytic upland hardwood forests, O; Morris et al. (1993)

Desmodium perplexum B.G. Schub., BP, PR, mesophytic upland hardwood forests, rivers/creeks (riparian -banks), canals/drainage ditches (riparian–banks), O; *670, 834*

Desmodium rotundifolium DC., IF, mesophytic upland hardwood forests, C(I); *907, 1581(R907)*

Dioclea multiflora (Torr. & A. Gray) C. Mohr, IF, bottomland hardwood forests, mesophytic upland hardwood forests, O; *331, 557(R331), Bryson 721, Clonts 473*, Theriot et al. (1993)

Galactia volubilis (L.) Britton, BP, IF, prairies, seepage areas, O; *518, 532, Bruza 924*

Gleditsia triacanthos L., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, roadsides, O; *Leidolf s.n.*, Morris et al. (1993), Theriot et al. (1993)

**Kummerowia striata* (Thunb.) Schindl., IF, pine forests, roadsides, A; *545, Brooks 409, Wigley 314023*

**Lathyrus hirsutus* L., BP, IF, prairies, lakes/ponds/impoundments (riparian–banks), canals/drainage ditches (riparian–banks), roadsides, O; *316, 1470, Brooks 152*, Pullen et al. (1968b), *Sundell 1549*

**Lespedeza bicolor* Turcz., IF, mesophytic upland hardwood forests, O; *443*

Lespedeza capitata Michx., IF, pine forests, seepage areas, roadsides, U; *867, 921*

**Lespedeza cuneata* (Dum. Cours.) G. Don, BP, IF, pine forests, prairies, prairie cedar woodlands, rivers/creeks (riparian–banks), road-

sides, C; *569, 676*, Leidolf and McDaniel (1998), *McDaniel 15509*

Lespedeza procumbens Michx., BP, chalk outcrops, C(I); *McDaniel 31316, 31648*

Lespedeza repens (L.) Barton, IF, pine forests, roadsides, O; *570, Brooks 496*, Lowe (1921)

Lespedeza violacea (L.) Pers., IF, pine forests; *Copeland s.n.*, Lowe (1921)

Lespedeza virginica (L.) Britton, BP, IF, xeric upland hardwood forests, pine forests, O; *702, Brooks 399, McDaniel 31624, Wigley 314086*

**Medicago arabica* (L.) Huds., BP, PR, cultivated fields, urban areas, U; *1206, 1288*, Lowe (1921)

**Medicago lupulina* L., BP, PR, prairies, roadsides, C; *75, McDaniel 31091*, Pullen et al. (1968b)

**Melilotus alba* Medik., BP, prairies, chalk outcrops, roadsides, C/A; *287, Brooks 142*, Leidolf and McDaniel (1998), *McDaniel 13451, 31096*, Morris et al. (1993)

**Melilotus officinalis* (L.) Lam. [= *Melilotus albus* Medik.], BP, roadsides, C; *292*

Neptunia lutea (Leavenw.) Benth., BP, prairies, prairie cedar woodlands, O/A(I), **S3S4**; *299, 399, 426, 466, Channell 73* (MISSA), *Davis s.n.* (MISSA), Leidolf and McDaniel (1998), *McDaniel 13460*, Morris et al. (1993), *Smith 1412*

Psoralea psoralioides (Walter) Cory [= *Orbexilum pedunculatum* (Mill.) Rydb. var. *psoralioides* (Walt.) Isely], BP, IF, pine forests, seepage areas, roadsides, U/C; *272, 1439, McDaniel 3147*

Rhynchosia tomentosa (L.) Hook. & Arn., BP, IF, prairies, grass/forb meadows, urban areas, O; *1589, 1600, McDaniel 31634*

Robinia pseudoacacia L., PR, roadsides, urban areas, O; *1321*

Schrankia microphylla (Dryand.) J.F. Macbr. [= *Mimosa quadrivalvis* L. var. *angustata* (Torr. & A. Gray) Barneby], IF, pine forests, pine-mixed hardwood forests, roadsides, O/C; *330, Bruza 928, McDaniel 13488*

Senna marilandica (L.) Link, IF, bottomland hardwood forests; Theriot et al. (1993)

**Senna obtusifolia* (L.) Irwin & Barneby, IF, lakes/ponds/impoundments (riparian–banks), C; *604*

Sesbania exaltata (Raf.) Rydb. ex A.W. Hill, BP, IF, rivers/creeks (riparian–banks), seepage areas, roadsides, C(I); *104, McDaniel 25286*

Strophostyles helvula (L.) Elliott, IF, pine forests, O; *595*

Strophostyles umbellata (Muhl. ex Willd.) Britton, IF, pine forests, O/C; *698, Brooks 495, Copeland s.n., McDaniel 2191*

Stylosanthes biflora (L.) Britton, Sterns & Poggenb., IF, mesophytic upland hardwood forests, O; *339, Wigley 312048*

Tephrosia spicata (Walter) Torr. & A. Gray, IF, pine-mixed hardwood forests, roadsides, C(I); *319, 1567, Clonts 820*

Tephrosia virginiana (L.) Pers., IF, pine forests, pine-mixed hardwood forests, O; *346, 531, Brooks 279*

**Trifolium arvense* L., BP, grass/forb meadows; *O'Brein s.n.* (MISSA), *Locke s.n.* (MISSA)

**Trifolium campestre* Schreb., PR, IF, roadsides, urban areas, C; *1311, 1315, 1323*

**Trifolium dubium* Sibth., BP, PR, prairie cedar woodlands, O; *223*, Pullen et al. (1968b)

**Trifolium incarnatum* L., PR, roadsides, A(I); *100*, Pullen et al. (1968b)

**Trifolium lappaceum* L., BP, PR, prairies, roadsides, urban areas, C; *1514, 1533a, Brooks 145, MacDonald 8721*, Morris et al. (1993)

**Trifolium pratense* L., BP, prairies, grass/forb meadows, roadsides, C(I); *164, Brooks 147, Sundell 1544, Wigley 313011*

Trifolium reflexum L., IF, pine forests, C(I); *McDaniel 21235*

**Trifolium repens* L., BP, PR, IF, roadsides, urban areas, C; *405, Askew 37, Wigley 314080*

**Trifolium resupinatum* L., BP, prairies, roadsides, O; *145, Brooks 153*, Pullen et al. (1968b)

Vicia caroliniana Walter, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, O; *248, 1296 (R248)*, Morris et al. (1993)

**Vicia grandiflora* Scop., BP, IF, cultivated fields, roadsides, O; *139, 1283*, Pullen et al. (1968b)

Vicia minutiflora F. Dietr., PR, xeric upland hardwood forests, O; *Ray 8006* (MISSA)

**Vicia sativa* L. ssp. *nigra* (L.) Ehrh., IF, roadsides, O; *137*, Pullen et al. (1968b)

**Vicia tetrasperma* (L.) Schreb., PR, canals/drainage ditches (riparian–banks); *Fletcher s.n.* (MISSA)

**Vicia villosa* Roth ssp. *varia* (Host) Corb., BP, PR, roadsides, O; *178, Brooks 209*, Pullen et al. (1968b)

Wisteria frutescens (L.) Poir., IF, lakes/ponds/impoundments (riparian–banks), R; *636*

**Wisteria sinensis* (Sims) DC., IF, roadsides, urban areas, O/C; *91, Askew 38 (R Leidolf 91)*

FAGACEAE

Fagus grandifolia Ehrh., BP, IF, bottomland hardwood forests, mesophytic upland hardwood forests, C; *475, 952, 1583 (R952), Laird 6*, Theriot et al. (1993)

Quercus alba L., PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, pine forests, C; *306, 1554*, Theriot et al. (1993)

Quercus durandii Buckley [– *Q. sinuata* Walter var. *sinuata*], BP, bottomland hardwood forests; *McDaniel 1067*

Quercus falcata Michx., IF, bottomland hardwood forests, xeric upland hardwood forests, pine forests, pine mixed hardwood forests, C; *1551*, Theriot et al. (1993)

Quercus laurifolia Michx., IF, bottomland hardwood forests, O; Leidolf pers. obs., Theriot et al. (1993)

Quercus lyrata Walter, IF, bottomland hardwood forests, swamp forests, rivers/creeks (riparian–banks), C; *355, Leidolf s.n.*, Theriot et al. (1993)

Quercus macrocarpa Michx., BP, xeric upland hardwood forests, R, **S2**; *1526a, Bryson 3123, McDaniel 32330, Smith 364*

Quercus marilandica Muenchh., BP, IF, xeric upland hardwood forests, prairie cedar woodlands, C; *387, 1553*, Leidolf and McDaniel (1998), Morris et al. (1993)

Quercus michauxii Nutt., IF, bottomland hardwood forests, C; *Leidolf s.n.*, Theriot et al. (1993)

Quercus muehlenbergii Engelm., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, prairie cedar woodlands, O; *435, Bryson 3124, 7440*, Leidolf and McDaniel (1998), *McDaniel 28151, 31646*, Morris et al. (1993)

Quercus nigra L., BP, IF, bottomland hardwood forests, xeric upland hardwood forests, pine forests, pine-mixed hardwood forests, O; *Leidolf s.n., McDaniel 31612a*, Theriot et al. (1993)

Quercus pagoda Raf., BP, IF, bottomland hardwood forests, xeric upland hardwood forests, O; *1458, Leidolf s.n., McDaniel 31613*, Theriot et al. (1993)

Quercus phellos L., BP, IF, bottomland hardwood forests, pine forests, prairie cedar woodlands, lakes/ponds/impoundments (riparian–banks), C; *982, 1592, Leidolf s.n.*, Leidolf and McDaniel (1998), Theriot et al. (1993)

Quercus rubra L., BP, IF, bottomland hardwood forests, O; *Laird 29, Leidolf s.n.*, Theriot et al. (1993)

Quercus shumardii Buckley, BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, pine forests, C; *354, 1555, Bryson 3126, Leidolf s.n., McDaniel s.n.*, Morris et al. (1993), Theriot et al. (1993)

Quercus stellata Wangenh., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine-mixed hardwood forests, prairie cedar woodlands, C; *305*, Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

Quercus texana Buckley, IF, bottomland hardwood forests, O; *Leidolf s.n.*, Theriot et al. (1993)

Quercus velutina Lam., BP, PR, mesophytic upland hardwood forests, xeric upland hardwood forests, R; *307, McDaniel 31614*

GENTIANACEAE

Frasera caroliniensis Walter, PR, mesophytic upland hardwood forests, U/A(I), **S2S3**; *Morris 3099*, Morris et al. (1993), *Ray 6724*

Sabatia angularis (L.) Pursh, BP, prairies, prairie cedar woodlands, chalk outcrops, O; *372*, Morris et al. (1993)

Sabatia brachiata Elliott, IF, pine-mixed hardwood forests, roadsides, O/C; *347, 1539, McDaniel 2534*

GERANIACEAE

Geranium carolinianum L., BP, lakes/ponds/impoundments (riparian–banks), roadsides, C; *189, McDaniel 31050*

**Geranium dissectum* L., BP, roadsides, C; *157*

Geranium maculatum L., PR, mesophytic upland hardwood forests, O; *Smith 1931*

HALORAGACEAE

**Myriophyllum aquaticum* (Vell.) Verdc.; Jones (1975b)

HAMAMELIDACEAE

Hamamelis virginiana L., IF, bottomland hardwood forests, O; *975*, Theriot et al. (1993)

Liquidambar styraciflua L., BP, PR, IF, bottomland hardwood forests, pine forests, pine mixed hardwood forests, xeric upland hardwood forests, C; *333*, Bryson (1980), *McDaniel 31615*, Morris et al. (1993), Theriot et al. (1993)

HIPPOCASTANACEAE

Aesculus × *bushii* Schneid. [= *A. pavia* L. × *A. glabra* Willd.], BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, rivers/creeks (riparian–banks), O/C; *109*, *112*, *Bennett 2 (UTC)*, *3 (UTC)*, *4 (UTC)*, *5 (UTC)*, *6 (UTC)*, *7 (UTC)*, Morris et al. (1993)

Aesculus glabra Willd., BP, PR, bottomland hardwood forests, rivers/creeks (riparian banks), C(I), **S2?**; *72*, *108*, *111*, *128*, *438*, *1270*, *Askew 32*, *Carpenter s.n.* (MISSA), *Channell s.n.* (MISSA), *Funchess s.n.* (MISSA), *Graham s.n.* (MISSA), Lowe (1921), *McDaniel 1066*, *Morris 3084*, Morris et al. (1993), *Persons s.n.* (MISSA), *Read s.n.* (MISSA), *Smith 1895*, *Tracy s.n.* (MISSA), *Webb 80* (MISSA)

Aesculus pavia L., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, rivers/creeks (riparian–banks), C; *65*, *110*, *119*, *McDaniel 1069*, *31027a*, Morris et al. (1993), Theriot et al. (1993)

HYDRANGEACEAE

Hydrangea quercifolia W. Bartram, IF, bottomland hardwood forests, pine-mixed hardwood forests, R; *1498*, *Bryson 732*, *Laird 16*

HYDROPHYLLACEAE

Hydrolea uniflora Raf., IF, rivers/creeks (emergent), lakes/ponds/impoundments (littoral emergent), A(I); *576*, *725*, Jones (1975b), *McDaniel 20935*

HYPERICACEAE (GUTTIFERAE)

Hypericum crux-andreae (L.) Crantz, IF, pine-mixed hardwood forests, seepage areas, O/C; *647*, *Brooks 403*, *McDaniel 2659*

Hypericum drummondii (Grev. & Hook.) Torr. & A. Gray, IF, roadsides, O/C; *719*, *McDaniel 1568*, *2028*

Hypericum gentianoides (L.) Britton, Sterns & Poggenb., IF, seepage areas, roadsides, A(I); *645*, *Bryson 129*

Hypericum gymnanthum Engelm. & A. Gray, IF, canals/drainage ditches (riparian–banks), O; *503*

Hypericum hypericoides (L.) Crantz, IF, bottomland hardwood forests, pine forests, pine-mixed hardwood forests, seepage areas, C; *874*, *1481*, *Brooks 404*, Theriot et al. (1993)

Hypericum lobocarpum Gatt., IF, rivers/creeks (riparian–banks), canals/drainage ditches (riparian banks), lakes/ponds/impoundments (riparian–banks), seepage areas, roadsides, O/C; *547*, *588*, *985*, *1566*, *Clonts 832*, *McDaniel 1434*

Hypericum mutilum L., IF, bottomland hardwood forests, pine-mixed hardwood forests, canals/drainage ditches (riparian–banks), C; *477*, *562*, *Brooks 402*, Theriot et al. (1993)

Hypericum punctatum Lam., IF, bottomland hardwood forests, canals/drainage ditches (riparian–banks), grass/forb meadows, O; *715*, *1588*, Theriot et al. (1993)

Hypericum sphaerocarpum Michx., BP, prairies, chalk outcrops, C(I); *374*, Leidolf and McDaniel (1998), *MacDonald 8718*, *McDaniel 31049*, Morris et al. (1993), *Smith 1413*

Hypericum stragulum W.P. Adams & E. Robson [= *H. hypericoides* (L.) Crantz ssp. *multicaule* (Michx. ex Willd.) E. Robson], IF, grass/forb meadows, R; *1549*

Triadenum tubulosum (Walter) Gleason, IF, bottomland hardwood forests; Theriot et al. (1993)

Triadenum walteri (J.G. Gmel.) Gleason, IF, bottomland hardwood forests, O; *908*, Theriot et al. (1993)

JUGLANDACEAE

Carya carolinae-septentrionalis (Ashe) Engl. & Graebn., PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, O; Morris et al. (1993), Pullen et al. (1968b), Theriot et al. (1993)

Carya cordiformis (Wangenh.) K. Koch, IF, bottomland hardwood forests, O; *Leidolf s.n.*, Theriot et al. (1993)

Carya glabra (Mill.) Sweet, IF, bottomland hardwood forests, xeric upland hardwood forests, pine forests, O; *1552*, Theriot et al. (1993)

Carya laciniosa (F. Michx.) G. Don, BP, bottomland hardwood forests, RR, **S2S3**; *161*, *McDaniel 3490*

Carya leiodermis Sarg. [= *C. glabra* (Mill.) Sweet var.*hirsuta* (Ashe) Ashe], IF, bottomland hard wood forests, **S2S3**; *Brooks 565*, Theriot et al. (1993)

Carya myristiciformis (F. Michx.) Nutt., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, O; *McDaniel 4233, 4324*, Morris et al. (1993)

Carya ovalis (Wangenh.) Sarg., IF, bottomland hardwood forests; Theriot et al. (1993)

Carya ovata (Mill.) K. Koch, IF, bottomland hardwood forests; Theriot et al. (1993)

Carya pallida (Ashe) Engl. & Graebn., BP, roadsides, O; *939*

Carya tomentosa (Lam. ex Poir.) Nutt. [= *C. alba* (L.) Nutt. ex Elliott], BP, IF, bottomland hardwood forests, xeric upland hardwood forests, pine forests, pine-mixed hardwood forests, O; *McDaniel 31612*, Theriot et al. (1993)

Juglans nigra L., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, U; *1513*, Morris et al. (1993)

LAMIACEAE (LABIATAE)

Blephilia ciliata (L.) Benth., BP, PR, prairies, chalk outcrops, roadsides, C; *269, 1444, Brooks 149 (MMNS), Carter 3013*, Leidolf and McDaniel (1998), *McDaniel 31043, 31069*, Morris et al. (1993), *Smith 2036*

Collinsonia tuberosa Michx., IF, bottomland hardwood forests, O; *906, McDaniel 26487*

Hedeoma hispida Pursh, BP, PR, IF, prairies, roadsides, O/A(I); *1505*, Leidolf and McDaniel (1998), *McDaniel 1820*, Pullen et al. (1968b)

**Lamium amplexicaule* L., BP, PR , roadsides, urban areas, A; *9, 80*, Jones (1976a), *Stewart 247*

**Lamium purpureum* L., BP, PR, roadsides, urban areas, C/A(I); *59, 142, 1210, Askew 35, McDaniel 1588*

Lycopus rubellus Moench, IF; *McDaniel 1566*

Lycopus virginicus L., IF, bottomland hardwood forests, rivers/creeks (riparian–mudflats); *McDaniel 1437, Smith 943*, Theriot et al. (1993)

**Mentha* × *rotundifolia* (L.) Huds. (pro sp.), IF, grass/forb meadows, A(I); *MacDonald 10902*

Monarda citriodora Cerv. ex Lag., BP, prairies, rivers/creeks (riparian–banks), O; *369*, Jones (1976a), *Bryson 3077*, Leidolf and McDaniel (1998), Morris et al. (1993), Pullen et al. (1968b)

Monarda fistulosa L., IF, roadsides, C; *Bruza 931*, Jones (1976a)

Physostegia angustifolia Fern., BP, IF, canals/drainage ditches (emergent), seepage areas, roadsides, A(I); *312, 1541*

Physostegia virginiana (L.) Benth., Jones (1976a)

Prunella vulgaris L., BP, IF, pine forests, prairies, prairie cedar woodlands, grass/forb meadows, roadsides, C; *174, 184, 235, 1443, Brooks 133*, Jones (1976a), Leidolf and McDaniel (1998), *Stewart 502*

Pycnanthemum albescens Torr. & A. Gray, IF, pine forests, pine-mixed hardwood forests, lakes/ponds/impoundments (riparian–banks), O/C; *810, Bruza 973*, Jones (1976a), *McDaniel 2197, 15729, 24534*

Pycnanthemum tenuifolium Schrad., IF, mesophytic upland hardwood forests, xeric upland hardwood forests, pine forests, canals/drainage ditches (riparian–banks), roadsides, O; *320, 337, Brooks 278, Bruza 598, Bryson 298, 683, Clonts 825*, Jones (1976a)

Salvia lyrata L., BP, PR, IF, bottomland hardwood forests, prairies, prairie cedar woodlands, roadsides, C; *136, 152, 187, Askew 70*, Jones (1976a), Leidolf and McDaniel (1998), Morris et al. (1993)

Scutellaria elliptica Muhl. ex Spreng., IF, mesophytic upland hardwood forests, O; *457*

Scutellaria incana Biehler, IF, pine forests, O; *594*

Scutellaria integrifolia L., IF, bottomland hardwood forests, roadsides, O; *325, Bryson 718*, Jones (1976a), *McDaniel 1092*, Theriot et al. (1993)

Scutellaria parvula Michx., BP, prairies, roadsides, O; *181, 212*, Jones (1976a), Leidolf and McDaniel (1998), Morris et al. (1993)

Teucrium canadense L., BP, IF, canals/drainage ditches (riparian–banks), O; *467, Bryson 724*

Trichostema brachiatum L., BP, IF, prairies, grass/forb meadows, O/C; *791*, Jones (1976a), Leidolf and McDaniel (1998), *MacDonald 7290, McDaniel 15506*

Trichostema dichotomum L., BP, IF, xeric upland hardwood forests, chalk outcrops, roadsides, R/O; *920, Brooks 486, McDaniel 31311, 31622*

LAURACEAE

Lindera benzoin (L.) Blume, IF, bottomland hardwood forests, R/O; *Leidolf s.n.*, Theriot et al. (1993)

Sassafras albidum (Nutt.) Nees, BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, pine forests, prairie cedar woodlands, roadsides, C; *140, 376, Askew 50, 63*, Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

LENTIBULARIACEAE

Utricularia gibba L., IF, lakes/ponds/impoundments (littoral–submergent), A(I); *696a*

LINACEAE

Linum medium (Planch.) Britton, BP, IF, prairies, roadsides, C; *285, 328*

Linum striatum Walter, IF, mesophytic upland hardwood forests, O; *556*

Linum sulcatum Riddell, BP, prairies, R, **S3S4**; *MacDonald s.n.*

LOGANIACEAE

Gelsemium sempervirens (L.) W.T. Aiton, IF, pine-mixed hardwood forests, C(I); *1594*

Spigelia marilandica L., PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, O; *249, 1499*, Morris et al. (1993)

LYTHRACEAE

Ammannia coccinea Rottb., BP, IF, rivers/creeks (emergent), cultivated fields, A(I); *691, Bryson 2607*, Jones (1975b), *McDaniel 25288*

**Cuphea carthagenensis* (Jacq.) J.F. Macbr., IF, mesophytic upland hardwood forests, O; *660*

Lythrum alatum Pursh var. *lanceolatum* (Elliott) Torr. & A. Gray ex Rothr., BP, prairies, rivers/creeks (riparian mudflats), A(I); *373*, Jones (1975b), Leidolf and McDaniel (1998), *McDaniel 25290, 31628*

Rotala ramosior (L.) Koehne, IF, canals/drainage ditches (riparian–mudflats), C; *537*, Jones (1975b)

MAGNOLIACEAE

Liriodendron tulipifera L., PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, O/C; *974, Morris 3101*, Theriot et al. (1993)

MALVACEAE

**Abutilon theophrasti* Medik., BP, cultivated fields; *Bryson 3419*

Anoda cristata (L.) Schltdl., BP, roadsides, R; *798*

Hibiscus laevis All., IF, rivers/creeks (riparian–banks), grass/forb meadows, O; *712, 716*

Hibiscus moscheutos L., BP, roadsides, U; *938*

Modiola caroliniana (L.) G. Don, PR, urban areas, U; *1204*

Sida rhombifolia L., BP, cultivated fields, A; *McDaniel 28085*

Sida spinosa L., BP, cultivated fields, roadsides, O/A; *409, 800, Bryson 3422*, Lowe (1921), *McDaniel 28084*

MELASTOMATACEAE

Rhexia mariana L. var. *mariana*, IF, xeric upland hardwood forests, pine forests, canals/drainage ditches (riparian–banks), roadsides, O/C; *440, Bryson 714, Clonts 817*

MELIACEAE

**Melia azedarach* L., PR, roadsides, U; *224*

MENISPERMACEAE

Calycocarpum lyonii (Pursh) A. Gray, BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, O; Lowe (1921), *McDaniel 24964*, Morris et al. (1993), Theriot et al. (1993)

Cocculus carolinus (L.) DC., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, prairie cedar woodlands, urban areas, U; *883, Brooks 582*, Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

Menispermum canadense L., PR, mesophytic upland hardwood forests, O/R, **S3S4**; *Morris 3088*, Morris et al. (1993)

MOLLUGINACEAE

Mollugo verticillata L., IF, canals/drainage ditches (emergent), O; *507*, Jones (1976b)

MORACEAE

**Broussonetia papyrifera* (L.) L'Hér. ex Vent.; Pullen et al. (1968b)

Maclura pomifera (Raf.) C.K. Schneid., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, prairie cedar woodlands, C; *202, 377, Brooks 467, Bryson 7439*, Leidolf and McDaniel (1998), *McDaniel 11622*, Morris et al. (1993)

Morus rubra L., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, prairie cedar woodlands, C; *156, Askew*

58, Bryson 7438, Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

MYRICACEAE

Myrica cerifera L., IF, pine forests, O; *121*

NELUMBONACEAE

Nelumbo lutea Willd., IF, lakes/ponds/impoundments (littoral–rooted-floating), O; *855*

NYCTAGINACEAE

Boerhavia erecta L.; Pullen et al. (1968b)

Mirabilis albida (Walter) Heimerl, BP, chalk outcrops, R; *McDaniel 13454*

NYMPHAEACEAE

Nymphaea odorata Aiton, lakes/ponds/impoundments (littoral–rooted-floating); Jones (1975b)

OLEACEAE

Fraxinus americana L., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, prairie cedar woodlands, O; Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

Fraxinus pennsylvanica Marshall, BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, lakes/ponds/impoundments (riparian banks), roadsides, O/C; *612, 1490, McDaniel 31639*, Morris et al. (1993), Theriot et al. (1993)

Fraxinus quadrangulata Michx., BP, PR, mesophytic upland hardwood forests, R, **S2**; *Bryson 10123, Gordon 2031*, Lowe (1921), *Morris 3083*, Morris et al. (1993), *Smith 1414*

**Ligustrum sinense* Lour., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, prairies, prairie cedar woodlands, C; *205, 854*, Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

ONAGRACEAE

Gaura biennis L., BP, IF, canals/drainage ditches (riparian–banks), O; *679, McDaniel 1565*

Gaura longiflora Spach; Jones (1974b)

Gaura parviflora Douglas ex Lehm.; Jones (1974b), Pullen et al. (1968b)

Ludwigia alternifolia L., IF, pine forests, grass/forb meadows, O; *502, 587, Brooks 328, Clonts 843*

Ludwigia decurrens Walter, IF, bottomland hardwood forests, canals/drainage ditches (emergent), O; *693*, Theriot et al. (1993)

Ludwigia glandulosa Walter, IF, bottomland hardwood forests, pine-mixed hardwood forests, canals/drainage ditches (emergent), O; *553, McDaniel 22135*, Theriot et al. (1993)

Ludwigia hirtella Raf., IF, pine-mixed hardwood forests, canals/drainage ditches (emergent), grass/forb meadows, O/C; *479, Brooks 327, Clonts 842, McDaniel 2537*

Ludwigia palustris (L.) Elliott, IF, canals/drainage ditches (emergent), lakes/ponds/impoundments (littoral–emergent), O; *452, 610*

Ludwigia peploides (Kunth) Raven, BP, rivers/creeks (emergent), canals/drainage ditches (emergent), O/A; *407, McDaniel 25287*

Oenothera biennis L., BP, IF, pine-mixed hardwood forests, roadsides, C; *850, Brooks 484*, Jones (1974b)

Oenothera fruticosa L. ssp. *glauca* (Michx.) Straley, IF, pine-mixed hardwood forests, seepage areas, O; *495, McDaniel 2532*

Oenothera laciniata Hill, BP, cultivated fields, A(I); *895, Bryson 3495*, Jones (1974b)

Oenothera linifolia Nutt., IF, roadsides, U; *Copeland s.n.*

Oenothera pilosella Raf., IF, roadsides, U; *Copeland s.n.*, Jones (1974b)

Oenothera speciosa Nutt., BP, prairies, roadsides, C; *188*, Leidolf and McDaniel (1998)

Oenothera triloba Nutt., BP, **SU**; *Donald s.n.* (MISSA)

OXALIDACEAE

Oxalis articulata Savigny ssp. *rubra* (St. -Hil.) Lourteig; Pullen et al. (1968b)

Oxalis dillenii Jacq., IF, bottomland hardwood forests, O; *263, 635*

Oxalis stricta L., BP, PR, IF, bottomland hardwood forests, rivers/creeks (riparian–banks), urban areas, O; *626, McDaniel 13440*, Theriot et al. (1993)

Oxalis violacea L., PR, IF, mesophytic upland hardwood forests, xeric upland hardwood forests, O; *1314*, Morris et al. (1993)

PAPAVERACEAE

Sanguinaria canadensis L., PR, mesophytic upland hardwood forests, A(I); *Morris 3089*, Morris et al. (1993)

PASSIFLORACEAE

Passiflora incarnata L., BP, IF, bottomland hardwood forests, lakes/ponds/impoundments

(riparian–banks), grass/forb meadows, roadsides, O/C; *329*, *1587*, *Bryson 709*, *Clonts 833*, Jones (1976b), *McDaniel 31323*

Passiflora lutea L., PR, IF, bottomland hardwood forests, xeric upland hardwood forests, O; *Clonts 822*, Jones (1976b), *Ray 4734* (MISSA), Theriot et al. (1993)

PENTHORACEAE

Penthorum sedoides L., IF, bottomland hardwood forests, mesophytic upland hardwood forests, rivers/creeks (emergent), canals/drainage ditches (emergent), A(l); *478*, *692*, *1584*, Theriot et al. (1993)

PHRYMACEAE

Phryma leptostachya L., PR, mesophytic upland hardwood forests, O; *461*, Morris et al. (1993), *Smith 1416*

PHYTOLACCACEAE

Phytolacca americana L., IF, roadsides, C; *522*

PLANTAGINACEAE

Plantago aristata Michx., IF, roadsides, C; *327*, *348*

**Plantago lanceolata* L., BP, roadsides, C; *213*, *400*

Plantago rugelii Decne., PR, IF, roadsides, urban areas, O; *344*, Pullen et al. (1968b), *Stewart 106*

Plantago virginica L., BP, prairies, urban areas, C/A(l); *183*, *McDaniel 31037*

PLATANACEAE

Platanus occidentalis L., PR, mesophytic upland hardwood forests, O; Morris et al. (1993)

POLEMONIACEAE

Phlox carolina L. ssp. *angusta* Wherry, IF, pine-mixed hardwood forests, seepage areas, O/C; *497*, *Brooks 119*, *McDaniel 15073*, Pullen et al. (1968b)

Phlox divaricata L., PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, O; *127*, Morris et al. (1993)

Phlox paniculata L., IF, C(l); Lowe (1921), *MacDonald 9721*

Phlox pilosa L., IF, pine forests, roadsides, O/A; *238*, *Brooks 118*, *McDaniel 1093*, *3145*

POLYGALACEAE

Polygala incarnata L., IF, pine forests, R; *1565*, *Bryson 713*

Polygala mariana Mill., IF, mesophytic upland hardwood forests, pine forests, pine-mixed hardwood forests, canals/drainage ditches (riparian–banks), lakes/ponds/impoundments (riparian–mudflats), O/C; *447*, *Bennett s.n.*, *Brooks 325*, *Bryson 731*, *Daugherty 2*, *McDaniel 2529*, *2641*, *13487*

Polygala nana (Michx.) DC., IF, mesophytic upland hardwood forests, pine forests, pine mixed hardwood forests, seepage areas, O/C; *243*, *1483*, *1495*, *1564*, *Bryson 702*, *708*, *McDaniel 2535*

Polygala sanguinea L., IF, bottomland hardwood forests, pine forests, grass/forb meadows, roadsides, O; *323*, *582*, *Bryson 680*, *Clonts 829*, *845*

POLYGONACEAE

Brunnichia ovata (Walter) Shinners, BP, IF, bottomland hardwood forests, lakes/ponds/impoundments (riparian–banks), O/A(l); *599*, Jones (1975b), *McDaniel 31616*, Theriot et al. (1993)

**Polygonum aviculare* L., BP, IF, lakes/ponds/impoundments (riparian–mudflats), cultivated fields, A(l); *404*, *608*, Jones (1975b)

**Polygonum cespitosum* Blume, IF, lakes/ponds/impoundments (riparian–mudflats), O; *979*

Polygonum densiflorum Meisn., IF, swamp forests, A; *McDaniel 24537*, *Stewart 124*

Polygonum hirsutum Walter, PR, canals/drainage ditches (emergent), R; Leidolf pers. obs.

Polygonum hydropiperoides Michx., IF, bottomland hardwood forests, canals/drainage ditches (emergent), lakes/ponds/impoundments (littoral–emergent), C/A; *450*, *856*, *Bruza 962*, *981*, Jones (1975b), Theriot et al. (1993)

Polygonum lapathifolium L., BP, canals/drainage ditches (emergent), lakes/ponds/impoundments (littoral–emergent), C; *893*, Jones (1975b), *McDaniel 31330*, *31641*

Polygonum pensylvanicum L., BP, IF, canals/drainage ditches (emergent), lakes/ponds/impoundments (littoral–emergent), roadsides, U/C; *410*, *597*, *882*, Jones (1975b)

Polygonum punctatum Elliott; Jones (1975b)

Polygonum virginianum L., IF, bottomland hardwood forests, pine-mixed hardwood forests, O; *721*, Jones (1975b), *Leidolf s.n.*, Theriot et al. (1993)

**Rumex acetosella* L.; Jones (1975b)

Rumex altissimum Alph. Wood; Jones (1975b)

**Rumex crispus* L., BP, IF, cultivated fields, road sides, C; *231, Bryson 3496*, Jones (1975b)

Rumex hastatulus Baldwin, BP, IF, roadsides, urban areas, C(I)/A(I); *468, 1312, Barbour 6685*, Jones (1975b), Pullen et al. (1968b)

**Rumex pulcher* L.; Jones (1975b), Pullen et al. (1968b)

PORTULACACEAE

Claytonia virginica L., PR, IF, bottomland hardwood forests, grass/forb meadows, roadsides, O/C; *34*, Lowe (1921), *McDaniel 1680*, Morris et al. (1993)

PRIMULACEAE

Anagallis minima (L.) Krause, BP, xeric upland hardwood forests; *McDaniel 29336a*

Dodecatheon meadia L., BP, PR, prairies, prairie cedar woodlands, R, **S2**; *Bryson 5400*, Lowe (1921), *Morris 3095*, Morris et al. (1993)

Lysimachia ciliata L., IF, seepage areas, U; *Bryson 712*

Lysimachia lanceolata Walter; Jones (1976b)

**Lysimachia nummularia* L., BP, canals/drainage ditches (riparian–banks, emergent), R; *408*

Samolus valerandi L. ssp. *parviflorus* (Raf.) Hultén, BP, IF, rivers/creeks (riparian–mudflats), canals/drainage ditches (emergent), O; *448, 1487 (R448), Bryson 3076*, Jones (1976b)

RANUNCULACEAE

Actaea pachypoda Elliott, BP, PR; *Gordon 2062 (MMNS)*

Anemone caroliniana Walter, BP, prairies, chalk outcrops, roadsides, O/C; *115, 143, 1267 (R115)*, Leidolf and McDaniel (1998), *Morris 3077*, Morris et al. (1993)

Anemone virginiana L., PR, bottomland hardwood forests, mesophytic upland hardwood forests, O; Lowe (1921), Morris et al. (1993)

Clematis crispa L., PR, IF, bottomland hardwood forests, canals/drainage ditches (riparian–banks), roadsides, O; *534*, Morris et al. (1993)

**Clematis terniflora* DC., BP, PR, prairie cedar woodlands, roadsides, O; *707, McDaniel 31617*

Delphinium carolinianum Walter ssp. *carolinianum*, BP, prairies, O/A(I); *273, 1509 (R273), Brooks 154, MacDonald 8716, McDaniel 31039*

Delphinium tricorne Michx., BP, prairies, C(I), **S2**; *McDaniel 31027*

Myosurus minimus L., BP, cultivated fields, C(I); *1271, 1284, Bryson 3500*

Ranunculus abortivus L., BP, PR, mesophytic upland hardwood forests, xeric upland hardwood forests, lakes/ponds/impoundments (riparian–mudflats), urban areas, C; *1278, 1292, 1335, McDaniel 1589*

**Ranunculus arvensis* L., BP, cultivated fields, A(I); *1273, 1343a*

Ranunculus fascicularis Muhl. ex Bigelow, BP, PR, mesophytic upland hardwood forests, prairies, O; *5, 67, 117(R5)*, Leidolf and McDaniel (1998), *McDaniel 2326*

Ranunculus hispidus Michx. var. *hispidus*, BP, cultivated fields, A; *McDaniel 1826*

Ranunculus hispidus Michx. var. *nitidus* (Chapm.) T. Duncan, BP, urban areas, A; *McDaniel 24967*

Ranunculus micranthus Nutt., BP, xeric upland hardwood forests, O; *1360*

**Ranunculus muricatus* L., BP, PR, IF, bottomland hardwood forests, cultivated fields, urban areas, C/A(I); *1275, 1282, Bryson 3497, Clonts 744, McDaniel 1689*

**Ranunculus parviflorus* L., BP, cultivated fields; *Bryson 3494*

Ranunculus pusillus Poir., BP, IF, canals/drainage ditches (riparian–banks), grass/forb meadows, O; *1345, 1363*

Ranunculus recurvatus Poir., BP, PR, mesophytic upland hardwood forests, R/U; *1349, McDaniel 31023*

**Ranunculus sardous* Crantz, BP, PR, roadsides, C/A; *68, 77, McDaniel 31058*

Thalictrum debile Buckley, BP, mesophytic upland hardwood forests, A, **S1S2**; *McDaniel 31385*

Thalictrum thalictroides (L.) Eames & B. Boivin, PR, IF, mesophytic upland hardwood forests, O; *89, Askew 42*, Morris et al. (1993)

RHAMNACEAE

Berchemia scandens (Hill) K. Koch, BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, prairies, prairie cedar woodlands, chalk outcrops, O/C; *227, Bryson 7441, Carter 3002*, Leidolf and McDaniel (1998), *McDaniel 10581*, Morris et al. (1993), Theriot et al. (1993)

Ceanothus americanus L., BP, prairie cedar woodlands, chalk outcrops, O/A(I); *286, 432*, Leidolf and McDaniel (1998), *McDaniel 13452, 31065*, Morris et al. (1993)

Rhamnus caroliniana Walter [= *Frangula caroliniana* (Walter) A. Gray], BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, prairie cedar woodlands, chalk outcrops, O/C; *388*, *1518*, Leidolf and McDaniel (1998), *MacDonald 8717*, *McDaniel 31611*, Morris et al. (1993)

Rhamnus lanceolata Pursh, BP, PR, prairie cedar woodlands, chalk outcrops, C(I), **S2**; *831*, *1326 (R831)*, *1340*, Leidolf and McDaniel (1998), *MacDonald 8150*, Pullen et al. (1968b), *Ray 8008* (MISSA), *Smith 1447*, *1937*

ROSACEAE

Agrimonia rostellata Wallr., BP, PR, mesophytic upland hardwood forests, xeric upland hardwood forests, O/A(I); *671*, *McDaniel 31611*

Amelanchier arborea (F. Michx.) Fernald, IF, bottomland hardwood forests, O; *Leidolf s.n.*, Theriot et al. (1993)

**Aphanes microcarpa* (Boiss. & Reut.) Rothm., PR, roadsides, urban areas, O/C; *1213*, *1506*

Crataegus calpodendron (Ehrh.) Medik., PR, mesophytic upland hardwood forests, O, **S?**; *216*, *Morris 3087*, Morris et al. (1993)

Crataegus crus-galli L., BP, IF, pine-mixed hardwood forests, prairie cedar woodlands, roadsides, O; *279*, *697*, Leidolf and McDaniel (1998)

Crataegus engelmannii Sarg., BP, xeric upland hardwood forests, prairie cedar woodlands, O; *206*, Leidolf and McDaniel (1998), *McDaniel 11619*

Crataegus marshallii Eggl., PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine-mixed hardwood forests, O; *135*, *1370*, *Leidolf s.n.*, *McDaniel 1687*, Morris et al. (1993), Theriot et al. (1993)

Crataegus pruinosa (H.L. Wendl.) K. Koch, IF, bottomland hardwood forests, O; *Leidolf s.n.*, Theriot et al. (1993)

Crataegus spathulata Michx., BP, IF, bottomland hardwood forests, xeric upland hardwood forests, R/O; *Leidolf s.n.*, *McDaniel 3493*, *Morris 3102*, Morris et al. (1993), Theriot et al. (1993)

Crataegus viridis L., IF, bottomland hardwood forests, R/O; *Leidolf s.n.*, Theriot et al. (1993)

**Duchesnea indica* (Andrz.) Focke, PR, mesophytic upland hardwood forests, O; *1306*

Fragaria virginiana Duchesne, BP, xeric upland hardwood forests, prairie cedar woodlands, O/C; *168*, *214*, *1328*, *Askew 27*, *Morris 3078*, Morris et al. (1993)

Geum canadense Jacq., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, rivers/creeks (riparian–banks), C; *304*, *Bryson 3079*, Morris et al. (1993)

Potentilla simplex Michx., BP, prairies, O; *169*, *1365*

Prunus americana Marshall, BP, IF, rivers/creeks (riparian–banks), roadsides, U; *103*, *141*, *437*

Prunus angustifolia Marshall, BP, PR, IF, prairies, chalk outcrops, roadsides, C; *30*, *31*, *32*, *277*

Prunus mexicana S. Watson, BP, IF, bottomland hardwood forests, pine-mixed hardwood forests, O; *43*, Morris et al. (1993), Pullen et al. (1968b), Theriot et al. (1993)

Prunus serotina Ehrh., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, pine-mixed hardwood forests, rivers/creeks (riparian–banks), C; *73*, *Askew 49*, Morris et al. (1993), Theriot et al. (1993)

**Pyracantha coccinea* M. Roem., BP, prairies, chalk outcrops, R/C(I); *207*, *621*, Leidolf and McDaniel (1998), *MacDonald 7531*, *8150b*, *McDaniel 15513*, *29756*

**Pyrus calleryana* Decne., BP, IF, pine forests, prairie cedar woodlands, U; *805*, *828*, Leidolf and McDaniel (1998)

Rosa carolina L., BP, prairies, prairie cedar woodlands, O; *842*, *1453*, *Brooks 146*, Leidolf and McDaniel (1998)

**Rosa chinensis* Jacq., BP, IF, mesophytic upland hardwood forests, roadsides, R/U; *208*, *1488*

**Rosa multiflora* Thunb. ex Murray, BP, PR, bottomland hardwood forests, prairies, prairie cedar woodlands, roadsides, C; *8*, *177*, Leidolf and McDaniel (1998), Morris et al. (1993)

Rubus argutus Link, BP, PR, IF, bottomland hardwood forests, prairies, O; Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

Rubus betulifolius Small [= *R. argutus* Link], PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, roadsides, C; *154*, *1373*

Rubus cuneifolius Pursh, BP, prairies, prairie cedar woodlands, O; *McDaniel 31139*

Rubus flagellaris Willd., IF, pine-mixed hardwood forests, O; *122*

Rubus trivialis Michx., BP, IF, bottomland hard-

wood forests, C; *McDaniel 2324*, Theriot et al. (1993)

RUBIACEAE

Cephalanthus occidentalis L., IF, bottomland hardwood forests, canals/drainage ditches (riparian–banks), lakes/ponds/impoundments (riparian–banks), C; *584, 607*, Jones (1976b), Theriot et al. (1993)

**Cruciata pedemontana* (Bellardi) Ehrend., BP, roadsides, C(I); *MacDonald 9305*

Diodia teres Walter, IF, roadsides, O; *439*, Jones (1976b)

Diodia virginiana L., BP, IF, bottomland hardwood forests, lakes/ponds/impoundments (riparian–mudflats), cultivated fields, roadsides, C; *416, 611*, Theriot et al. (1993)

Galium aparine L., BP, PR, lakes/ponds/impoundments (riparian–banks), roadsides, C; *155*, Jones (1976b), *McDaniel 31049*

Galium circaezans Michx., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, prairie cedar woodlands, C; *303*, Jones (1976b), Leidolf and McDaniel (1998), Morris et al. (1993)

Galium obtusum Bigelow, IF, bottomland hard wood forests, A(I); *245*, Jones (1976b)

**Galium parisiense* L., BP, roadsides, A(I); *314*

Galium pilosum Aiton, BP, IF, xeric upland hardwood forests, grass/forb meadows, U; *1590, Clonts 826*, Jones (1976b)

Galium tinctorium (L.) Scop.; Jones (1976b)

Galium uniflorum Michx., IF, mesophytic upland hardwood forests, O; *446*

Galium virgatum Nutt., BP, prairies, O; *146*, Leidolf and McDaniel (1998)

Hedyotis australis W.H. Lewis & D.M. Moore [= *Houstonia micrantha* (Shinners) Terrell], IF, urban areas, U/C(I); *1316, MacDonald 8236*

Hedyotis crassifolia Raf. [– *Houstonia pusilla* Schoepf], BP, PR, IF, prairies, grass/forb meadows, urban areas, C; *42, 62, 132*, Jones (1976b), Leidolf and McDaniel (1998)

Hedyotis nigricans (Lam.) Fosberg, BP, prairies, chalk outcrops, O; *294*, Jones (1976b), Leidolf and McDaniel (1998), *McDaniel 15512*

Hedyotis purpurea (L.) Torr. & A. Gray var. *calycosa* (A. Gray) Fosberg, BP, IF, bottomland hard wood forests, prairies, prairie cedar wood lands, grass/forb meadows, roadsides, C; *165, 185, 257, 1341 (R185), 1371, Brooks 125, Bryson 57, 715*, Jones (1976b), Leidolf and McDaniel (1998), *McDaniel 10523*, Morris et al. (1993), Theriot et al. (1993)

Mitchella repens L., IF, bottomland hardwood forests, mesophytic upland hardwood forests, C; *251, 1580, Brooks 474*, Jones (1976b), Theriot et al. (1993)

Oldenlandia boscii (DC.) Chapm., IF, pine forests, pine-mixed hardwood forests, canals/drainage ditches (riparian–banks), C/A; *505, Brooks 322, Copeland s.n., McDaniel 2661*

Oldenlandia uniflora L., IF, pine mixed hardwood forests; *Brooks 324*

Richardia scabra L.; Jones (1976b)

**Sherardia arvensis* L., PR, roadsides, urban areas, C/A; *102*, Jones (1976b), *McDaniel 1610*, Pullen et al. (1968b)

Spermacoce glabra Michx., BP, canals/drainage ditches (riparian–banks), roadsides, O; *631*

RUTACEAE

**Poncirus trifoliata* (L.) Raf., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, roadsides, U; *69, 870*, Theriot et al. (1993)

Ptelea trifoliata L., IF, bottomland hardwood forests, rivers/creeks (riparian–banks), U, **S3S4**; *260, 717*

Zanthoxylum clava-herculis L., BP, PR, mesophytic upland hardwood forests, xeric upland hard wood forests, U; *935, McDaniel 1988, 24448, 31042*, Morris et al. (1993)

SALICACEAE

**Populus alba* L., IF, roadsides, urban areas, U; *1542, 1545*

Populus deltoides W. Bartram ex Marshall, PR, bottomland hardwood forests, mesophytic up land hardwood forests, C; *1322*, Morris et al. (1993)

Salix exigua Nutt., BP, canals/drainage ditches (riparian–banks), R; *613*, Lowe (1921)

Salix humilis Marshall, IF, pine forests, pine-mixed hardwood forests, lakes/ponds/impoundments (riparian–banks), seepage areas, roadsides, U; *508, 1501 (R508), Edwards s.n., MacDonald 6132, McDaniel 2840*

Salix nigra Marsnall, BP, IF, bottomland hardwood forests, rivers/creeks (riparian–banks/mudflats), canals/drainage ditches (riparian–

banks), C; *131*, *1362*, *Askew 129*, Theriot et al. (1993)

SAPINDACEAE

Cardiospermum halicacabum L., IF, rivers/creeks (riparian–banks), canals/drainage ditches (riparian–banks), cultivated fields, O; *694*, *710*, Pullen et al. (1968b), *Smith 942*

SAPOTACEAE

Bumelia lycioides (L.) Pers. [= *Sideroxylon lycioides* L.], BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, prairie cedar woodlands, rivers/creeks (riparian–banks), C; *434*, *688*, *827*, Leidolf and McDaniel (1998), Morris et al. (1993)

SAURURACEAE

Saururus cernuus L., PR, IF, bottomland hardwood forests, swamp forests, O; *341*, Jones (1975b), *McDaniel 28882*, Theriot et al. (1993)

SCROPHULARIACEAE

Agalinis fasciculata (Elliott) Raf., IF, pine forests, O; *880*

Agalinis gattingeri (Small) Small ex Britton, BP, prairies, O; *929*, Leidolf and McDaniel (1998)

Agalinis heterophylla (Nutt.) Small ex Britton, BP, R; *McDaniel 31653*

Agalinis pseudaphylla (Pennell) Shinners, BP, prairies, R, **S2**; *829*, Leidolf and McDaniel (1998), *McDaniel 15617*

Agalinis purpurea (L.) Pennell, BP, IF, pine forests, prairies, roadsides, C(I); *871*, *931*, *960*, Leidolf and McDaniel (1998), *McDaniel 24535*, *31308*, *Stewart 117*

Agalinis tenuifolia (Vahl) Raf., BP, IF, pine-mixed hardwood forests, chalk outcrops, roadsides, O; *989*, *McDaniel 14664*, *31312*

Aureolaria flava (L.) Farw., BP, IF, xeric upland hardwood forests, pine-mixed hardwood forests, roadsides, U/A(I); *718*, *Clonts 1400*, *McDaniel 31623*

Aureolaria pectinata (Nutt.) Pennell, IF, pine-mixed hardwood forests, U/A(I); *1538*, *McDaniel 2724*

Buchnera floridana Gandog. [= *B. americana* L.], BP, IF, prairies, seepage areas, O/R; *296*, *371 (R296)*, *539*, Leidolf and McDaniel (1998), *McDaniel 13450*, *31086*

Dasistoma macrophylla (Nutt.) Raf., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, roadsides, O, **S3S4**; *433*, *1601*, Morris et al. (1993)

Epifagus virginiana (L.) Barton, IF, bottomland hardwood forests, A(I); *943*

Gratiola neglecta Torr., IF, bottomland hardwood forests, canals/drainage ditches (emergent), grass/forb meadows, C; *264*, *1347*, *McDaniel 1679*

Gratiola pilosa Michx., IF, seepage areas, O; *481*

Gratiola virginiana L., IF, bottomland hardwood forests, swamp forests, canals/drainage ditches (emergent), O/A(I); *1294*, *1440*, *McDaniel 2451*

Leucospora multifida (Michx.) Nutt., BP, cultivated fields, O; *422*

Linaria canadensis (L.) Chaz. [= *Nuttalanthus canadensis* (L.) D.A. Sutton], BP, cultivated fields, A(I); *1281*

Lindernia dubia (L.) Pennell, BP, IF, bottomland hardwood forests, rivers/creeks (riparian–mudflats), O; *McDaniel 25289*, Theriot et al. (1993)

Mecardonia acuminata (Walter) Small, IF, pine forests, seepage areas, lakes/ponds/impoundments (riparian–banks), O; *646*, *652*, *Copeland s.n.*

Micranthemum umbrosum (J.F. Gmel.) S.F. Blake, IF, lakes/ponds/impoundments (riparian–mudflats), O/C; *1595*, *McDaniel 1570*, *1570a*

Mimulus alatus Aiton, BP, IF, bottomland hardwood forests, rivers/creeks (riparian–banks/mudflats), canals/drainage ditches (riparian–banks), O; *554*, *672*, Theriot et al. (1993)

**Parentucellia viscosa* (L.) Caruel, PR, urban areas, C(I); *MacDonald 9377*

Pedicularis canadensis L., PR, mesophytic upland hardwood forests, O; *Smith 1930*

Penstemon digitalis Nutt. ex Sims, BP, PR, mesophytic upland hardwood forests, prairies, prairie cedar woodlands, rivers/creeks (riparian–banks), O; *217*, *1452*, *Morris 3098*

Penstemon laevigatus Aiton, BP, prairies, roadsides, O; *211*, *1466*

Penstemon tenuiflorus Pennell, BP, prairies, prairie cedar woodlands, chalk outcrops, roadsides, U/C(I), **S2S3**; *270*, *Bryson 129*, *7442*, *McDaniel 10584*, *31020*, *Morris 3079*, Morris et al. (1993), *Stewart 357*

Penstemon tubiflorus Nutt., BP, PR, mesophytic upland hardwood forests, lakes/ponds/im-

poundments (riparian–banks), R/U; *McDaniel 31051*, Morris et al. (1993)

Scrophularia marilandica L., PR, mesophytic upland hardwood forests, U/O; *McDaniel 28889*, Morris et al. (1993)

Seymeria cassioides (J.F. Gmel.) S.F. Blake, IF, pine forests, pine-mixed hardwood forests, C/A(l); *959, McDaniel 22134, 24536*

Tomanthera auriculata (Michx.) Raf. [= *Agalinis auriculata* (Michx.) S.F. Blake], BP, prairies, roadsides, RR, **S1**; *928, 930*, Leidolf and McDaniel (1998), *McDaniel 15621*

**Verbascum blattaria* L., BP, prairies, roadsides, O; *318, Brooks 156*

**Verbascum thapsus* L., IF, roadsides, C(l); *521*

**Veronica arvensis* L., BP, roadsides, C; *70, 159*

Veronica peregrina L., BP, PR, cultivated fields, urban areas, C; *1208, 1274, 1285*

**Veronica persica* Poir., PR, urban areas, O; *1207*

SIMAROUBACEAE

**Ailanthus altissima* (Mill.) Swingle, PR, urban areas, R; *Smith 363*

SOLANACEAE

**Datura stramonium* L., BP, urban areas; *Carraway 490*

Physalis angulata L., BP, IF, chalk outcrops, cultivated fields, grass/forb meadows, O; *417, 520, 713, Clonts 1408, McDaniel 22195*

Physalis heterophylla Nees, BP, PR, mesophytic upland hardwood forests, lakes/ponds/impoundments (riparian–mudflats), O; *McDaniel 31047*, Morris et al. (1993)

Physalis pubescens L.; Pullen et al. (1968b)

Physalis virginiana Mill., BP, IF, pine forests, rivers/creeks (riparian–mudflats), canals/drainage ditches (riparian–banks), O; *685, 835, McDaniel 21234*

Solanum carolinense L., IF, roadsides, O; *252, Clonts 821*

Solanum ptychanthum Dunal, PR, mesophytic upland hardwood forests, U; *890*

STAPHYLEACEAE

Staphylea trifolia L., IF, bottomland hardwood forests, A(l), **S3**; *280, 352 (R280), 978 (R280), 1368 (R280), Blocker s.n.* (MISSA), *Channell s.n.* (MISSA), Theriot et al. (1993)

STYRACACEAE

Styrax americanus Lam., IF, bottomland hardwood forests, lakes/ponds/impoundments (riparian–banks), U/C; *949, Leidolf s.n., McDaniel 1820a*, Theriot et al. (1993)

SYMPLOCACEAE

Symplocos tinctoria (L.) L'Hér., IF, bottomland hardwood forests, C; *903, 948, Askew 47*, Theriot et al. (1993)

TILIACEAE

Tilia americana L., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, rivers/creeks (riparian–banks), O/C(l); *Bryson 7430, Morris 3085*, Morris et al. (1993)

ULMACEAE

Celtis laevigata Willd., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, pine-mixed hardwood forests, prairie cedar woodlands, C; *233, 936*, Leidolf and McDaniel (1998), Lowe (1921), Morris et al. (1993), Theriot et al. (1993)

Planera aquatica J.F. Gmel., IF, bottomland hardwood forests, rivers/creeks (riparian–banks), R/O; *Leidolf s.n.*, Theriot et al. (1993)

Ulmus alata Michx., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, pine-mixed hardwood forests, prairies, prairie cedar woodlands, chalk outcrops, lakes/ponds/impoundments (riparian–banks), roadsides, C; *39, 350, 634, 1336*, Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

Ulmus americana L., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, pine-mixed hardwood forests, roadsides, C; *24, 37*, Morris et al. (1993), Theriot et al. (1993)

Ulmus rubra Muhl., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, prairie cedar woodlands, rivers/creeks (riparian–banks), O; *104*, Leidolf and McDaniel (1998), Morris et al. (1993)

Ulmus serotina Sarg., PR, mesophytic upland hardwood forests, R, **S3?**; *884, Anderson s.n.* (MISSA), *Crawford s.n.* (MISSA), *Henry s.n.* (MISSA), *Howell s.n.* (MISSA), *Johnson s.n.* (MISSA), *McDaniel 1046, Smith 1022*

URTICACEAE

Boehmeria cylindrica (L.) Sw., BP, IF, bottomland

hardwood forests, rivers/creeks (riparian–mudflats), A(I); *673*, Theriot et al. (1993)

Parietaria pensylvanica Muhl. ex Willd., BP, lakes/ponds/impoundments (riparian–mudflats), A(I); *McDaniel 31056*

Pilea pumila (L.) A. Gray, IF, bottomland hardwood forests, swamp forests, rivers/creeks (riparian–banks), O/A; *905*, *Smith 944*

VALERIANACEAE

**Valerianella locusta* (L.) Betcke, PR, urban areas, O; *McDaniel 21186*

Valerianella radiata (L.) Dufr., BP, PR, IF, bottomland hardwood forests, roadsides, urban areas, C/A; *101*, *Askew 66*, Jones (1976b), *McDaniel 1666*, *31036*

VERBENACEAE

Callicarpa americana L., BP, IF, bottomland hardwood forests, mesophytic upland hardwood forests, grass/forb meadows, C; *449*, *857*, *Clonts 844*, Morris et al. (1993), Theriot et al. (1993)

Lippia lanceolata Michx. [= *Phyla lanceolata* (Michx.) Greene], BP, chalk outcrops, cultivated fields, O; *415*, *McDaniel 22926*

Verbena bipinnatifida Nutt. [= *Glandularia bipinnatifida* (Nutt.) Nutt. var. *bipinnatifida*], BP, IF, prairies, chalk outcrops, roadsides, R/C; *167*, *275*, *1329*, *Bruza 925*, *Bryson 7446*, *McDaniel 13449*, *31019*, *Morris 3082*, Morris et al. (1993), Pullen et al. (1968b)

**Verbena bonariensis* L., IF, grass/forb meadows, U/C(I); *1655*, *Bruza 963*

**Verbena brasiliensis* Vell., BP, PR, IF, grass/forb meadows, roadsides, urban areas, C/A(I); *290*, *463*, *1572*, *Bryson 730*, *Scruggs 100*

Verbena canadensis (L.) Britton [= *Glandularia candensis* (L.) Nutt.], BP; Morris et al. (1993)

**Verbena rigida* Spreng., PR, IF, grass/forb meadows, roadsides, U; *847*, *1532*

Verbena simplex Lehm., BP, IF, prairies, chalk outcrops, roadsides, O; *267*, *298*, *Clonts 815*, Leidolf and McDaniel (1998), Lowe (1921), *McDaniel 13448*, *31040*, *Morris 3080*, Morris et al. (1993), *Sundell 1538*

Verbena urticifolia L., BP, canals/drainage ditches (riparian–banks), roadsides, U; *833*, Lowe (1921)

VIOLACEAE

Hybanthus concolor (T.F. Forst.) Spreng., PR, mesophytic upland hardwood forests, C(I), **S2**; *Channell s.n.* (MISSA), *Mckee s.n.* (MISSA), *Ray 8214* (MISSA), *Smith 1929*

Viola affinis Leconte, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine forests, canals/drainage ditches (riparian–banks), C; *41*, *86*, *98*, *McDaniel 2884*, Morris et al. (1993), Theriot et al. (1993)

Viola bicolor Pursh, PR, roadsides, C; *60*

Viola palmata L., PR, IF, mesophytic upland hardwood forests, O; *97*, *123*, *153(R123)*

Viola primulifolia L., IF, mesophytic upland hardwood forests, R/O; *198*, *Bryson 963*

Viola sagittata Aiton, BP, IF, bottomland hardwood forests, pine forests, pine-mixed hardwood forests, chalk outcrops, rivers/creeks (riparian–banks), C; *87*, *106*, *118*, *Bryson 5392*, *McDaniel 1590*, *1608*

VISCACEAE

Phoradendron leucarpum (Raf.) Reveal & M.C. Johnst., PR, urban areas, C; *1203*

VITACEAE

Ampelopsis arborea (L.) Koehne, BP, IF, bottomland hardwood forests, xeric upland hardwood forests, prairie cedar woodlands, C; *469*, Leidolf and McDaniel (1998), *McDaniel 31634*, *31655*, Theriot et al. (1993)

Ampelopsis cordata Michx., BP, PR, IF, bottomland hardwood forests, roadsides, urban areas, C; *614*, *1491*, *1533*

Cissus incisa Des Moul., PR, urban areas; *McDaniel 9786*

Parthenocissus quinquefolia (L.) Planch., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, prairie cedar woodlands, O; Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

Vitis aestivalis Michx., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, prairie cedar woodlands, chalk outcrops, O; Leidolf and McDaniel (1998), Morris et al. (1993), Theriot et al. (1993)

Vitis cinerea (Engelm.) Millard, BP, IF, bottomland hardwood forests, pine-mixed hardwood forests, urban areas, R/O; *1446*, *1496*, *1599*, Theriot et al. (1993)

Vitis rotundifolia Michx., PR, IF, bottomland hardwood forests, pine forests, pine-mixed hardwood forests, C; *1593*, Morris et al. (1993), Theriot et al. (1993)

LILIOPSIDA

AGAVACEAE

Manfreda virginica (L.) Salisb. ex Rose, BP, IF, prairies, roadsides, C; *425, 627, 802, 839, Bruza 967*, Leidolf and McDaniel (1998), *Locke s.n.* (MISSA), *Ray 49* (MISSA)

ALISMATACEAE

Alisma subcordatum Raf., IF, canals/drainage ditches (emergent), lakes/ponds/impoundments (littoral–emergent), RR, **SH**; *Frasier s.n.*, Leidolf pers. obs., *MacDonald 10884*

Echinodorus cordifolius (L.) Griseb., IF, lakes/ponds/impoundments (riparian–mudflats, littoral–emergent), O; *726, Easley s.n.* (MISSA), Jones (1974a)

Sagittaria calycina Engelm.; *Hare s.n.* (MISSA)

Sagittaria lancifolia L.; *Blocker s.n.* (MISSA), Jones (1974a)

Sagittaria platyphylla (Engelm.) J.G. Sm., IF, lakes/ponds/impoundments (riparian–mudflats, littoral–emergent), O; *727*

ALLIACEAE

**Allium ampeloprasum* L., BP, grass/forb meadows, roadsides, O; *311*

Allium canadense L., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, prairies, lakes/ponds/impoundments (riparian–mudflats), grass/forb meadows, urban areas, O/A; *276, Fisher 82* (MISSA), Leidolf and McDaniel (1998), *McDaniel 31054*, Morris et al. (1993)

Allium mobilense Regel [= *A. canadense* L. var. *mobilense* (Regel) Ownbey], PR, urban areas; *Prescott s.n.* (MISSA)

**Allium vineale* L., BP, prairies, roadsides, O; *310*, Leidolf and McDaniel (1998)

Nothoscordum bivalve (L.) Britton, BP, PR, mesophytic upland hardwood forests, prairies, prairie cedar woodlands, C; *61, 113*, Leidolf and McDaniel (1998), *Mitchell s.n.* (MISSA), *Murphy s.n.* (MISSA), *Persons s.n.* (MISSA), *Rainwater s.n.* (MISSA), *Sistrunk s.n.* (MISSA), *Stauffer s.n.* (MISSA), *Tringle s.n.* (MISSA)

AMARYLLIDACEAE

**Leucojum aestivum* L., IF, bottomland hardwood forests, R; *Askew 46*

**Lycoris radiata* (L'Hér.) Herb., PR, roadsides, urban areas, O; *996*

**Narcissus biflorus* Curtis [= *N.* × *medioluteus* Mill. (pro sp.)], PR, roadsides, urban areas, O; *33*

**Narcissus* × *incomparabilis* Mill., BP, roadsides, urban areas, O; *79*

**Narcissus jonquilla* L., PR, roadsides, urban areas, O; *22*

ARACEAE

Arisaema dracontium (L.) Schott, BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, lakes/ponds/impoundments (riparian–mudflats), A(l); *218, 258, Brown s.n.* (MISSA), Jones (1974a), Lowe (1921), *McDaniel 31057*, Morris et al. (1993), Theriot et al. (1993)

Arisaema quinatum (Buckley) Schott [= *A. triphyllum* (L.) Schott ssp. *quinatum* (Buckley) Huttleston], PR, mesophytic upland hardwood forests, R; Morris et al. (1993), *Tracy s.n.* (MISSA)

Arisaema triphyllum (L.) Schott, PR, bottomland hardwood forests, mesophytic upland hardwood forests, U; *147*, *Channell s.n.* (MISSA), Jones (1974a), *Moore s.n.* (MISSA)

ARECACEAE (PALMAE)

Sabal minor (Jacq.) Pers., IF, bottomland hardwood forests, pine-mixed hardwood forests, A(l); *714, Askew 61, McDaniel 2549*

ASPARAGACEAE

**Asparagus officinalis* L., BP, PR, prairies, roadsides, urban areas, U; *804*, *Channell s.n.* (MISSA), *18* (MISSA), *Christian s.n.* (MISSA), *Clonts 490*, Leidolf and McDaniel (1998)

COMMELINACEAE

**Commelina communis* L., BP, canals/drainage ditches (emergent), roadsides, C; *797*, Jones (1976b)

Commelina diffusa Burm.f., PR, canals/drainage ditches (emergent), urban areas, O; *923*

Commelina virginica L., BP, IF, bottomland hardwood forests, rivers/creeks (riparian–mudflats), canals/drainage ditches (emergent), C; *675, 695, 1374, Brooks 400*, Jones (1976b), *Moore s.n.* (MISSA), *Stauffer s.n.* (MISSA)

Tradescantia ohiensis Raf., IF, pine forests, roadsides, C; *256, 326, Brooks 124, Easley s.n.* (MISSA), *Funchess s.n.* (MISSA), Jones (1976b), *Rainwater s.n.* (MISSA), *Stauffer s.n.* (MISSA)

Tradescantia virginiana L., BP, IF, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, O/C; *Persons s.n.* (MISSA), *Presley s.n.* (MISSA), *Price 52* (MISSA), *Ray 8008* (MISSA), Theriot et al. (1993), *Tracy s.n.* (MISSA)

CONVALLARIACEAE

Maianthemum racemosum (L.) Link, IF, bottomland hardwood forests; *Locke s.n.* (MISSA), *Shelley s.n.* (MISSA), *Stauffer s.n.* (MISSA), Theriot et al. (1993)

Polygonatum biflorum (Walter) Elliott, PR, mesophytic upland hardwood forests, O; *219, 1348 (R219), Bryson 8331, Channell s.n.* (MISSA), *Donald s.n.* (MISSA), *Easley s.n.* (MISSA), *Hammer s.n.* (MISSA), *Morris et al. (1993), Stauffer s.n.* (MISSA)

Uvularia floridana Chapm., **S1**; *Eckles s.n.* (MISSA)

Uvularia grandiflora Sm.; *Easley s.n.* (MISSA)

Uvularia sessilifolia L., IF, bottomland hardwood forests, mesophytic upland hardwood forests, O; *1297, 1367, 1486(R1297)*

CYPERACEAE

Carex abscondita Mack., IF, bottomland hardwood forests; Theriot et al. (1993)

Carex albicans Willd. ex Spreng. var. *albicans*, PR, mesophytic upland hardwood forests, O; Morris et al. (1993)

Carex albicans Willd. ex Spreng. var. *australis* (L.H. Bailey) Rettig, PR, mesophytic upland hardwood forests, O; *66*

Carex albolutescens Schwein., PR, IF, canals/drainage ditches (riparian–banks), roadsides, O; *176, Bryson 3138 (Charles T. Bryson personal herbarium [ctb]), 3191 (ctb), 3833 (ctb)*

Carex annectens (E.P. Bicknell) E.P. Bicknell, PR, IF, bottomland hardwood forests, roadsides, O; *266, Bryson 149*, Morris et al. (1993)

Carex atlantica Bailey ssp. *atlantica*, IF, pine-mixed hardwood forests, seepage areas; *Bryson 3841 (MMNS)*

Carex austrina (Small) Mack., PR, IF; Bryson et al. (1992)

Carex basiantha Steud., BP, PR, mesophytic upland hardwood forests, prairies, O/C(I); *1530, Bryson 3210, 3217, McDaniel 31053*, Morris et al. (1993)

Carex blanda Dewey, BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, O; *191, 1355, Bryson 416, 2880a, 2880b, 3215*, Morris et al. (1993)

Carex brevior (Dewey) Mack. ex Lunell, BP, IF, pine forests, roadsides, O; *225, Bryson 5391, 8600*, Bryson et al. (1992)

Carex bushii Mack., BP, xeric upland hardwood forests, prairie cedar woodlands, C(I); *Bryson 31, McDaniel 10524*

Carex caroliniana Schwein., IF, bottomland hardwood forests, roadsides, A(I); *262, Bryson 92*

Carex cephalophora Muhl. ex Willd., BP, PR, IF, mesophytic upland hardwood forests, xeric upland hardwood forests, pine forests, prairies, rivers/creeks (riparian–banks), urban areas, O/C; *221, Bryson 19, 40, 42, 98, 139, 346, 350, 1337a, 2877, 3214, McDaniel 1818, 2439*, Morris et al. (1993)

Carex cherokeensis Schwein., BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, prairies, prairie cedar woodlands, AA(I); *5, 107, Bryson 5, 6, 13, 16, 20, 26, 27, 34, 126, 352*, Bryson (1980), Leidolf and McDaniel (1998), *McDaniel 1816, Schuster 9*, Morris et al. (1993)

Carex complanata Torr. & Hook., PR, IF, mesophytic upland hardwood forests, pine forests, canals/drainage ditches (riparian–banks), roadsides, C; *237, 240, 1335a, 1476, Bryson 148, 3141*

Carex corrugata Fernald, BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, O; *190, 229, 1520a, Bryson 93 (ctb), 622 (ctb), 3059 (ctb), 3827 (ctb), 5631 (ctb), 5635 (ctb), 5641 (ctb)*

Carex crebriflora Wiegand, IF, bottomland hardwood forests, pine-mixed hardwood forests; *Bryson 675, 3063, 3200, 3656, Rosenkranz s.n.*

Carex crus-corvi Shuttlew. ex Kuntze, IF; *Bryson 288*

Carex debilis Michx., IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine-mixed hardwood forests, O; *1302, Bryson 376, 3139*, Theriot et al. (1993)

Carex digitalis Willd. var. *macropoda* Fernald [= *C. digitalis* Willd.], IF; *Bryson 373 (ctb), 377 (ctb)*

Carex festucacea Schkuhr ex Willd., BP, IF, bottomland hardwood forests, pine forests, canals/drainage ditches (riparian–banks), grass/forb meadows, roadsides, O; Leidolf pers. obs., *Brooks 131, Bryson 282, 366, 3191*

Carex flaccosperma Dewey, BP, IF, bottomland hardwood forests, swamp forests, mesophytic upland hardwood forests, pine forests, canals/drainage ditches (emergent), C; *247, 1295, 1299, 1309, 1478, 1523a, Brooks 127, Bryson 17, 100, 128, 147, 155, 309, 429 (ctb), 964 (ctb), 1853 (ctb), 3060 (ctb), 3071, 3209 (ctb), 3829 (ctb), McDaniel 1675, 2438*, Theriot et al. (1993)

Carex frankii Kunth, BP, PR, IF, bottomland hardwood forests, lakes/ponds/impoundments (littoral–emergent), canals/drainage ditches (emergent), seepage areas, roadsides, C; *384, 575, 1493, 1559, 1571, 1591, Bryson 283, 286*, Morris et al. (1993), *Wigley 314017*

Carex glaucodea Tuck. ex Olney [= *C. flaccosperma* Dewey var. *glaucodea* (Tuck. ex Olney) Kuek.], BP; *Bryson 11671 (ctb)*, Morris et al. (1993)

Carex gracilescens Steud., BP, PR, IF, mesophytic upland hardwood forests, A(I), **S2S3**; *McDaniel 31021*, Morris et al. (1993)

Carex granularis Muhl. ex Willd., BP, prairies, O/C(I); *1529, Bryson 135, McDaniel 31432*, Morris et al. (1993)

Carex hirsutella Mack., BP, IF, prairies; *Brooks 138, McDaniel 11621*

Carex hyalinolepis Steud., IF, canals/drainage ditches (emergent); *Bryson 285, 1860*, Lowe (1921)

Carex intumescens Rudge, IF, bottomland hardwood forests, swamp forests, A(I); *473, 1376, Bryson 90*, Theriot et al. (1993)

Carex jamesii Schwein., BP, PR, mesophytic upland hardwood forests, prairies, R, **S1S2**; *1531, McDaniel 31375*, Morris et al. (1993), Naczi and Bryson (1990)

Carex joorii L.H. Bailey, IF, bottomland hardwood forests, swamp forests, canals/drainage ditches (emergent), O; *912, Bryson 304, 3440*

Carex laevivaginata (KÚk.) Mack., PR, seepage areas; *Bryson 3839 (ctb)*

Carex laxiflora Lam. var. *serrulata* F.J. Herm., PR, mesophytic upland hardwood forests, R, **S1**; *1334a*, Morris et al. (1993)

Carex leavenworthii Dewey, BP, PR, IF, bottomland hardwood forests, roadsides, C; *196, 228*, Morris et al. (1993)

Carex longii Mack., IF, bottomland hardwood forests; *Bryson 153 (ctb), 282 (ctb), 623 (ctb), 707, 2029 (ctb), 3069 (ctb), 3431 (ctb), 7013 (ctb), 8608 (ctb), 8610 (ctb)*

Carex louisianica L.H. Bailey, IF, bottomland hard wood forests, A(I); *456, 910 (R456), 1578 (R456)*

Carex lupulina Muhl. ex Willd., IF, mesophytic upland nardwood forests, O; *558, 1579 (R558)*

Carex lurida Wahlenb., IF, seepage areas, road sides, O; *1479, Bryson 150*

Carex meadii Dewey, BP, PR, prairies, O/C(I), **S3S4**; *1524a, Bryson 44, 59, 415, 1822 (ctb), 3143 (ctb), 3640 (ctb), 3644 (ctb), 3738 (ctb), 3825 (ctb), 4108 (ctb), 5402 (ctb), 11668 (ctb)*, Bryson (1980), Morris et al. (1993), *Tracy 31* (MISSA)

Carex microdonta Torr. & Hook., BP, prairies, O, **S2?**; *1522, Bryson 11667 (ctb)*, Bryson (1980), Bryson et al. (1992)

Carex molesta Mack. ex Bright, BP, PR; Bryson et al. (1992)

Carex muehlenbergii Schkuhr ex Willd., BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, prairies, canals/drainage ditches (riparian–banks), O/C(I); *172, 261, Bryson 4409, McDaniel 11620*, Morris et al. (1993)

Carex oxylepis Torr. & Hook. var. *oxylepis*, BP, PR, bottomland hardwood forests, mesophytic upland hardwood forests, prairie cedar woodlands, O; *Bryson 130, 353, 354 (ctb), 2881 (ctb), 3830 (ctb), 5637 (ctb), 5643 (ctb), 5644 (ctb)*

Carex oxylepis Torr. & Hook. var. *pubescens* J.K. Underw., PR; *Bryson 3218 (ctb)*, Bryson et al. (1992)

Carex pigra Naczi, BP, PR; *Bryson 11672 (ctb), 12348 (ctb)*

Carex planispicata Naczi, BP, PR, IF, mesophytic upland hardwood forests, rivers/creeks (riparian–banks), roadsides, O; *222, 1356(R222), Bryson 24, 25, 93, 133, 2879, 3216*

Carex reniformis (L.H. Bailey) Small, IF, bottomland hardwood forests, O/C; *246, McDaniel 1824*

Carex retroflexa Muhl. ex Willd., PR, IF, mesophytic upland hardwood forests, pine forests, O; *192, Bryson 351*

Carex rosea Schkuhr ex Willd., IF; *Bryson 369 (ctb)*

Carex socialis Mohlenbr. & Schwegman, BP, PR, IF, bottomland hardwood forests; *Bryson 966* (MISSA), *5394, Tracy s.n.* (MISSA)

Carex squarrosa L., IF; *Bryson 284*

Carex striatula Michx., PR, mesophytic upland hardwood forests, O; *1301*
Carex stricta Lam., **S2**; Bryson (1980)
Carex styloflexa Buckley, PR, IF, mesophytic upland hardwood forests, pine-mixed hardwood forests, O; *193, Bryson 3055, 3137*
Carex triangularis Boeck., BP, PR, IF, mesophytic upland hardwood forests, xeric upland hardwood forests, pine forests, rivers/creeks (riparian–banks), canals/drainage ditches (riparian–banks), roadsides, O/C; *236, Bryson 23, 38, 39a, 91a, 132a, 156, 1859, 2028, Copeland s.n., McDaniel 1825*
Carex tribuloides Wahlenb., IF, bottomland hardwood forests, rivers/creeks (riparian–banks), canals/drainage ditches (emergent), O; *358, 474, Bryson 676, 3072*, Theriot et al. (1993)
Carex typhina Michx., IF, bottomland hardwood forests, O; *911*
Carex umbellata Schkuhr ex Willd., BP, PR, xeric upland hardwood forests, roadsides, U; *1263, Bryson 5164*, Naczi and Bryson (1990)
Carex vulpinoidea Michx., PR, mesophytic upland hardwood forests, O; Morris et al. (1993)
Cyperus acuminatus Torr. & Hook. ex Torr., BP, canals/drainage ditches (emergent), C; *406, Bryson 10110, MacDonald 10887*
Cyperus compressus L., PR, urban areas, O; *784, Bryson 2605, Copeland s.n., McDaniel 2206*
Cyperus croceus Vahl, IF, pine forests, U; *876a, Bryson 698*
Cyperus echinatus (L.) Wood, IF, grass/forb meadows, roadsides, C; *483, 506, 546, 661, McDaniel 2536, Wigley 314019*
Cyperus erythrorhizos Muhl., IF, lakes/ponds/impoundments (riparian–mudflats), C; *981, Bryson 3439a, 3439b*
**Cyperus esculentus* L., BP, IF, cultivated fields, C; *709, 816, Bryson 3426*
Cyperus flavescens L., PR, urban areas, U; *785*
**Cyperus iria* L., IF, lakes/ponds/impoundments (riparian–mudflats), C; *606, Bryson 345, 3428*, Pullen et al. (1968b), *Wigley 312059*
Cyperus odoratus L., BP, IF, canals/drainage ditches (riparian–banks), urban areas, C; *623, 967, Bryson 3441, Carraway 179, McDaniel 31331*
Cyperus polystachyos Rottb., IF, seepage areas, roadsides, O; *859*
Cyperus pseudovegetus Steud., IF, rivers/creeks (riparian–banks), C; *357, Bruza 980, Bryson 689*
Cyperus retroflexus Buckley, BP, cultivated fields; Bryson and Carter (1992)
Cyperus retrorsus Chapm., IF, grass/forb meadows, O; *662, Bryson 3437*, Lowe (1921)
**Cyperus rotundus* L., BP, IF, seepage areas, cultivated fields, C; *412, 540, 708, Bruza 957, Bryson 2135, 3427, Wigley 313036*
Cyperus strigosus L., IF, canals/drainage ditches (riparian -banks), roadsides, C; *484, 550, Bruza 960, 961, Bryson 701, 3438*, Lowe (1921), *Wigley 315070*
Eleocharis compressa Sull., BP; *Bryson 3146 (ctb)*
Eleocharis elliptica Kunth, BP; *Bryson 1858 (ctb)*
Eleocharis montevidensis Kunth, BP; *Bryson 8920 (ctb)*
Eleocharis obtusa (Willd.) Schult., BP, IF, canals/drainage ditches (emergent), C; *430, 814, 866, Bruza 959, Bryson 685, McDaniel 2539, Wigley 312060*
Eleocharis quadrangulata (Michx.) Roem. & Schult., IF, lakes/ponds/impoundments (littoral–emergent), U; *601, Bruza 982, McDaniel 2550*
Eleocharis smallii Britton, BP; *McDaniel 25026*
Eleocharis tenuis (Willd.) Schult., IF, canals/drainage ditches (emergent), O; *197*
Fimbristylis annua (All.) Roem. & Schult., PR, IF, canals/drainage ditches (emergent), urban areas, O; *783, 862, McDaniel 2727*
Fimbristylis autumnalis (L.) Roem. & Schult., IF, canals/drainage ditches (emergent), O; *860, 863, Bryson 2610, McDaniel 2728*
Fimbristylis decipiens Kral, BP; *MacDonald 10886*
Fimbristylis littoralis Gaudich. [= *F. miliacea* (L.) Vahl], IF, canals/drainage ditches (emergent), O; *864*
Fimbristylis puberula (Michx.) Vahl; *Brooks 151*
Fimbristylis tomentosa Vahl; *Bruza 964*
Kyllinga brevifolia Rottb., PR, urban areas, O; *786, McDaniel 7526*
Kyllinga odorata Vahl, PR, IF, seepage areas, grass/forb meadows, urban areas, C; *546, 846, 965, 1560, Bryson 3434, Carraway 180*
Rhynchospora caduca Elliott, IF, seepage areas, C(I); *491, McDaniel 2547*
Rhynchospora corniculata (Lam.) A. Gray, IF, canals/drainage ditches (emergent), C; *442, Bruza 979*
Rhynchospora globularis (Chapm.) Small; *Brooks 490, Bruza 935, McDaniel 2639*

Rhynchospora glomerata (L.) Vahl, IF, C; *1477*
Rhynchospora inexpansa (Michx.) Vahl, IF, seepage areas, roadsides, C(I); *489, 490 (R489), 492 (R489), 1562*
Scirpus atrovirens Willd., IF, canals/drainage ditches (emergent), roadsides, O; *509*
Scirpus cyperinus (L.) Kunth, IF, lakes/ponds/impoundments (riparian–mudflats, littoral–emergent), O; *583*
Scirpus koilolepis (Steud.) Gleason, IF, urban areas, A(I); *1313*
Scirpus lineatus Michx.; *Carter 3010*
Scirpus pendulus Muhl., BP, canals/drainage ditches (emergent), O; *170*
Scleria oligantha Michx., BP, prairies, R/O; *1521, McDaniel 1087*

DIOSCOREACEAE

Dioscorea villosa L., PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, U; *668*, Jones (1976b), *Phares s.n.* (MISSA), Theriot et al. (1993)

HEMEROCALLIDACEAE

**Hemerocallis fulva* (L.) L., BP, roadsides, urban areas, C; *317*

HYACINTHACEAE

Camassia scilloides (Raf.) Cory, BP, grass/forb meadows, **S2S3**; *Bryson 58, McDaniel 31379*
**Hyacinthoides nonscripta* (L.) Chouard ex Rothm., PR, urban areas, R; *Askew 55*
**Muscari botryoides* (L.) Mill.; *Easley s.n.* (MISSA)
**Muscari neglectum* Guss. ex Ten., PR, roadsides; *Murphy s.n.* (MISSA)

HYDROCHARITACEAE

Limnobium spongia (Bosc) Rich. ex Steud., IF, lakes/ponds/impoundments (littoral–rooted-floating); *Stewart 123*
Najas guadalupensis (Spreng.) Magnus, PR, canals/drainage ditches (submergent), O; *924*
**Najas minor* All., PR, lakes/ponds/impoundments (submergent); Nuttle pers. obs.

HYPOXIDACEAE

Hypoxis hirsuta (L.) Coville, BP, IF, bottomland hardwood forests, mesophytic upland hardwood forests, pine-mixed hardwood forests, prairies, roadsides, O/A(I); *173, 242, Arnett 91* (MISSA), *Channell s.n.* (MISSA), *Locke s.n.* (MISSA), *McDaniel 2414*

IRIDACEAE

**Belamcanda chinensis* (L.) DC., PR, roadsides, U; *Ray 104* (MISSA), *Smith 1444*
Iris virginica L., IF, canals/drainage ditches (emergent), O; *254*
Nemastylis geminiflora Nutt., BP, prairies, chalk outcrops, C(I)/R, **S2**; *1510, McDaniel 31002, Morris 3094*, Morris et al. (1993)
Sisyrinchium albidum Raf., BP, PR, prairies, chalk outcrops, C; *116, 148*, Leidolf and McDaniel (1998), Morris et al. (1993)
Sisyrinchium angustifolium Mill., IF, bottomland hardwood forests, pine forests, O; *250, McDaniel 2440*
Sisyrinchium atlanticum E.P. Bicknell, BP, PR, mesophytic upland hardwood forests, prairies, O; *166, 1330a, McDaniel 31024*
Sisyrinchium mucronatum Michx., IF; *Copeland s.n.*
Sisyrinchium rosulatum E.P. Bicknell, IF, seepage areas, cultivated fields, urban areas, O/C; *499, 1468*

JUNCACEAE

Juncus acuminatus Michx., BP, IF, rivers/creeks (emergent), canals/drainage ditches (emergent), O; *Bryson 1854, McDaniel 25028*
Juncus biflorus Ell., IF, pine-mixed hardwood forests, canals/drainage ditches (emergent), C/A; *362, Bryson 687, McDaniel 2538, 3149*
Juncus brachycarpus Engelm., IF; *Webster 1539*
Juncus bufonius L., BP, PR, cultivated fields, C; *1469, Bryson 3289, 3501*
Juncus coriaceus Mack., IF, canals/drainage ditches (emergent), C; *360, Bryson 1856*
Juncus debilis A. Gray, IF, canals/drainage ditches (emergent), O; *865*
Juncus dichotomus Elliott, IF, canals/drainage ditches (emergent); *Bryson 1855*
Juncus diffusissimus Buckley, IF, canals/drainage ditches (emergent), O; *451*
Juncus effusus L., IF, canals/drainage ditches (emergent), O; *241*
Juncus elliottii Chapm., IF, lakes/ponds/impoundments (riparian–mudflats); *Bryson 686*
Juncus filipendulus Buckley, BP, **S3S4**; *Maddox 1146*
Juncus marginatus Rostk., IF, canals/drainage ditches (emergent), O; *362, McDaniel 2538, 3149*

Juncus nodatus Coville, IF, canals/drainage ditches (emergent), lakes/ponds/impoundments (littoral–emergent), U; *510, 656*

Juncus scirpoides Lam., IF, canals/drainage ditches (emergent); *Bruza 930*

Juncus tenuis Willd., BP, PR, IF, mesophytic upland hardwood forests, xeric upland hardwood forests, pine forests, prairies, rivers/creeks (riparian–banks), canals/drainage ditches (emergent), urban areas, O/C; *378, 476, 1293, Bryson 8, 15, 699, 1682, 2027, Copeland s.n.*, Leidolf and McDaniel (1998)

Juncus torreyi Coville, BP, IF, prairies, canals/drainage ditches (emergent), cultivated fields, grass/forb meadows, C; *288, 383, Bryson 700, 2030, 3994*, Leidolf and McDaniel (1998), *McDaniel 31082*

Juncus validus Coville, IF, bottomland hardwood forests, canals/drainage ditches (emergent), lakes/ponds/impoundments (riparian–mudflats, littoral–emergent), C; *361, Bruza 926, 972, Bryson 727*

Luzula bulbosa (Alph. Wood) Smyth & Smyth, BP, IF, xeric upland hardwood forests, O; *1264, 1318*

Luzula echinata (Small) F.J. Herm., PR, mesophytic upland hardwood forests, O; Morris et al. (1993)

LEMNACEAE

Spirodela polyrrhiza (L.) Schleid., PR, lakes/ponds/impoundments (littoral/profundal–free-floating), A(I); *925*

LILIACEAE

Erythronium albidum Nutt., BP, xeric upland hardwood forests, C(I), **S2**; *McDaniel 10369*

Lilium michauxii Poir., PR, mesophytic upland hardwood forests, R; *Morris 3093*, Morris et al. (1993)

Lilium superbum L., PR, IF, bottomland hardwood forests, RR, **S3S4**; *Leidolf s.n., Phares s.n.*, Theriot et al. (1993)

MELANTHIACEAE

Aletris aurea Walter, IF, pine forests, pine-mixed hardwood forests, seepage areas, roadsides, U/O; *501, 527 (R501), 564, Easley s.n.* (MISSA), *Jordan s.n.* (MISSA), *McDaniel 2638, McKay s.n.* (MISSA), *Ray 4844* (MISSA), *5213* (MISSA)

Aletris farinosa L., IF, pine-mixed hardwood forests; *Ray 6248* (MISSA)

ORCHIDACEAE

Corallorrhiza wisteriana Conrad; Morris pers. obs.

Hexalectris spicata (Walter) Barnhart, PR, mesophytic upland hardwood forests, U; **S2**; *Gordon 2032*

Listera australis Lindl.; McDaniel pers. obs. (specimen extant)

Malaxis unifolia Michx.; McDaniel pers. obs.

Platanthera ciliaris (L.) Lindl., IF, pine forests, pine-mixed hardwood forests, canals/drainage ditches (riparian–banks), R/A(I); *591, Bennett s.n., McDaniel 2637, Ray 4756* (MISSA), *4845* (MISSA), *5215* (MISSA), *Smith 1442*

Platanthera clavellata (Michx.) Luer, IF, pine-mixed hardwood forests; *Ray 4818* (MISSA)

Platanthera cristata (Michx.) Lindl., IF, seepage areas, A(I), **S3**; *526, Ray 5258* (MISSA)

Ponthieva racemosa (Walter) C. Mohr, BP, prairie cedar woodlands, RR, **S2?**; *926*, Leidolf and McDaniel (1998)

Spiranthes cernua (L.) Rich., IF, seepage areas, O; *966*, Morris (1989)

Spiranthes lacera (Raf.) Raf., BP, xeric upland hardwood forests, RR, **S3S4**; *937*

Spiranthes magnicamporum Sheviak, BP, prairies, roadsides, AA(I), **S2S3**; *1002, 1006, 1010, Hare s.n.* (MISSA), Leidolf and McDaniel (1998), Morris (1989), *Ray s.n.* (MISSA)

Spiranthes ovalis Lindl., IF, bottomland hardwood forests, RR, **S2S3**; *970*

Spiranthes praecox (Walter) S. Watson, IF, lakes/ponds/impoundments (riparian–banks), seepage areas, O; *1480*, Morris (1989), *Patts 87* (MISSA), *Tracy s.n.* (MISSA)

Spiranthes tuberosa Raf., IF, pine forests, pine-mixed hardwood forests, U; *876, Ewing s.n.* (MISSA), Morris (1989), *Ray 4848a* (MISSA)

Spiranthes vernalis Engelm. & A. Gray, IF, pine-mixed hardwood forests, lakes/ponds/impoundments (riparian–banks), seepage areas, grass/forb meadows, roadsides, O/C; *321, Hollimon s.n.* (MISSA), *Miles s.n.* (MISSA), Morris (1989), *Ray 6244* (MISSA)

Tipularia discolor (Pursh) Nutt., PR, mesophytic upland hardwood forests, U; *667, 1216 (R667)*

Triphora trianthophora (Sw.) Rydb., IF, bottomland hardwood forests, O/C(I), **S2S3**; *976, Leidolf s.n.*, Theriot et al. (1993)

POACEAE (GRAMINEAE)

Agrostis hiemalis (Walter) Britton, Sterns & Poggenb., IF, seepage areas, cultivated fields, C; *1467*, *1500*, Barkworth et al. (In preparation), *Brooks 134*, Lowe (1921)

Agrostis perennans (Walter) Tuck., BP, IF, bottomland hardwood forests, mesophytic upland hardwood forests, O; *941*, *950*, Lowe (1921), Theriot et al. (1993)

**Aira caryophyllea* L. var. *capillaris* (Host) Mutel [= *A. elegans* Willd. ex Gaudin], IF, roadsides, O; *1484*, *McDaniel 3007*

Alopecurus carolinianus Walter; *Askew 33*, *Bryson 3489*

Andropogon gerardii Vitman, IF, pine forests, C; *918*, Bryson (1980), Lowe (1921)

Andropogon glomeratus (Walter) Britton, Sterns & Poggenb., BP, prairies, C; *995*, Barkworth et al. (In preparation), Leidolf and McDaniel (1998), Lowe (1921), Morris et al. (1993), *Wigley 314108*

Andropogon virginicus L. var. *virginicus*, BP, prairies, C; *1018*, Barkworth et al. (In preparation), Bryson (1980), Leidolf and McDaniel (1998), Lowe (1921), Morris et al. (1993)

Aristida dichotoma Michx.; Barkworth et al. (In preparation), *McDaniel 22200*

Aristida longespica Poir. in Lam. var. *longespica*, BP, prairies, O; *787*, Leidolf and McDaniel (1998), Lowe (1921)

Aristida oligantha Michx., BP, prairies, roadsides, O; *851*, *1599b*, Barkworth et al. (In preparation), *MacDonald 18*

Arundinaria gigantea (Walter) Muhl., PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, A(I); *977*, *1369 (R977)*, Barkworth et al. (In preparation), *Brooks 590*, *Laird 21*, Morris et al. (1993), Theriot et al. (1993)

Axonopus fissifolius (Raddi) Kuhlm. [– *A. affinis* Chase], IF, urban areas, C; *511*, Barkworth et al. (In preparation)

Bothriochloa barbinodis (Lag.) Herter; Barkworth et al. (In preparation)

**Bothriochloa ischaemum* (L.) Keng; Barkworth et al. (In preparation)

Bothriochloa laguroides (DC.) Pilger in Engler ssp. *torreyana* (Steud.) Allred & Gould [= *Andropogon saccharoides* Sw.], BP, prairies, C; *436*, Barkworth et al. (In preparation), Leidolf and McDaniel (1998), Morris et al. (1993), Pullen et al. (1968b), *Wigley 315065*

**Bothriochloa pertusa* (L.) A. Camus [= *Andropogon pertusus* (L.) Willd.], BP, PR, roadsides, O; *1001*, *Allison 8016*, *McDaniel 14669*, Morris et al. (1993), *Stewart 167*, *Wigley 313107*

Bouteloua curtipendula (Michx.) Torr. in Marcy, BP, prairies, A(I), **S3S4**; *616*, Barkworth et al. (In preparation), Bryson (1980), Leidolf and McDaniel (1998), Lowe (1921), Morris et al. (1993)

**Briza minor* L., BP, roadsides, O; *1460*, Barkworth et al. (In preparation)

**Bromus japonicus* Thunb. in Murray, BP, prairies, A(I); *1523*, Barkworth et al. (In preparation), Leidolf and McDaniel (1998)

**Bromus tectorum* L., BP, roadsides, A(I); *1338*, Barkworth et al. (In preparation)

Chasmanthium latifolium (Michx.) H.O. Yates, BP, PR, IF, bottomland hardwood forests, mesophytic upland hardwood forests, C; *390*, Barkworth et al. (In preparation), Lowe (1921), Morris et al. (1993), Theriot et al. (1993)

Chasmanthium ornythorhynchum Nees; Barkworth et al. (In preparation)

Chasmanthium sessiliflorum (Poir.) H.O. Yates, IF, bottomland hardwood forests, mesophytic upland hardwood forests, xeric upland hardwood forests, C; *453*, *640*, *1547*, Barkworth et al. (In preparation), *Bruza 965*, *Clonts 541*, Lowe (1921), Theriot et al. (1993)

**Chloris pectinata* Benth.; Barkworth et al. (In preparation)

Cinna arundinacea L., IF, bottomland hardwood forests, lakes/ponds/impoundments (riparian–mudflats), O; *633*, Theriot et al. (1993)

Coelorachis cylindrica (Michx.) Nash, **S1**; Barkworth et al. (In preparation)

**Cynodon dactylon* (L.) Pers., BP, cultivated fields, O; *421*, Barkworth et al. (In preparation), *Bryson 3421*, Lowe (1921)

**Dactylis glomerata* L., BP, prairies, A(I); *1524*, Barkworth et al. (In preparation)

**Dactyloctenium aegyptium* (L.) Willd.; Barkworth et al. (In preparation), Lowe (1921)

Dichanthelium aciculare (Desv. ex Poir. in Lam.) Gould & C.A. Clark ssp. *aciculare*; Barkworth et al. (In preparation)

Dichanthelium aciculare (Desv. ex Poir. in Lam.) Gould & C.A. Clark ssp. *angustifolium* (Elliott)

Freckmann & Lelong in ed.; Barkworth et al. (In preparation)

Dichanthelium aciculare (Desv. ex Poir. in Lam.) Gould & C.A. Clark ssp. *neuranthum* (Griseb.) Freckmann & Lelong in ed., IF, lakes/ponds/impoundments (riparian–mudflats), O; *703*

Dichanthelium acuminatum (Sw.) Gould & C.A. Clark ssp. *fasciculatum* (Torr.) Freckmann & Lelong in ed.; Barkworth et al. (In preparation)

Dichanthelium acuminatum (Sw.) Gould & C.A. Clark ssp. *implicatum* (Scribn.) Freckmann & Lelong in ed., IF, seepage areas, roadsides; *494*

Dichanthelium acuminatum (Sw.) Gould & C.A. Clark ssp. *lindheimeri* (Nash) Freckmann & Lelong in ed., IF, bottomland hardwood forests, pine forests, urban areas, O; *514*; Barkworth et al. (In preparation), *McDaniel 13491*, Theriot et al. (1993)

Dichanthelium boscii (Poir.) Gould & C.A. Clark, PR, IF, mesophytic upland hardwood forests, xeric upland hardwood forests, C; *459*, *639*, Barkworth et al. (In preparation), Morris et al. (1993)

Dichanthelium clandestinum (L.) Gould; Barkworth et al. (In preparation)

Dichanthelium commutatum (Schult.) Gould ssp. *commutatum*; Barkworth et al. (In preparation), Lowe (1921)

Dichanthelium commutatum (Schult.) Gould. ssp. *joorii* (Vasey) Freckmann & Lelong in ed., PR, IF, bottomland hardwood forests, rivers/creeks (riparian–banks), O; *669*

Dichanthelium consanguineum (Kunth) Gould & C.A. Clark, IF, roadsides, O; *861*

Dichanthelium depauperatum (Muhl.) Gould, BP, IF, xeric upland hardwood forests, pine forests, prairies, O; *1358*, *1522a*, Barkworth et al. (In preparation), *McDaniel 1086*, *13490*

Dichanthelium dichotomum (L.) Gould ssp. *dichotomum*; Barkworth et al. (In preparation), Lowe (1921)

Dichanthelium dichotomum (L.) Gould ssp. *microcarpon* (Muhl. ex Elliott) Freckmann & Lelong in ed. [= *P. microcarpon* Muhl. ex Elliott], IF, bottomland hardwood forests, mesophytic upland hardwood forests, O; *455*, Barkworth et al. (In preparation), Theriot et al. (1993)

Dichanthelium dichotomum (L.) Gould ssp. *nitidum* (Lam.) Freckmann & Lelong in ed.; Barkworth et al. (In preparation), Lowe (1921)

Dichanthelium laxiflorum (Lam.) Gould, BP, PR, IF, pine forests, pine-mixed hardwood forests, prairies, roadsides, C; *429*, *592*, *1366a*, Barkworth et al. (In preparation), Lowe (1921), *McDaniel 9798*

Dichanthelium oligosanthes (Schult.) Gould ssp. *oligosanthes*; Barkworth et al. (In preparation)

Dichanthelium oligosanthes (Schult.) Gould ssp. *scribnerianum* (Nash) Freckmann & Lelong in ed., BP, xeric upland hardwood forests, O; Barkworth et al. (In preparation), *McDaniel 1500*

Dichanthelium ovale (Elliott) Gould & C.A. Clark ssp. *villosissimum* (Nash) Freckmann & Lelong in ed.; Barkworth et al. (In preparation)

Dichanthelium polyanthes (Schult.) Mohlenbr., IF, mesophytic upland hardwood forests, canals/drainage ditches (riparian–banks), O; *458*, *572*, Barkworth et al. (In preparation)

Dichanthelium ravenelii (Scribn. & Merr.) Gould, BP, canals/drainage ditches (riparian–banks), O; *171*, Barkworth et al. (In preparation),

Dichanthelium scabriusculum (Elliott) Gould & C.A. Clark, BP, chalk outcrops, urban areas, R/O; Barkworth et al. (In preparation), *McDaniel 22194*, *31045*

Dichanthelium scoparium (Lam.) Gould, IF, grass/forb meadows, C; *493*, Barkworth et al. (In preparation), Lowe (1921)

Dichanthelium sphaerocarpon (Elliott) Gould, IF, canals/drainage ditches (riparian–banks), O; *571*, Barkworth et al. (In preparation), Lowe (1921)

Digitaria ciliaris (Retz.) Koeler var. *ciliaris*, BP, cultivated fields, A(I); *403*, Barkworth et al. (In preparation)

Digitaria filiformis (L.) Koeler; Barkworth et al. (In preparation), *Brooks 492*, Lowe (1921)

**Digitaria ischaemum* (Schreb.) Muhl., BP, prairies, A(I); *994*, Barkworth et al. (In preparation), *Copeland s.n.*, Lowe (1921)

**Digitaria violascens* Link; Barkworth et al. (In preparation)

**Echinochloa colona* (L.) Link, BP, cultivated fields, C; *402*, Barkworth et al. (In preparation), Lowe (1921), *MacDonald 1*, *Wigley 312053*

**Echinochloa crusgalli* (L.) P. Beauv.; Barkworth et al. (In preparation), *Wigley 312054*

**Echinochloa esculenta* (A. Braun) H. Scholtz; Barkworth et al. (In preparation)

**Echinochloa muricata* (P.Beauv.) Fernald, BP, cultivated fields, O; *413*, Barkworth et al. (In preparation)

**Eleusine indica* (L.) Gaertn., BP, roadsides, C(I); *681*, Barkworth et al. (In preparation), *Bryson 3425*, Lowe (1921), *Wigley 313005*

Elymus glabriflorus (Vasey ex L.H. Dewey) Scribn. & C.R. Ball var. *glabriflorus;* Barkworth et al. (In preparation)

Elymus villosus Muhl. var. *villosus*; Barkworth et al. (In preparation)

Elymus virginicus L., BP, PR, IF, bottomland hardwood forests, roadsides, C(I); *385*, *549*, Barkworth et al. (In preparation), Lowe (1921), *MacDonald 24*, Morris et al. (1993)

Eragrostis capillaris (L.) Nees in Mart., BP, prairies, prairie cedar woodlands, C; *795*, *825*, Barkworth et al. (In preparation), Leidolf and McDaniel (1998), *McDaniel 15510, 22168*

Eragrostis frankii C.A. Mey. ex Steud.; Barkworth et al. (In preparation), Lowe (1921)

Eragrostis hirsuta (Michx.) Nees, BP, chalk outrops, R; Barkworth et al. (In preparation), *McDaniel 22931 (MMNS)*

Eragrostis hypnoides (Lam.) Britton, Sterns & Poggenb.; Lowe (1921), *McDaniel 33287*

Eragrostis intermedia Hitchc.; Barkworth et al. (In preparation)

Eragrostis japonica (Thunb.) Trin. [= *E. glomerata* (Walter) L.H. Dewey]; Lowe (1921), *McDaniel 33290, 33296*

Eragrostis pectinacea (Michx.) Nees; Barkworth et al. (In preparation), Lowe (1921)

Eragrostis pilosa (L.) P. Beauv.; Barkworth et al. (In preparation)

Eragrostis refracta (Muhl. ex Elliott) Scribn., IF, lakes/ponds/impoundments (riparian–banks), O; *696*, Barkworth et al. (In preparation), Lowe (1921), *McDaniel 2730*

Eragrostis spectabilis (Pursh) Steud., IF, grass/forb meadows; *633*, Barkworth et al. (In preparation)

Eragrostis trichodes (Nutt.) Alph. Wood; Barkworth et al. (In preparation)

Eriochloa acuminata (J. Presl) Kunth [= *E. gracilis* (E. Fourn.) Hitchc.]; Barkworth et al. (In preparation), *McDaniel 2207*

Eriochloa aristata Vasey; Barkworth et al. (In preparation), Lowe (1921)

**Glyceria declinata* Bréb., IF, grass/forb meadows, U; *1344*, Barkworth et al. (In preparation)

Glyceria striata (Lam.) Hitchc., BP, prairies, O; *1516*, Barkworth et al. (In preparation)

Gymnopogon ambiguus (Michx.) Britton, Sterns & Poggenb.; Barkworth et al. (In preparation), Lowe (1921)

Gymnopogon brevifolius Trin.; Barkworth et al. (In preparation), Lowe (1921), *McDaniel 26518*

Hordeum pusillum Nutt., BP, urban areas, O; *1456*, Barkworth et al. (In preparation), *Bryson 3487*

**Imperata cylindrica* (L.) Raeusch., BP, roadsides, C(I); *1507*, Barkworth et al. (In preparation)

Leersia lenticularis Michx., IF, bottomland hard wood forests, swamp forests, O; *909*

Leersia oryzoides (L.) Sw., IF, bottomland hardwood forests; Barkworth et al. (In preparation), Lowe (1921), *McDaniel 33292*, Theriot et al. (1993)

Leersia virginica Willd., IF, bottomland hardwood forests, rivers/creeks (riparian–banks), O; *689*, Lowe (1921), *MacDonald 23*, Theriot et al. (1993)

Leptochloa panicea (Retz.) Ohwi ssp. *brachiata* (Steud.) N. Snow, BP, canals/drainage ditches (riparian–banks), O; *801*, Barkworth et al. (In preparation)

Leptochloa panicoides (J. Presl) Hitchc., IF, lakes/ponds/impoundments (riparian–banks), A(I); *605*, Barkworth et al. (In preparation)

**Lolium multiflorum* Lam., BP, cultivated fields, C; *414*, Lowe (1921)

Melica mutica Walter, PR, IF, mesophytic upland hardwood forests, O; *1300*, *1310*, Barkworth et al. (In preparation), Lowe (1921)

**Miscanthus sinensis* Andersson, Barkworth et al. (In preparation), *Mathies 864*

Muhlenbergia glabriflora Scribn., IF, bottomland hardwood forests, canals/drainage ditches (riparian–banks), U **S?**; *Leidolf s.n.*, Theriot et al. (1993)

Nassella leucotricha (Trin. & Rupr.) R.W. Pohl; Barkworth et al. (In preparation)

Nassella viridula (Trin.) Barkworth; Barkworth et al. (In preparation)

Panicum anceps Michx. ssp. *anceps*, IF, mesophytic upland hardwood forests, O; *454*, *552 (R454)*, Barkworth et al. (In preparation)

Panicum capillare L. ssp. *capillare*, BP, cultivated

fields, roadsides, C; *411*, *629*, Barkworth et al. (In preparation)

Panicum dichotomiflorum Michx. ssp. *dichotomiflorum*, BP, roadsides, O; *892*, Barkworth et al. (In preparation)

Panicum flexile (Gatt.) Scribn. in Kearney, BP, prairie cedar woodlands, O; *826*, Barkworth et al. (In preparation), Lowe (1921)

Panicum rigidulum Bosc ex Nees in Mart. ssp. *pubescens* (Vasey) Freckmann & Lelong in ed., IF, bottomland hardwood forests, lakes/ponds/impoundments (riparian–banks), A(I); *602*

Panicum rigidulum Bosc ex Nees in Mart. ssp. *rigidulum*; Barkworth et al. (In preparation), Lowe (1921)

Panicum verrucosum Muhl.; Barkworth et al. (In preparation), Lowe (1921), *McDaniel 33288*

Panicum virgatum L., BP, IF, prairies, seepage areas, C; *590*, *617*, Barkworth et al. (In preparation), Leidolf and McDaniel (1998), Lowe (1921)

Paspalum bifidum (A. Bertol.) Nash; Barkworth et al. (In preparation), Lowe (1921)

Paspalum boscianum Flüggé; Barkworth et al. (In preparation), Lowe (1921), *Wigley 312056*

Paspalum conjugatum P.J. Bergius; Barkworth et al. (In preparation)

**Paspalum dilatatum* Poir. in Lam., BP, prairies, cultivated fields, C; *382*, *419*, Barkworth et al. (In preparation), *MacDonald 16*

Paspalum distichum L., IF, lakes/ponds/impoundments (riparian–mudflats), U; *632*, Barkworth et al. (In preparation), Lowe (1921)

Paspalum floridanum Michx., BP, IF, prairies, seepage areas, roadsides, C; *488*, Barkworth et al. (In preparation), *Carraway 177*, *Clonts 1401*, Leidolf and McDaniel (1998), Lowe (1921)

Paspalum laeve Michx., IF, seepage areas, roadsides, C; *487*, Barkworth et al. (In preparation), Lowe (1921), *McDaniel 2729*

**Paspalum notatum* Flüggé, BP, roadsides, C; *401*, Barkworth et al. (In preparation), *Wigley 314024*

Paspalum paniculatum L.; Barkworth et al. (In preparation)

Paspalum praecox Walter; Barkworth et al. (In preparation), Lowe (1921)

Paspalum pubiflorum Rupr. ex E. Fourn., BP, cultivated fields, U; *818*, Barkworth et al. (In preparation), *McDaniel 2265*

**Paspalum racemosum* Lam.; Barkworth et al. (In preparation)

Paspalum repens P.J. Bergius, IF, bottomland hardwood forests, rivers/creeks (riparian–banks), O; Barkworth et al. (In preparation), *Leidolf s.n.*, *McDaniel 33289*, *33293*, Theriot et al. (1993)

Paspalum setaceum Michx. var. *ciliatifolium* (Michx.) Vasey; Barkworth et al. (In preparation)

**Paspalum urvillei* Steud., IF, seepage areas, road sides, C; *486*, Barkworth et al. (In preparation), *Brooks 476*, *Webster 277*, *Wigley 314026*

**Pennisetum ciliare* (L.) Link; Barkworth et al. (In preparation)

**Pennisetum setigerum* (Vahl) Wipff; Barkworth et al. (In preparation)

Phalaris caroliniana Walter, BP, prairies, O; *1364*, *Brooks 126*, *Wigley 313006*

**Phyllostachys aureosulcata* McClure; *MacDonald 1368*

**Phyllostachys flexuosa* Rivière & C. Rivière, IF, lakes/ponds/impoundments (riparian–banks), A(I); *869*, *MacDonald 1369*

**Phyllostachys meyeri* McClure, PR, IF, lakes/ponds/impoundments (riparian–banks), roadsides, A(I); *723*, *845*, *MacDonald 1371*

**Poa annua* L., BP, cultivated fields, urban areas, C; *1265*, *1280*, Barkworth et al. (In preparation), *Bryson 349*, Lowe (1921)

Poa arachnifera Torr.; Barkworth et al. (In preparation), Lowe (1921)

Poa autumnalis Muhl. ex Elliott, PR, mesophytic upland hardwood forests, C; *1336a*, *1354*, Barkworth et al. (In preparation), Lowe (1921)

Poa chapmaniana Scribn.; Barkworth et al. (In preparation), Lowe (1921)

**Poa pratensis* L., PR, urban areas, C; Leidolf pers. obs., Lowe (1921)

Saccharum brevibarbe (Michx.) Pers. var. *brevibarbe*; Barkworth et al. (In preparation), Lowe (1921)

Saccharum brevibarbe (Michx.) Pers. var. *contortum* (Elliott) R.D. Webster [= *Erianthus contortus* Elliott], IF, pine forests, C; *988*, Lowe (1921)

Saccharum giganteum (Walter) Pers. [= *Erianthus giganteus* (Walter) F.T. Hubb.], IF, pine forests, C; *916*, Barkworth et al. (In preparation), Lowe (1921)

**Schedonorus arundinaceus* (Schreber) Dumort.

[= *Lolium arundinaceum* (Schreber) Darbysh., *Festuca elatior* L.]–BP, PR, bottomland hardwood forests, cultivated fields, O; *418*, Morris et al. (1993)
